## DEDICATION

I would like to dedicate my thesis and all my work throughout these years to my mother, Judith A. Diaz-Rodriguez, my father, Edward A. Caro-Lopez, my sister, Xiomara P. Caro-Diaz, and my grandmother Doña Carmen Rodriguez. They have always encouraged me to pursue a higher education, and they have been unconditionally supportive of all my decisions towards my career goals. Their love and support during good and bad times has been key to my success, and for that I will always be grateful. "Familia es familia, cariño es cariño."

Also I would like to dedicate my work to the love of my life and the woman who has given me so much support, love, companionship, emotional effort and time. Maritxell Carrero, you are my true inspiration to continue my journey through anything that may lie ahead in my path.

## TABLE OF CONTENTS

Signature Page ..... iii
Dedication ..... iv
Table of Contents ..... v
List of Abbreviations ..... viii
List of Figures ..... xi
List of Schemes ..... xii
List of Tables ..... xiv
List of Spectra ..... xv
Acknowledgements ..... xxi
Vita ..... xxiii
Abstract of the Dissertation ..... xxiv
Chapter 1 Synthetic studies and chemical biology of englerin A ..... 1
1.1 Isolation and biological characterization ..... 2
1.2 Biosythesis of guianine sesquiterpenes ..... 3
1.3 Reported synthetic studies ..... 4
1.3.1 Christmann's synthesis (+)-englerin A ..... 5
1.3.2 Ma's and Echevarren's Au-catalyzed cyclization strategy ..... 5
1.3.3 Nicolaou's [5+2] annulation strategy ..... 7
1.3.4 Chain's, Maiers', Lin's and Parkers strategies ..... 7
1.4 Formal synthesis of (-)-Englerin A ..... 8
1.4.1 Retrosynthetic Analysis ..... 8
1.4.2 Synthesis of the $B C$ ring system ..... 9
1.4.3 Synthesis of the A ring ..... 13
1.4.4 Completion of formal synthesis ..... 16
1.5 Synthesis and biology of englerin analogues ..... 17
1.5.1 Synthesis of analogues ..... 18
1.5.2 Biological evaluation ..... 20
1.6 Concluding remarks ..... 22
1.7 Experimental techniques and characterization data ..... 22
1.8 References ..... 116
1.9 Acknowledgments ..... 119
Chapter 2 Total synthesis and chemical biology of Fusarisetin A ..... 120
2.1 Introduction ..... 121
2.2 Isolation and biological characterization ..... 122
2.3 Previous synthetic work ..... 123
2.4 Synthesis of (-)-fusarisetin A ..... 126
2.4.1 Retrosynthetic Analysis ..... 126
2.4.2 Synthesis of the $A B$ decalin ring system ..... 128
2.4.3 Synthesis of the CDE ring. ..... 130
2.5 Synthesis of (+)-fusarisetin A ..... 133
2.5.1 Biomimmetic approach and model studies ..... 134
2.5.2 Scalable synthesis of (-)-equisetin and (+)-fusarisetin A ..... 136
2.6 Chemical biology of fusarisetin A ..... 138
2.6.1 Cell migration assays ..... 138
2.6.2 Fusarisetin A and actin networks ..... 142
2.6.3 Synthesis of analogues and biological evaluation ..... 143
2.7 Concluding remarks ..... 149
2.8 Experimental techniques and characterization data ..... 151
2.9 References ..... 274
2.10 Acknowledgements ..... 279

## LIST OF ABBREVIATIONS

| Ac | acetyl |
| :---: | :---: |
| AcOH | acetic acid |
| $t$-Bu | tert-butyl |
| Bn | beznyl |
| ${ }^{\circ} \mathrm{C}$ | degrees Celsius |
| calcd | calculated |
| $\mathrm{CDCl}_{3}$ | deuterated chloroform |
| $\mathrm{CHCl}_{3}$ | chloroform |
| $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ | methylene chloride |
| $\mathrm{CD}_{3} \mathrm{OD}$ | deuterated methanol |
| $\mathrm{CH}_{3} \mathrm{OH}$ | methanol |
| DCM | dichloromethane |
| DIPEA | diisopropylamine |
| DMAP | N,N-4-dimethylaminopyridine |
| DMF | N,N-dimethylformamide |
| DMP | Dess-Martin periodinane |
| Et | ethyl |
| EtOAc | ethyl acetate |
| EtOH | ethanol |
| $\mathrm{Et}_{3} \mathrm{~N}$ | triethylamine |
| $\mathrm{GI}_{50}$ | mean growth inhibition concentration |
| h | hours |
| HCl | hydrochloric acid |

| ho | irradiation with light |
| :---: | :---: |
| KHMDS | potassium bis(trimethylsilyl)amide |
| HRMS | high-resolution mass spectrometry |
| IBX | o-iodoxybenzoic acid |
| $\mathrm{IC}_{50}$ | mean inhibition concentration |
| LiHMDS | lithium bis(trimethylsilyl)amide |
| $m$-CPBA | meta-chloroperoxybenzoic acid |
| Me | methyl |
| Mel | methyl iodide |
| MeOH | methanol |
| Mhz | megahertz |
| mL | milliliter |
| rt | room temperature |
| $\mu \mathrm{L}$ | microliter |
| $\mu \mathrm{mole}$ | micromole |
| mmol | millimole |
| NaHMDS | sodium bis(trimethylsilyl)amide |
| NMR | nuclear magnetic resonance |
| Ph | phenyl |
| $\mathrm{PPh}_{3}$ | triphenylphosphine |
| ppm | parts per million |
| RCM | ring-closing metathesis |
| $\mathrm{R}_{f}$ | retention factor |
| SAR | structure-activity relationship |
| TBAF | tetrabutylammonium fluoride |

| TBDPS | tert-butyldiphenylsilyl |
| :--- | :--- |
| TBS | tert-butyldimethyllsilyl |
| TEA | triethylamine |
| TES | triethylsilyl |
| Tf | trifluoromethanesulfonate |
| THF | tetrahydrofuran |
| TLC | thin layer chromatography |
| TMS | trimethylsilyl |

## LIST OF FIGURES

Figure 1.1.1 Phyllanthus engleri. ..... 2
Figure 1.1.2 Structure of englerin A, B, and related natural products ..... 2
Figure 1.6.1 Effect of englerin $A$ and analogues 50 and 53 on the proliferation in of A498 renal cancer cells ..... 20
Figure 1.6.1 Effect of analogues $\mathbf{2 8}$ and $\mathbf{3 0}$ on the proliferation in of A498 renal cancer cells ..... 21
Figure 2.2.1 Fusarium sp. FN080326 and the structure of fusarisetin A ..... 122
Figure 2.2.2 Structure of fusarisetin A and structurally related secondary metabolites ..... 123
Figure 2.6.1.1 (+)-Fusarisetin A (1) reversibly inhibits the migration of MDA-MB-231 breast cancer cells in an in vitro scratch-wound assay ..... 139
Figure 2.6.1.2 (+)-Fusarisetin A (1) inhibits the migration of MDA-MB-231 breast cancer cells in an in vitro Transwell migration assay ..... 140
Figure 2.6.1.3 (+)-Fusarisetin A (1) inhibits cell migration in an ex vivo mouse skin assay ..... 141
Figure 2.6.1.4 Screening of fusarisetin $A$ (1), equisetin (2) and their stereoisomers ..... 141
Figure 2.6.2.1 Structures of fusarisetin $A$, fusarisetin B and cytochalasin D ..... 142
Figure 2.6.2.2 Effect of cytochalasin D and fusarisetin A on actin and microtubule dynamics ..... 143
Figure 2.6.3.1 Evaluation of synthetic fusarisetins in a scratch wound assay. ..... 147
Figure 2.6.3.2 Dose-dependent inhibition of Transwell cell migration by 44 and 46 ..... 148
Figure 2.6.3.3 Structure-function relationship map of fusarisetins ..... 149

## LIST OF SCHEMES

Scheme 1.1.1 Biosynthesis of guaiane sesquiterpenes ..... 4
Scheme 1.3.1.1 Chirstmann's synthesis of englerin A ..... 5
Scheme 1.3.2.1 a) Ma's and b) Echevarren's Au-catalyzed cyclization strategy ... ..... 6
Scheme 1.3.2.1 Echevarren's Au-catalyzed cyclization strategy in the synthesis of 5 ..... 6
Scheme 1.3.3.1 Nicolaou's [5+2] annulation reaction towards the synthesis of englerin A ..... 7
Scheme 1.4.1 Retrosynthetic analysis of (-)-englerin A ..... 8
Scheme 1.4.2.1 Davies [4+3] cycloaddition of furans to asymmetric chiral diazoesters ..... 9
Scheme 1.4.2.2 Stereochemical rationale of Davies Rh-catalyzed [4+3] cycloaddition ..... 10
Scheme 1.4.2.3 Rationale of Davies Rh-catalyzed [4+3] cycloaddition ..... 11
Scheme 1.4.2.4 Asymmetric synthesis of the BC ring of 1 ..... 12
Scheme 1.4.3.1 Attempts to construct the A ring of 1 via a RCM reaction ..... 14
Scheme 1.4.3.2 Synthesis of the A ring via a intramolecular aldol condesation ..... 15
Scheme 1.4.3.3 Finalization of the formal synthesis of englerin A ..... 16
Scheme 1.5.1.1 Synthesis of BC ring truncated analogues of 1 ..... 18
Scheme 1.5.1.2 Syntheisis BC ring on 46 via a [5+2] cycloaddition ..... 19
Scheme 1.5.1.3 Synthesis of nor-A-englerin A 52 and acetate derivative 51 ..... 19
Scheme 2.3.1 Ley's enantioselective synthesis of (-)-equisetin ..... 124
Scheme 2.3.2 Li's synthesis of (-)-fusarisetin $A$ and its $C_{5}$ epimer ..... 125
Scheme 2.3.3 Yang's synthesis of (+)-fusarisetin A ..... 125
Scheme 2.4.1.1 Biosynthetic hypothesis of the relationship of equisetin to fusarisetin ..... 127
Scheme 2.4.1.2 Retrosynthetic analysis of (-)-fusarisetin A. ..... 128
Scheme 2.4.2.1 Synthesis of the AB ring system via an IMDA reaction ..... 129
Scheme 2.4.3.1 Conversion of (+)-equisetin to $\mathrm{C}_{5}$-epi-(-)-1 through an ORC reaction. ..... 130
Scheme 2.4.3.2 Total synthesis of (-)-fusarisetin A (1) via a TEMPO-mediated ORC ..... 132
Scheme 2.5.1 Model studies of metal-promoted ORC reactions ..... 135
Scheme 2.5.2.1 Scalable total synthesis of (-)-equisetin and (+)-fusarisetin A .. ..... 137
Scheme 2.6.3.1 Synthesis of C3 analogs via a peptide coupling. ..... 145
Scheme 2.6.3.2 Synthesis of CDE core fusarisetin analog 43 ..... 145
Scheme 2.6.3.3 Synthesis of derivatives of fusarisetin A ..... 146

## LIST OF TABLES

Table 1.1.1 Renal cancer cell inhibition given as $\mathrm{GI}_{50}$ values (in $\mu \mathrm{M}$ ) for englerin $A(1)$ compared to average values of Taxol. ..... 3
Table 1.4.2.1 Optimization of the key $[4+3]$ cycloaddition reaction ..... 12
Table 1.6.1 Inhibition of cell proliferation by (-)-englerin A and analogues ..... 21
Table 1.8.1 Crystal data and structure refinement for compound (-)-30 ..... 103
Table 1.8.2. Atomic coordinates $\left(\times 10^{4}\right)$ and equivalent isotropic displacement parameters ( $\AA^{2} \times 10^{3}$ ) for Compound (-)-30 ..... 104
Table 1.8.3. Bond lengths [ $\AA$ ] and angles [ ${ }^{\circ}$ ] for Compound 30 ..... 104
Table 1.8.4. Anisotropic displacement parameters $\left(\AA^{2} \times 10^{3}\right)$ for Compound (-)-30 ..... 106
Table 1.8.5 Hydrogen coordinates ( $\times 10^{4}$ ) and isotropic displacement parameters $\left(\AA^{2} \times 10^{3}\right)$ for Compound (-)-30. ..... 106
Table 1.8.6 Crystal data and structure refinement for 47 ..... 107
Table 1.8.7 Atomic coordinates ( $\times 10^{4}$ ) and equivalent isotropic displacement parameters $\left(\AA^{2} \times 10^{3}\right)$ for 47 ..... 108
Table 1.8.8 Bond lengths $[\AA]$ and angles $\left[{ }^{\circ}\right]$ for 47 ..... 109
Table 1.8.9 Anisotropic displacement parameters $\left(\AA^{2} \times 10^{3}\right)$ for 47 . ..... 113
Table 1.8.10 Hydrogen coordinates ( $x 10^{4}$ ) and isotropic displacement parameters $\left(\AA^{2} \times 10^{3}\right)$ for 47 . ..... 114
Table 1.8.11 Hydrogen bonds for 47 [ $\AA$ and ${ }^{\circ}$ ]. ..... 115
Table 2.5.1 Conversion of 32 to 33 and 34 via a metal-promoted ORC reaction ..... 134
Table 2.6.3.1 $\mathrm{IC}_{50}$ values of fusarisetin analogs ..... 148
Table 2.8.1 Studies of the oxidative radical cyclization (ORC) of $\mathbf{3 2}$ ..... 170
Table 2.8.2 ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR datum comparison of synthetic and natural (+)-1 ..... 174

## LIST OF SPECTRA

Spectrum $1.1{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 20 ..... 49
Spectrum $1.2{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 20 ..... 50
Spectrum $1.3{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 27 ..... 51
Spectrum $1.4{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 27 ..... 52
Spectrum $1.5{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 21 ..... 53
Spectrum $1.6{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 19 ..... 54
Spectrum $1.7{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 19 ..... 55
Spectrum $1.8{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 28 ..... 56
Spectrum $1.9{ }^{13} \mathrm{CNMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound $\mathbf{2 8}$ ..... 57
Spectrum $1.10{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 30 ..... 58
Spectrum $1.11{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound $\mathbf{3 0}$ ..... 59
Spectrum $1.12{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 31 ..... 60
Spectrum $1.13{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 31 ..... 61
Spectrum $1.14{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 32 ..... 62
Spectrum $1.15{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 33 ..... 63
Spectrum $1.16{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 34 ..... 64
Spectrum $1.17{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 34 . ..... 65
Spectrum $1.18{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 35 ..... 66
Spectrum $1.19{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 36 ..... 67
Spectrum $1.20{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 18 ..... 68
Spectrum $1.21{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 18 . ..... 69
Spectrum $1.22{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 38 ..... 70
Spectrum $1.23{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 38 A ..... 71
Spectrum $1.24{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 39 ..... 72
Spectrum $1.25{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 39 ..... 73
Spectrum $1.26{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 40 ..... 74
Spectrum $1.27{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 40 ..... 75
Spectrum $1.28{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 41 ..... 76
Spectrum $1.29{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 41 ..... 77
Spectrum $1.30{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 17 ..... 78
Spectrum $1.31{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 17 ..... 79
Spectrum $1.32{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 45 ..... 80
Spectrum $1.33{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 45 ..... 81
Spectrum $1.34{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 46 . ..... 82
Spectrum $1.35{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 46 ..... 83
Spectrum $1.36{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 47 ..... 84
Spectrum $1.37{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 47 ..... 85
Spectrum $1.38{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 48 ..... 86
Spectrum $1.39{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 49 ..... 87
Spectrum $1.40{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 49 ..... 88
Spectrum $1.41{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 50 ..... 89
Spectrum $1.42{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 50 ..... 90
Spectrum $1.43{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 51 ..... 91
Spectrum $1.44{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 51 ..... 92
Spectrum $1.45{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 52 ..... 93
Spectrum $1.46{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 53 ..... 94
Spectrum $1.47{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 54 ..... 95
Spectrum $1.48{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 54 ..... 96
Spectrum $1.49{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 41 . ..... 97
Spectrum $1.50{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 41 ..... 98
Spectrum $1.51{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 42 ..... 99
Spectrum $1.52{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 42 ..... 100
Spectrum $1.53{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 43 ..... 101
Spectrum $1.54{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 43 ..... 102
Spectrum 2.1 ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 17 ..... 190
Spectrum $2.2{ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}, 100 \mathrm{MHz}$ ) of compound 17 ..... 191
Spectrum $2.3{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 9 ..... 192
Spectrum $2.4{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 9 ..... 193
Spectrum $2.5{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 15 ..... 194
Spectrum $2.6{ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}, 100 \mathrm{MHz}$ ) of compound 15 ..... 195
Spectrum $2.7^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 18 ..... 196
Spectrum $2.8{ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}, 100 \mathrm{MHz}$ ) of compound 18 ..... 197
Spectrum $2.9{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 14 ..... 198
Spectrum $2.10{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 14 ..... 199
Spectrum $2.11{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 20 ..... 200
Spectrum $2.12{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 20 . ..... 201
Spectrum $2.13{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 21 ..... 202
Spectrum $2.14{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 23 ..... 203
Spectrum $2.15{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 24 ..... 204
Spectrum $2.16{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 24 ..... 205
Spectrum $2.17{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 25a ..... 206
Spectrum $2.18{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 25b ..... 207
Spectrum $2.19{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 26 ..... 208
Spectrum $2.20{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 13a ..... 209
Spectrum $2.21{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 13a ..... 210
Spectrum $2.22{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 13b ..... 211
Spectrum $2.23{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 13b ..... 212
Spectrum $2.24{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound $\mathbf{2 8}$ ..... 213
Spectrum $2.25{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 28 ..... 214
Spectrum $2.26{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 32 ..... 215
Spectrum $2.27{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 32 ..... 216
Spectrum $2.28{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 33 ..... 217
Spectrum $2.29{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 33 ..... 218

## ACKNOWLEDGEMENTS

Tremendous thanks to Professor Theodorakis, my advisor as his doors have always been open for me. He has taught me the fundamentals of organic chemistry, and encouraged me to think critically and pursue experimental work outside the field of organic chemistry. His support has been unconditional, and for that I'm ever grateful. Thanks to Dr. Jing Xu for his help, support and training during both of my thesis projects. His training is invaluable to me and has fortified my research skills.

All of this research was supported by the UCSD Academic Senate, and the National Institue of Health (NIH). The material in Chapter 1, in full, is a reprint of the material as it appears in Enantioselective Formal Synthesis of (-)-Englerin A via a RhCatalyzed [4 + 3] Cycloaddition Reaction in Organic Letters 2010. Xu, J.; Caro-Diaz, E.J.E.; Theodorakis, E.A., 2010 and in Formal Synthesis of (-)-Englerin A and Cytotoxicity Studies of Truncated Englerins in Chemistry: An Asian Journal. Xu, J.; CaroDiaz, E.J.E.; Batova, A.; Theodorakis, E.A., 2012. The dissertation author was the primary investigator and author of this material.

The material in Chapter 2, in full, is a reprint of the material as it appears in Nature-Inspired Total Synthesis of (-)-Fusarisetin A in Journal of the American Chemical Society 2012. Xu, J.; Caro-Diaz, E.J.E.; Trzoss, L., 2012, in Fusarisetin A: scalable total synthesis and related studies in Chemical Science 2012. Caro-Diaz, E.J.E.; Xu, J.; Lacoske, M.; Jamora, C.; Theodorakis, E.A., 2012 and in Fusarisetins: structurefunction studies on a novel class of cell migration inhibitors in Organic Chemistry Frontiers 2013. Caro-Diaz, E.J.E.; Aung, A.; Xu, J.; Varghese, S.; Theodorakis, E.A., 2013. The dissertation author was the primary investigator and author of this material.

## ABSTRACT OF THE DISSERTATION

Secondary metabolites as potential cancer therapeutic leads: Synthesis and chemical biology of Englerin A and Fusarisetin A
by

Eduardo J.E. Caro-Diaz

Doctor of Philosophy in Chemistry

University of California, San Diego, 2014

Professor Emmanuel A. Theodorakis, Chair

Secondary metabolites generated from natural sources such as microbes, fungi, marine fauna and other microorganism have proven to represent a microcosm of chemical diversity and therefore a great source of novel phamacophoric structures. It is without question that nature in its long biological and chemical evolution has gifted us with beautiful molecular architectures with equally important biological function to
provide leads into new and potentially useful biologically active molecules. As a result, it is not surprising that drug discovery efforts, in both industry and academia, have greatly benefited from isolation and characterization of secondary metabolites. For this reason, it is still important to continue our investigative endeavors toward the discovery of novel motifs with undescribed mechanisms of action in the effort to provide new leads towards oncologic small molecule therapeutics.

As synthetic chemist secondary metabolites can also encompass lessons about complex reactivity and, with the accelerated development of more sophisticated reactions, can present new challenges to develop more efficient and elaborate strategies towards the total synthesis of complex organic structures. It is both an intricate structural architecture and unprecedented biological activity that provide a solid research project towards the development of a synthetic route of a small molecule secondary metabolite. Englerin A and fusarisetin A both represent all these important attributes and were therefore selected by the primary investigator as synthetic targets for research.

Research herein described the work surrounding the formal synthesis of englerin A, the chemical biology in terms of Structural-Activity-Relationship of englerin A, the total synthesis of fusarisetin $A$, and the chemical biology of fusarisetins. Chapter 1 will narrate the background and research related to synthetic studies and chemical biology of englerin A. Chapter 1 will narrate the background and research related to synthetic studies and chemical biology of fusarisetin A.

## Chapter 1

Synthetic studies and chemical biology of englerin A

### 1.1 Isolation and biological characterization

The need to identify new chemical motifs as potential drug leads has spurred the screening of plant extracts used in traditional African, Ayurvedic (Indian) and Chinese medicines. ${ }^{1}$ In particular, South Africa has a remarkable botanical diversity with over 30,000 flowering species, from which more than 3,000 are used for medicinal purposes throughout the country. ${ }^{2}$ Among them, plants of the genus Phyllanthus (Euphorbiaceae, Figure 1.1.1) ${ }^{3}$ are widely distributed and have long been used in African folk medicine to treat kidney and urinary tract infections. ${ }^{4}$ With this in mind, the Beutler laboratory has been screening extracts of the Tanzanian plant Phyllanthus engleri against renal cell carcinoma (RCC) and has recently reported the isolation of two novel bioactive sesquiterpenes, named englerin $A(1)$ and englerin $B(2)$ (Figure 2). ${ }^{5}$

Figure 1.1.2 Structure of englerin A, B, and related natural products

Preliminary biological investigations ${ }^{4}$ have shown that 1 possesses very potent growth inhibitory activity $\left(\mathrm{GI}_{50}=1-87 \mathrm{nM} \text {, Table 1.1.1 }\right)^{4}$ against RCC with approximately 1,000 -fold tissue selectivity as compared to other carcinomas. These findings are of particular significance since RCC: (a) is among one of the ten leading cancer types in the US; ${ }^{6}$ (b) is characterized by a lack of early warning signs, has diverse clinical manifestations and shows resistance to radiation; ${ }^{7}$ and (c) cannot be effectively treated with current chemotherapeutic agents, leaving surgical procedures as the only treatment option. ${ }^{8}$

### 1.2 Biosynthesis of guianine sesquiterpenes

Biogenetically, the englerins belong to the family of guaiane natural products ${ }^{9}$ which arise originally from mutiple carbocataionic rearrangments of the E,E farnesyl cation well documented in terpene biosynthesis. The guaiyl cation can arrange and skeleton and can then undergo a sequence of oxygenations and oxo-cyclizations rearrange olefin functionalities at different regions of the common bicyclic sesquiterpene Further decoration at the periphery of this core produces the structures of $\mathbf{1}$ and $\mathbf{2}$. In
general, the englerin family is characterized by decahydroazulene fused ring core with an oxygen bridge between $\mathrm{C}_{7}$ and $\mathrm{C}_{10}$ carbon centers as well hydroxyl substitutions at the $\mathrm{C}_{6}$ position. Synthetically, this motif represents an interesting and complex exercise to develop and investigate in the chemical laboratory.

Scheme 1.1.1 Biosynthesis of guaiane sesquiterpenes.

### 1.3 Reported synthetic studies

Due to the combination of uncommon structural architecture, potent and selective cytotoxicity against RCC and promising pharmacology, the englerins have received enormous amount of attention from the chemical community. Since their isolation in 2008, more than half a dozen total syntheses and many strategies and studies have been reported toward these natural products. In good scientific spirit, strategies towards the synthesis of englerin A have shown to be quite dynamic and diverse in approach. The most attention has been dedicated to construction of the $A B C$ ring system that represents the core of englerin's molecular complexity. It is worth summarizing these strategies.

### 1.3.1 Christmann's synthesis of (+)-englerin A

Christmann's synthesis ${ }^{10}$ of englerin $A$ is highlighted by the conversion of lactone 6 to pentalactone 7 via oxidative rearrangement, opening of the $B$ ring to diolefin 8 and a Grubbs promoted ring closing metathesis to generate the decahydroazulene moiety. Finally, diol 9 can be converted to englerin A via mCPBA epoxidation of 9 and opening of this epoxide by $\mathrm{C}_{10}$ hydroxl attack to the $\mathrm{C}_{7}$ center to generate the oxygen bridge. The final synthetic material gave the exact opposite optical rotation as the isolated natural product, therefore reassigned the absolute stereochemistry of englerin $A$.

Scheme 1.3.1.1 Chirstmann's synthesis of englerin A.

### 1.3.2 Echevarren's and Ma's Au-catalzyed cyclization strategy

Echevarren et al. have investigated the reactivity profile of intramolecular cyclizations of ketoenynes in the presence of different gold catalysts and through this strategy has successfully synthesized orientalol F (4) (Scheme 1.3.2.1). ${ }^{11}$ Presumably, this pathway operates via a insertion of gold to the alkyene, attack by the alkene to generate a reactive cyclopropane intermediate that can undergo 5-exo-dig cyclization
from the ketone, seven member ring formation and reductive elimination to yield the $B$ ring of 1. Both $\mathrm{Ma}^{12}$ (Scheme 1.3.2.2, a) and Echevarren ${ }^{13}$ (Scheme 1.3.2.2, b) would use this reactivity toward the synthesis of englerin $A$ and in this way generate the $A B C$ core ring structure in a 1 step process. Final functionalization of the ABC core would ultimately yield (-)-englerin A.

Scheme 1.3.2.1 Echevarren's Au-catalyzed cyclization strategy in the synthesis of $\mathbf{5}$

Scheme 1.3.2.2 a) Ma's and b) Echevarren's Au-catalyzed cyclization strategy

### 1.3.3 Nicolaou's synthesis of ( $\pm$ )-englerin A and formal synthesis of (-)-engelerin A

Nicolaou et al took advantage of chemistry described by Wender ${ }^{14}$ to assemble the $A B$ ring of englerin $A$ system via a $[5+2]$ cycladdition. ${ }^{15}$ They could then also provide a stereoselective formal synthesis by using a chiral acrylate ester to generate modest diasteremeric enrichment (2:1) (Scheme 1.3.3.1).

Scheme 1.3.3.1 Nicolaou's [5+2] annulation reaction towards the synthesis of englerin $A$

### 1.3.4 Chain's, Maiers', Lin's and Parkers strategies

After completion and publication of our synthetic work on englerin A, the synthetic community continued to develop new approaches towards the synthesis of 1. Chain's presented a strategy towards the tricyclic core of englerin A through an umpolung addition of an aliphatic aldehyde moiety to a proximal $\alpha, \beta$-unsaturated ketone promoted by $\mathrm{Sml}_{2} .{ }^{16}$ Maiers' approach encompassed a similar approach to Nicolaou's by use of a late stage [5+2] Rh-catalyzed cylcoaddition. ${ }^{17}$ Lin's synthesis used a similar approach to Theodorakis, making us of a $[4+3]$ cycloaddition between a furan and diene, yet differed by generating the asymmetric environment of this process using a chrial organocatalyst. ${ }^{18}$ Most recently, Parker et al reported a bicylcization strategy consisting of a relay ene-yne-ene metathasis that coverts a linear substrate into the guiaine core of
englerin A. ${ }^{19}$ Two recent reviews nicely summarize all of these approached and the current status of englerins. ${ }^{20}$

### 1.4 Formal synthesis of (-)-englerin $A$

Our continuous interest in exploring natural products from ethnomedicine as medicinal leads ${ }^{21}$ prompted us to design an enantioselective strategy toward englerins. ${ }^{22}$ Here in, we describe in detail the results of our synthetic efforts, failed strategies, and detailed mechanistic approach towards the synthesis guiaine core of ()-englerin A. ${ }^{23}$

Scheme 1.4.1 Retrosynthetic analysis of (-)-englerin A

Our retrosynthetic strategy is shown in Scheme 1. We anticipated that a sequence of reactions including: inversion of the $\mathrm{C}_{6}$ stereocenter, hydrogenation of the $\mathrm{C}_{4}-\mathrm{C}_{5}$ alkene (englerin numbering) and selective esterifications at $\mathrm{C}_{6}$ and $\mathrm{C}_{9}$ hydroxyl
groups would form englerin (1) from diol 17. Compound 17 could be derived a regioselective hydroboration of the $\mathrm{C}_{8}-\mathrm{C}_{9}$ double bond and the cyclopentene moiety of 17 could be constructed from an intramolecular aldol condensation. An $\alpha$-hydroxylation would produce the $\mathrm{C}_{6}$ hydroxyl substitution and conjugate addition of common propanal could generate diketone 18. Further disconnection along these lines led us to target the construction of bicyclic motif 19 possessing the BC ring scaffold of englerins. We hypothesized that compound 19 could be formed in enantiomerically pure form by exploring a asymmetric $\mathrm{Rh}(\mathrm{II})$-catalyzed [4+3] cycloaddition between readily available furan 20 and chiral pantolactone-derived diazoester 21.

### 1.4.2. Synthesis of the BC ring system

Rhodium-triggered cyclization reactions have been widely applied in synthetic chemistry. ${ }^{24}$ In 1996, Davies et al. reported an elegant enantioselective Rh (II)-catalyzed $[4+3]$ cycloaddition between furans and chiral diazoesters (Scheme 1.4.2.1). ${ }^{25}$ Selection of the appropriate pantolactone enantiomer, as the chiral auxiliary, allows diastereocontrol of the produced oxy-bridged adduct. The transfer of chirality, observed in this reaction, can be rationalized by considering that the carbonyl moiety of pantolactone interacts with the Rh-carbenoid as shown in Scheme 1.4.2.2. This interaction blocks one of the two faces of the carbene 21 leading to a selective si-face attack by the 2-

Scheme 1.4.2.1 Davies $[4+3]$ cycloaddition of furans to asymmetric chiral diazoesters
methyl-5-isopropylfuran 20. The stereochemical outcome is consistent with a tandem cyclopropanation/Cope rearrangement. Cyclopropanation of the unsymmetric furan 20 was expected to occur in a regioselective manner at the less substituted and thus less hindered $\mathrm{C}_{9}-\mathrm{C}_{10}$ double bond. The potential of this cycloaddition to construct bicyclic structure 19 was of great interest to our strategy, as it provided an efficient, rapid and enantioselective access to the englerin core. Notably, both of starting materials $\mathbf{2 0}^{26}$ and $21^{19 a, 27}$ can be simply prepared in more than 50 gram-scale from commercially available materials in 3 steps for each, respectively.

Scheme 1.4.2.2 Stereochemical rationale of Davies Rh-catalyzed [4+3] cycloaddition

To the best of our knowledge, 2,5-disubstituted furans have not been evaluated as substrates in the $\mathrm{Rh}(\mathrm{II})$-catalyzed [4+3] cycloaddition. With this in mind, we initially evaluated the regioselectivity of this reaction using achiral diazoester $\mathbf{2 6}^{\mathbf{2 8}}$ as a model system (Scheme 1.4.2.3). Refluxing of $\mathbf{2 0}$ and diazoester 26 in hexane in the presence of catalytic amounts of rhodium(II) octanoate ( $2 \mathrm{~mol} \%$ ), afforded oxacyclic product ( $\pm$ )-28 as the only regio-isomer in excellent yields (95\%). Cleavage of the ester auxiliary proved to be more challenging than anticipated. In fact, the reported $\mathrm{LiAlH}_{4}$ reductive cleavage led only to decomposition. Gratifyingly, treatment of ester 27 with DIBAL-H yielded a labile $\beta$-hydroxy silyl enol ether that, upon immediate treatment with
stoichiometric amounts of $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$, underwent rearrangement ${ }^{29}$ to afford exocyclic enone ( $\pm$ )-28 in good yield (81\%).

26
Scheme 1.4.2.3 Rationale of Davies Rh-catalyzed [4+3] cycloaddition

Encouraged by these results, we synthesized chiral diazoester 21 departing from (R)-pantolactone. ${ }^{15 a, 17}$ The $\mathrm{Rh}(I I)$-catalyzed [4+3] cycloaddition of 20 with 21 proceeded efficiently with $\mathrm{Rh}_{2}(\mathrm{OOct})_{4}$ to yield 19 in good yield (90\%) albeit in moderate diastereoselectivity (dr 3:1, calculated via ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ) (Scheme 1.4.2.4). It should be noted that, under the same conditions, use of $\mathrm{Rh}_{2}(\mathrm{OAc})_{2}$ led only to decomposition of the starting materials. Moreover, attempts to increase the d.r by performing this reaction at lower temperature or by using less catalyst loading led to a significant decrease in the yield without any significant enhancement of diastereoselectivity (Table 1.4.2.1). The diastereomeric mixture of 19 could be separated via a silica gel column chromatography. Our previously established reductive cleavage conditions were applied to 19 to produce optically active enone (-)-30, although the yield was significantly lowered (59\%). This decrease of yield may be due to the presence of the two reactive carbonyl moieties in 19 that require extended reaction times and excess of DIBAL-H (7.5 equiv) as compared to reduction of ( $\pm$ )-28 (2.5 equiv), leading to partial decomposition of the sensitive silyl enol ether moiety.

The next attempts of installing a hydroxyl group on the $\mathrm{C}_{6}$ carbon of $(-)-\mathbf{2 8}$ with Davis oxaziridines ${ }^{30}$ proved unsuccessful. Gratifyingly, Rubottom oxidation ${ }^{31}$ provided the desired hydroxy enone 30 in good yield ( $87 \%$ brsm), although with the inverse
stereochemistry as compared to the englerin $\mathrm{C}_{6}$ hydroxyl moiety. The absolute stereochemistry of hydroxyl enone $\mathbf{3 0}$ was established by a single crystal X-ray analysis, ${ }^{32}$ which simultaneously confirmed the absolute stereochemistry of oxy-bridged ester 19. We were pleased to observe that the Rubottom oxidation proceeded regioselectively at the more electronically rich TMS enol ether without affecting any other alkenes in this molecule. The stereochemical outcome of this reaction was also satisfactory since it proceeded exclusively from the top face of the intermediate TMSenolate 29 suggesting that this face is less hindered. We predicted that this selectivity would allow us to have complete substrate control during the following steps and invert the $\mathrm{C}_{6}$ stereochemistry at a latter stage in our synthesis.

### 1.4.3 Synthesis of the A ring

The next stage of the synthesis involved construction of the tricyclic core of englerin from compound 30. We envisioned to accomplish this cyclization by the means of a Grubbs ring closing metathesis $(\mathrm{RCM})^{33}$ of precursor 32 (Scheme 1.4.3.1) that after oxidation of $\mathrm{C}_{6}$ hydroxyl group would reveal a conjugate system for 1,4-addition of methyl nucleophile at the $\mathrm{C}_{4}$ site. Lewis acid-promoted allylation with allyltrimethylsilane afforded the corresponding ketone 31 in moderate yield (68\%) as a single diastereomer. The ensuing olefination of $\mathrm{C}_{5}$, however, proved to be unexpectedly challenging. After attempting many different methods including Wittig reaction, Peterson olefination, ${ }^{34}$ Petasis ${ }^{35}$ or Tebbe olefination ${ }^{36}$ etc., the $\mathrm{TiCl}_{4}$-assisted Nysted olefination ${ }^{37}$ gave low yields (15-36\%) of trialkene 32. Despite the inefficient formation of 32 we attempted the RCM. We were pleased to see that this reaction proceeded smoothly in almost quantitative yields to give the corresponding allylic alcohol, which after TPAP/NMO
oxidation, ${ }^{38}$ formed $\alpha, \beta$-unsaturated ketone 33 . Unfortunately, all efforts to add methyl nucleophiles to 33 via conjugate addition met with failure. To overcome this issue, we sought to perform the RCM on a substrate that has the challenging $\mathrm{C}_{11}$ methyl group preinstalled. Along these lines, we allylated $\mathbf{3 0}$ with methylallyltrimethyl silane. While we were successful in producing 34 , olefination of this precursor at $\mathrm{C}_{5}$ resulted in irreproducible results. This prompted us to abandon this approach and seek an alternative strategy for the formation of the 5-membered ring from 30.

Scheme 1.4.3.1 Attempts to construct the A ring of 1 via a RCM reaction

Based on the above results, we pursued an alternative strategy for the construction of the tricyclic core of englerin based on an intramolecular aldol condensation. Initially, we explored the feasibility of this reaction using non hydroxylated enone 17 as a model system (Scheme 1.4.3.2). To this end, treatment of propanal with thiazolium salt (A) and enone 28 under Stetter conditions ${ }^{39}$ produced diketone 35. To our delight, the intramolecular aldol reaction of 35 proceeded under mild conditions ( $\mathrm{KOH} / \mathrm{EtOH}, \mathrm{rt}, 24$ hours) to afford 36 in good yield (76\%).

2) TBSOTf,
$\mathrm{NEt}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$
$80 \%$ over 2 steps

Scheme 1.4.3.2 Synthesis of the A ring via a intramolecular aldol condesation

Motivated by this result, we converted $\mathbf{3 0}$ to the $\mathrm{C}_{6}$ TBS silyl ether 37 and treated this product with propanal under the previously established Stetter conditions. This reaction proceeded efficiently under basic conditions to furnish diketone 18 in good yield (75\% over two steps) as a single diastereomer (Scheme 1.4.3.2). However, application of previously successful KOH condensation only resulted in deprotection of the TBS ether with no further reaction. This prompted an extensive investigation on this intramolecular condensation, with different $\mathrm{C}_{6}$ protecting groups (H-, MOM-, TES-, etc.), various bases (t-BuOK, KOH, NaOMe, LDA, etc.) and various reaction conditions. Many failed attempts of the aldol condensation to provide the tricyclic motif proved this reaction to be unexpectedly difficult. Eventually, treatment of diketone 18 with NaHMDS afforded the corresponding aldol product, which underwent sequential dehydration process $(\mathrm{NaOMe}, \Delta)$ to produce the key tricyclic core 38 in an acceptable yield ( $43 \% \mathrm{brsm}$ ).

Scheme 1.4.3.3 Finalization of the formal synthesis of englerin A

### 1.4.4 Completion of formal synthesis

$\mathrm{NaBH}_{4}$ reduction of enone 38 yielded the corresponding allylic alcohol (99\%) as a single diastereomer that, without further purification, was protected as the benzyl ether to furnish 39 in good yield (71\%) (Scheme 1.4.3.3). Treatment of 39 with $\mathrm{BH}_{3} \cdot T H F$ followed by $\mathrm{H}_{2} \mathrm{O}_{2}$ oxidation afforded regio- and stereoselectively alcohol $\mathrm{C}_{9}(60 \%)$. That after standard TBS silylation followed by deprotection of the $\mathrm{C}_{3}$ benzyl ether yielded 40 in $57 \%$ over 3 steps. (Scheme 7). Our efforts to hydrogenate the tetra-substituted alkene of 40 using different catalysts and $\mathrm{H}_{2}$ pressure were unsuccessful presumably due to the steric hindrance of the double bond $\left(\mathrm{C}_{3}-\mathrm{C}_{4}\right)$. This prompted us to deoxygenate the $\mathrm{C}_{3}$ hydroxyl group under Barton-McCombie conditions ${ }^{40}$ ( $40 \%$ yield). In our efforts to improve this transformation, we discovered that dehydration of 40 with Burgess
reagent ${ }^{41}$ followed by standard hydrogenation improved significantly the yield to $90 \%$ over the two steps. Deprotection of the di-TBS ether 41 with TBAF gave poor results, however, we were pleased to find that a microwave accelerated reaction under similar conditions (TBAF/THF, $80^{\circ} \mathrm{C}$ ) made diol (+)-17 in a quick and high yielding conversion (45 min, 93\%).

To access the natural product from diol (+)-17, we would need to achieve stereoselective saturation of the tetra-substituted bond followed by esterification of the $\mathrm{C}_{9}$ hydroxyl group, inversion of $\mathrm{C}_{6}$ stereocenter by oxidation/reduction sequence and finally esterification in the presence of cinnamic acid. Our synthetic route to $(+)-17$ provides another novel and facile method for the construction of englerin $A$ and related compounds. More significantly, the Rh-catalyzed [4+3] annulation/ intramolecular aldol condensation sequence presents a very useful, practical and general method for the preparation of the guaiane sesquiterpene core present in englerin related compounds.

### 1.5 Synthesis and Biology of englerin analogues

The intriguing bioactivity of englerin A has prompted several groups to perform SAR studies. ${ }^{42,43}$ These studies have focused exclusively on modifications of the $\mathrm{C}_{6}$ and $\mathrm{C}_{9}$ side chains. An advantage to our strategy is that it can produce in an efficient and stereoselective manner compound 19, which represents the $B C$ ring system of englerins. In other words, this approach could provide information on the biological significance of the $A$ ring of englerin. Our synthesis also allows for evaluation of different $A B C$ core analogs parting from trycyclic ketone 38 to evaluate the SAR of the guaiane core moiety of 1 .

### 1.5.1 Synthesis of analogues

With our strategy in mind, we synthesized truncated englerins 41, 42 and 43 (Scheme 1.5.1.1) readily from ( $\pm$ )-30 in via 1 step conversions. To further expand such SAR studies, we designed a new approach towards a compound that could represent nor-A-ring englerin A. The synthesis of nor-A-ring 46 is highlighted in Scheme 1.5.1.2 and is inspired by Wender's pioneering [5+2] cycloaddition reactions. ${ }^{14}$ 2-methyl-5furfural (44) was first alkylated under Grignard conditions and the resulting alcohol was converted to hemiacetal 45 in $85 \%$ overall yield. Treatment of 45 with excess acrylonitrile $\left(100^{\circ} \mathrm{C}, 14 \mathrm{~h}\right)$ under gave the desired bicyclic product 46 in $32 \%$ yield. This reaction could be accelerated under microwave conditions with improved yield $\left(150^{\circ} \mathrm{C}\right.$, $4 \mathrm{~h}, 45 \%$ ). To the best of our knowledge, this is the first example of microwave accelerated this type of [5+2] cycloaddition reaction. Luche reduction ${ }^{44}$ followed by hydrogenation provided compound $47^{45}$ in almost quantitative yield and provided crystalline material to confirm the relative stereochemistry of 47 . The transformation from 47 to 50 was accomplished in a 3-step sequence that included: (a) oxidative cleavage of the cyanide group to the corresponding ketone; (b) esterification oxidative cleavage of

Scheme 1.5.1.1 Synthesis of BC ring truncated analogues of 1

Scheme 1.5.1.2 Syntheisis BC ring on 46 via a [5+2] cycloaddition
oxidative cleavage of the cyanide group to the corresponding ketone; (b) esterification with cinnamic acid under Yamaguchi condition; ${ }^{46}$ (c) hydride reduction of $\mathrm{C}_{9}$ carbonyl moiety. The last two steps were performed following the reported method ${ }^{9 b}$ to furnish 53. Moreover, the acetate analogue 51 was readily prepared from acetylation of 50.

Scheme 1.5.1.3 Synthesis of nor-A-englerin A 52 and acetate derivative 51

### 1.6 Biological Evaluation

The cytotoxicity of the truncated englerins was evaluated in both A498 renal cancer cells and CEM T-cell acute lymphoblastic leukemia (T-ALL) cells using a ${ }^{3} \mathrm{H}$ thymidine incorporation assay. In our initial study, we compared the growth inhibitory activity of englerin $A$ to that of truncated englerins 50 and 53 . We found that englerin $A$ inhibited the growth of A498 renal cancer cells with a $\mathrm{GI}_{50}$ of 45 nM which is in agreement with previous findings (Figure 2). ${ }^{4,9 \mathrm{daf}, 10 \mathrm{e}}$ However, compounds 50 and $\mathbf{5 3}$ did not have any effect on the growth of A498 cells even at concentrations of 100 nM or greater (Figure 1.6.1). These results suggest that the A ring is essential for the growth inhibitory activityonglerin $A$ in renal canclere ctelesn evaluated the antiproliferative activity of englerin analogues in CEM cells, a cell line in which englerin A has little activity with a reported $\mathrm{Gl}_{50}$ of $20.4 \mathrm{mM} .{ }^{4}$ Of all analogues tested, $17,( \pm)-17$,

Figure 1.6.1 Effect of englerin A and analogues 50 and 53 on the proliferation in of A498 renal cancer cells

Table 1.6.1 Inhibition of cell proliferation by (-)-englerin A and analogues

| Compound | \%aff2OanMol | (M1PA) |
| :---: | :---: | :---: |
| $\mathbf{( - ) - \mathbf { 1 }}$ | $81.4 \pm 2.5$ | $>20$ |
| $\mathbf{4 4}$ | $74.6 \pm 2.6$ | $>20$ |

and 19 had significant cytotoxicity with $\mathrm{GI}_{50}$ values of $3.3,1.8$, and 2.4 mM , respectively (Figure 3, Table 2). We assume that the cytotoxicities might be due to the exocyclic enone. In contrast, englerin A and analogues containing an additional ring, such as 7, had little or no cytotoxicity at concentrations as high as 20 mM .

Figure 1.6.1 Effect of analogues 28 and $\mathbf{3 0}$ on the proliferation in of A498 renal cancer cells

### 1.6 Concluding remarks

We have accomplished an efficient and enantioselective synthesis of englerin $A$ (1), a potent and selective growth inhibitor of renal cancer cells. The synthetic approach to intermediate 6 proceeds in 15 steps from readily available compounds 9 and 10 in $5 \%$ overall yield. Key to our strategy is the enantioselective formation of the $B C$ ring of 1 via a Rh (II)-induced enantioselective [4+3] cycloaddition, followed by the construction of the A ring via an intramolecular aldol condensation. Inspired by this sequence, we have synthesized a small family of truncated englerins and have evaluated their growth inhibitory activities against certain renal cancer and leukemia cell lines. These studies suggest that the A-ring of englerin A plays an important role in its bioactivity and tissue selectivity. Interestingly, compounds (-)-17, ( $\pm$ )-17 and ( - )-19 have shown significant growth inhibitory activity against CEM cell lines at low micromolar concentrations $\left(\mathrm{GI}_{50}=\right.$ $1-3 \mathrm{mM})$. Consequently, these compounds may represent new lead structures for the development of small molecule therapeutics against leukaemia.

### 1.7 Experimental techniques and characterization data

## General Techniques

All reactions were carried out under argon atmosphere. Dry tetrahydrofuran (THF), diethyl ether ( $\mathrm{Et}_{2} \mathrm{O}$ ), methylene chloride $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ and dimethylformamide (DMF) were obtained by passing commercially available pre-dried, oxygen-free formulations through activated alumina columns. Diisopropylamine and propanaldehyde were dry distilled from flamed dried $4 \AA$ A powdered molecular sieves. Dry hexanes was purchased from Sigma Aldrich and used directly. Chromatography: Flash column chromatography
was performed on silica gel (Merck Kieselgel 60, 230-400 mesh) using Hexane-EtOAc (H-E) mixtures of increasing polarity. ${ }^{13} \mathrm{C}$ NMR and ${ }^{1} \mathrm{H}$ NMR spectra: These were recorded on 400 MHz and 500 MHz Varian instruments and 500 MHz JOEL instrument. $\mathrm{CDCl}_{3}$ was treated with flamed dried $\mathrm{K}_{2} \mathrm{CO}_{3}$, chemical shifts $(\delta \mathrm{H})$ are quoted in parts per million (ppm) referenced to the appropriate residual solvent peak $\left(\mathrm{CHCl}_{3}\right)$, with the abbreviations s , $\mathrm{br} \mathrm{s}, \mathrm{d}, \mathrm{t}, \mathrm{q}$, hept and m denoting singlet, broad singlet, doublet, triplet, quartet, heptet and multiplet respectively. $J=$ coupling constants given in Hertz (Hz) were analyzed by MestReNova software. Mass spectra: HRMS were recorded on a trisector WG AutoSpecQ spectrometer. Optical rotation: $[\alpha]_{D}$ measurements were collected on a Jasco P-1010 polarimeter using HPLC grade $\mathrm{CHCl}_{3}$ (dried over molecular sieves). Microwave reactor: Microwave experiments were carried out in Biotage (model:Initiator) microwave reactor using high-pressure vessels. X-ray data were recorded on a Bruker SMART APEX 3kW Sealed Tube X-ray diffraction system.

## Experimental procedure

5-Methyl-2l-methylethenyl)furan. To a solution of 2-methylfuran
$(42.0 \mathrm{~g}, 0.51 \mathrm{~mol})$ in ether $(600 \mathrm{ml}) \mathrm{n}$-BuLi $(1.6 \mathrm{M}$ in hexane, $300 \mathrm{ml}, 0.48$ mol ) was added dropwise at $-20^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. After refluxing for 4 h , the mixture was cooled to $-20^{\circ} \mathrm{C}$, anhydrous acetone ( $33.0 \mathrm{~g}, 0.58 \mathrm{~mol}$ ) was added in dropwise, and then the mixture was refluxed for overnight. To the mixture saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 450 ml ) was added slowly at rt , and the mixture was stirred until a clear solution was formed. The organic phase was separated and the aqueous phase was extracted with ether for 3 times. The combined organic phases were washed with brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated to give 61.2 g of crude tertial alcohol as a red oil, which was used to the next step directly without further purification. A mixture of the crude alcohol ( $33 \mathrm{~g}, 240 \mathrm{mmol}$ )
above, $\mathrm{Ac}_{2} \mathrm{O}(33 \mathrm{ml}, 350 \mathrm{mmol})$ and of $\mathrm{KOAc}(15 \mathrm{~g}, 150 \mathrm{mmol})$ was stirred for 30 min at $110^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. After neutralization with aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$ solution, the organic layer was separated and the aqueous layer was extracted twice with ether. The combined organic phases were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated as a brown oil. The crude was used to the next step without further purification. Analytical data were all in accordance with reported data. [P. Weyerstahl, J. Brendel, Liebigs Ann. Chem. 1988, 1015-1016.]

5-Methyl-2-isopropylfuran (20). An ether solution (200 ml) of crude 5-
20 Methyl-2-(l-methylethenyl)furan (~33 g) was added 300 mg of $\mathrm{Pd} / \mathrm{C}$ ( $10 \% \mathrm{Pd}$ ) was added and the mixture was hydrogenated (1 bar) for 1 hour. The mixture was then filtrated through celite. Regular distillation gave 9 as a colorless oil which should be stored in freezer ( $-20^{\circ} \mathrm{C}$ ) and be consumed within 2 weeks. ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ ס: 5.84 (s, br, 2 H ), $2.90(\mathrm{~m}, 1 \mathrm{H}), 2.28$ (s, 3H), 1.25 (s, 3H), 1.24 (s, 3H); ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 160.3,150.2,105.8,103.3,28.0,21.5,13.7$; HRMS (FAB) $\mathrm{m} / \mathrm{z}$ : cacld for $\mathrm{C}_{8} \mathrm{H}_{13} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$125.0961, found: 125.0962.
 Ethyl 3-(TBS)oxy)-2-diazobut-3-enoate (26). To an ice-cooled, stirred mixture of ethyl acetoacetate ( $13.0 \mathrm{~g}, 0.10 \mathrm{~mol}$ ) and $p$ acetamidobenzenesulfonyl azide ( $p-A B S A, 24.5 \mathrm{~g}, 0.10 \mathrm{~mol}$ ) in anhydrous acetonitrile ( 750 ml ) was added triethylamine ( $41.3 \mathrm{ml}, 0.30 \mathrm{~mol}$ ) in one portion. The reaction mixture is warmed to rt and stirred for 2 hours. The solvent is removed under reduced pressure, and the residue is triturated with 500 mL of a $1: 1$ mixture of ether/hexanes. The mixture is filtered and concentrated under reduced pressure. The crude product is purified by chromatography on silica gel (hexanes/ether, $3: 1$ to $1.5: 1$ ) to yield 14.7 g ( $94 \%$ ) of ethyl diazoacetoacetate as a yellow oil. ${ }^{1} \mathrm{H}$ NMR
$\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 4.28(\mathrm{q}, \mathrm{J}=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.46(\mathrm{~s}, 3 \mathrm{H}), 1.31(\mathrm{t}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H})$; To an ice-cooled solution of ethyl diazoacetoacetate ( $10 \mathrm{~g}, 64 \mathrm{mmol}$ ) in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(200$ $\mathrm{ml})$ was sequentially added triethylamine ( $17.9 \mathrm{ml}, 128 \mathrm{mmol}$ ) and TBSOTf ( 19.1 ml , 83.2 mmol ). This reaction was stirred for 30 min at the same temperature before get carefully quenched by $5 \% \mathrm{NaHCO}_{3}$ solution. This mixture was extracted with hexanes for three times and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure to obtain 26 as a yellow oil. This unstable TBS-enol-ether 26 was then used for the next step without further purification. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 4.98(\mathrm{~d}, \mathrm{~J}=1.7 \mathrm{~Hz}, 1 \mathrm{H})$, $4.24(\mathrm{~m}, 3 \mathrm{H}), 1.29(\mathrm{t}, \mathrm{J}=5.9 \mathrm{~Hz}, 3 \mathrm{H}), 0.91(\mathrm{~s}, 9 \mathrm{H}), 0.21(\mathrm{~s}, 6 \mathrm{H})$. HRMS (ESI) m/z: cacld for $\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{NaO}_{3} \mathrm{Si}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$293.1292, found: 293.1295.

## Oxabicyclic ethyl ester (27)

$( \pm)-27$

A solution of $26(8.5 \mathrm{~g}, 31.6 \mathrm{mmol})$ in dry hexanes ( 750 mL ) was added dropwise over 5.5 hours to a refluxing solution of $20(7.85 \mathrm{~g}, 8.8$ mL ) and Rhodium(II) octanoate dimer (492 mg) in dry hexanes (750 mL ). The reaction mixture was stirred an additional 30 minutes, at which time TLC showed no starting material remaining. The reaction mixture was then allowed to cooled down to room temperature, filtered and concentrated. Crude product purification using flash column chromatography afforded 11.0 g of bicyclic ester 27 as colorless thick oil ( $95 \%$ ). ${ }^{1} \mathrm{H} \mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 6.40$ (d, $J=5.7 \mathrm{~Hz}, 1 \mathrm{H}) 5.70(\mathrm{~d}, J=5.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.23(\mathrm{q}, J=5.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.48(\mathrm{~d}, J=17.3$ $\mathrm{Hz}, 1 \mathrm{H}), 1.88(\mathrm{~m}, 1 \mathrm{H}), 1.82(\mathrm{~d}, \mathrm{~J}=17.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.58(\mathrm{~s}, 3 \mathrm{H}), 1.29(\mathrm{t}, J=5.8 \mathrm{~Hz}, 3 \mathrm{H})$, 0.98 (d, J = $6.9 \mathrm{~Hz}, 3 \mathrm{H}$ ), 0.95 (d, J = $6.9 \mathrm{~Hz}, 3 \mathrm{H}$ ), 0.90 (s, 9H), 0.16 (s, 3H), 0.13 (s, 3H); ${ }^{13} \mathrm{C}$ NMR (126 MHz, $\mathrm{CDCl}_{3}$ ) $\delta: 166.8,153.2,141.9,126.6,119.9,88.6,83.0,60.1,36.4$,
34.3, 25.7, 20.4, 17.1, 14.5, $-3.5,-3.5$. HRMS (ESI) $m / z$ : cacld for $\mathrm{C}_{20} \mathrm{H}_{34} \mathrm{NaO}_{4} \mathrm{Si}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$ 389.2119, found: 389.2118.

## Diazo pentalactone silyl enol ether (21).

A solution of ( $R$ )-pantolactone ( $5.0 \mathrm{~g}, 38.4 \mathrm{mmol}$ ) and 2,2,6-trimethyl-4H-1,3-dioxin-4-one ( $5.5 \mathrm{~g}, 38.4 \mathrm{mmol}$ ) in xylene ( 10 ml ) was placed in a round bottom flask, which was then immersed in an oil bath which was preheated to $150^{\circ} \mathrm{C}$. This reaction was vigorously stirred at this temperature for 15 min and cooled to rt . The crude oil was then concentrated under reduced pressure to afford ( $R$ )-4,4-dimethyl-2-oxotetrahydrofuran-3yl 3-oxobutanoate as a red brown oil, which could be used for the next step without further purification. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 5.43(\mathrm{~s}, 1 \mathrm{H}), 4.06(\mathrm{~m}, 2 \mathrm{H}), 3.64(\mathrm{~m}$, $2 \mathrm{H}), 2.30(\mathrm{~s}, 3 \mathrm{H}), 1.25(\mathrm{~s}, 3 \mathrm{H}), 1.12(\mathrm{~s}, 3 \mathrm{H})$. To an ice-cooled, stirred mixture of the before mentioned red brown oil ( $4.3 \mathrm{~g}, 20 \mathrm{mmol}$ ) and $p$-acetamidobenzenesulfonyl azide ( $p$-ABSA, $4.8 \mathrm{~g}, 20 \mathrm{mmol}$ ) in anhydrous acetonitrile ( 60 ml ) was added triethylamine $(2.95 \mathrm{ml}, 21 \mathrm{mmol})$ in one portion. The reaction mixture is warmed to r.t. and stirred for 2 hours. The solvent is removed under reduced pressure, and the residue is triturated with 500 mL of dichloromethane. The mixture is filtered, concentrated, and the crude product was purified via Flash Column Chromatography on silica gel (hexanes/ethyl acetate, 5:1 to $2: 1$ ) to yield $4.6 \mathrm{~g}(96 \%)$ of (R)-4,4-dimethyl-2-oxotetrahydrofuran-3-yl-2-diazo-3oxobutanoate as a yellow solid. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ); $\delta: 5.47(\mathrm{~s}, 1 \mathrm{H}), 4.10(\mathrm{~m}$, $2 \mathrm{H}), 2.50(\mathrm{~s}, 3 \mathrm{H}), 1.27(\mathrm{~s}, 3 \mathrm{H}), 1.15(\mathrm{~s}, 3 \mathrm{H})$ To an ice-cooled solution of this diazooxobutanoate ( $4.5 \mathrm{~g}, 18.7 \mathrm{mmol}$ ) in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 50 ml ) was sequentially added triethylamine ( $3.65 \mathrm{ml}, 26.1 \mathrm{mmol}$ ) and TBSOTf ( $5.1 \mathrm{ml}, 22.4 \mathrm{mmol}$ ). This reaction was stirred for 30 min at the same temperature before get carefully quenched by $5 \%$
$\mathrm{NaHCO}_{3}$ solution. This mixture was extracted with hexanes for three times and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure to obtain 21 as a yellow oil. This unstable TBS-enol-ether 21 was then used for the next step without further purification. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 5.47(\mathrm{~s}, 1 \mathrm{H}), 4.98(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.28(\mathrm{~d}, J=1.3 \mathrm{~Hz}$, 1H), 4.07 (s, 2H), 1.24 (s, 3H), 1.11 (s, 3H), 0.93 (s, 9H), 0.25 (s, 6H) HRMS (ESI) m/z: cacld for $\mathrm{C}_{16} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{NaO}_{5} \mathrm{Si}\left(\mathrm{M}+\mathrm{Na}^{+}\right) 377.1503$, found: 377.1501

## Oxabicyclic pentalactone silylether 19

A solution of $20(11.2 \mathrm{~g}, 31.6 \mathrm{mmol})$ in dry hexanes $(750 \mathrm{~mL})$ was

19 added dropwise over 5.5 hours to a refluxing solution of 21 (7.85 g, 8.8 mL ) and Rhodium(II) octanoate dimer ( 492 mg ) in dry hexanes $(750 \mathrm{~mL})$. The reaction mixture was stirred an additional 30 minutes, at which time TLC showed no starting material remaining. The reaction mixture was then allowed to cooled down to room temperature, filtered and concentrated. Crude product purification using flash column chromatography (hexanes to $10 \%$, very slow gradient, EtOAc/hexanes) afforded 8.1 g of bicyclic ester 8 as colorless thick oil ( $68 \%$ ). $[\alpha]_{D}{ }^{23}=+36.40\left(\mathrm{c}=1.0, \mathrm{CHCl}_{3}\right) .{ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 6.38(\mathrm{dd}, J=5.7,0.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.72(\mathrm{~d}, J=5.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.40(\mathrm{~s}$, 1H), 4.04 (q, $J=8.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.41$ (d, $J=17.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.95-1.83(\mathrm{~m}, 2 \mathrm{H}), 1.62(\mathrm{~s}, 3 \mathrm{H})$, 1.24 (s, 3H), 1.17 (s, 3H), 1.00 (d, $J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 0.95(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 0.92(\mathrm{~s}, 9 \mathrm{H})$, 0.19 (s, 3H), 0.18 (s, 3H). 13C NMR (101 MHz, CDCI3) $\delta: 172.4,164.2,157.2,141.6$, $126.8,117.9,88.6,82.8,76.3,75.0,40.2,37.1,34.3,25.8,23.4,21.5,20.6,18.4,17.2$, 17.1, $-3.4,-3.5$. HRMS (FAB) $\mathrm{m} / \mathrm{z}$ : cacld for $\mathrm{C} 24 \mathrm{H} 38 \mathrm{O} 6 \mathrm{SiNa}(\mathrm{M}+\mathrm{Na}+$ ) 473.2330, found: 473.2331 .

## Oxabicycloexo-enone 28

To a solution of $8(20.7 \mathrm{~g}, 45.9 \mathrm{mmol})$ in dry dichloromethane ( 459 mL ) was added quickly dropwise via addition funnel a 1.0 M solution of DIBAL in heptanes ( $344.3 \mathrm{mmol}, 344.3 \mathrm{~mL}$ ) at $-78{ }^{\circ} \mathrm{C}$. After completion of addition, the reaction was stirred for 15 min at which time TLC showed no starting material. The reaction mixture was quenched with saturated potassium sodium tartrate solution ( 300 mL ), was allowed to reach room temperature and was stirred for 1 hour. The reaction mixture was filtered through celite and washed with DCM until TLC showed no more crude product remaining in the filter cake. The filtered mixture was separated, extracted ( $2 \times 150 \mathrm{~mL}$ ), washed with brine ( 300 mL ) dried over Na 2 SO , filtered, and concentrated under vacuum to 500 mL of DCM. This solution was flushed with Argon and treated directly with $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}(68.9 \mathrm{mmol}, 8.7 \mathrm{~mL})$ dropwise at $-30^{\circ} \mathrm{C} .5 \mathrm{~min}$ after addition TLC showed no starting material. The reaction mixture was further diluted with DCM ( 250 mL ), quenched with saturated NaHCO 3 solution $(350 \mathrm{~mL})$ and extracted with DCM ( $2 \times 200 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 300 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under vacuum. Crude product purification using flash column chromatography ( $1 \%$ to $10 \%$, EtOAc/Hexanes) afforded 5.2 g of ketone 17 as a yellow oil (59\%). $[\alpha]_{D}{ }^{23}=-103.01$ (c = 1.0, $\left.\mathrm{CHCl}_{3}\right) .{ }^{1} \mathrm{H}$ NMR $(500 \mathrm{MHz}$, CDCl3) $\delta: 6.05(\mathrm{~d}, J=5.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.96(\mathrm{~d}, J=0.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.92(\mathrm{~d}, J=5.7 \mathrm{~Hz}, 1 \mathrm{H})$, $5.24(\mathrm{~s}, 1 \mathrm{H}), 2.56(\mathrm{~d}, \mathrm{~J}=17.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.46(\mathrm{~d}, \mathrm{~J}=17.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.00-1.89(\mathrm{~m}, 1 \mathrm{H})$, $1.61(\mathrm{~s}, 3 \mathrm{H}), 0.99(\mathrm{~d}, J=4.9 \mathrm{~Hz}, 3 \mathrm{H}), 0.98(\mathrm{~d}, J=4.7 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 101 MHz , CDCI3) $\delta: 197.7,147.3,136.2,133.4,115.2,89.7,84.8,45.8,33.6,19.8,17.3$. HRMS (FAB) $\mathrm{m} / \mathrm{z}$ : cacld for $\mathrm{C}_{12} \mathrm{H}_{17} \mathrm{O}_{2}(\mathrm{M}+\mathrm{H}+)$ 193.1223, found: 193.1224.

## $\alpha$-hydroxy oxabicyclic enone (30)

$n$-Butyllithium ( $77.6 \mathrm{~mL}, 124.2 \mathrm{mmol}$ ) was added dropwise to a solution of dry diisopropylamine ( $19 \mathrm{~mL}, 135.0 \mathrm{mmol}$ ) in dry $\mathrm{THF}(800 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$. The reaction mixture was stirred for 15 minutes, and then a solution of 17 ( $5.2 \mathrm{~g}, 27.0 \mathrm{mmol}$ ) in dry THF ( 500 mL ) was added quickly dropwise to the reaction mixture. The reaction mixture temperature was raised from $-78{ }^{\circ} \mathrm{C}$ to $0^{\circ} \mathrm{C}$ over 45 minutes and stirred 1 hour at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was cooled down to -78 ${ }^{\circ} \mathrm{C}$ and $\mathrm{TMSCI}(15.8 \mathrm{~mL}, 124.2 \mathrm{mmol})$ was added dropwise. The reaction mixture temperature was raised from $-78^{\circ} \mathrm{C}$ to $0^{\circ} \mathrm{C}$ over 45 minutes and stirred for 1 hour at 0 ${ }^{\circ} \mathrm{C}$ at which time TLC showed no starting material. The reaction mixture was diluted in hexanes ( 650 mL ) quenched with $5 \% \mathrm{NaHCO} 3$ solution ( 500 mL ), washed with brine ( 300 mL ), dried over Na 2 SO 4 , filtered, and concentrated under vacuum. To a solution of the crude enol ether product in DCM ( 250 mL ) a solution of $\mathrm{NaHCO}(250 \mathrm{~mL}, 10 \%$ ) was added all at once at $0^{\circ} \mathrm{C}$. Then a solution of $m$-CPBA ( $5.2 \mathrm{~g}, 30.0 \mathrm{mmol}$ ) in DCM ( 60 mL ) was added slowly while vigorous stirring of the reaction mixture. The reaction was closely monitored by TLC. When traces of enol ether (> $>5$ ) was observed the reaction was further diluted in DCM ( 200 mL ), quenched with saturated NaHSO 3 solution ( 300 mL ), allowed to reach room temperature, extracted with DCM $(2 \times 200 \mathrm{~mL})$, washed with brine ( 300 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under vacuum to approximately 250 mL . To this solution of crude epoxide product was added a solution of $(\mathrm{COOH})_{2}(15.6 \mathrm{~g}, 124.2 \mathrm{mmol})$ in $\mathrm{MeOH}(150 \mathrm{~mL})$. After 30 min of stirring at room temperature TLC showed no epoxide product remaining. The reaction mixture was slowly quenched with saturated $\mathrm{K}_{2} \mathrm{CO}_{3}$ solution until neutral pH was achieved and extracted with DCM ( $2 \times 200 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 300 mL ), dried over Na2SO4, filtered, and concentrated under vacuum. Crude product
purification using flash column chromatography (1\% to 20\%, EtOAc/Hexanes) afforded 17 ( 2.7 g ) and 2.2 g of a-hydroxy ketone 19 as a crystalline solid ( $83 \%$ b.r.s.m). Recrystallization from hexanes afforded high purity crystals for X-Ray characterization. $[\alpha]_{D}{ }^{23}=-101.00\left(\mathrm{c}=1.3, \mathrm{CHCl}_{3}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}(500 \mathrm{MHz}, \mathrm{CDCl} 3) \delta: 6.08(\mathrm{dd}, \mathrm{J}=5.8,0.9$ $\mathrm{Hz}, 1 \mathrm{H}), 6.00(\mathrm{~d}, J=5.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.97(\mathrm{~s}, 1 \mathrm{H}), 5.28(\mathrm{~s}, 1 \mathrm{H}), 3.81(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 1 \mathrm{H})$, $2.37-2.28(\mathrm{~m}, 1 \mathrm{H}), 1.62(\mathrm{~s}, 3 \mathrm{H}), 1.05(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 0.94(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (126 MHz, CDCI3) $\delta: 199.0,146.9,140.2,130.1,116.5,93.4,85.5,73.3,28.5$, 19.4, 17.7, 17.0. ## Oxybicyclic triolefin (32)

Due to unknown reason the following procedure was not well reproducible. To a solution of Nysted reagent (Aldrich, $4.62 \mathrm{~mL}, 2.4 \mathrm{~mL}$ ) in THF ( 1.2 mL ) was added $\mathrm{NaHCO}_{3}$ powder ( $144 \mathrm{mg}, 1.68 \mathrm{mmol}$ ) and $\mathrm{TiCl}_{4}\left(2.4 \mathrm{~mL}, 2.4 \mathrm{mmol}, 1 \mathrm{M}\right.$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) at $0{ }^{\circ} \mathrm{C}$, followed by adding a solution of 31 ( $60 \mathrm{mg}, 0.24 \mathrm{mmol}$ ) in THF ( 0.6 mL ). The reaction was stirred at $0^{\circ} \mathrm{C}$ for 15 min and at rt for 45 min . Then this mixture was cooled to $0^{\circ} \mathrm{C}$ and quenched carefully with sat. $\mathrm{NaHCO}_{3}$ solution, filtered through celite and washed with EtOAc. The aqueous layer was extracted with EtOAc for 3 times and the combined organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under reduced pressure. Crude product purification using flash column chromatography (hexanes/EtOAc, 50:1 to $5: 1$ ) afforded 32 ( $22 \mathrm{mg}, 36 \%$ ) as pale yellow oil. ${ }^{1} \mathrm{H}$ NMR ( 500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 5.89(\mathrm{~d}, \mathrm{~J}=5.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.78(\mathrm{~d}, \mathrm{~J}=6.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.78(\mathrm{~m}, 1 \mathrm{H}), 5.09(\mathrm{~d}$, $J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.00(\mathrm{~m}, 2 \mathrm{H}), 4.90(\mathrm{~d}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.94(\mathrm{~d}, J=9.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.46(\mathrm{~m}$, 1H), 2.34 (d, J = $9.5 \mathrm{~Hz}, 1 \mathrm{H}) 2.18$ (m, 2H), 2.07 (m, 1H), 1.52 (m, 1H) 1.45 (s, 3H), 1.00 (d, $J=6.9 \mathrm{~Hz}, 3 \mathrm{H}$ ), $0.87(\mathrm{~d}, \mathrm{~J}=6.9 \mathrm{~Hz}, 3 \mathrm{H}) . \mathrm{HRMS}(\mathrm{ESI}) \mathrm{m} / \mathrm{z}$ : cacld for $\mathrm{C}_{16} \mathrm{H}_{25} \mathrm{O}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$ 249.1849, found: 249.1850.

## Guiaine unsaturated ketone (33)

To a solution of $32(22 \mathrm{mg}, 0.086 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(8 \mathrm{ml})$ was added Grubbs (2 ${ }^{\text {nd }}$ gen., $3.6 \mathrm{mg}, 5 \mathrm{~mol} \%)$. This solution was then stirred for 2 hours. Silica was added in to this solution and column chromatography (hexanes/EtOAc, $30: 1$ to $3: 1$ ) afforded the

33
corresponding allylic alcohol ( $21 \mathrm{mg}, 99 \%$ ). This alcohol ( 0.085 mmol ) was then dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$, TPAP ( $3 \mathrm{mg}, 8.5 \mathrm{mmol}$ ) and NMO ( 30 mg , 0.25 mmol ) was added in sequentially. The reaction was stirred for 1 h and filtered through celite, washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and concentrated. Crude product purification using flash column chromatography (hexanes/EtOAc, 50:1 to $5: 1$ ) afforded 33 ( $15 \mathrm{mg}, 72 \%$ ) as an unstable, pale yellow oil. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ : 6.63 (d, J = $5.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.95(\mathrm{~m}, 2 \mathrm{H}), 3.26(\mathrm{~m}, 1 \mathrm{H}), 2.42(\mathrm{~m}, 1 \mathrm{H}), 2.34(\mathrm{~m}, 2 \mathrm{H}), 2.03(\mathrm{~m}$, $1 \mathrm{H}), 2.00(\mathrm{~m}, 1 \mathrm{H}), 1.50(\mathrm{~s}, 3 \mathrm{H}), 0.93(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 0.92(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H})$. HRMS (ESI) $m / z$ : cacld for $\mathrm{C}_{14} \mathrm{H}_{19} \mathrm{O}_{2}\left(\mathrm{M}+\mathrm{H}^{+}\right)$219.1380, found: 219.1381.

## Oxybicyclic triolefin (34)

To a solution of 19 (208 mg, 1 mmol ) in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(9 \mathrm{~mL})$ was added $\mathrm{TiCl}_{4}\left(1.1 \mathrm{ml}, 1.1 \mathrm{mmol}, 1 \mathrm{M}\right.$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) dropwise at $-78{ }^{\circ} \mathrm{C}$ and stirred for 10 min . Then trimethyl(2-methylallyl))silane ( $0.88 \mathrm{ml}, 5 \mathrm{mmol}$ ) was added in dropwise and the reaction was allowed to stir under the same temperature for 1 hour before get quenched by sat. $\mathrm{NaHCO}_{3}$ solution. The mixture was then separated with $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ brine, the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ for 3 times. The combined organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated. Crude product purification using flash column chromatography (hexanes/EtOAc, $50: 1$ to $5: 1$ ) afforded 24 ( $187 \mathrm{mg}, 71 \%$ ) as pale yellow solid. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 6.08(\mathrm{dd}, J=6.0,0.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.94(\mathrm{~d}, J=6.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.73(\mathrm{~s}$, $1 \mathrm{H}), 4.67(\mathrm{~d}, J=1.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.79(\mathrm{~d}, J=9.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.73(\mathrm{dd}, J=8.3,3.2 \mathrm{~Hz}, 1 \mathrm{H})$, 2.57 (d, J = $9.8 \mathrm{~Hz}, 1 \mathrm{H}) 2.21(\mathrm{~m}, 2 \mathrm{H}), 2.04(\mathrm{~m}, 1 \mathrm{H}), 1.77(\mathrm{~m}, 1 \mathrm{H}), 1.72(\mathrm{~s}, 3 \mathrm{H}), 1.51(\mathrm{~s}$, $3 \mathrm{H}), 1.00(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.93(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta:$

## $\gamma$-keto oxybicyclicheptanone (27)

Propanaldehyde ( $75 \mu \mathrm{~L}, 1.04 \mathrm{mmol}$ ), 17 ( $100 \mathrm{mg}, 0.52 \mathrm{mmol}$ ), catalyst $\mathbf{A}$ $(57 \mathrm{mg}, 0.21 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(88 \mu \mathrm{~L}, 0.63 \mathrm{mmol})$ were heated to $85^{\circ} \mathrm{C}$ in a dry conical flask under argon atmosphere for 5 h . At this time TLC showed no starting material. The reaction mixture was diluted in EtOAc ( 100 mL ), quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 50 mL ) and extracted with EtOAc ( $2 \times 50 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 50 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under vacuum. Crude product purification using flash column chromatography afforded 97 mg of diketone 35 (77\%) as a yellow oil. $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 6.02(\mathrm{~d}, J=5.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.90(\mathrm{~d}, J=5.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.25(\mathrm{dd}, J=8.9$, $3.9 \mathrm{~Hz}, 1 \mathrm{H}) 2.70(\mathrm{dd}, J=16.6,8.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.61(\mathrm{~m}, 1 \mathrm{H}), 2.54(\mathrm{~d}, J=15.1 \mathrm{~Hz}, 1 \mathrm{H}) 2.46$ (dd, $J=17.6,7.3 \mathrm{~Hz}, 1 \mathrm{H}) 2.36(\mathrm{~d}, J=15.1 \mathrm{~Hz}, 1 \mathrm{H}) 2.07(\mathrm{dd}, J=16.7,3.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.94$ (m, 1H), $1.44(\mathrm{~s}, 3 \mathrm{H}), 1.08(\mathrm{t}, J=5.8 \mathrm{~Hz}, 3 \mathrm{H}) 0.97(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.96(\mathrm{~d}, J=6.9$ $\mathrm{Hz}, 3 \mathrm{H})$. $\mathrm{HRMS}(\mathrm{ESI}) \mathrm{m} / \mathrm{z}$ : cacld for $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{NaO}_{3}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$273.1461, found: 273.1460.

## tricyclic $\alpha, \beta$-unsaturated ketone (36)

To a solution of $35(9 \mathrm{mg}, 0.036 \mathrm{mmol})$ in $\mathrm{EtOH}(1 \mathrm{~mL})$ was added KOH ( $0.18 \mathrm{~mL}, 1.0 \mathrm{M}$ in EtOH ) dropwise at room temperature. The reaction mixture was stirred at this temperature for 24 hours. The reaction was mixture was concentrated under reduced pressure, dissolved in water (5 mL ), acidified with 1 M HCl , extracted with diethyl ether ( 3 x 10 mL ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, concentrated and the residue was purified using
preparative plate chromatography to yield 6.5 mg of 36 ( $76 \%$ ) as a clear oil. ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta: 5.94(\mathrm{~d}, J=6.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.80(\mathrm{~d}, J=5.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.73(\mathrm{~s}, 1 \mathrm{H}), 2.83(\mathrm{~m}, 1 \mathrm{H})$, 2.62 (dd, $J=14.0,2.6 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.48-2.27 (m, 2H) $1.98(\mathrm{~m}, 1 \mathrm{H}), 1.44(\mathrm{~s}, 3 \mathrm{H}), 1.26(\mathrm{~s}, 3 \mathrm{H})$ $1.04(\mathrm{~d}, \mathrm{~J}=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 1.00(\mathrm{~d}, \mathrm{~J}=6.9 \mathrm{~Hz}, 3 \mathrm{H})$. HRMS (ESI) m/z: cacld for $\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{NaO}_{2}$ $\left(\mathrm{M}+\mathrm{Na}^{+}\right)$255.1361, found: 255.1359.

## $\alpha$-silylhydroxy diketone (18)

To a solution of $30(1.30 \mathrm{~g}, 6.2 \mathrm{mmol})$ in DCM ( 62 mL ) at $0{ }^{\circ} \mathrm{C}$ was added $\mathrm{NEt}_{3}(4.3 \mathrm{~mL}, 31.0 \mathrm{mmol})$. Then TBSOTf ( $2.9 \mathrm{~mL}, 12.4 \mathrm{mmol}$ ) was added dropwise to the reaction mixture. The reaction mixture was then allowed to warm up to room temperature and stirred for 1 h at which time TLC showed no starting material. The reaction mixture was diluted in hexanes ( 150 mL ), quenched with saturated $\mathrm{NaHCO}_{3}$ solution ( 100 mL ) and extracted with hexanes ( $2 \times 100 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 150 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under vacuum. Crude product purification using flash column chromatography (10:1, hexanes: EtOAc) afforded 1.96 g of corresponding TBS ether $37(98 \%)$ as a yellow solid. Propanaldehyde ( 1.7 mL , $24.4 \mathrm{mmol})$, TBS-ether $(1.96 \mathrm{~g}, 6.1 \mathrm{mmol})$, catalyst $\mathbf{A}(329 \mathrm{mg}, 1.2 \mathrm{mmol})$ and $\mathrm{NEt}_{3}(1.0$ $\mathrm{mL}, 7.3 \mathrm{mmol}$ ) were heated to $85^{\circ} \mathrm{C}$ in a dry conical flask under argon atmosphere for 5 h. At this time TLC showed no starting material. The reaction mixture was diluted in EtOAc ( 150 mL ), quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 100 mL ) and extracted with EtOAc ( $2 \times 100 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 100 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under vacuum. Crude product purification using flash column chromatography (1\% to $15 \%$, slow gradient, EtOAc/hexanes) afforded 1.78 g of diketone $18(77 \%)$ as a yellow oil. $[\alpha]_{\mathrm{D}}{ }^{23}=+32.3\left(\mathrm{c} 0.8, \mathrm{CHCl}_{3}\right) \cdot{ }^{1} \mathrm{H}$

## Hemiketal 45

To a solution of comerically available fufuraldehyde 44 ( $15 \mathrm{~g}, 13.6 \mathrm{~mL}$, 148.5 mmol ) in dry ether ( 75 mL ) was added $i \mathrm{PrMgCl}(111.4 \mathrm{~mL}, 222.8$ $\mathrm{mmol})$ dropwise at $-10^{\circ} \mathrm{C}$. The reaction was stirred 20 minutes at this temperature at which time TLC showed consumption of the starting material. The reaction was diluted with ether $(150 \mathrm{~mL})$ quenched carefully with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution and allowed to reach room temperature. The layers were separated; the aqueous layer was extracted with ether ( $2 \times 100 \mathrm{~mL}$ ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The material was used crude without further purification. To a solution of crude furan ( $15.5 \mathrm{~g}, 124 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0^{\circ} \mathrm{C}$ was added $m$-CPBA ( 21.5 $\mathrm{g}, 124 \mathrm{mmol}$ ) portion wise over 3 min . After stirring for 5 min TLC showed no starting material. The reaction mixture was filtered through a Buchner funnel and rinsed once with cold $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The filtrate was then washed with saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and saturated $\mathrm{NaHCO}_{3}$. The combined aqueous layers were then backwashed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organics were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. Flash chromatography of the residue ( $15 \%$ ethyl acetate in hexanes) provided enone 45 (15.0 g, $75 \%$ over 2 steps) as an inseparable 9:1 mixture of diastereomers as a pale yellow oil. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 6.81(\mathrm{~d}, J=10.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.01(\mathrm{~d}, J=10.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.35$ (d, $J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.55-2.36(\mathrm{~m}, 2 \mathrm{H}), 1.64(\mathrm{~s}, 3 \mathrm{H}), 1.03(\mathrm{~d}, \mathrm{~J}=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.86(\mathrm{~d}, \mathrm{~J}$ $=6.8 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 MHz, $\left.\mathrm{CDCl}_{3}\right)_{\text {_ }}$ 197.6, 148.4, 127.0, 92.6, 78.4, 28.8, 23.9, 19.1, 16.1. $\mathrm{HRMS}(\mathrm{ESI}) \mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{9} \mathrm{H}_{14} \mathrm{NaO}_{3}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$193.0835, found: 193.0838 .

## Cyano unstaturated ketone 46

46

To a solution of $45(1.6 \mathrm{~g}, 11.0 \mathrm{mmol})$ in acrylonitrile ( 60 mL ) was added diisopropylethylamine $(2.3 \mathrm{~mL}, 13 \mathrm{mmol})$, followed by methanesulfonyl chloride ( $1.0 \mathrm{~mL}, 13 \mathrm{mmol}$ ). The resulting solution was microwave heated at $150^{\circ} \mathrm{C}$ for 4 hours. After cooling to room temperature, the reaction mixture was filtered through a plug of Celite, and the filtrate was concentrated in vacuo. Flash chromatography of the residue (20\% ethyl acetate in hexanes) provided the cycloadduct $46(880 \mathrm{mg}, 45 \%)$ as colorless oil. ${ }^{1} \mathrm{H}$ NMR (500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 6.93(\mathrm{~d}, \mathrm{~J}=9.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.01(\mathrm{~d}, \mathrm{~J}=9.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.06(\mathrm{dd}, J=9.2,2.9$ $\mathrm{Hz}, 1 \mathrm{H}), 2.52(\mathrm{dd}, J=14.3,2.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.30(\mathrm{p}, J=7.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.19(\mathrm{dd}, J=14.3,9.3$ $\mathrm{Hz}, 1 \mathrm{H}), 1.74(\mathrm{~s}, 3 \mathrm{H}), 1.08(\mathrm{~d}, \mathrm{~J}=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.04(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}){ }^{13} \mathrm{C}$ NMR (126 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 196.7,151.8,128.1,118.8,100.0,90.4,37.4,35.2,30.0,21.6,17.6$, 16.5. HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{12} \mathrm{H}_{15} \mathrm{NNaO}_{2}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$228.0995, found: 228.0996.

## Cyanoalcohol 48

47

To a solution of $46(210 \mathrm{mg}, 1.03 \mathrm{mmol})$ in methanol $(12 \mathrm{~mL})$ at room temperature was added $\mathrm{CeCl}_{3} \cdot 7 \mathrm{H}_{2} \mathrm{O}(1.1 \mathrm{~g}, 1.03 \mathrm{mmol})$. The reaction was cooled to $0{ }^{\circ} \mathrm{C}$ and $\mathrm{NaBH}_{4}(40 \mathrm{mg}, 1.03 \mathrm{mmol})$ was added. After 5 min , the reaction mixture was allowed to warm to room temperature at which time TLC showed no starting material remaining. The reaction was quenched with $\mathrm{H}_{2} \mathrm{O}$ and diluted with ethyl acetate. This biphasic mixture was stirred for 5 min, and then the layers were separated. The aqueous layer was extracted once with ethyl acetate, and the combined organics were dried and concentrated in vacuo. Flash chromatography of the residue ( $20 \%$ ethyl acetate in hexanes) provided the allylic alcohol 47 ( $210 \mathrm{mg}, 98 \%$ ) as a white crystalline solid. ${ }^{1} \mathrm{H}$

48

NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 5.77(\mathrm{dd}, J=9.5,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.58(\mathrm{dd}, J$ $=9.6,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.65(\mathrm{~s}, 1 \mathrm{H}), 2.94(\mathrm{dd}, J=9.2,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.74$ (dd, $J=14.0,9.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.09-1.96(\mathrm{~m}, 2 \mathrm{H}), 1.53(\mathrm{~s}, 3 \mathrm{H}), 1.09(\mathrm{~d}$, $J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.07(\mathrm{~d}, \mathrm{~J}=6.9 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 133.86,130.66,120.11,86.75,80.01,69.83,39.79,33.36,32.21,21.35,17.64$, 17.37. A suspension of allylic alcohol ( $210 \mathrm{mg}, 0.07 \mathrm{mmol}$ ) and $\mathrm{Pd} / \mathrm{C}$ (10\%) in ethanol (7 mL ) was stirred under an atmosphere of $\mathrm{H}_{2}$ for 2 h . Then the reaction mixture was filtered through Celite, washed with ethyl acetate and the filtrate was concentrated in vacuo. The product was purified flash chromatography and recrystalized in hexanes to yield to saturated cyano alcohol 48 in quantitative yield ( $210 \mathrm{mg}, 99 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 3.84(\mathrm{dd}, J=10.4,5.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.90(\mathrm{dd}, J=10.1,4.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.48(\mathrm{dd}$, $J=13.8,10.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.03(\mathrm{~m}, 2 \mathrm{H}), 1.70(\mathrm{td}, J=13.6,5.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.60(\mathrm{dd}, J=5.8$, $1.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.56$ (dd, J = 5.9, $1.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.49(\mathrm{~s}, 3 \mathrm{H}), 1.38(\mathrm{~m}, 1 \mathrm{H}), 1.04(\mathrm{~d}, 3 \mathrm{H}), 1.02$ (d, 3H). HRMS (ESI) m/z: calcd for $\mathrm{C}_{12} \mathrm{H}_{19} \mathrm{NNaO}_{2}\left(\mathrm{M}+\mathrm{Na}^{+}\right)$232.1308, found: 232.1309.

Hydroxyketone 49

To a solution of diisopropylethylamine ( $0.31 \mathrm{~mL}, 2.2 \mathrm{mmol}$ ) in THF $(4.7 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ was added butyllithium in hexanes $(1.4 \mathrm{~mL}, 2.2$ $\mathrm{mmol})$. The solution was warmed to $0{ }^{\circ} \mathrm{C}$ and stirred for 30 min . Then the solution was recooled to $-78{ }^{\circ} \mathrm{C}$, and a solution of the cyano alcohol 43 ( $210 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) in THF ( 1.4 mL ) was added via cannula. After stirring for 2 min, dry oxygen (passed through KOH column) gas was bubbled into the solution for 30 min . The reaction was quenched with 28 mL of 1 M stannous chloride in 2 M HCL solution and stirred for 30 min at $0^{\circ} \mathrm{C}$. Then the reaction mixture was diluted with ethyl acetate and washed with water, 1 M NaOH and brine. The organics were dried and concentrated in vacuo. Flash chromatography purification yielded the corresponding
hydroxy ketone ( $90 \mathrm{mg}, 40 \%$ ) as a clear oil. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 4.02(\mathrm{dd}, \mathrm{J}=$ $10.8,6.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.49(\mathrm{~d}, J=18.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.33(\mathrm{dd}, J=18.7,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.08-1.96$ (m, 2H), $1.65-1.54(\mathrm{~m}, 2 \mathrm{H}), 1.46-1.33(\mathrm{~m}, 1 \mathrm{H}), 1.20(\mathrm{~s}, 3 \mathrm{H}), 1.06(\mathrm{~d}, \mathrm{~J}=7.0 \mathrm{~Hz}, 3 \mathrm{H})$, $1.04(\mathrm{~d}, \mathrm{~J}=6.9 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 218.1(\mathrm{~d}, J=2.8 \mathrm{~Hz}), 100.0$, 82.8, 68.2, 40.2, 32.9, 19.6, 17.5, 16.8. HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{11} \mathrm{H}_{18} \mathrm{NNaO}_{3}$ $\left(\mathrm{M}+\mathrm{Na}^{+}\right)$221.1148, found: 228.1150.

## Cinnamic hydroxy ester (51)

To a stirred mixture of cinnamic acid ( $39 \mathrm{mg}, 0.26 \mathrm{~mol}$,
 2.0 equiv) and hydroxy-ketone above ( $25 \mathrm{mg}, 0.13 \mathrm{~mol}$, 1.0 equiv) in dry toluene ( 1.8 mL ) were added successively $\mathrm{NEt}_{3}(60 \mu \mathrm{~L}, 0.39 \mathrm{~mol}, 3.0$ equiv.) and 2,4,6-trichlorobenzoyl chloride ( $50 \mu \mathrm{~L}, 0.33 \mathrm{~mol}, 2.5$ equiv). The reaction mixture was stirred for 10 min , then catalytic amount of 4-DMAP ( $5 \mathrm{mg}, 40 \mu \mathrm{~mol}, 0.3$ equiv) was added. After 16 h of stirring at rt , the reaction was diluted with ethyl acetate, and the organic phase was washed successively with aqueous HCl solution (1M), saturated sodium bicarbonate solution, and brine. The organic phase was dried over MgSO4 and concentrated in vacuo after filtration. The residue was purified by flash chromatography to afford the cinnamic keto-ester ( $40 \mathrm{mg}, 95 \%$ ) as a colorless oil: ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta: 7.66(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.51(\mathrm{~m}, 2 \mathrm{H}), 7.46-7.33(\mathrm{~m}, 3 \mathrm{H}), 6.38(\mathrm{~d}, J=16.0$ $\mathrm{Hz}, 1 \mathrm{H}), 5.26(\mathrm{ddd}, J=10.6,6.0,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.65(\mathrm{~d}, J=18.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.48(\mathrm{dd}, J=$ 18.6, 1.2 Hz, 1H), 2.33-2.19 (m, 1H), 1.96 (hept, $J=7.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.75-1.64(\mathrm{~m}, 2 \mathrm{H})$, $1.56-1.39(\mathrm{~m}, 1 \mathrm{H}), 1.25(\mathrm{~s}, 3 \mathrm{H}), 1.04(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.01(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 MHz, $\mathrm{CDCl}_{3}$ ) $\delta: 217.3,165.8,145.7,134.3,130.7,129.1,128.3,117.8,82.3$, 81.9, 69.8, 41.8, 33.7, 32.5, 25.0, 19.7, 17.6. To the solution of the cinnamic keto ester
( $26 \mathrm{mg}, 80 \mu \mathrm{~mol}, 1.0$ equiv) in $\mathrm{MeOH}(1.5 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added $\mathrm{NaBH}_{4}(3.4 \mathrm{mg}, 90$ $\mu \mathrm{mol}, 1.1$ equiv). After 30 min of stirring at $0^{\circ} \mathrm{C}$, the reaction was quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution and extracted twice with ethyl acetate. The combined organic phases were washed with brine, dried over $\mathrm{MgSO}_{4}$. The solvent was removed in vacuo, and the residue was purified by flash chromatography to give 44 ( $26 \mathrm{mg}, 100 \%$ ) as a clear oil. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 7.64(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.51(\mathrm{~d}, J=6.0$ $\mathrm{Hz}, 2 \mathrm{H}), 7.42-7.34(\mathrm{~m}, 3 \mathrm{H}), 6.39(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.12(\mathrm{dd}, J=10.0,6.0 \mathrm{~Hz}, 1 \mathrm{H})$, 4.04 (dd, $J=10.9,5.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.31(\mathrm{ddd}, J=13.7,10.9,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.13(\mathrm{ddd}, J=$ $13.3,6.3,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.99(\mathrm{dd}, J=13.7,5.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.96-1.77(\mathrm{~m}, 4 \mathrm{H}), 1.60(\mathrm{dt}, J=$ 12.9, $6.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.23(\mathrm{~s}, 3 \mathrm{H}), 0.96(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 0.93(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta: 166.2,145.0,130.5,129.0,128.2,118.4,83.7,81.3,78.5$, 71.8, 38.5, 33.2, 31.3, 24.9, 24.6, 17.6, 16.8. HRMS (ESI) $\mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{20} \mathrm{H}_{26} \mathrm{NaO}_{4}$ $\left(\mathrm{M}+\mathrm{Na}^{+}\right)$353.1723, found: 353.1725 .

## Cinnamic-aceto diester 52

To a solution of $44(7.5 \mathrm{mg}, 0.023 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.2$ mL ) was added sequentially at room temperature 4DMAP ( $2 \mathrm{mg}, 0.012 \mathrm{mmol}$ ), $\mathrm{NEt}_{3}(15 \mu \mathrm{~L}, 0.92 \mathrm{mmol})$ and $\mathrm{Ac}_{2} \mathrm{O}(4 \mathrm{~mL}, 0.035 \mathrm{mmol})$. The reaction was stirred at this temperature overnight. The reaction mixture was quenched with saturated $\mathrm{NaHCO}_{3}$, extracted twice with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$ and concentrated. The residue was purified through preparative plate chromatography to yield $45(6.8 \mathrm{mg}, 80 \%)$ as a clear oil. . ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 7.65(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.41(\mathrm{~m}, 3 \mathrm{H}), 6.47(\mathrm{~d}$, $J=15.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.38(\mathrm{dd}, J=16.0,2.2 \mathrm{~Hz}, 1 \mathrm{H}) 5.27(\mathrm{dd}, J=10.3,5.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.66$ (dd, $J=18.5,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.49(\mathrm{~d}, \mathrm{~J}=18.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.25(\mathrm{~m} 1 \mathrm{H}), 2.00(\mathrm{~m}, 1 \mathrm{H}), 1.70(\mathrm{~s}$,

HRMS (ESI) m/z: calcd for $\mathrm{C}_{22} \mathrm{H}_{28} \mathrm{NaO}_{5}\left(\mathrm{M}+\mathrm{Na}^{+}\right) 395.1829$, found: 395.1831

## Nor-A ring englerin 54

LiHMDS in THF ( $1 \mathrm{M}, 80 \mu \mathrm{~L}, 80 \mu \mathrm{~mol}, 1.5$ equiv) was added to the solution of $51(16 \mathrm{mg}$, 50 _mol, 1.0 equiv) in dry $\operatorname{THF}(0.85 \mathrm{~mL})$ at 0 ${ }^{\circ} \mathrm{C}$. The solution was stirred for 30 min , then cooled to $-10{ }^{\circ} \mathrm{C}$ and $N, N$ '-sulfuryldiimidazole (16

54 $\mathrm{mg}, 80 \mu \mathrm{~mol}, 1.5$ equiv) was added in one portion, and the solution was then stirred at rt overnight. The reaction was quenched with $\mathrm{MeOH}(0.2 \mathrm{~mL})$. After 30 min of stirring, the solution was concentrated, diluted with EtOAc, washed with saturated $\mathrm{NaHCO}_{3}$ solution, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. The residue was purified through flash chromatography to yield imidazole thiosester $53(22 \mathrm{mg}, 99 \%)$ as a clear oil. ${ }^{1} \mathrm{H}$ NMR (500 MHz, CDCl ${ }_{3}$ ) $\delta: 8.04(b s, 1 \mathrm{H}), 7.63(\mathrm{~d}, \mathrm{~J}=16.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.53(\mathrm{~m}, 2 \mathrm{H}), 7.39$ (m, 4H), 7.24 (bs, 1H) 6.36 (d, $J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.08$ (m, 1H), 4.50 (dd, $J=10.9,4.6 \mathrm{~Hz}$, $1 \mathrm{H}), 2.24(\mathrm{dd}, \mathrm{J}=14.5,11.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.18(\mathrm{~m}, 1 \mathrm{H}), 2.02(\mathrm{dd}, \mathrm{J}=14.5,4.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.84$ (m, 1H), $1.77(\mathrm{~m}, 1 \mathrm{H}), 1.66(\mathrm{~m}, 1 \mathrm{H}), 1.13(\mathrm{~s}, 3 \mathrm{H}), 0.91(\mathrm{~d}, \mathrm{~J}=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 0.88(\mathrm{~d}, \mathrm{~J}=$ $7.0 \mathrm{~Hz}, 3 \mathrm{H}$ ). To a mixture of 18 -crown- $6(11.4 \mathrm{mg}, 43 \mu \mathrm{~mol}, 5.0$ equiv) and cesium hydroxy acetate ( $9.0 \mathrm{mg}, 43 \mu \mathrm{~mol}, 5.0$ equiv) was added to the solution of $53(4.0 \mathrm{mg}, 9$ $\mu \mathrm{mol}, 1.0$ equiv) in dry toluene ( 0.4 mL ). After 48 h of stirring at $110^{\circ} \mathrm{C}$ under argon, the solution was diluted with ethyl acetate, washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The residue was purified by flash chromatography to give 54 ( 14 mg ,
$74 \%$ ) as clear oil. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 7.65(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.52(\mathrm{dd}, \mathrm{J}=$ $6.6,2.9 \mathrm{~Hz}, 2 \mathrm{H}), 7.38(\mathrm{~d}, J=3.2 \mathrm{~Hz}, 3 \mathrm{H}), 6.38(\mathrm{~d}, J=16.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.25(\mathrm{dd}, J=7.8,2.6$ $\mathrm{Hz}, 1 \mathrm{H}), 5.03$ (dd, $J=10.4,5.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.20(\mathrm{~d}, J=5.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.70(\mathrm{dd}, J=14.7,7.9$ $\mathrm{Hz}, 1 \mathrm{H}), 2.32(\mathrm{t}, \mathrm{J}=5.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.23-2.16(\mathrm{~m}, 1 \mathrm{H}), 1.89(\mathrm{~d}, \mathrm{~J}=6.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.81(\mathrm{dd}, \mathrm{J}$ $=14.8,2.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.74-1.63(\mathrm{~m}, 2 \mathrm{H}), 1.50-1.43(\mathrm{~m}, 1 \mathrm{H}), 1.20(\mathrm{~s}, 3 \mathrm{H}), 0.99(\mathrm{~d}, \mathrm{~J}=$ $6.8 \mathrm{~Hz}, 3 \mathrm{H}), 0.96(\mathrm{~d}, \mathrm{~J}=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 MHz, CDCl ${ }_{3}$ ) $\delta: 174.6,173.0$, $165.9,145.3,134.3,130.5,129.0,128.2,118.0,85.3,82.5,79.8,60.7,38.9,34.3,33.3$, 24.5, 20.4, 18.0, 17.0. ## Chapter 2

## Synthetic studies and chemical biology of fusarisetin A

### 2.1 Introduction

Despite the tremendous advances, cancer still represents an enormous medical challenge since, only in America, it is responsible for more than half a millions of deaths per year. ${ }^{1}$ About $90 \%$ of these deaths are attributed to cancer metastasis, which is the ability of tumor cells to migrate from their tissue of origin and colonize elsewhere in the body. ${ }^{2}$ When cancer is detected at a premetastatic stage, it can often be treated successfully either by local therapy (surgery, radiation) or by systemic therapy (chemotherapy, targeted therapy, hormonal therapy). ${ }^{3}$ However, when it is detected after it has metastasized, such treatments are much less successful. Along these lines, metastasis is considered as the "last frontier" in cancer management for which, todate, there is no effective treatment. ${ }^{4,5}$

In principle, it is possible to halt (or retard) cancer metastasis with the help of small molecules that inhibit cell migration. ${ }^{6}$ Recent advances in high-throughput screening and high content imaging techniques permit the identification of new cancer metastasis inhibitors from libraries of natural products or small molecules. ${ }^{7,8}$ On the other hand, the availability of complex natural products via improved isolation techniques and streamlined synthetic strategies (or genetic engineering) allows evaluation of their effect in cell migration assays. Sceptrin ${ }^{9}$ and migrastatin ${ }^{10}$ represent a few recent examples of such efforts. Importantly, the development of scalable syntheses of these compounds ${ }^{11,12}$ have resulted in the development of new chemical tools for the study of proteins involved in cancer metastasis and the discovery of potent cell migration inhibitors for further preclinical studies. ${ }^{11 \mathrm{~b}, 12 \mathrm{c}, \mathrm{d}}$

### 2.2 Isolation and Biological Characterization

Recent efforts to identify potent inhibitors of cancer metastasis have led to the isolation of novel structure from from the soil fungus Fusarium sp. FN080326 (Figure 1.2.1). ${ }^{13}$ Fusarisetin $A(1)$ (Figure 1.2.2) has attracted considerable attention due to its unprecedented complex molecular architecture and remarkable bioactivity. This compound was found to inhibit cancer metastasis in MDA-MB-231 cells, a particularly aggressive breast cancer cell line. Specifically, 1 was found to inhibit acinar morphogenesis ( $\mathrm{IC}_{50}$ ca 77 mM ), cell migration ( $\mathrm{IC}_{50}$ ca 7.7 mM ) and cell invasion ( $\mathrm{IC}_{50}$ ca 26 mM ) in these cell lines without any significant cytotoxicity in concentrations up to 77 mM . Interestingly, the proteomic profiling of 1 was found to be significantly different to those of other reference compounds. Moreover, $\mathbf{1}$ did not inhibit the phosphorylation of ERK1/2, AKT, c-Jun and p38 kinases in response to EGF treatment, as it is commonly observed with compounds that inhibit cancer metastasis by altering protein kinases. ${ }^{6}$

Figure 2.2.1 Fusarium sp. FN080326 and the structure of fusarisetin A

These findings suggest that the molecular target of fusarisetin A is different from those of known compounds and thus, its identification could produce new fundamental knowledge in the pathways related to cancer metastasis. Structurally, fusarisetin A possesses an unprecedented pentacyclic ring system of which the CDE rings contain various polar functionalities (ketone, lactam, hemiketal and primary alcohol).

Figure 2.2.2 Structure of fusarisetin $A$ and structurally related secondary metabolites

### 2.3 Previous synthetic work

The combination of impressive chemical structure and potent bioactivity drew great attention from the synthetic community. This is evidenced by the production of multiple publications describing various syntheses of 1 in about one year after its structure became known in the literature. Several researchers took advantage of chemistry previously described by Ley ${ }^{14}$ to describe the synthesis of the $A B$ decalin ring of fusarisetin A in which sequential Horner-Wadsworth-Emmons olefinations ${ }^{15}$ yield triene 4 (Scheme 1.3.1) which can undergo Lewis Acid promoted Intramolecular DielsAlder Reaction (IMDA) to form decalin $\beta$-ketothioester 6. This decalin moiety can be further functionalized to yield (-)-equisetin (2) ${ }^{16}$, a cytotoxic secondary metabolite known to be a potent HIV-1 integrase inhibitor. ${ }^{17}$

Scheme 2.3.1 Ley's enantioselective synthesis of (-)-equisetin

Not surprisingly, Li and co-workers ${ }^{18}$ would use Ley's chemistry to develop a synthetic strategy toward's the synthesis of (-)-fusarisetin A. Parting from $\beta$-ketothioester 7, which was generated via Ley's protocol starting from (S)-(-)-citronellal, Li was able to construct the C ring through a Pd-catalyzed O-C allylic rearrangement (Scheme 1.3.2). Peptide coupling of the serine moiety, followed by Wacker oxidation and finally $\mathrm{NaBH}_{4}$ reduction/Dieckmann condensation sequence yielded fusarisetin $A$ and it's $C_{5}$ epimer. The synthetic material gave the exact opposite optical rotation as the isolated natural product, therefore reassigning the absolute stereochemistry of fusarisetin $A$ and providing insight to the biosynthetic relationship of (-)-equisetin and (+)-1.

Scheme 2.3.2 Li's synthesis of (-)-fusarisetin $A$ and its $C_{5}$ epimer

After our synthetic work towards the synthesis of fusarisetin A was published, ${ }^{19}$ Yang and co-workers ${ }^{20}$ reported an asymmetric total synthesis of (+)-1. Yang devised a different strategy in which the generated the $A B C$ ring system of fusarisetin $A$ via a Pauson-Khand reaction. ${ }^{21}$ Final fictionalization along with the well-described Dieckmann condensation yielded the natural isomer of fusarisetin $A$.

Scheme 2.3.3 Yang's synthesis of (+)-fusarisetin A

### 2.4 Synthesis of (-)-Fusarisetin A

Intrigued by this molecule, we devised a project focused on the development of a scalable chemical synthesis that may allow the study of its chemical biology. The developed strategy is short, efficient and stereoselective and is highlighted by the use of a key oxidative radical cyclization (ORC) reaction that allows conversion generation of the CD ring system of fusarisetin A (1) following a likely bioinspired pathway. Moreover, we able to generate a more robust and scalable approach in a $2^{\text {nd }}$ generation synthesis via equisetin that represent a biomimmetic approach to fusarisetin $A$ and related analogues. Herein we report a detailed account on the synthesis of fusarisetin A .

### 2.4.1 Retrosynthetic analysis

Close inspection of the fusarisetin framework, specifically after reassigment of absolute stereochemistry, reveals the fusion of a trans-decalin unit (AB ring system) with a tetramic acid moiety ( E ring). These rings can also be found in the structure of equisetin (2), ${ }^{16,22}$ another secondary metabolite produced by a Fusarium species, suggesting that both molecules may arise from a common biosynthetic pathway (Scheme 2.4.1). ${ }^{23}$ Along these lines, we hypothesized that 1 derives biogenetically from oxidation of 2 upon exposure to reactive oxygen species (ROS). ${ }^{24}$ This biosynthetic scenario could account for the formation of stabilized radical 12 that, upon cyclization at the pendant alkene followed by trapping by ROS and hemiketalization, would produce the $C D$ ring system and furnish 1.

proposed assignment

(+)-2: equisetin

(+)-1: fusarisetin A
revised assignment
cyclization $\uparrow$

Scheme 2.4.1.1 Biosynthetic hypothesis of the relationship of equisetin to fusarisetin $A$

Translating this proposal to a synthetic plan, we had envisioned that (-)fusarisetin A could arise from a one-pot Dieckmann condesation and hemiketalization to from de DE ring. A $\beta$-ketoamide intermidiate could undergo a 5 -exo-trig oxidative radical cyclization (ORC) $)^{25}$ to form the $\mathrm{C}_{1}-\mathrm{C}_{6}$ bond. The resulting $\mathrm{C}_{5}$ radical could then be trapped by ROS like TEMPO. Further bond disconnection suggested that 1 could be produced from b-ketoester 4, which would arise from a Reformasky reaction with ethylbromoacetate and the correponding aldehyde. The trans-decalin motif of which (AB ring system) could be made via an Lewis acid induced intramolecular Diels-Alder reaction (IMDA). ${ }^{26}$ This scenario led to consider polyene 5 as the potential precursor of the IMDA. In turn, 5 could be synthesized through an olefin metathesis and Wittig olifenation from commercially available citronellal (6) whose motif contains the $\mathrm{C}_{21}$ methyl group with the desired stereochemistry. ${ }^{22}$

Scheme 2.4.1.2 Retrosynthetic analysis of (-)-fusarisetin A

### 2.4.2 Synthesis of the $A B$ decalin ring system

Guided by the original assignment of fusarisetin $A,{ }^{13}$ we started our synthesis with commercially available (S)-(-)-citronellal (ent-16) (Scheme 1). ${ }^{27}$ Inspiration for our studies came from previously reported syntheses of equisetin by the Danishefsky, Dixon and Shishido groups. ${ }^{14,28}$ With an eye toward step-economy, ${ }^{29}$ we sought to develop an alternative synthesis of this compound. To this end, ent-17 was synthesized from ent-16 via cross-metathesis with methacrolein using a Ru-carbene catalyst (Grubbs $2^{\text {nd }}$ generation, $5 \mathrm{~mol} \%)^{30}\left(75 \%\right.$ yield). Alternatively, allylic oxidation of ent-16 with $\mathrm{SeO}_{2} / \mathrm{IBX}$ can also form ent-17 in $65 \%$ yield. The two chemically differentiable carbonyl groups of this compound provide the possibility to install the polyene motif in a regioselective
manner. Initial olefination studies of 17 under HWE or Julia ${ }^{31}$ conditions proved to be unsatisfactory. ${ }^{24 b, c}$ However, slow addition of the Wittig ylide, generated upon deprotonation of phosphonium salt $\mathbf{9},{ }^{32}$ to 17 afforded polyene 15 in $61 \%$ overall yield as a mixture of $E / Z$ isomers ( $E: Z=$ ca $3: 2$ ). Photo-induced isomerisation of this mixture with catalytic amount of iodine ${ }^{33}$ produced exclusively the trans polyene. Without purification, this compound was subjected to a $\mathrm{Et}_{2} \mathrm{AICl}-$ promoted IMDA reaction, that stereoselectively produced the desired trans-decalin aldehyde ( - )-18 ( $\mathrm{dr}>10: 1,82 \%$ yield). It is noted that the rapid construction of this trans-decalin motif could grant access to other biologically interesting natural products. ${ }^{34}$ Treatment of (-)-18 with ethyl bromoacetate under Reformatsky conditions followed by IBX oxidation yielded b-keto ester (+)-14 in 91\% combined yield.
 or $\mathrm{SeO}_{2} / \mathrm{BuOOH}$, then IBX, $53 \%$

### 2.4.3 Synthesis of the CDE ring system

In our initial efforts to synthesize the CDE ring of fusarisetin $A$, me invisioned to target equisetin (2) as a key synthetic precursor. To those effects, aminolysis of (+)-14 with (D)-serine derivative 19, followed by deprotection of the TBS group, produced $\beta$ ketoamide 20 ( $43 \%$ yield overall). Dieckmann condensation of 20 produced a mixture of (+)-equisetin together with its $\mathrm{C}_{3}$-epimer (ent-C $\mathrm{C}_{3}$-epi-2) ( $100 \%$ yield, $\mathrm{dr}=1: 1$ ). ${ }^{35}$ It should be noted that the tendency of equisetin to epimerize at the $\mathrm{C}_{3}$ center under basic conditions has been previously reported ${ }^{36}$ and has been observed consistently in our studies. Low temperature ${ }^{1} \mathrm{H}$ NMR experiments have also confirmed that equisetin exists exclusively in the enol form. The structures were also confirmed by comparison with the known data. ${ }^{14,16,22,28}$

Scheme 2.4.3.1 Conversion of (+)-equisetin to $\mathrm{C}_{5}$-epi-(-)-1 through an ORC reaction

With ent-2 in hand, we sought to explore ORC processes for the formation of the C ring of fusarisetin. It is worth noting that although radical reactions have often been used in natural products synthesis for the construction of C-C bonds, ${ }^{37}$ their application to the formation of C-O bonds remains limited. ${ }^{38}$ A report by Jahn et al on the construction of 5-membered rings, using 1,3-dicarbonyl groups and alkenes under TEMPO conditions, provided a possible way for the desired transformation. ${ }^{39}$ However, our initial studies with ent-2 gave unsatisfactory results, presumably due to the sensitivity of its $C_{3}$ hydroxymethyl group. To overcome this issue, we protected equisetin as its TBS ether 21 ( $90 \%$ yield). Gratifyingly this compound underwent the desired ORC, using ferrocenium hexafluorophosphate (13) or Mn (III) acetate as the oxidants, ${ }^{40}$ to afford cyclized TEMPO-product 23 albeit in moderate yield (35\%). Mechanistically, this reaction proceeds via a heat-promoted homolytic cleavage of the TEMPO-C ${ }_{1}$ bond. ${ }^{41}$ The resulting stabilized radical at $\mathrm{C}_{1}$ reacts with the pendant $\mathrm{C}_{5}-\mathrm{C}_{6}$ alkene to generate the $\mathrm{C}_{5}$-radical that can subsequently be trapped by the available TEMPO. ${ }^{42}$ Reduction of the alkoxylamine bond of $\mathbf{2 3}$ under $\mathrm{Zn} / \mathrm{AcOH}$ conditions ${ }^{43}$ liberated the $\mathrm{C}_{5}$-alcohol that underwent the desired hemiketalization, along with concomitant deprotection of the TBS group, to form a compound that was spectroscopically identified as the $\mathrm{C}_{5}$-epimer of (-)fusarisetin $A(1) .{ }^{18}$

The results of this study allowed us to draw several conclusions related to the TEMPO-mediated ORC reaction. As predicted, the TEMPO can indeed act as an ROS synthetic alternative and could form the C ring of $\mathbf{2 3}$ albeit in low yield. Gratifyingly, the stereochemistry of the $\mathrm{C}_{1}-\mathrm{C}_{6}$ bond was efficiently cotrolled by the structure of the decalin ring. Unfortunately, the stereochemistry of the $\mathrm{C}_{5}$ center was not the desired one. Moreover, we encountered difficulties applying this reaction to a non-protected equisetin (ent-2). These considerations prompted us to apply the TEMPO-mediated ORC on a
less functionalized substrate. $\beta$-Keto ester (+)-14 appeared to be an attractive substrate for the TEMPO-mediated ORC, since it is less functionalized than equisetin and also contains an easily oxidizable $\mathrm{C}_{1}$ center. With this in mind, 14 was treated with LiHMDS and the resulting $\mathrm{C}_{1}$ enolate was in situ oxidized with 13 to afford, after quenching of the $\mathrm{C}_{1}$ radical with TEMPO, compound ent-15. As expected, under these conditions (5 min, $0{ }^{\circ} \mathrm{C}$ ) the ORC did not occur and ent-15 was isolated and fully characterized as a mixture of $\mathrm{C}_{1}$-isomers (ca 2.5:1) in $99 \%$ yield. Heating this isomeric mixture at $90^{\circ} \mathrm{C}$ over a period of 36 h gave rise to the tricyclic motif of ent-16 via the desired 5-exo-trig cyclization. Similarly with the above study, the formation of the $\mathrm{C}_{1}-\mathrm{C}_{6}$ bond proceeded with excellent stereocontrol, presumably due to the stereochemical bias of the decalin motif. Interestingly however, in this case we obtained a mixture of stereoisomers at $\mathrm{C}_{5}$ (ca 1:1). It is worth mentioning that attempts to decrease the reaction time by raising the temperature proved to be problematic since they led to significant amounts of decarboxylated product ent-17.

Scheme 2.4.3.2 Total synthesis of (-)-fusarisetin A (1) via a TEMPO-mediated ORC

To further enhance the overall efficiency, we also examined the one-pot ORC and aminolysis sequence in presence of serine derivative ent-18. To our delight, this one-pot reaction gave rise to compound ent-19 ( $\mathrm{C}_{5} \mathrm{dr}=$ ca 1:1) in $70 \%$ overall yield. To avoid the difficult separation of these diastereomers, ent-19 was directly treated with $m$ CPBA $^{44}$ to oxidatively cleave the $\mathrm{N}-\mathrm{O}$ bond producing ent-20 in $95 \%$ yield. Regio- and stereo-selective reduction of this compound under Luche conditions ${ }^{45,18}$ followed by a one-pot Dieckmann condensation/hemiketalization yielded (-)-fusarisetin A (ent-1) together with its $\mathrm{C}_{5}$-epimer ( $\mathrm{dr}=\mathrm{ca} 4: 1,42 \%$ over 2 steps). Synthetic ( - )-fusarisetin A was identical in all aspects with naturally occurring fusarisetin $\mathrm{A}\left({ }^{1} \mathrm{H}-\mathrm{NMR},{ }^{13} \mathrm{C}-\mathrm{NMR}\right.$ and HR-MS), except for the optical rotation (synthetic: $[\mathrm{a}]_{\mathrm{D}}{ }^{23}=-86.2(\mathrm{c}=0.065$ in MeOH$)$; natural: $[\mathrm{a}]_{\mathrm{D}}{ }^{25}=+84.6(\mathrm{c}=0.2 \mathrm{in} \mathrm{MeOH})^{13}$, reported synthetic $(-)-1$ : $[\mathrm{a}]_{\mathrm{D}}{ }^{27}=-88.0(\mathrm{c}=$ 0.15 in MeOH ). ${ }^{18}$ The structure of ent- $\mathrm{C}_{5}$-epi-1 was confirmed by comparison to the literature data. ${ }^{18}$

### 2.5. Synthesis of (+)-fusarisetin A

After successful completion of the total synthesis of $(-)$-1 our interest turned to make the natural isomer of fusarisetin $A$ to begin the exploration into the chemical biology of these novel phamacophores. For this reason, we proposed that the biosynthetic relationship of equisetin and fusarisetin could be approached in a synthetic study. Here in, we report the synthesis of (+)-fusarisetin A via a biomimmetic strategy that would prove to not only be efficient but also scalable. Our strategy allowed for large amounts of natural fusarisetin $A$ to be prepared and for this reason facilitate multiple biological studies that begin to describe the chemical biology of (+)-1.

### 2.5.1 Biomimetic approach and model studies

Upon completion of the first generation synthesis of fusarisetin A, we focused our efforts on the evaluation of metal-promoted ORC reactions. We had correctly hypothesized that equisetin and fusarisetin A were related based on stereochemistry of the $A B D$ ring structure as well as the reactivity profile in the presence of ROS. The feasibility of this proposal was initially evaluated in model system 32 that contains all key carbons needed for the proposed cyclization (Scheme 3). This compound was prepared via a sequence of 3 steps that included: (a) kinetic alkylation ${ }^{46}$ of ethyl acetoacetate (29) with crotyl bromide to form 30; (b) aminolysis of the ester group with $N$-methyl glycine methyl ester to produce 31; and (c) Dieckmann condensation (formation of the $\mathrm{C}_{1}-\mathrm{C}_{4}$ bond) to yield 32 ( $45 \%$ yield overall). Tetramic acid 32 was then subjected to various reagents and conditions in order to perform the desired ORC (Table 2.5.1.1). Scarce literature reports ${ }^{38}$ indicate the feasibility of this transformation that, nonetheless, has never been applied to intramolecular systems or any natural product synthesis.

[d] ferrocenium hexafluorophosphate. [e] 0.1 equiv of CAN was used. [f] reaction opened to air. CAN $=$ cerium(IV) ammonium nitrate.

Table 2.5.1 Conversion of $\mathbf{3 2}$ to 33 and $\mathbf{3 4}$ via a metal-promoted ORC reaction. ${ }^{[a][b]}$

It is known that certain high oxidation state metals, such as Mn (III), $\mathrm{Co}(\mathrm{II}), \mathrm{Ag}(\mathrm{II})$, $\mathrm{Pd}(\mathrm{II}), \mathrm{Pb}(\mathrm{IV})$ and $\mathrm{Ce}(\mathrm{III})$, can promote the addition of carbon radicals derived from ketones to alkenes. ${ }^{42}$ On the other hand, molecular oxygen exists as a persistent triplet diradical in its ground state and as such it can react rapidly with carbon-centered radicals. ${ }^{43}$ With this in mind, we treated 24 with various metals in the presence of $\mathrm{O}_{2}$ and, in certain cases, were able to isolate peroxyhemiketal 25 (as $\mathrm{C}_{5}$ isomers). Reduction of the peroxide motif of $\mathbf{2 5}$ then produced $\mathbf{2 6}$ (as $\mathrm{C}_{5}$ isomers) representing the tricyclic core of fusarisetin $A$.

### 2.5.2 Scalable synthesis of (-)-equisetin and (+)-fusarisetin A

Encouraged with these results, we proceeded to implement the optimized ORC conditions to the synthesis of (+)-fusarisetin A, the natural occuring isomer, using (-)equisetin, also the natural occuring stereoisomer, as the key synthetic intermediate (Scheme 4). It is worth noting that during the course of our research, Gao and coworkers ${ }^{47,}$ instated our working hypothesis to convert (-)-equisetin to (+)-fusarisetin A using a metal oxidant and $\mathrm{O}_{2}$ gas as the ROS. Even so, our unique approach to the decalin system combined with our optimized ORC reaction represented an extremely efficient, short and scalable route to access (+)-1.

Along tbese lines, decalin aldehyde 18 was rapidly and stereoselectively constructed from (R)-citronellal (16) in decagram-scale (35\% over 3 steps) following the above procedure. Conversion of 18 to 14 proceeded under Reformatsky conditions followed by oxidation of the resulting alcohol with Dess-Martin periodinane (2 steps, 92\% overall yield, ca 7 grams prepared). It is worth noting that the DMP oxidation protocol is highly dependent on the quality and freshness of the DMP oxidant. Also, IBX oxidation when heated to $80^{\circ} \mathrm{C}$ produced significant amounts of decarboxylated material. We can circumvent this problem by mild heating $\left(45^{\circ} \mathrm{C}\right)$ in which case no decarboxilation is observed and more reproducible high yields are obtained. Aminolysis of ester 4 under various conditions, such as DMAP ${ }^{18,19}$ and NHC-based reagents, ${ }^{48,}$ with (L)-N-methyl serine methylester (27) ${ }^{49,}$ afforded 11 in low yield. However, mild hydrolysis of 14 with ethanolic $\mathrm{KOH}(\mathrm{rt}, 96 \mathrm{~h}$ ) quantitatively produced the corresponding carboxylic acid that, upon coupling with 18 under HATU conditions afforded the desired amide 20 in 90\% yield. Dieckmann condensation of 20 quantitatively produced a mixture of (-)-equisetin
(2) and $\mathrm{C}_{3}$-epi-equisetin ( $\mathbf{C}_{3}$-epi-2) ( $100 \%$, $\mathrm{dr}=$ ca $1: 1$ )..$^{14,16,36,47,50,}$ Gratifyingly, the previously defined ORC conditions were successfully applied for the conversion of (-)equisetin (2) to (+)-fusarisetin $\mathrm{A}(1)$. Specifically, oxidation of 2 under $\mathrm{CAN} / \mathrm{AcOH} / \mathrm{O}_{2}$ conditions produced an inseparable mixture of peroxy-fusarisetin $\mathrm{A}(35)$ and its $\mathrm{C}_{5}$ epimer ( $\mathbf{C}_{5}$-epi-35) ( $\mathrm{dr}=1.3: 1$ ). This mixture was further reduced with thiourea ( CuCl reduction interestingly failed) to afford (+)-fusarisetin A (1) together with its $\mathrm{C}_{5}$ epimer $\left(\mathrm{C}_{5}\right.$-epi-1) $(62 \%$ overall, $\mathrm{dr}=1.3: 1)$. The structures of both $\mathrm{C}_{5}$ epimers of 35 and 1 have been confirmed by ${ }^{1} \mathrm{H}-\mathrm{NMR},{ }^{13} \mathrm{C}$ NMR and HR-MS analysis. ${ }^{13,18,47}$ As observed previously, the stereoselectivity of this ORC reaction is substrate-controlled and affords the desired stereochemistry at the $\mathrm{C}_{1}$ and $\mathrm{C}_{6}$ centers. It is worth noting that after our synthetic work had finished, a patent filed by the isolation authors ${ }^{51,}$ became available to the public. It revealed that the $\mathrm{C}_{5}$ epimer of fusarisetin A is in fact another natural product (from now on fusarisetin B) that was isolated from the same Fusarium strain.

Scheme 2.5.2.1 Scalable total synthesis of (-)-equisetin and (+)-fusarisetin A

We were also able to use the mixture of equisetin (2) and $\mathrm{C}_{3}$-epi-equisetin ( $\mathrm{C}_{3}$ -epi-2) in the ORC reaction. In fact, 1.1 grams of this mixture ( $\mathrm{dr}=1: 1$ ) were treated under $\mathrm{CAN} / \mathrm{AcOH} / \mathrm{O}_{2}$ conditions and the resulting crude mixture of peroxy-fusarisetins was reduced with excess thiourea. Purification of this mixture produced 200 mg of (+)fusarisetin A (1). Notably, the whole synthetic process from decalin (+)-18 to (+)fusarisetin $A$ and $B$ was performed on gram-scale and requires only one purification via column chromatography. In summary, the syntheses of both 1, 2 and are scalable, redox-/step-economic and protecting-group free. ${ }^{52,}$

### 2.6 Chemical biology of fusarisetin A

Even though extensive synthetic investigations had been done, no further reports had been published on the chemical biology of fusarisetin A. For this reason, our chemical investigation geared into a more biological approach and led us to experiment with MDA-MB-231 cell lines to better understand the biological significance of 1 . Here in, we report our research towards understanding the chemical biology of $(+) \mathbf{- 1}$.

### 2.6.1 Cell migration assays

To confirm and expand upon the previously reported findings, we evaluated the biological activity of (+)-fusarisetin A (1) in a scratch-wound assay and in a Boyden Chamber Transwell assay. The first assay (Figure 2.7.1.1) involves inflicting a scratch wound in a confluent cell monolayer and measuring the migration of cells. ${ }^{53}$ We were pleased to find that synthetic 1 inhibited migration of these cells at concentrations as low as $1 \mu \mathrm{~g} / \mathrm{mL}$ (Figure 2.7.1.1, C) as compared to vehicle control (B). Importantly, removing

1 from the cells followed by incubation with fresh growth media allowed cells to migrate in a similar fashion to the control experiment (D). This observation demonstrates that the effect of 1 on these cells is reversible, in turn suggesting that (+)-fusarisetin A has little to no cytotoxicity at $1 \mu \mathrm{~g} / \mathrm{mL}$ concentration.

Figure 2.6.1.1 (+)-Fusarisetin $A(1)$ reversibly inhibits the migration of MDA-MB-231 breast cancer cells in an in vitro scratch-wound assay.

We then performed Transwell migration assays using increasing concentrations of 1 normalized with the appropriate DMSO controls. This assay measures the capacity of cells to migrate across a porous membrane using serum-rich media as a chemoattractant. ${ }^{54}$ As seen in Figure 3, cell migration was significantly inhibited at 3.0 and 6.0 $\mu \mathrm{g} / \mathrm{mL}$, while almost complete inhibition is observed at $12.0 \mu \mathrm{~g} / \mathrm{mL}$. Even at this concentration we did not observe any changes in the cell morphology, suggesting that 1 exhibits low cytotoxicity. The results of these two assays confirm the reported biological activity of fusarisetin A in vitro. Encouraged by these findings, we then evaluated (+)fusarisetin $A$ in an ex vivo assay measuring migration of cells from a 5 mm mouse skin biopsy (Figure 2.7.1.3). ${ }^{55}$ We observed that both keratinocyte and fibroblast migration is inhibited upon exposure to $1(10 \mu \mathrm{~g} / \mathrm{mL})$. Specifically, a substantial amount of cell migration is observed 5 days after plating the skin explant (Figure 2.6.1.3, A), as compared to the initial time of plating (B). In contrast, when explants were exposed to 10 $\mu \mathrm{g} / \mathrm{mL}$ of $1(\mathrm{C})$, there was no detectable migration of keratinocytes from the explants,
while fibroblast migration was reduced by approximately $80 \%$. The observed ability of fusarisetin $A$ to inhibit cell migration from skin explants is particularly exciting. The migration of fibroblasts is an example of mesenchymal cell migration whereas keratinocytes move via collective cell migration. ${ }^{56}$ Interestingly, compounds that target one type of migration have had disappointing results in clinical studies as the cancer cells are able to adapt and switch between different modes of migration. ${ }^{57}$ Since fusarisetin A can significantly inhibit both types of migratory behavior, it could provide a powerful tool to circumvent the ability of cancer cells to alter their mode of motility if one pathway is inhibited.

(+)-fusarisetin A ( $\mu \mathrm{g} / \mathrm{mL}$ )

Figure 2.6.1.2 (+)-Fusarisetin A (1) inhibits the migration of MDA-MB-231 breast cancer cells in an in vitro Transwell migration assay

Figure 2.6.1.3 (+)-Fusarisetin A (1) inhibits cell migration in an ex vivo mouse skin assay.

Having demonstrated the cell-migration inhibitory properties of 1 both in vitro and ex vivo we then screened selected compounds containing the fusarisetin framework using the scratch-wound assay. We observed that natural (-)-equisetin (2), its enantiomer ent-2, and ent-fusarisetin A (ent-1) do not exhibit any activity at the concentrations tested (Figure 2.6.1.4). However, the $\mathrm{C}_{5}$ epimer of natural fusarisetin A $\mathbf{C}_{5}$-epi-1) was found to display similar activity to that of $(+)-1$. These initial findings attest to the importance of the CDE ring structure and suggest that only the naturally occurring enantiomer of fusarisetin A could be used as a motif for the identification of new inhibitors of cell migration.

Figure 2.6.1.4 Screening of fusarisetin $A(1)$, equisetin (2) and their stereoisomers

### 2.6.2 Fusarisetin $A$ and actin networks

At the onset of this investigation, we evaluated the effects of 1 on the cell morphology and function. In general, motility inhibitors are known to interfere with microtubules, ${ }^{58}$ actin ${ }^{59}$ and/or cell adhesion processes. ${ }^{60}$ For instance cytochalasin $D(3)$, a natural product that binds to actin filaments and induces actin depolymerization, is a well-known cell motility inhibitor. ${ }^{61}$ Intrigued by the observation that $\mathbf{3}$ is structurally and biogenetically related to $1,{ }^{62}$ we sought to compare their effects in vitro.

1: $R_{1}=M e, R_{2}=H: \quad(+)$-fusarisetin $A$ 36: $R_{1}=H, \quad R_{2}=M e:(+)$-fusarisetin $B$

37: cytochalasin D

Figure 2.6.2.1 Structures of fusarisetin $A$, fusarisetin $B$ and cytochalasin $D$

Incubation of cells with $\mathbf{3}$ induced the expected actin depolymerization as shown by intense staining of monomeric actin and lack of actin fibers (Figure 2.7.2.1, column A). This effect was reversible, since removal of 3, by washing the cells with PBS and reincubation with vehicle control, led to recovery of the actin network (Figure 2, column B). Removal of 3 followed by re-incubation with growth media containing 1, led to reconstitution of actin filaments (Figure 2, column C), indicating that fusarisetin A does not affect actin polymerization. Similar observations were made upon sole treatment of cells with 1 (Figure 2, column D). Moreover, in all cases we observed healthy microtubules morphology (Figure 2). Based on these findings we can conclude that
fusarisetin A does not affect actin nor microtubules dynamics. These results, parallel previous findings ${ }^{13}$ and further support the notion that fusarisetin $A$ acts via a novel mechanism of action that is distinctly different from those of known anti-migration agents.

Figure 2.6.2.2 Effect of cytochalasin $D$ and fusarisetin $A$ on actin and microtubule dynamics.

### 2.6.3 Synthesis of analogues and biological evaluation

At present, the key structural features of fusarisetins that account for their antimotility properties are unknown. To address this issue, we sought to construct a library of analogs in which key reactive sites of 1 were systematically evaluated for their
bioactivity. Interestingly, incorporation of various amino acids has been shown to occur in biosynthetically related natural products that derive from the same gene cluster of Fusarium species. ${ }^{62}$ We began this study by exploring the biological significance of the $N$-methyl serine moiety in fusarisetin A by varying the amino acid motif (C3 modification) (Scheme 1). Our synthetic strategy towards 1 allows coupling of $N$-methyl serine with $\beta$ keto acid 38, and conversion of the resulting amide to fusarisetin A via a key oxidative radical cyclization (ORC) reaction cascade. Using this strategy, $\beta$-keto acid 38 was coupled with the $N$-methyl amino methyl esters of phenyl alanine (27a), alanine (27b), isoleucine (27c) and glycine (27d) to produce compounds 20a-20d respectively. Treatment of these adducts with NaOMe led to tetramic acid analogs 2a to 2d (86-94\% over 2 steps). It is worth noting that during this Dieckmann condensation we observed only minimal epimerization at the C3 center. On the other hand, significant racemization at the C3 center was observed when a serine analog was cyclized under the same conditions en route to the synthesis of $1 .{ }^{15}$ This difference is attributed to the methyl hydroxy group of serine that inductively increases the acidity of the C3 proton. ${ }^{63}$ Exposure to cerium ammonium nitrate in acetic acid under oxygen atmosphere followed by reduction of the resulting endoperoxides, ${ }^{64}$ produced fusarisetin analogs 1a-1d.

The $A B$ decalin ring system of fusarisetins is also present in a wide array of natural products. ${ }^{65}$ It was hypothesized that the biological properties of 1 arise from the unique architectural motif of its CDE ring system. We also speculated that the stereochemistry at the C5 center is not critical to the fusarisetin bioactivity since both fusarisetin $A(1)$ and $B(36)$ are equipotent. ${ }^{51}$ With this in mind, we developed a synthesis of truncated analog 12 containing a C5 dimethylated center that, in turn, simplifies the stereoisomeric ratio obtained during the ORC reaction (Scheme 2.6.3.2). Compound 43 was synthesized via the following sequence: (a) kinetic alkylation of ethylacetoacetate

Scheme 2.6.3.1 Synthesis of C3 analogs via a peptide coupling
(29) with prenyl bromide to form 39; (b) saponification of the ethyl ester followed by coupling of the resulting carboxylic acid (40) with 27 to produce 41 ( $85 \%$ yield over 2 steps); (c) Dieckmann condensation ( $\mathrm{NaOMe} / \mathrm{MeOH}$ ); and (d) ORC reaction (CAN, $\mathrm{O}_{2}$ ) followed by endoperoxide reduction (CuCl) to form 12 (34\% yield over 2 steps).

Scheme 2.6.3.2 Synthesis of CDE core fusarisetin analog 43

We then explored the structure/function relationship of the decalin system of 1 by functionalizing the $\mathrm{C}_{8}-\mathrm{C}_{9}$ alkene (Scheme 3 ). $\mathrm{OsO}_{4}$-catalyzed dihydroxylation produced diol 13 ( $58 \%$ yield). The stereoselectivity of this reaction has been unambiguously confirmed by X-ray structure analysis. ${ }^{13}$ Similarly, treatment of 1 with $m$ CPBA selectively afforded epoxide 14 (68\% yield). Reduction of the C8-C9 alkene proceeded under Pdcatalyzed hydrogenation conditions to afford saturated analog 15 ( $95 \%$ yield). On the other hand, acetylation of the C18 hydroxyl group produced acetate 16 ( $66 \%$ yield).

Scheme 2.6.3.3 Synthesis of derivatives of fusarisetin A

Initial cell-based evaluation of all fusarisetins (synthetic material, ${ }^{15} 1-100 \mu \mathrm{M}$ ) was performed using a well-described scratch wound assay. ${ }^{53}$ MDA-MB- 231 cells were grown as a confluent monolayer, scratched and treated with analogs over a 24 hour period. Compounds $8 \mathrm{a}-8 \mathrm{~d}$ proved to be inactive up to $100 \mu \mathrm{M}$ concentrations suggesting that the hydroxy-methyl group of serine plays a significant role in the biological activity of

1. Truncated fusarisetin 12, representing the CDE motif, was also inactive in the scratch wound assay even at high $\mu \mathrm{M}$ concentrations (Table 1). Among the synthetic fusarisetin derivatives (compounds 13-16) neither epoxide 14 nor reduced analog 15 showed any activity in vitro. However, dihydroxylated derivative 13 (Figure 2.5.1.3, C) and acetate 16 (Figure 2.5.1.3, D) demonstrated inhibition of wound healing as compared to the original wound (A) and DMSO control (B) shown in Figure 2.5.1.3. These compounds were then subjected to a Boyden chamber Transwell assay to quantitatively determine their antimotility activity (Figure 4). The $\mathrm{IC}_{50}$ values of fusarisetin analogs are shown in Table 1.

Figure 2.6.3.1 Evaluation of synthetic fusarisetins in a scratch wound assay

Figure 2.6.1.5 summarizes the observed structure-function relationship of fusarisetins. Comparison of the bioactivity data indicates that: (a) both the $A B$ decalin motif and the serine amino acid are critical to the biological profile of fusarisetins; (b) the C5 stereochemistry is insignificant to the activity; and (c) although the B ring alkene is significant to bioactivity, its dihydroxylation can lead to analogs that maintain the
bioactivity albeit at a higher concentration. Similarly, acetylation of the C18 oxygen produces a compound that inhibits cell migration at high $\mu$ Molar concentration.

Figure 2.6.3.2 Dose-dependent inhibition of Transwell cell migration by 44 and 46

Table 2.6.3.1 $\mathrm{IC}_{50}$ values of fusarisetin analogs

| Compound | IC50 $(\mu \mathrm{M})$ |
| :---: | :---: |
| $\mathbf{1}$ | $7.7^{15}$ |
| $\mathbf{2}$ | $7.7^{\mathrm{b}}$ |
| $\mathbf{1 a}$ | $>100$ |
| $\mathbf{1 b}$ | $>100$ |
| $\mathbf{1 c}$ | $>100$ |
| $\mathbf{1 d}$ | $>100$ |
| $\mathbf{4 3}$ | $>100^{\mathrm{c}}$ |
| $\mathbf{4 4}$ | $>100$ |
| $\mathbf{4 5}$ | $74.5 \pm 3.2$ |
| $\mathbf{4 6}$ | $>100$ |
| $\mathbf{4 7}$ | $85.3 \pm 3.8$ |

${ }^{a}$ Compounds with no significant activity in the scratch wound assay (up to $100 \mu \mathrm{M}$ ) were not submitted to the Transwell assay. ${ }^{I} C_{50}$ values of compounds 13 and 16 were determined by the Transwell assay. ${ }^{b}$ Value obtained from references 10 and $15 .{ }^{\circ}$ Compound 12 was tested as the racemate.

Figure 2.6.3.3 Structure-function relationship map of fusarisetins

### 2.7 Concluding remarks

We report here a concise, efficient, and protecting group-free synthesis of fusarisetin A (1). Key to our synthetic strategy is the implementation of a bioinspired oxidative radical cyclization (ORC) reaction that forms the $C$ ring of 1 via stereoselective construction of the $\mathrm{C}_{1}-\mathrm{C}_{6}$ bond. Subsequent oxidation at the $\mathrm{C}_{5}$ center allows formation of the $D$ ring of 1 ultimately converting equisetin (2) to fusarisetin $A(1)$. The TEMPOmediated ORC reaction could be successfully applied for the conversion of $\beta$-ketoester 14 to a tricyclic motif 28 that, upon Dieckmann condensation/ hemiketalization, formed fusarisetin (1) together with its $\mathrm{C}_{5}$ epimer ( $\mathrm{C}_{5}$-epi-1). However, treatment of equisetin under these conditions produced exclusively the $\mathrm{C}_{5}$ epimer of fusarisetin $\mathrm{A}\left(\boldsymbol{C}_{5}-\mathrm{epi}-1\right)$. On the other hand, metal-mediated ORC reactions, such as $\mathrm{Co}(\mathrm{OAc})_{2}, \mathrm{Mn}(\mathrm{OAc})_{3}$, ferrocenium- and cerium(IV)-salts, could be successfully applied in a model system for the construction of the CDE ring of $\mathbf{1}$. Moreover, the conversion of 2 to 1 was best
achieved using $\mathrm{CAN} / \mathrm{AcOH} / \mathrm{O}_{2}$. Overall, the optimized synthesis of (+)-fusarisetin A proceeds in 8 steps from commercially available $R$-(+)-citronellal.

We have also confirmed that (+)-fusarisetin A exhibits potent inhibitory activities against cancer metastasis in vitro and demonstrated its capability to inhibit different types of cell migration in mice skin. Interestingly, equisetin (either enantiomer) and (-)fusarisetin A were found to be inactive in these assays, while $C_{5}$-epi-1 displayed comparable activities to that of the natural product. In turn, this suggests that the motif of (+)-fusarisetin A could lead to new potent cancer metastasis inhibitors.

The scalable synthetic strategy presented has paved the way for more detailed structure-activity relationship and chemical biology studies. Fusarisetin A, the archetype of this family, inhibits cell motility without directly targeting actin or microtubule networks. Empowered by our robust synthetic strategy, we have produced several analogs that were used to interrogate the biological significance of the fusarisetin framework. We found that structural modifications of this rigid scaffold, such as deletion of the $A B$ ring system or replacement of the E-ring serine with other amino acids, result in acute loss of potency. However, subtle changes at the periphery of the fusarisetin motif, such as shuffling of the stereochemistry at the C5 center, result in retention of activity. Moreover, acetylation of the C18 hydroxyl group or dihydroxylation of the C8-C9 alkene produces compounds that maintain biological function albeit at higher concentration, suggesting that these functionalities could be used as tethering sites for further functionalization. Our observations strongly support the notion that fusarisetins operate via an unexplored mechanism of action associated with cell motility. Importantly, these findings attest to the uncharted and highly promising potential of fusarisetins as novel leads for the development of cancer metastasis inhibitors.

### 2.8 Experimental techniques and characterization data

## General Techniques

Unless indicated, all commercially available reagents and anhydrous solvents were purchased at the highest commercial quality and were used as received without further purification. All non-aqueous reactions were carried out under argon atmosphere using dry glassware that had been flame-dried under a stream of argon unless otherwise noted. Anhydrous tetrahydrofuran (THF) and dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ were obtained by passing commercially available pre-dried, oxygen-free formulations through activated alumina columns. Flash column chromatography was performed on silica gel (Merck Kieselgel 60, 230-400 mesh) using hexanes-EtOAc or $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}$ mixtures of increasing polarity. The progress of all the reactions was monitored by thin-layer chromatography (TLC) using glass plates precoated with silica gel-60 $F_{254}$ to a thickness of 0.5 mm (Merck), and compounds were visualized by irradiation with UV light and/or by treatment with a solution of ninhydrin stain or Ceric Ammonium Molybdate (CAM) stain followed by heating. ${ }^{13} \mathrm{C}$ NMR and ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a $400 \mathrm{MHz}, 500$ $\mathrm{MHz}, 800 \mathrm{MHz}$ Varian instrument or a 500 MHz JEOL instrument. $\mathrm{CDCl}_{3}$ was treated with flame dried $\mathrm{K}_{2} \mathrm{CO}_{3}$, chemical shifts ( $\delta$ ) are quoted in parts per million (ppm) referenced to the appropriate residual solvent peak reference $\left(\mathrm{CDCl}_{3}\right.$ or $\left.\mathrm{CD}_{3} \mathrm{OD}\right)$, with the abbreviations s, br s, d, t, q, m, td, dt and qd denoting singlet, broad singlet, doublet, triplet, quartet, multiplet, quartet of doublets, triplet of doublets, doublet of triplets and quartet of doublets, respectively. $J=$ coupling constants given in Hertz (Hz). High resolution Mass spectra (HRMS) were recorded on a trisector WG AutoSpecQ spectrometer. Optical rotation data were collected on a Jasco P-1010 polarimeter using HPLC grade anhydrous $\mathrm{CHCl}_{3}$ or anhydrous MeOH. Microwave experiments were
carried out in Biotage (model:Initiator) microwave reactor using high pressure vessels. Cell cultures were incubated in $\mathrm{NABCO} \mathrm{CO}_{2} 6000$ incubator and biological assays were performed in 24-well Falcon Multiwell (3047) cell dishes. Micrographs were processed with ImageJ software

## Experimental procedure

Di-aldehyde 17 (Method 1): To a solution of $(R)$-(+)-citronellal ( $\mathbf{6}, 1.45 \mathrm{ml}, 1.23 \mathrm{~g}, 8.0$
 mmol, purchased from TCI America) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(150 \mathrm{ml})$ was added methacrolein ( $1.32 \mathrm{ml}, 16.0 \mathrm{mmol}$ ) and Grubbs catalyst ( $2^{\text {nd }}$ generation, $340 \mathrm{mg}, 0.4 \mathrm{mmol}$ ). The reaction mixture was refluxed for 24 hours under argon atmosphere. The reaction was allowed to cool to room temperature and concentrated. The residue was purified via silica column chromatography (hexanes:EtOAc, 100:1 to 10:1) to recover the ( $R$ )-(+)-citronellal (205 $\mathrm{mg}, 17 \%)$ and yield the di-aldehyde $17(1.01 \mathrm{~g}, 75 \%, 90 \% \mathrm{brsm})$ as a pale yellow oil. $R_{\mathrm{f}}$ $=0.5$ (silica gel, hexanes:EtOAc, 2:1); $[\alpha]_{\mathrm{D}}{ }^{23}=+13.7\left(c=1.0, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR $(500$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 9.77(\mathrm{~d}, \mathrm{~J}=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 9.39(\mathrm{~s}, 1 \mathrm{H}), 6.46(\mathrm{t}, \mathrm{J}=5.8 \mathrm{~Hz}, 1 \mathrm{H}) 2.42-2.33$ (m, 4H), $2.34(\mathrm{~m}, 1 \mathrm{H}), 1.74(\mathrm{~s}, 3 \mathrm{H}), 1.57(\mathrm{~m}, 1 \mathrm{H}), 1.42(\mathrm{~m}, 1 \mathrm{H}), 1.01(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR (125 MHz, $\mathrm{CDCl}_{3}$ ) $\delta: 202.5,195.4,154.3,139.7,51.0,35.4,27.9,26.7,19.9$, 9.4; HRMS (ESI) m/e 191.1042 [M+Na+] calcd for $\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{O}_{2} \mathrm{Na}^{+}$: 191.1043.

Di-aldehyde 17 (Method 2): To a solution of $\mathrm{SeO}_{2}(416 \mathrm{mg}, 3.7 \mathrm{mmol})$ and salicylic acid ( $1.99 \mathrm{~g}, 12.4 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 40 ml ) was added $t$-butyl hydrogenperoxide slowly ( $70 \%$ in $\left.\mathrm{H}_{2} \mathrm{O}, 71.0 \mathrm{ml}, 496 \mathrm{mmol}\right)$. The mixture was stirred for 15 min then $(R)-(+)$-citronellal ( 6 ,
$18.8 \mathrm{~g}, 122 \mathrm{mmol}$ ) was added. The reaction was stirred at room temperature for 96 hours. The reaction was diluted with benzene ( 100 ml ) and concentrated. The residue was diluted with ether ( 400 ml ) and washed with $10 \% \mathrm{NaOH}(2 \times 130 \mathrm{ml})$ and brine (120 ml ). The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered, concentrated and purified through silica column chromatography (hexanes:EtOAc, 200:1 to $5: 1$ ) to recover the $(R)-(+)-$ citronellal ( $1.0 \mathrm{~g}, 5 \%$ ) and yield the di-aldehyde $7(4 \mathrm{~g}, 20 \%)$ and corresponding allylic alcohol ( $10.2 \mathrm{~g}, 49 \%$ ) as a clear oil. To a solution of this allylic alcohol ( $10.2 \mathrm{~g}, 60 \mathrm{mmol}$ ) in DMSO (220 ml) was added IBX $(24 \mathrm{~g}, 85.7 \mathrm{mmol})$ in one portion at $0^{\circ} \mathrm{C}$. The reaction was stirred for 1.5 hours at rt , then was diluted with water ( 500 ml ) and filtered through Celite ${ }^{\circledR}$ to remove the precipitate and washed thoroughly with ether. The filtrate separated, and the aqueous phase was extracted with ether ( $5 \times 500 \mathrm{ml}$ ). The combined organic layers were washed with brine ( 1000 ml ) and $10 \% \mathrm{NaOH}(2 \times 500 \mathrm{ml})$, dried over $\mathrm{MgSO}_{4}$, filtered and concentrated to yield 17 ( $9.16 \mathrm{~g}, 90 \%$ ) as a pale yellow oil. The analytical data was identical with the one obtained from method 1.
(2E,4E)-Hexa-2,4-dien-1-yltriphenylphosphonium bromide (9): To a stirred solution of $(2 E, 4 E)$-hexadien-l-o1 $(9.80 \mathrm{~g}, 100 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20$

ml ) at $-10^{\circ} \mathrm{C}$ was slowly added a solution of phosphorus tribromide ( $9.20 \mathrm{~g}, 34.0 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{ml})$ dropwise via an additional funnel. After all the phosphorous tribromide was added, the reaction mixture was stirred for 3 hours before it was diluted with ether ( 150 ml ) and quenched with a saturated $\mathrm{NaHCO}_{3}(100 \mathrm{ml})$ solution. The mixture was separated with diethyl ether with the aid of brine. The aqueous phase was extracted with ether ( $2 \times 100 \mathrm{ml}$ ). The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under reduced pressure to afford crude ( $2 E, 4 E$ )-hexadienylbromide (10.4 g, 65\%) as a brown
oil. The crude $(2 E, 4 E)$-hexadienylbromide was then dissolved in anhydrous toluene (90 ml ), followed by the addition of triphenyl phosphine ( $18.9 \mathrm{~g}, 72.0 \mathrm{mmol}$ ). This reaction was then stirred for 72 hours at room temperature, and the resulting crystalline product was collected by suction filtration, rinsing the solids with a small amount of toluene. After pumping under high vacuum at room temperature for 12 hours, the phosphonium salt 8 were obtained ( $27.2 \mathrm{~g}, 99 \%$, $64 \%$ from ( $2 E, 4 E$ )-hexadien-l-ol). $\mathrm{mp}: 159-160{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR (500 MHz, $\mathrm{CDCl}_{3}$ ) $\delta: 7.85-7.65(\mathrm{~m}, 15 \mathrm{H}), 6.36(\mathrm{~m}, 1 \mathrm{H}), 5.89(\mathrm{~m}, 1 \mathrm{H}), 5.67(\mathrm{~m}, 1 \mathrm{H}), 5.28$ (m, 1H), 4.83 (dd, $J=15.5 \mathrm{~Hz}, 7.5 \mathrm{~Hz}, 2 \mathrm{H}), 1.68(\mathrm{br} \mathrm{d}, J=6.3 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 140.7,140.6,135.0,135.0,133.9,133.8,132.6,132.6,130.4,130.3$, 130.0, 129.9, 118.3, 117.6, $113.2(\mathrm{~d}, \mathrm{~J}=45.9 \mathrm{~Hz}), 28.2(\mathrm{~d}, J=195.8 \mathrm{~Hz}), 18.2$; HRMS (ESI) m/e $343.1613\left[\mathrm{M}-\mathrm{Br}^{-}\right]$calcd for $\mathrm{C}_{24} \mathrm{H}_{24} \mathrm{P}^{+}$: 343.1610 .

Polyene 15: To a suspension of (2E,4E)-hexa-2,4-dien-1yltriphenylphosphonium bromide $9(41.2 \mathrm{~g}, 97.4 \mathrm{mmol})$ in THF ( 500 ml ) was added dropwise $n$-BuLi ( $60.8 \mathrm{ml}, 97.4 \mathrm{mmol}, 1.6 \mathrm{M}$ in hexane) via addition funnel at $-78^{\circ} \mathrm{C}$. The mixture was stirred for 1 h at $-60^{\circ} \mathrm{C}$ then re-cooled to $-78^{\circ} \mathrm{C}$ and transferred via cannula, slowly dropwise to a solution of the di-aldehyde $7(16.4 \mathrm{~g}, 97.4 \mathrm{mmol})$ in THF ( 500 ml ) at $-78^{\circ} \mathrm{C}$ over 6 hours. After completion of addition the reaction mixture was stirred at this temperature for 10 min, quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 500 ml ), diluted with ethyl ether ( 500 ml ) and allowed to reach room temperature. The layers were separated and the aqueous layer was extracted with ether ( $2 \times 500 \mathrm{ml}$ ). The combined organic layers were washed with brine, dried over $\mathrm{MgSO}_{4}$, filtered, concentrated and purified through neutralized $\left(\mathrm{Et}_{3} \mathrm{~N}, 1 \%\right)$ silica column chromatography (pure hexanes, then hexanes:EtOAc, 500:1 to $150: 1$ ) to yield polyene 15 ( $13.7 \mathrm{~g}, 62 \%$ ) as a pale yellow oil as an inseparable $E / Z$
isomeric mixture ( $E: Z=$ ca. $3: 2$ ). $R_{f}=0.5$ (silica gel, hexanes:EtOAc, $10: 1$ ); ${ }^{1} \mathrm{H}$ NMR ( 500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right)(E: Z=$ ca. $3: 2) \delta: 9.38(\mathrm{~s}, 1 \mathrm{H}), 6.47(\mathrm{t}, J=6.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.36-6.01(\mathrm{~m}, 4 \mathrm{H})$, 5.75-5.36 (m, 2H), $2.35(\mathrm{~m}, 2 \mathrm{H}), 2.22-1.96(\mathrm{~m}, 2 \mathrm{H}), 1.77$ and $1.76(\mathrm{~d}, \mathrm{~d}, J=13.8 \mathrm{~Hz}$, $13.8 \mathrm{~Hz}, 3 \mathrm{H}), 1.74(\mathrm{~s}, 3 \mathrm{H}), 1.56-1.49(\mathrm{~m}, 2 \mathrm{H}), 1.35-1.28(\mathrm{~m}, 1 \mathrm{H}), 0.93$ and $0.91(\mathrm{~d}, \mathrm{~d}, \mathrm{~J}=$ 6.9 Hz, 6.9 Hz, 3H); ${ }^{13} \mathrm{C}$ NMR (125 MHz, $\left.\mathrm{CDCl}_{3}\right)(E: Z=$ ca. 3:2) $\delta: 209.0,208.2,130.9$, $130.8,129.5,128.5,128.5,126.8,126.6,125.7,49.0,42.9,41.7,41.7,39.9,39.2,38.8$, $37.3,37.2,35.5,35.4,35.4,33.4,33.2,27.1,27.0,22.5,18.0,17.9,13.9,13.8$; HRMS (ESI) m/e 255.1720 $\left[\mathrm{M}+\mathrm{Na}^{+}\right]$calcd for $\mathrm{C}_{16} \mathrm{H}_{24} \mathrm{ONa}^{+}:$255.1719.

Decalin aldehyde 18: To a solution of polyene 15 ( $13.7 \mathrm{~g}, 58.96 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(700$ $\mathrm{ml})$ was added dropwise a solution of $\mathrm{I}_{2}(752 \mathrm{mg}, 2.95 \mathrm{mmol})$ in

(+)-18 $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{ml})$. The reaction mixture was irradiated with visible light (sunlamp, visible light) for 5 minutes. (caution: keep the flask in a certain distance away from the light source to avoid the heat-induced IMDA reaction.) The mixture was then cooled down to $-78^{\circ} \mathrm{C}$, at which time $\mathrm{Et}_{2} \mathrm{AlCl}(65.5 \mathrm{ml}, 58.96 \mathrm{mmol}, 0.9 \mathrm{M}$ in toluene) was added dropwise. The reaction mixture was stirred for 24 hours at this temperature. The reaction was quenched with saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3} / \mathrm{NaHCO}_{3}$ solution ( $500 \mathrm{ml}, 1: 1$ ) and allowed to reach room temperature. The mixture was filtered through a Celite plug and the layers were separated and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 300 \mathrm{ml})$. The combined organic layers were washed with brine ( 300 ml ), dried over $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure to obtain the trans-decalin aldehyde 9 as a clear viscous oil ( $11.28 \mathrm{~g}, 82 \%$ ). This material can be used directly to the next step without further purification. Large scale purification can be achieved with a silica plug (100\% Hexanes). An analytical sample of 18 was purified through preparative TLC (silica gel,
hexanes:EtOAc, 20:1). $R_{\mathrm{f}}=0.6$ (silica gel, hexanes:EtOAc, 10:1); $[\alpha]_{\mathrm{D}}{ }^{23}=+283.7(c=$ $0.5, \mathrm{CHCl}_{3}$ ); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 9.47(\mathrm{~s}, 1 \mathrm{H}), 5.47-5.43(\mathrm{~m}, 4 \mathrm{H}), 2.53(\mathrm{~m}, 1 \mathrm{H})$, 1.82-1.73 (m, 3H), $1.66(\mathrm{~m}, 1 \mathrm{H}), 1.65(\mathrm{~d}, \mathrm{~J}=5.2 \mathrm{~Hz}, 3 \mathrm{H}), 1.48(\mathrm{~m}, 1 \mathrm{H}), 1.38-1.35(\mathrm{~m}$, $1 \mathrm{H}), 1.12-1.02(\mathrm{~m}, 2 \mathrm{H}) 1.00(\mathrm{~s}, 3 \mathrm{H}), 0.92(\mathrm{~d}, J=6.3 \mathrm{~Hz}, 3 \mathrm{H}), 0.87(\mathrm{q}, J=12.0 \mathrm{~Hz}, 1 \mathrm{H})$; ${ }^{13} \mathrm{C}_{\mathrm{NMR}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \mathrm{\delta}: 209.1,131.0,129.5,128.6,126.8,50.3,49.1,41.7,38.8$, 37.4, 35.4, 33.2, 27.1, 22.6, 18.0, 13.9. HRMS (ESI) m/e $255.1717\left[\mathrm{M}+\mathrm{Na}^{+}\right]$calcd for $\mathrm{C}_{16} \mathrm{H}_{24} \mathrm{ONa}^{+}$: 255.1719 .
$\beta$-ketoester 4: To a solution of $9(5.5 \mathrm{~g}, 23.7 \mathrm{mmol})$ in benzene ( 200 ml ) was added

$(-)-14$ ethyl bromoacetate ( $7.89 \mathrm{ml}, 71.1 \mathrm{mmol}$ ) and activated zinc dust ( $7.76 \mathrm{~g}, 118.5 \mathrm{mmol}$ ). The reaction mixture was then refluxed for 45 minutes. The reaction mixture was allowed to cool to room temperature, acidified with 1 N HCl and extracted with EtOAc (3 x 300 ml ). The combined organic layers were washed with saturated $\mathrm{NaHCO}_{3}(300 \mathrm{ml})$, brine ( 300 ml ), dried over $\mathrm{MgSO}_{4}$ and concentrated to afford the corresponding isomeric alcohol mixture. The crude alcohols were then dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(200 \mathrm{ml})$ and DessMartin periodinane ( $20.0 \mathrm{~g}, 47.2 \mathrm{mmol}$ ) was added portionwise at room temperature. The reaction mixture was then stirred for 2 hours. The reaction was quenched with with saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3} / \mathrm{NaHCO}_{3}$ solution ( $500 \mathrm{ml}, 1: 1$ ), filtered through Celite ${ }^{\circledR}$ (washed with 500 ml of ethyl ether) and the filtrate was extracted with ethyl ether ( $3 \times 300 \mathrm{ml}$ ). The combined organic layers were washed with brine ( 300 ml ), dried over $\mathrm{MgSO}_{4}$ and concentrated to yield crude b-ketoester 4 ( $6.85 \mathrm{~g}, 92 \%$ ) as a viscous yellow oil. This material can be used directly to the next step without further purification. An analytical sample of 4 was purified through preparative TLC (silica gel, hexanes:EtOAc, 10:1). $R_{\mathrm{f}}=$ 0.4 (silica gel, hexanes:EtOAc, 10:1); $[\alpha]_{D}{ }^{23}=-146.9\left(c=1.0, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR $(500$

$\mathbf{N}$-Methyl-L-serine methyl ester 27 : L-serine methyl ester hydrochloride (5.0 g, 32 mmol, Sigma Aldrich) was dissolved in a minimum amount of
 methanol and stirred with Amberlite IRA-410 for 2 h and filtered and rinsed with methanol. The collected solution of free amine was concentrated and concentrated in vacuo. The neutral amine was dissolved in MeOH $(300 \mathrm{ml})$. To this solution, fresh distilled benzaldehyde ( $3.42 \mathrm{ml}, 34 \mathrm{mmol}$ ) was added in one portion. After 3 hours of stirring at room temperature, $\mathrm{NaBH}_{3} \mathrm{CN}(2.12 \mathrm{~g}, 34 \mathrm{mmol})$ was added. After stirring for 18 hours, solid powder paraformaldehyde $\left(\left(\mathrm{CH}_{2} \mathrm{O}\right)_{\mathrm{n}}, 3.02 \mathrm{~g}\right.$, 32 mmol (for MW = 90.1)) was added and allowed to dissolve within 8 hours. Following full dissolution an additional portion of $\mathrm{NaBH}_{3} \mathrm{CN}(2.12 \mathrm{~g}, 34 \mathrm{mmol})$ was added and the reaction was allowed to stir at room temperature for 18 hours. The reaction mixture was concentrated in vacuo. Ethyl acetate was added and the resulting slurry was filtered though Celite ${ }^{\circledR}$ and concentrated in vacuo. Flash column chromatography (hexanes: $\mathrm{Et}_{2} \mathrm{O}, 2: 1$ ) on neutralized silica gel afforded the $N$-methyl- $N$-benzyl-L-serine methyl ester ( $6.5 \mathrm{~g}, 90 \%$ ) as a clear oil. $R_{\mathrm{f}}=0.3$ (silica gel, hexanes:EtOAc, 2:1); $[\alpha]_{\mathrm{D}}{ }^{24}=$ -77.0, $(c=1.0, \mathrm{MeOH}) ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 7.35-7.25(\mathrm{~m}, 5 \mathrm{H}), 3.86(\mathrm{~d}, \mathrm{~J}=$ $13.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.80-3.72(\mathrm{~m}, 3 \mathrm{H}), 3.76(\mathrm{~s}, 3 \mathrm{H}), 3.53(\mathrm{dd}, J=9.3 \mathrm{~Hz}, 5.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.33(\mathrm{~s}$,

A high pressure steel autoclave equipped with magnetic stir bar was filled with N -methyl- $N$-benzyl-D-serine methyl ester prepared as described above ( $4.3 \mathrm{~g}, 19 \mathrm{mmol}$ ), $\mathrm{Pd}(\mathrm{OH})_{2}(20 \%$ on activated charcoal, 2.2 g$)$ and $\mathrm{MeOH}(200 \mathrm{ml})$. The autoclave was pressurized to 60 atm with $\mathrm{H}_{2}$ and the suspension was vigorously stirred at room temperature for 12 hours. The pressure was released slowly and the mixture was filtered through a Celite ${ }^{\circledR}$ pad. The filter pad was washed with $\mathrm{MeOH}(5 \times 200 \mathrm{ml}$ ), and the combined filtrates were concentrated to afford $N$-methyl-D-serine methyl ester 27 ( 2.0 g , $80 \%)$ as a colorless oil. $[\mathrm{a}]_{\mathrm{D}}{ }^{24}=-12.1,(c=1.0, \mathrm{MeOH}) ;{ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right) \delta$ : 3.75 (m, 2H), $3.74(\mathrm{~s}, 3 \mathrm{H}), 3.29(\mathrm{t}, \mathrm{J}=4.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.37(\mathrm{~s}, 3 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR ( 125 MHz , $\mathrm{CD}_{3} \mathrm{OD}$ ) $\delta: 174.3,65.7,63.3,52.4,34.4$; HRMS (ESI) m/e $134.0811\left[\mathrm{M}+\mathrm{H}^{+}\right]$calcd for $\mathrm{C}_{5} \mathrm{H}_{12} \mathrm{NO}_{3}{ }^{+}$: 134.0812 . (Note: the amine 27 should be prepared freshly and used for the next step.)

Ketoamide 11: To a solution of $\beta$-keto ester 14 ( $3.5 \mathrm{~g}, 11.2 \mathrm{mmol}$ ) in anhydrous EtOH (
 6.6 ml ) was added the ethanolic KOH solution ( 3.5 g KOH in 35 ml EtOH), the reaction was then stirred at rt for 96 hrs. Alternatively, to a solution of $\beta$-keto ester 14 ( $700 \mathrm{mg}, 2.2 \mathrm{mmol}$ ) in $\mathrm{EtOH}(11.7 \mathrm{~mL})$ was added dropwise $\mathrm{KOH}(1 \mathrm{M}, 5.8 \mathrm{~mL}$ ) and stirred for 9 hrs . In both protocols, the reaction mixture was acidified with 2 M HCl solution to $\mathrm{pH}=2$. The mixture was extracted with ether ( 3 x 200 ml ), the combined organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo. This afforded acid was that can be used directly without further purification. This $\beta$ ketoacid can be purified via a short silica column chromatography (Hex: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, then
$100 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}$, then $40: 1-\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :Acetone, $\mathrm{R}_{f}: 0.12$ ). The $\beta$-ketoacid was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (20 ml) and transferred to a round bottom flask which contains the freshly prepared amine 27 ( $1.79 \mathrm{~g}, 13.4 \mathrm{mmol}$ ). To this solution was added DMF ( 4.4 ml ), O-(7-azabenzotriazol-1-yl)- $\mathrm{N}, \mathrm{N}, \mathrm{N}, \mathrm{N}$-tetramethyluronium hexafluorophosphate (HATU, 4.68 g , 12.3 mmol ) and cooled to $0^{\circ} \mathrm{C}$, followed by adding in the diisopropylethylamine (DIPEA, $5.93 \mathrm{ml}, 33.6 \mathrm{mmol}$ ) dropwise. The reaction was stirred at rt for 2 hrs before it was acidified with 2 M HCl solution to $\mathrm{pH}=2$. The mixture was then diluted with EtOAc (500 ml ), sequentially washed with 2 M HCl solution $(3 \times 200 \mathrm{ml}), \mathrm{NaHCO}_{3}(100 \mathrm{ml})$ and brine ( $2 \times 200 \mathrm{ml}$ ). The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo to afford the desired $\beta$-ketoamide 20 as a yellow oil ( $90 \%, 4.0 \mathrm{~g}$ ). This $\beta$-ketoamide 20 was used directly to the next step without further purification. Large scale silica chromotography purification can be perfomed using a $\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}$ solvent system ( $100 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}$ to $25: 1$ ). An analytical sample of 20 was purified with preparative TLC (EtOAc: Hexanes, $1: 1 \times 3$ ). The ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR were complicated by the enolketo tautomers and the amide rotamers. $R_{\mathrm{f}}=0.4$ (silica gel, $\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}, 20: 1$ ); $[\alpha]_{\mathrm{D}}{ }^{23}=$ -192.3 ( $c=0.46, \mathrm{CHCl}_{3}$ ); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 5.43-5.32(\mathrm{~m}, 3 \mathrm{H}), 5.15(\mathrm{~m}, 1 \mathrm{H})$, $4.79(\mathrm{~m}$, minor), 4.07-3.99 (m, 2H), 3.74 (m, 3H), 3.54-3.47 (m, 1H), $2.96(\mathrm{~m}, 3 \mathrm{H}), 2.57-$ 2.51 (br m, 1H), 1.80-1.65 (m, 6H), 1.59 (m, 3H), 1.57-1.40 (m, 1H), 1.23 (s, 3H), 1.05 $(\mathrm{m}, 1 \mathrm{H}), 0.90(\mathrm{~m}, 1 \mathrm{H}), 0.88(\mathrm{~d}, \mathrm{~J}=8.2 \mathrm{~Hz}, 3 \mathrm{H}) 0.84(\mathrm{~m}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, $\left.\mathrm{CDCl}_{3}\right)$ $\delta: 207.9,169.8,168.7,130.9,130.5,126.9,126.4,61.0,60.0,53.5,52.3,49.8,46.3$, $41.9,39.8,38.7,38.4,35.4,33.4,27.2,22.4,17.9,17.3$. TBS-(+)-equisetin 21 (synthesized from (S)-(-)-citronellal):

21

To a solution of (+)-equisetin (ent-2, $37 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 1 ml ) was added imidazole ( $13.6 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and TBS-CI ( $23 \mathrm{mg}, 0.15 \mathrm{mmol}$ ). This reaction was stirred for 12 h before it was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 5 ml ). The mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $3 \times 10 \mathrm{ml}$ ), dried over and concentrated. Purification via silica column chromatography (hexanes:EtOAc, 100:1 to 20:1) afforded 21 as pale red oil (44 $\mathrm{mg}, 90 \%$ ). $R_{\mathrm{f}}=0.7$ (silica gel, hexanes:EtOAc, $5: 1$ ); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 5.39$ $(\mathrm{m}, 2 \mathrm{H}), 5.30-5.15(\mathrm{~m}, 2 \mathrm{H}), 3.92(\mathrm{~m}, 2 \mathrm{H}), 3.57(\mathrm{~m}, 1 \mathrm{H}), 3.31(\mathrm{br}, 1 \mathrm{H}), 3.03(\mathrm{~s}, 3 \mathrm{H}), 1.94$ (m, 1H), 1.85-1.70 (m, 4H), $1.54(\mathrm{~d}, \mathrm{~J}=5.4 \mathrm{~Hz}, 3 \mathrm{H}), 1.42(\mathrm{br} \mathrm{s}, 3 \mathrm{H}), 1.11(\mathrm{~m}, 1 \mathrm{H}), 1.02$ (m, 1H), $0.90(\mathrm{~d}, \mathrm{~J}=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 0.86(\mathrm{~m}, 1 \mathrm{H}), 0.81(\mathrm{~s}, 9 \mathrm{H}), 0.02(\mathrm{~s}, 3 \mathrm{H}), 0.00(\mathrm{~s}, 3 \mathrm{H})$; HRMS (ESI) m/e $510.3016\left[\mathrm{M}+\mathrm{Na}^{+}\right]$calcd for $\mathrm{C}_{28} \mathrm{H}_{45} \mathrm{NO}_{4} \mathrm{SiNa}^{+}: 510.3010$.

TEMPO ether 23: A solution in a sealed tube contains ent-12 ( $24 \mathrm{mg}, 50 \mathrm{mmol}$ ), TEMPO (23 mg, 0.15 mmol$)$, ferrocenium

23 hexafluorophosphate ( $13,33 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) or Mn (III) acetate $(27 \mathrm{mg}, 0.1 \mathrm{mmol})$ in DMF ( 0.71 ml ) was heated in a microwave at $100{ }^{\circ} \mathrm{C}$ for 10 min . The residue was directly purified via preparative TLC (hexanes:EtOAc, $20: 1 \times 2$ ) to afford ent-14 as a colorless oil (11 mg, 35\%). $R_{\mathrm{f}}=0.7$ (silica gel, hexanes:EtOAc, 10:1); ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 5.82(\mathrm{ddd}, J=11.9,5.0,2.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.52(\mathrm{~d}, J=12.5 \mathrm{~Hz}$, $1 \mathrm{H}), 4.25(\mathrm{~m}, 2 \mathrm{H}), 4.04(\mathrm{~m}, 1 \mathrm{H}), 3.96(\mathrm{~m}, 1 \mathrm{H}), 3.13(\mathrm{~s}, 3 \mathrm{H}), 2.89(\mathrm{t}, \mathrm{J}=11.9 \mathrm{~Hz}, 1 \mathrm{H})$, 2.43 (dd, $J=14.4,6.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.81-1.65(\mathrm{~m}, 4 \mathrm{H}), 1.50(\mathrm{~m}, 2 \mathrm{H}), 1.45(\mathrm{~d}, \mathrm{~J}=7.6 \mathrm{~Hz}, 3 \mathrm{H})$, $1.38(\mathrm{~m}, 6 \mathrm{H}), 1.07(\mathrm{~m}, 1 \mathrm{H}), 1.02(\mathrm{~m}, 1 \mathrm{H}), 1.00(\mathrm{~s}, 6 \mathrm{H}), 0.97(\mathrm{~s}, 3 \mathrm{H}), 0.94(\mathrm{~s}, 3 \mathrm{H}), 0.91(\mathrm{~s}$,

9 H ), 0.90 (d, J = $6.9 \mathrm{~Hz}, 3 \mathrm{H}$ ), 0.88 (s, 3H), 0.10 (s, 6H); HRMS (ESI) m/e 665.4318 $\left[\mathrm{M}+\mathrm{Na}^{+}\right]$calcd for $\mathrm{C}_{37} \mathrm{H}_{62} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{SiNa}^{+}$: 665.4320.
(-)-fusarisetin B (ent-C $\mathbf{C}_{5}$-epi-1): To a solution of 23 (9.2

(-)-fusarisetin B $\mathrm{mg}, 14.6 \mathrm{mmol}$ ) in THF ( 100 ml ) and water ( 100 ml ) was added acetic acid ( 300 ml ) and activated zinc dust (95 $\mathrm{mg}, 1.46 \mathrm{mmol})$. The mixture was heated at $80^{\circ} \mathrm{C}$ for 3 hours and cooled to room temperature. To this mixture saturated solution of $\mathrm{NaHCO}_{3}(1 \mathrm{ml})$ was slowly dropped in to neutralize the solution. The mixture was then diluted with ethyl acetate ( 100 ml ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under reduced pressure. The residue was purified through preparative TLC (silica gel, hexanes:EtOAc, $1: 1 \times 5$ ) to afford (-)-fusarisetin $B$ (ent- $\mathrm{C}_{5}$-epi-1) as a white powder ( $1.7 \mathrm{mg}, 30 \%$ ). For the analytical data, see page 173.
$\alpha$-TEMPO- $\beta$-ketoester ent-15: To a solution of HMDS ( $0.57 \mathrm{ml}, 2.70 \mathrm{mmol}$ ) in 1,2-

24 dimethoxyethane ( 30 ml ) at $-78^{\circ} \mathrm{C}$ was added $n-\operatorname{BuLi}(1.6 \mathrm{ml}$, $2.60 \mathrm{mmol}, 1.6 \mathrm{M}$ in hexane) dropwise. The mixture was stirred at this temperature for 30 min . Then a solution of b-ketoester 4 ( $550 \mathrm{mg}, 1.73 \mathrm{mmol}$ ) in 1,2-dimethoxyethane ( 30 ml ) was added dropwise to the reaction mixture and the mixture was warmed up to $-60^{\circ} \mathrm{C}$ and stirred for 30 min . The reaction was then raised to $0^{\circ} \mathrm{C}$, TEMPO ( $283 \mathrm{mg}, 1.80 \mathrm{mmol}$ ) was added in one portion, stirred for 5 min at this temperature, followed by addition of ferrocenium hexafluorophophate ( $850 \mathrm{mg}, 2.6 \mathrm{mmol}$ ) in one portion. The dark blue mixture was stirred for 5 min at $0^{\circ} \mathrm{C}$ and quenched with 20 drops of saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution. The reaction mixture was diluted with ether ( 120 ml ) and filtered through a short
silica pad. The filtrate was concentrated and purified through silica column chromatography (hexanes:EtOAc, 200:1 to 50:1) to yield $\alpha$-TEMPO ester ent-15 (785 mg , as an inseparable $\mathrm{C}-1$ isomeric mixture, $99 \%$ ) as a clear oil. $R_{\mathrm{f}}=0.5$ (silica gel, hexanes:EtOAc, 10:1); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) (C-1 isomeric mixture, ca 3:1) $\delta: 5.42$ $5.25(\mathrm{~m}, 3 \mathrm{H}), 5.25-5.10(\mathrm{~m}, 2 \mathrm{H}), 4.28-4.07(\mathrm{~m}, 2 \mathrm{H}), 2.56$ and $2.47(\mathrm{t}, \mathrm{J}=5.9 \mathrm{~Hz}, 1 \mathrm{H}$ in total), 1.76-1.65 (m, 4H), $1.60(\mathrm{~d}, \mathrm{~J}=5.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.58-1.53(\mathrm{~m}, 5 \mathrm{H}), 1.40(\mathrm{~s}, 3 \mathrm{H}), 1.38$ $(\mathrm{m}, 1 \mathrm{H}), 1.31(\mathrm{t}, \mathrm{J}=7.4 \mathrm{~Hz}, 3 \mathrm{H}), 1.30-1.25(\mathrm{~m}, 2 \mathrm{H}), 1.22$ and $1.20(\mathrm{~s}, 3 \mathrm{H}$ in total), 1.17 (s, 3H), 1.16-1.05 (m, 3H), $1.00(\mathrm{~s}, 3 \mathrm{H}), 0.97(\mathrm{~s}, 3 \mathrm{H}), 0.88(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 3 \mathrm{H}), 0.84-0.80$ (m, 2H); ${ }^{13} \mathrm{C}$ NMR (125 MHz, $\mathrm{CDCl}_{3}$ ) (C-1 isomeric mixture) $\delta: 204.1$, 203.7* (minor isomer), 167.4, 167.2*, 131.1*, 130.5, 130.1, 130.0*, 127.3*, 126.9, 126.4, 125.8*, 91.1, 89.8*, 61.3, 61.2*, 60.8, 59.7*, 59.6, 53.7, 53.4*, 49.2*, 48.2, 41.7, 40.8*, 40.4, 40.4*, 40.2, 40.2, 38.9*, 38.4, 38.2*, 35.6, 35.5*, 33.8*, 33.3*, 33.3, 33.1, 33.1, 32.9*, 26.9, 22.5, 20.5, 20.3, 18.6*, 18.2, 17.9*, 17.1, 16.4, 15.3*, 14.1, 14.0*; HRMS (ESI) m/e $474.3577\left[\mathrm{M}+\mathrm{H}^{+}\right]$calcd for $\mathrm{C}_{29} \mathrm{H}_{48} \mathrm{NO}_{4}{ }^{+}: 474.3578$.
tricyclic TEMPO ketone 25 and 26: A solution of 24 ( $47 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) in toluene ( 1
 ml ) was heated at $90{ }^{\circ} \mathrm{C}$ for 3 h . The reaction was concentrated and purified via column chromatography (hexanes:EtOAc, 200:1 to 50:1) to yield the cyclized ester 25a (21 mg, 45\%) and 25b (21 mg, 45\%) along with the decarboxylated product 26a and 26b (inseparable $C_{5}$ isomeric mixtures, ca $1: 1,2 \mathrm{mg}$, 5\%) all as clear oil. 25a: $R_{\mathrm{f}}=0.68$ (more polar, silica gel, hexanes:EtOAc, 10:1); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 5.80$ (ddd, $\left.J=10.4,7.5,2.9 \mathrm{~Hz}, 1 \mathrm{H}\right), 5.51(\mathrm{~d}, J=10.4 \mathrm{~Hz}$, $1 \mathrm{H}), 4.17(\mathrm{~m}, 3 \mathrm{H}), 3.23(\mathrm{~d}, J=10.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.84(\mathrm{td}, J=10.9,4.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.08$ (dd, $J=$ $11.5,4.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.83(\mathrm{~m}, 2 \mathrm{H}), 1.72(\mathrm{~m}, 1 \mathrm{H}), 1.52-1.39(\mathrm{~m}, 8 \mathrm{H}), 1.29(\mathrm{~m}, 2 \mathrm{H}), 1.26(\mathrm{~m}$,

Tricyclic di-ketoamide 28: To a mixture of 13a and 13b ( $50 \mathrm{mg}, 89 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (1 ml ) at $0^{\circ} \mathrm{C}$ was added a solution of 3 -chloroperoxybenzoic acid ( $19 \mathrm{mg}, 107 \mathrm{mmol}$ ) in

$\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (200 ml ) dropwise. The reaction mixture was stirred for 15 min at the same temperature and then quenched with saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution ( 0.5 ml ) followed by adding saturated $\mathrm{NaHCO}_{3}$ solution ( 0.5 ml ). The mixture was vigorously stirred for 5 min at room temperature and was diluted with 200 ml of EtOAc, washed with NaOH solution (10\%) and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtrated and concentrated under reduced pressure. Purification of the crude product by silica column chromatography (hexane:ethyl acetate, 10:1 to 2:1) afforded ketone 28 (35 $\mathrm{mg}, 95 \%)$ as a colorless oil. $R_{\mathrm{f}}=0.3$ (silica gel, hexanes:EtOAc, 1:1); $[\alpha]_{\mathrm{D}}{ }^{24}=-27.5,(c=$ $\left.0.33, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 5.74(\mathrm{~m}, 1 \mathrm{H}), 5.60(\mathrm{~d}, \mathrm{~J}=10.3 \mathrm{~Hz}, 1 \mathrm{H})$, $4.90(\mathrm{t}, \mathrm{J}=5.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.10-4.05(\mathrm{~m}, 2 \mathrm{H}), 3.90-3.81(\mathrm{~m}, 2 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 3.21(\mathrm{~s}, 3$ H), 2.37 (m, 1 H), 2.27 (s, $3 H$ ), 1.86-1.81 (m, $2 H$ ), 1.72-1.69 (m, 1H), 1.48-1.40 (m, 3H), $1.08(\mathrm{~m}, 1 \mathrm{H}), 0.98(\mathrm{~s}, 3 \mathrm{H}), 0.88(\mathrm{~d}, \mathrm{~J}=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 0.85-0.80(\mathrm{~m}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) ~ \delta: ~ 212.6,209.5,170.2,168.7,133.8,123.7,60.8,60.5,56.3,55.7,52.6$, 52.1, 47.4, 41.6, 38.3, 37.0, 35.3, 34.7, 33.1, 32.0, 25.2, 22.4, 15.4; HRMS (ESI) m/e $420.2380\left[\mathrm{M}+\mathrm{H}^{+}\right]$calcd for $\mathrm{C}_{23} \mathrm{H}_{34} \mathrm{NO}_{6}{ }^{+}: 420.2381$.
(-)-Fusarisetin A: To a solution of tricyclic di-ketoamide 28 ( $35 \mathrm{mg}, 85 \mathrm{mmol}$ ) in MeOH ( 850 ml ) was added $\mathrm{CeCl}_{3} \cdot 7 \mathrm{H}_{2} \mathrm{O}(48 \mathrm{mg}, 128 \mathrm{mmol})$ and

(-)-fusarisetin A, 1 stirred at rt for 10 min . The reaction was then cooled to $-20^{\circ} \mathrm{C}$ and to this solution $\mathrm{NaBH}_{4}(3.5 \mathrm{mg}, 94 \mathrm{mmol})$ was added. This reaction was allowed to stir for 30 min at this temperature, then saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution (0.5 ml ) was added in. The mixture was warmed up to room temperature and extracted with EtOAc ( $3 \times 20 \mathrm{ml}$ ), the combined organic phase was washed with brine, dried over
anhydrous $\mathrm{MgSO}_{4}$ and concentrated in vacuo. The residue was purified by flash column chromatography (EtOAc:hexanes, $1: 1$ to $3: 1$ ) to give a ca. $4: 1$ mixture of tricyclic alcohols as a white foam. The obtained alcohol was dissolved in anhydrous MeOH (2 ml ) and a solution of sodium methoxide ( $850 \mathrm{ml}, 425 \mathrm{mmol}, 0.5 \mathrm{M}$ in MeOH ) was dropped in at $0^{\circ} \mathrm{C}$. This reaction was allowed to warm up to room temperature and stirred for 10 min and quenched by saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 1 ml ). The mixture was then diluted with ethyl acetate ( 200 ml ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under reduced pressure. The residue was purified through preparative TLC (EtOAc:hexanes, $1: 1 \times 5$ ) to afford (-)-fusarisetin $\mathrm{A}(e n t-1)$ as a white foam ( 11.2 mg , $34 \%$ from ent-20) and its $\mathrm{C}_{5}$-epimer (ent- $\mathrm{C}_{5}$-epi-1, $2.8 \mathrm{mg}, 8 \%$ ). ent-1: $[\alpha]_{\mathrm{D}}{ }^{23}=-86.3, c=$ $0.065, \mathrm{MeOH}$; natural: $[\alpha]_{\mathrm{D}}{ }^{23}=+84.6, c=0.2, \mathrm{MeOH}$ ). For other analytical data, see page 173 and Table 2.8.2 (pg. 174).

Tetramic acid 32: To a suspension of sodium hydride ( $6.05 \mathrm{~g}, 60 \%$ in mineral oil, 151

32 $\mathrm{mmol})$ in THF ( 500 ml ) was added ethyl acetoacetate $29(17.55 \mathrm{ml}$, 137 mmol ) dropwise at $0{ }^{\circ} \mathrm{C}$ and stirred for 10 min . Then $n-\mathrm{BuLi}$ ( $99.5 \mathrm{ml}, 1.45 \mathrm{M}$ in hexanes, 144 mmol ) was added in dropwise at the same temperature. Upon completion of addition, this solution was stirred for another 10 min . Then a solution of crotyl bromide ( $15.1 \mathrm{ml}, 147.6 \mathrm{mmol}$ ) in THF ( 200 ml ) was slowly dropped into the previous solution over 15 min . The reaction was then allowed to warm up to rt and stirred for 2 hrs before it was quenched carefully with conc. $\mathrm{HCl} / \mathrm{H}_{2} \mathrm{O}(20 \mathrm{ml} / 200 \mathrm{ml})$. The mixture was extracted with ether ( $3 \times 500 \mathrm{ml}$ ), and the combined organic phase was washed with water until the solution become neutral. Silica column chromatography (hexanes:EtOAc, 200:1 to 10:1) afforded the corresponding ketoester 30 ( $23.3 \mathrm{~g}, 92 \%$ ). The ketoester 30 ( $7.5 \mathrm{~g}, 40.7 \mathrm{mmol}$ ), N -
methyl glycine methyl ester hydrochloride ( $11.3 \mathrm{~g}, 81.4 \mathrm{mmol}$ ), 4-DMAP ( $9.95 \mathrm{~g}, 81.4$ $\mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(17.0 \mathrm{ml}, 122.1 \mathrm{mmol})$ was refluxed in toluene ( 80 ml ) for 12 hrs . The reaction was then cooled down and absorbed with silica gel. Following silica column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}, 200: 1\right.$ to $\left.20: 1\right)$ afforded the corresponding ketoamide 31 ( $4.9 \mathrm{~g}, 50 \%$ ). The obtained ketoamide 31 ( $1.7 \mathrm{~g}, 7.0 \mathrm{mmol}$ ) was then dissolved in $\mathrm{MeOH}(210 \mathrm{ml})$ and the sodium methoxide solution ( $14 \mathrm{ml}, 0.5 \mathrm{M}$ in methanol) was added in. The reaction was stirred at rt for 2 hrs before it was quenched with 1 N HCl ( 300 ml ). The mixture was diluted with water ( 500 ml ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(500 \mathrm{ml}$ ) and separated, the aqueous layer was further extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(500 \mathrm{ml} \times 5)$. The combined organic phase was dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo to yield the tetramic acid 32 as a dark red oil ( $1.43 \mathrm{~g}, 97 \%$ ). $R_{\mathrm{f}}=0.3\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}, 20: 1\right) ;{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 5.50-5.35(\mathrm{~m}, 2 \mathrm{H}), 3.68(\mathrm{~s}, 2 \mathrm{H}), 2.98(\mathrm{~s}, 3 \mathrm{H}), 2.83(\mathrm{t}, J=7.4 \mathrm{~Hz}$, $2 \mathrm{H}), 2.30(\mathrm{~m}, 2 \mathrm{H}), 1.59(\mathrm{~d}, \mathrm{~J}=5.5 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 191.4,186.8$, 173.5, 128.8, 126.6, 101.8, 57.7, 32.8, 28.7, 28.5, 17.9; HRMS (ESI) m/e 208.0979 [ $\mathrm{M}-\mathrm{H}^{-}$] calcd for $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{O}_{3} \mathrm{~N}^{-}$: 208.0980 .
endoperoxy $\beta$-ketoamide 33: solution of tetramic acid 32 ( $20.9 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) and ceric ammonium nitrate (CAN, $54.8 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) in acetic acid ( 0.5 ml ) was stirred under

33 oxygen atmosphere (1 atm) for 3 hrs . The reaction mixture was then diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 5 ml ), passed through a short silica pad, washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}(20: 1,20 \mathrm{ml})$ and concentrated in vacuo. An analytical sample of 33 could be isolated as an inseparable $C_{5}$ diastereomeric mixture via preparative $\operatorname{TLC}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}: \mathrm{AcOH}, 30: 1: 0.15,2\right.$ times $)$. 33 (ca 2:1, as inseparable mixture): $R_{\mathrm{f}}=0.25\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}: \mathrm{AcOH}, 50: 1: 0.5,2\right.$ times); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 4.43$ (major, qd, $J=6.9,2.9 \mathrm{~Hz}, 1 \mathrm{H}$ ), $4.11^{*}$ (minor, qd, $J=$

Amino esters 5a-5d: All amine coupling partners are commercially available from Sigma Aldrich (CDSO15644, PH006931) and FCH Group (FCH1120224, FCH1241743).

They also can be readily prepared using standard reductive amination strategies.

C $_{3}$-benzyl $\beta$-ketoamide 20a: To a solution $\beta$-ketoacid 38 ( $42 \mathrm{mg}, 0.144 \mathrm{mmol}$ ) was
 transferred to a round bottom flask which contained N methyl phenyl alanine methyl ester ( $33 \mathrm{mg}, 0.173 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.6 \mathrm{~mL})$. To this solution was added, DMF (0.1 $\mathrm{mL})$, $\quad \mathrm{O}$-(7-azabenzotriazol-1-yl)-N,N,N,N-tetramethyluroniumhexafluorophosphate (HATU, $54 \mathrm{mg}, 0.144 \mathrm{mmol}$ ) and cooled to $0{ }^{\circ} \mathrm{C}$, followed by adding in the diisopropylethylamine (DIPEA, $0.16 \mathrm{ml}, 0.36 \mathrm{mmol}$ ) dropwise. The reaction was stirred at rt for 2 hrs before it was acidified with 2 M HCl solution to $\mathrm{pH}=2$. The mixture was then diluted with EtOAc, sequentially washed with 2 M HCl solution, $\mathrm{NaHCO}_{3}$ and brine. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo to afford the desired ketoamide $\mathbf{6 a}$ as a yellow oil $(95 \%, 64 \mathrm{mg})$. This ketoamide was used directly to the next step without further purification. The ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR can be complicated due to enol-keto tautomers and amide rotamers. $[\alpha]^{25}{ }_{D}=-80.4$ ( $c=1.0$, $\mathrm{CHCl}_{3}$ ), ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$, complicated by enol-keto tautomer and amide rotamers) $\delta: 7.24(\mathrm{~m}, 5 \mathrm{H}), 5.41-5.30(\mathrm{~m}, 2 \mathrm{H}), 5.19(\mathrm{~m}, 2 \mathrm{H}), 3.71(\mathrm{~m}, 3 \mathrm{H}), 3,3.56(\mathrm{~d}, \mathrm{~J}=$

## Synthesis of CDE ring core analog

$\beta$-keto ester 39: To a solution of ethyl acetoacetate ( $1.0 \mathrm{~g}, 0.98 \mathrm{~mL}$,
 $7.68 \mathrm{mmol})$ in THF at $0^{\circ} \mathrm{C}$ was added all at once $\mathrm{NaH}(60 \%$ in mineral oil, $340 \mathrm{mg}, 8.45 \mathrm{mmol}$ ). The reaction was allowed to stir for 30 mins and then n-BuLi ( 1.6 M in Hexanes, $5.8 \mathrm{~mL}, 8.07 \mathrm{mmol}$ ) was added drop wise to form a bright blood-orange solution. The mixture was stirred at this temperature for 30 mins, followed by rapid addition of 3,3-dimethylallyl bromide. The reaction was stirred at $0{ }^{\circ} \mathrm{C}$ for 3 hours, then allowed to reach room
temperature and stirred for an additional 4 hours when TLC showed consumption of starting material. The reaction mixture was then quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution and extracted with diethyl ether (3x). The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated. The residue was purified by silica flash column chromatography to yield $\beta$-keto ester 39 ( $1.1 \mathrm{~g}, 73 \%$ ) as a clear oil. $R_{\mathrm{f}}$ : 0.3 (10:1, Hex:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 5.05(\mathrm{t}, \mathrm{J}=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.19$ (q, J = 8.8 $\mathrm{Hz}, 1 \mathrm{H}), 3.43(\mathrm{~s}, 2 \mathrm{H}), 2.56(\mathrm{t}, J=9.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.27(\mathrm{q}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.67(\mathrm{~s}, 3 \mathrm{H}), 1.61$ (s, 3H), $1.28(\mathrm{t}, \mathrm{J}=8.8 \mathrm{~Hz}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 203.1,169.6,134.7$, 119.7, 61.2, 59.7, 29.0, 26.9, 25.7, 17.7, 14.0; HRMS (ESI) m/e $198.1256[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{11} \mathrm{H}_{18} \mathrm{O}_{3} \mathrm{Na}^{+}$: 198.1257 .
$\beta$-ketoamide 41: To a solution of $\beta$-keto ester 39 ( $110 \mathrm{mg}, 0.56 \mathrm{mmol}$ ) in EtOH ( 2 mL )
 was added $\mathrm{KOH}\left(1 \mathrm{M}\right.$ in $\mathrm{H}_{2} \mathrm{O}, 1 \mathrm{~mL}$ ) at room temperature. The reaction mixture was stirred for 10 hours at which time the reaction was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and was quenched with 1 M HCl . The layers were separated and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 x)$. The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. The crude residue was used without further purification. To a solution of crude $\beta$-keto acid ( $40 \mathrm{mg}, 0.24 \mathrm{mmol}$ ) and freshly prepared $N$-methyl serine methyl ester ( $45 \mathrm{mg}, 0.34 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.8 \mathrm{~mL}$ ) was added consecutively HOBt ( $70.4 \mathrm{mg}, 0.46 \mathrm{mmol}$ ) and EDC ( $71.4 \mathrm{mg}, 0.45 \mathrm{mmol}$ ) at room temperature. The reaction was stirred overnight at this temperature and was then diluted with EtOAc and quenched with 1 M HCl . The aqueous layers was extracted with EtOAc (3x), washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. The crude residue was used was purified via silica flash column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}, 200: 1\right.$ to $20: 1$ ) to yield 41 ( 65 mg ,
$96 \%)$ as a pale yellow oil. $R_{\mathrm{f}}: 0.44\left(15: 1, \mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}\right) ;{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$, complicated by enol-keto tautomer and amide rotamers) $\delta: 5.11-5.05(\mathrm{~m}, 1 \mathrm{H}), 4.83$ (dd, $J=7.3,5.4 \mathrm{~Hz}, 1 \mathrm{H}$ ), 4.54 (dd, minor), 4.06 (dd, $J=11.6,4.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.00$ (dd, $J=11.8$, $7.4 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.78 (s, minor), 3.76 (s, 3H), 3.67 (s, minor), 3.62 (s, 2H), 3.04 (s, minor), 3.02 (s, 3H), $2.59(\mathrm{t}, \mathrm{J}=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.27(\mathrm{q}, \mathrm{J}=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 1.66(\mathrm{~s}, 3 \mathrm{H}), 1.61(\mathrm{~s}, 3 \mathrm{H})$; ${ }^{13} \mathrm{C}^{2}$ NMR (125 MHz, $\mathrm{CDCl}_{3}$ ) $\delta: 204.5,169.9,168.1,133.4,122.2,61.0,60.4,52.6,49.7$, 43.1, 35.6, 25.8, 22.4, 17.9; HRMS (ESI) m/e $308.1468[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{14} \mathrm{H}_{23} \mathrm{O}_{5} \mathrm{NNa}^{+}: 308.1470$.

CDE ring analog 10: $\beta$-ketoamide 11 ( $45 \mathrm{mg}, 0.16 \mathrm{mmol}$ ) was dissolved in MeOH ( 5.3 ml ) and then NaOMe solution ( $1.6 \mathrm{ml}, 0.5 \mathrm{M}$ in MeOH ) was added

43 dropwise. The reaction was stirred at rt for 30 mins before it was quenched with 1 M HCl . The mixture was diluted with water and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, separated, and the aqueous layer was further extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{x})$. The combined organic phase was dried over $\mathrm{MgSO}_{4}$ and concentrated to yield the corresponding tetramic acid ( $40 \mathrm{mg}, 98 \%$ ) as a dark red oil. This tetramic acid was dissolved in acetic acid $(0.8 \mathrm{~mL})$ and ceric ammonium nitrate (CAN, $88 \mathrm{mg}, 0.16 \mathrm{mmol}$ ) was added. The reaction was stirred under oxygen atmosphere ( 1 atm ) for 30 mins and then diluted with CH 2 Cl 2 ( 5 ml ), passed through a short silica pad, washed with $\mathrm{CH} 2 \mathrm{Cl} 2 / \mathrm{MeOH}(20: 1,20 \mathrm{ml})$ and concentrated in vacuo. The crude residue above was dissolved in anhydrous MeCN ( 0.8 ml ), followed by the addition of $\mathrm{CuCl}(160 \mathrm{mg}, 1.6 \mathrm{mmol})$. This reaction was stirred at rt for 2 hr , and was then concentrated in vacuo and purified via preparative TLC (CH2Cl2:MeOH 25:1, 4 times) to afford tricyclic core analog 10 ( $6.2 \mathrm{mg}, 14 \%$ ) as a clear oil. $R_{\mathrm{f}}$ : 0.22 (15:1, $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}\right) ;{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl} 3\right) \delta: 3.92(\mathrm{~m}, 2 \mathrm{H}), 3.53(\mathrm{t}, \mathrm{J}=4.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.1$
(t, J = $9.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.94(\mathrm{~s}, 3 \mathrm{H}), 2.49(\mathrm{~m}, 2 \mathrm{H}), 2.14(\mathrm{~m}, 2 \mathrm{H}), 1.45(\mathrm{~s}, 3 \mathrm{H}), 1.18(\mathrm{~s}, 3 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR (125 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta: 211.9,170.7,108.9,87.2,68.8,59.6,55.1,41.2,30.6$, 29.9, 29.2, 25.2, 22.7; HRMS (ESI) m/e $269.1263\left[\mathrm{M}+\mathrm{Na}^{+}\right]$calcd for $\mathrm{C}_{13} \mathrm{H}_{19} \mathrm{O}_{5} \mathrm{NNa}^{+}$: 269.1261
dihydroxy fusarisetin 44 : To a solution of (+)-1 (4 mg, 0.01 mmol$)$ in acetone: $\mathrm{H}_{2} \mathrm{O}$ (9:1, 0.5 mL ) was added sequentially $\mathrm{NMO}(1.4 \mathrm{mg}, 0.01$
 mmol ) and $\mathrm{OsO}_{4}\left(4 \% \mathrm{w} / \mathrm{w}\right.$ in $\left.\mathrm{H}_{2} \mathrm{O}, 13 \mu \mathrm{~L}\right)$ at room temperature. The reaction mixture was stirred for 16 hours was then diluted with EtOAc and water, extrated with EtOAc (3x), washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. The residue was purfied by prep TLC (20:1 $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH} 3 x\right)$ to yield $44(2.6 \mathrm{mg}, 62 \%)$ as a white solid. $[\alpha]^{25}{ }_{\mathrm{D}}=$ $+65.6\left(c=0.26, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 4.39$ (quint, $\left.J=6.9 \mathrm{~Hz}, 1 \mathrm{H}\right), 4.00-$ $3.90(\mathrm{~m}, 3 \mathrm{H}), 3.56(\mathrm{dd}, J=4.6,2.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.25(\mathrm{dd}, J=12.1,6.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.94(\mathrm{~s}, 3 \mathrm{H})$, $2.25(\mathrm{~m}, 1 \mathrm{H}), 1.76-1.63(\mathrm{~m}, 4 \mathrm{H}), 1.55-1.45(\mathrm{~m}, 2 \mathrm{H}), 1.39(\mathrm{~d}, \mathrm{~J}=6.4 \mathrm{~Hz}, 3 \mathrm{H}), 1.04(\mathrm{~s}$, $3 \mathrm{H}), 0.98-0.91(\mathrm{~m}, 2 \mathrm{H}), 0.84(\mathrm{~d}, \mathrm{~J}=6.3 \mathrm{~Hz}, 3 \mathrm{H}), 0.80(\mathrm{~m}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 125 MHz , $\mathrm{CDCl}_{3}$ ) d: 211.4, 169.4, 108.6, 83.8, 78.7, 74.7, 73.3, 69.5, 69.1, 67.2, 59.0, 54.2, 47.6, $47.3,38.3,37.0,36.5,34.5,32.0,29.0,25.4,22.6,17.1$; HRMS (ESI) m/e 446.2149 $[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{22} \mathrm{H}_{33} \mathrm{O}_{7} \mathrm{NNa}^{+}: 446.2150$.
epoxy fusarisetin 45 : To a solution of $1(3 \mathrm{mg}, 0.0077 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.13 \mathrm{~mL})$ at
 $0^{\circ} \mathrm{C}$ was added m -CPBA $(70 \% \mathrm{w} / \mathrm{w}, 2.3 \mathrm{mg})$. The reaction was allowed to reach room temperature and stirred for 3 hours. The reaction mixture was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$,
quenched with saturated aq. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and saturated aq. $\mathrm{NaHCO}_{3}$ (1:1) and stirred for 15 mins. The aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 x)$. The combined organic layers were washed with saturated aq. $\mathrm{NaHCO}_{3}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. ## Biological Experiments

Scratch wound assay: MDA-MB- 231 cells ( $5 \times 10^{5}$ cells/ 24 -well plate) were plated in dishes, and after 24 h of incubation at $37{ }^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2}$ in Dulbecco's Modified Eagle's Medium (DMEM) containing 10\% fetal bovine serum (FBS), the confluent monolayer of cells was scratched with a pipette tip twice (in the shape of a cross, forming 4 quarter-
circle quadrants) to create a cell-free zone in each well. The medium was aspirated and each well washed with $10 \%$ Phosphate-buffered Saline (PBS) solution to remove any detached cells. The PBS was aspirated and replaced with fresh DMEM medium ( $500 \mu \mathrm{~L}$ ) in the presence or absence of appropriate concentrations compound. The scratchwounds (cell-free zones) were photographed (4 pictures per well; top, bottom, right and left) under a microscope (10x magnification). After 48 h , migrated cells were photographed (4 pictures per well; top, bottom, right and left) under a microscope (10x magnification). Values are the means $\pm$ SD for quadruplicate $(n=4)$ samples of the ratio (original wound area/area occupied by migrated cells) standardized to DMSO controls for each concentration.

Boyden-Chamber Transwell assay: Transwell cell migration assays were carried out using Transwell membrane filter inserts (BioExpress Transwell PC well insert, 6.5 mm diameter) in a 24 -well tissue-culture plate. The Transwell filter has $8 \mu \mathrm{~m}$ pore-size membranes. MDA-MB- 231 cells $\left(5 \times 10^{5}\right.$ cells/well) suspended in serum free DMEM medium with diverse concentrations of fusarisetin A were added to the upper chambers, and DMEM medium containing $10 \%$ FBS was placed in the lower well, then incubated for 24 h at $37^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2}$. Non-invading cells on the upper surface of the membrane were removed by wiping them out with a cotton swab, and migrated cells on the lower surface were fixed with $4 \%$ formaldehyde solution and stained with Crystal Violet staining solution. The number of invaded cells per membrane was counted under a light microscope at 10x magnification. Values are the means $\pm$ SD for triplicate samples as a ratio of migrated cells with (+)-1 : migrated with corresponding concentration of DMSO.
ex-vivo Mice skin assay: Mice skin explants ( 5 mm ) were plated in a tissue culture dish
and incubated $\left(37^{\circ} \mathrm{C}\right.$ at $5 \% \mathrm{CO}_{2}$ atmosphere) with DMEM growth media containing 10 $\mu \mathrm{g} / \mathrm{ml}$ of (+)-1 or corresponding amount of DMSO. After 5 days of incubation the explants were photographed under a microscope (10x).

Immunofluorescence Assay: Cell culturing: MDA-MB-231 cells ( $1 \times 10^{4}$ cells/24-well plate) were plated in 12-well cell culture dishes (with circular cover slips installed inside the wells) and incubated for 24 hrs at $37^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2}$ in Dulbecco's Modified Eagle's Medium (DMEM) containing 10\% fetal bovine serum (FBS). The wells were then aspirated and given DMEM (10\% FBS) containing $10 \mu \mathrm{~g} / \mathrm{mL}$ of Cytochalasin D (2) (Sigma Aldrich, C8273), $10 \mu \mathrm{~g} / \mathrm{mL}$ of Fusarisetin A or appropriate amount of DMSO (vehicle control) then incubated for $4 \mathrm{hrs}\left(37{ }^{\circ} \mathrm{C}, 5 \% \mathrm{CO}_{2}\right)$. At $\mathrm{t}=4 \mathrm{hrs}$, select coverslips were removed from wells and washed for fixing. Media was then removed from remaining wells containing Cytochalsin D by aspiration and wells were washed with 10\% Phosphate-buffered Saline (PBS, 3x), given DMEM (10\% FBS) containing $10 \mu \mathrm{~g} / \mathrm{mL}$ of Fusarisetin A, or appropriate amount of DMSO (vehicle control) and incubated for 4 hrs $\left(37{ }^{\circ} \mathrm{C}, 5 \% \mathrm{CO}_{2}\right)$. At $\mathrm{t}=8 \mathrm{hrs}$, coverslips were removed and washed for fixing. The well containing Fusarisetin $\mathrm{A}($ since $\mathrm{t}=0$ ) was allowed to incubate for an additional 16 hrs ( 37 ${ }^{\circ} \mathrm{C}, 5 \% \mathrm{CO}_{2}$ ) at which time the coverslip was removed and washed (PBS 3x) for fixing.

Fixing and Staining Protocol: All removed cover slips were washed with PBS (3x) then treated with paraformaldehyde (4\% in PBS) for 10 mins. The formaldehyde solution was aspirated and the slips were washed with PBS (3x). At this time, they were treated with blocking buffer [0.1\% Triton X, 3\% bovine serum albumin (BSA) both in PBS] for 30 mins. Then the slips were treated with FITC-conjugated Phalloidin (Sigma Aldrich, P5282) and Rhodamine-conjugated anti-tubulin antibody (Cytoskeleton Inc., TL590M)
both at 1:100 dilution in blocking buffer for 1 hr , then washed with PBS (3x). The coverslips were finally mounted onto microscope slides with 4',6-diamidino-2phenylindole dihydrochloride (DAPI, Life Technologies, D1306) solution. Fluorescent images were taken at 40x magnification.

Spectrum $2.8{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 18

Spectrum $2.9{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 14

Spectrum $2.10{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 14

Spectrum $2.11{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 20

Spectrum $2.12{ }^{13} \mathrm{CNMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 20

Spectrum $2.13{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 21

Spectrum $2.14{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 23

Spectrum $2.15{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 24

Spectrum $2.16{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 24

Spectrum $2.17{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 25a

Spectrum $2.18{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 25b

Spectrum $2.19{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 26

Spectrum $2.20{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 13a

Spectrum $2.21{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 13a

Spectrum $2.22{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 13b

Spectrum $2.23{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 13b

Spectrum $2.24{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 28

Spectrum $2.25{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 28

Spectrum $2.26{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 32

Spectrum $2.27{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 32

Spectrum $2.28{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 33

Spectrum $2.29{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 33

Spectrum $2.30{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 34a

Spectrum $2.31{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound $\mathbf{3 4 a}$

Spectrum $2.32{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 34b

Spectrum $2.33{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound $\mathbf{3 4 b}$

Spectrum $2.34{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 2

Spectrum $2.35{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 2

Spectrum 2.36 ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound $\mathrm{C}_{3}$-epi 2

Spectrum $2.36{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound $\mathrm{C}_{3}$-epi 2

Spectrum $2.37{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 35

Spectrum $2.38{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 35

Spectrum $2.39{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 1

Spectrum $2.40{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 1

Spectrum $2.41{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 36

Spectrum $2.42{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 36

Spectrum $2.43{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 20a

Spectrum 2.44 ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 20a

Spectrum $2.45{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 20b

Spectrum $2.46{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound $\mathbf{2 0 b}$

Spectrum $2.47{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound $\mathbf{2 0 c}$

Spectrum $2.48{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 20c

Spectrum 2.49 ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 20d

Spectrum $2.50{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 20d

Spectrum $2.51{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 2a

Spectrum $2.52{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 2a

Spectrum $2.53{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 2b

Spectrum $2.54{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 2b

Spectrum $2.55{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 2c

Spectrum $2.56{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 2c

Spectrum 2.57 ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 2d

Spectrum $2.58{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 2d

Spectrum $2.59{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 1a

Spectrum $2.60{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 1a

Spectrum $2.61{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound $\mathbf{1 b}$

Spectrum $2.62{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 1b

Spectrum 2.63 ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound $\mathrm{C}_{5}$-epi-1b

Spectrum $2.64{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound $\mathrm{C}_{5}$-epi-1b

Spectrum $2.65{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 1 c

Spectrum $2.66{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 1c

Spectrum 2.67 ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound $\mathrm{C}_{5}$-epi-1c

Spectrum $2.68{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 1 d

Spectrum $2.69{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 1d

Spectrum $2.70{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 39

Spectrum $2.71{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 39

Spectrum $2.72{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 41

Spectrum $2.73{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 41

Spectrum $2.74{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 43

Spectrum 2.76 ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 43

Spectrum 2.77 ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 44

Spectrum $2.78{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 44

Spectrum $2.79{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 45

Spectrum $2.80{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 45

Spectrum $2.81{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 46

Spectrum $2.82{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 46

Spectrum $2.83{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$ of compound 47

Spectrum $2.84{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ of compound 47

[64] In this case the resulting endoperoxides (C5 epimeric structures) have not been isolated. Their formation is proposed based on the previously reported syntheses of fusarisetin A in which the corresponding endoperoxides have been isolated and spectroscopically/analytically characterized (see references 19, 46).
