Acknowledgements

There are so many people to whom I owe thanks. First and foremost, to Dr. Wendy Ashmore, who has been a constant source of support and encouragement, challenging me to grow both professionally and personally. I will be forever grateful for her willingness to take a chance on an eager graduate student, and for encouraging me to explore unconventional interpretations. I am grateful for her warm support and constructive critiques. She was and continues to be generous with her praise, modest in her suggestions, and always reminding me that learning is a lifelong process. I would not be the scholar I am today without her and I consider myself lucky to call her my mentor and friend.

I would also like to extend my thanks to Dr. Christine Gailey, who has always supported and encouraged me to pursue the things which I thought were impossible. She has taught me to always think critically about the world around me, explore and engage with facets of anthropology not related to archaeology, to persevere when things become difficult, and to thrive with a special grace reserved for those who have seen and experienced some of the best and worst that life has to offer. She is an inspirational mentor and friend.

Dr. Travis Stanton not only supported my ideas, but helped me to approach them pragmatically while also reminding me of the “big picture” of what I intended to accomplish. He has helped me keep both my research and my academic career in

perspective, allowing me to find the answers on my own, while ensuring that I didn't fall painfully flat on my face.

Dr. Thomas Patterson's brilliant mind, eagerness to offer input, and quick wit made graduate school a fun and memorable experience, while Dr. Karl Taube was always willing to discuss iconography and offer insights and opinions when I most needed them. To both I offer my heartfelt gratitude for their time, knowledge, and energy. I also owe a special thanks to Anna Wire, Becky Campbell, Lilia Liederbach-Vega, and Tiara Caldwell-Pleas for their tireless efforts on behalf of all graduate students, and their ability to do their job every day with smiles on their faces.

This dissertation would not have been possible without the moral and financial support of the Belize Valley Archaeological Reconnaissance Project (BVAR) and project directors Dr. Jaime Awe (Northern Arizona University) and Dr. Julie Hoggarth (Baylor University). I thank both Dr. Awe and Dr. Hoggarth for being so generous with their time and energy, and for allowing me to explore multiple dimensions of figurine usage at Cahal Pech and throughout the larger Belize River Valley.

I wish to thank Emily Kaplan from the Smithsonian Institution who provided invaluable conservation advice and guidance in order to protect the Cahal Pech figurine corpus for future generations of researchers. I would also like to extend my heartfelt thanks to my laboratory assistants through the BVAR project: G. Van Kollias, Sydney Lonaker, Stephen Rosenberg, Mike Berns, Lisa Green, Johnny Chuch, Divine Gamez, Magdalen Gibson, Daniel Lopez, Annabel Avendano, Amanda Bermudez, Josie Howl,

Casana Popp, and E.J. Taylor. Additionally, I would like to thank Antonio Beardall from the Belize Institute of Archaeology for his friendship and support throughout my field research and beyond. This dissertation would not be what it is without the editorial expertise and wonderful comments of Dr. Tom Garrison of University of Southern California, and Dr. Guy Hepp of California State University, San Bernardino, and to both of them, I extend my gratitude for their time and energy.

I wish to also thank my family and friends, whose love and encouragement, both emotional and financial, kept me going. And last but certainly not least, to my cohort: Jared Katz, Erin Gould, Sharon Rushing, Jennifer Cullin, and Kyle Harp-Rushing for providing unwavering friendship and support throughout graduate school and beyond. It is safe to say that this dissertation would not have been completed without their love and encouragement. They are not just colleagues and friends, but dear family, and I consider myself lucky to call them such.

This dissertation research was funded by both the BVAR project and the Center for Ideas and Society Humanities Research Grant, along with the Graduate Student Research Fellowship and private funding from Virginia DeLance and Larry and Vicki DeLance. Writing of the dissertation was supported by the University of California, Riverside Dean's Distinguished Fellowship and the University of California Graduate Student Resource Center and the GradSuccess program.

ABSTRACT OF THE DISSERTATION

Enchaining Kinship: Figurines and State Formation at Cahal Pech, Cayo, Belize

by

Lisa LaVon DeLance

Doctor of Philosophy, Graduate Program in Anthropology
University of California, Riverside, December 2016
Dr. Wendy Ashmore, Chairperson

This dissertation examines the use and deposition of ceramic figurine fragments from the site of Cahal Pech, Cayo, Belize over the range of occupation of the site from the Formative Period to the Terminal Classic Period (ca. 1,100 BC to AD 900). This research considers critically the similarities and differences in figurine use and depositional practices between the site core and smaller neighboring structure groups examined synchronically, while also charting similarities and differences across the entire site diachronically.

Mesoamerican figurines are often tied to notions of ancestor veneration and are generally, although not exclusively, believed to have been tools for ritual practice. An investigation of use and depositional practices of these figurines reveals that the rise of social and political complexity and the presence of ceramic figurine deposits at Cahal Pech have a negative correlation. This suggests that during the state formation process at

Cahal Pech, ancestor veneration rituals involving figurines were either fundamentally changed to not include figurines in ritual practice or the importance of community based ancestor veneration ritual gradually ceased. Furthermore, the exploitation and decline of kin group autonomy associated with state formation is further examined to elucidate how the deposition of ceramic figurines tied to ancestor veneration were used as symbols of acquiescence and resistance to the marginalization of kin groups inherent in the state formation process.

CHAPTER 1: STATE FORMATION, ENCHAINMENT, AND FIGURINES

The investigation of how people on the path of state formation navigated their religious, economic, political, and social lifestyle is a particularly salient topic of research for archaeologists today. Given the rapid, sometimes fundamental, political and social change that people experience in the present, it is important that we understand how social groups in the past responded to potentially equivalent social change. A study of state formation in Pre-Hispanic Mesoamerica may provide evidence of how social groups respond to the shifting power dynamics inherent in the process state formation (see Chapter 3). Throughout this dissertation, I define the concept of state as the institutionalization of inequality. By examining the archaeological record for evidence of the increasing social complexity that is linked to the establishment of institutionalized equality, we can begin to see patterns of material culture that potentially indicate acquiescence and resistance to the state formation process.

Ancient Maya society is highly enigmatic, and each year new discoveries are continuously challenging previous interpretations of the past. Particularly salient to this research is the ability to trace the use and deposition of a specific type of material culture from the establishment of a site, potentially through the process of state formation and eventual decline of that system. By examining a specific type of material culture, such as ceramic figurines, diachronically, we can begin to understand changes in artifact patterns and hypothesize how those changes correlated to the social and political environment. Ceramic figurines, I contend, are essentially enchained objects (see Chapter 2): that is,

tied to individuals and groups through multiple layers of meaning that extends past their deposition into the archaeological record. It is important to note that figurines are not the only artifacts that may be enchainment. While many types of objects in the archaeological record may be linked to individuals and groups through the enchainment process, I have chosen to focus this research on ceramic figurines because of their ubiquity and diachronic presence at Cahal Pech and because of the connection that Mesoamerican figurines have to ancestor veneration (see Chapter 2) and kin group identity (see Chapter 3). Because of this enchainment, figurines are an excellent medium to use to explore issues of resistance and acquiescence of kin groups to shifting power dynamics inherent in the process of state formation.

Anthropomorphic (human-like) figurines provide us with visual evidence as not only to show how the physical body was perceived by people who made and used them, but also to demonstrate, if sometimes subtly, how those who used figurines physically experienced the world. An extension of the idea of embodiment, understood here as the physical experience of the human body, anthropomorphic figurines also provide clues relating to the experience of aestheticism. What figurine manufacturers deliberately chose to emphasize, what they deemphasized, and how those distinctions were made are important sources of information related to the potentially multiple uses and purposes of figurines that allows archaeologists to attempt to understand the importance of certain features to the people who illustrated them. While on the surface this may seem like a simple task, anthropomorphic figurines do not make up the entirety of ceramic figurine corpuses, zoomorphic (animal-like) and supernatural images are also depicted on

figurines, complicating notions of human-ness, sex and gender designations, and identity in ways that invite rigorous academic critique (see Chapter 6).

In some regions of pre-Hispanic Mesoamerica and at certain times, figurines appear to have been manufactured and used by large portions of the population, as figurine fragments are found in high number throughout some sites, though certainly not all. In these cases, archaeological excavations frequently encounter ceramic figurines in multiple contexts across multiple socio-economic status groups. In fact, figurines are associated with both the extraordinarily wealthy and the extremely poor. The use of an artifact class that crosses socio-economic status lines provides archaeologists with the opportunity to explore the impact of specific phenomena on a whole range of social groups within a community. Figurines have mostly been interpreted as a tool for ancestor veneration or for fertility rituals, although such explanations are now understood to be lacking the depth related to the lived experience of the people and groups that made and used figurines (see Chapter 6). The ways that figurines were used, and how they were placed into the archaeological record can elucidate types of ritual and social practices that involved ceramic figurines which may, in turn, illustrate what may have been important ritual and social concerns to the people of the past.

Christina Halperin (2007; 2009; 2014) argues that figurines reproduced individual and family values, ideologies, identities, and as such, provide important clues about the people of the past, such as how they expressed their beliefs and values within a larger system that may have contradicted those beliefs. In particular, the formation of identity connected to kin groups and the expression of that identity through the ritual use of

figurines is important for examining Mesoamerican figurines for clues about how people understood themselves in relation to their larger world (see Chapter 6). The figurine corpus from the ancient Maya site of Cahal Pech, situated in the heart of the Belize River Valley in the Cayo district of Belize, is particularly important for studying how the patterns of figure use and deposition of at the site of Cahal Pech may demonstrate the process of state formation.

The Belize River Valley was home to some of the earliest Maya settlements in the lowlands. The hilltop that would become the city center of the larger Cahal Pech community was settled by people who built permanent residential structures by at least 1100 BC if not earlier (Awe 1992:345; 2013; Cheetham 1995:20; Healy et. al 2004:105). Ceramic figurines have been found in contexts of the earliest occupation of the hilltop. The presence of these figurines at the outset of occupation at Cahal Pech (see Chapter 8) demonstrates that people were not only concerned with ceramic crafts when they settled the hilltop, but that they were also concerned with the material manifestation of ideas of embodiment and rituality.

While the site of Cahal Pech is understood today to be the hilltop ruins of a medium- sized city (see Chapter 4), archaeological investigations have discovered and recorded ten peripheral, or smaller architectural groups nearby, linked to individuals of various means indicating differential social statuses (see Figure 1.1). It is likely that there were more such groups, although many have likely been lost to the construction of the modern San Ignacio town to the north of the site. Figurine fragments have been recovered from nearly all smaller architectural groups, thus providing data that permits

comparison between groups of different statuses (as demonstrated architecturally). On a larger scale, the figurine fragments in question make up a specific data set that can be compared to those at other Maya sites in order to elucidate both the similarities and differences of figurine use across the Maya region (Brumfiel 1996; Halperin 2007, 2009; Hendon et al 2014; among others).

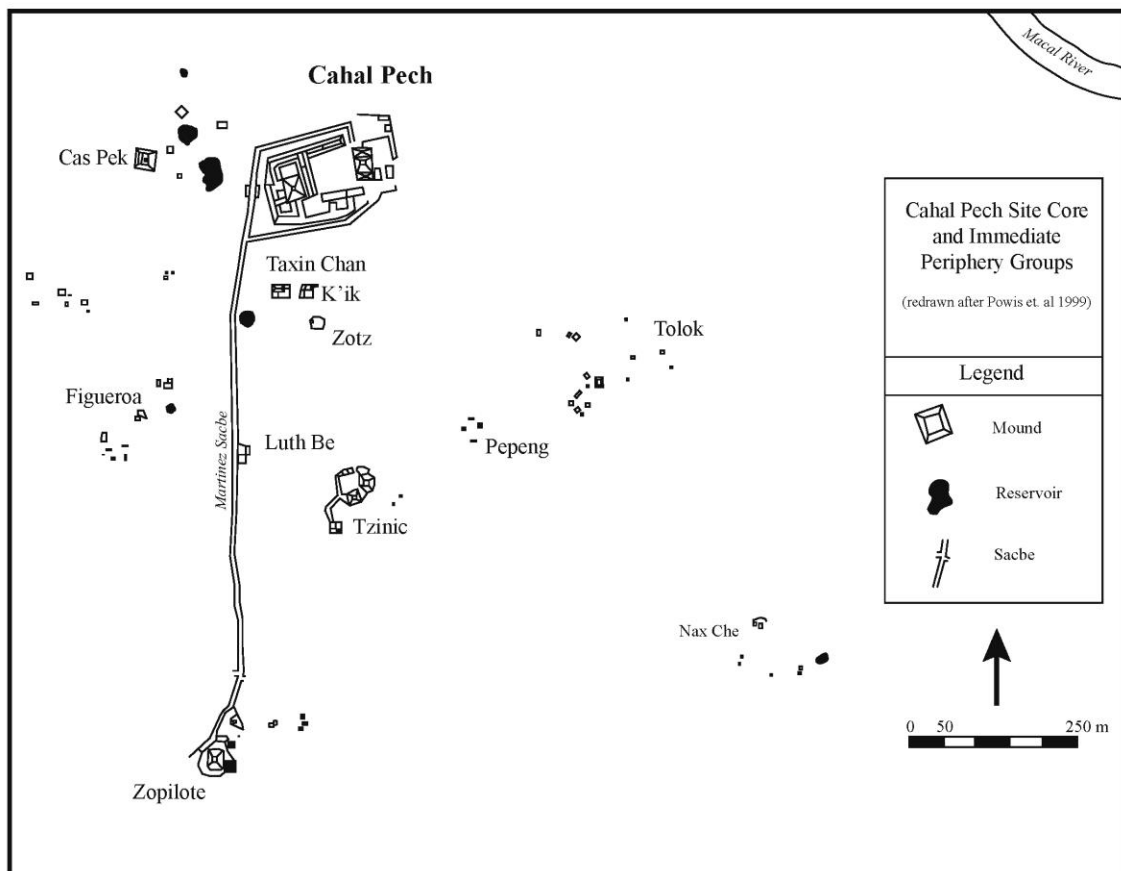

Figure 1.1 - Map of the Cahal Pech site core and periphery groups

Research Questions

The Cahal Pech figurine collection is the largest assemblage found in the Belize River Valley, and one of the largest collections of figurines associated with the Formative Period Maya anywhere. The rarity of such a corpus cannot be understated, and invites substantive comparisons at both the micro settlement level and the regional level. The Cahal Pech figurine corpus was examined with four specific research questions that guided analysis.

Question 1: Is there a difference in the treatment of ceramic figurines found at the Cahal Pech site core versus the Cahal Pech periphery groups?

Figurine fragments at Cahal Pech have been found in multiple contexts including stela caches and burials. Additionally, they have been found in construction fill and trash middens. While all of the figurines are fragmented, some figurines show signs of deliberate defacement and breakage, such as patterned scratches across the face, while other figurines show no evidence of being defaced. Purposeful breakage, as opposed to breakage occurring during normal taphonomic processes, is indicated by the fact that most of the figurine fragments from a similar area do not correspond with one another. It would appear, based on the excavation unit placement, that the figurines were not simply broken, but also that the pieces were scattered around a fairly large area, indicated by the absence of pieces across these areas that were able to be refitted. The forms and implications of fragmentation are discussed at length in Chapter 2.

My first research question examines the specific context of defaced ceramic figurines comparatively between the site core and the five nearby smaller architectural groups at Cahal Pech where excavation records indicate the presence of figurines (Zopilote, Tzubin, Tzinic, Tolok, and Cas Pek). Brumfiel (1996) discussed differences in figurine representation and use in different residential settlements within the Aztec empire. In particular, she noted that the farther away from the central core of the Aztec capital of Tenochtitlan, the more varied were the representation and use of figurines. The analysis guided by this question sought to explore similarities and differences in figurine use and deposition between the peripheral groups and the site core, potentially indicating as Brumfiel claimed, a conscious act of resistance to centrally established ideals.

Question 2: Do the features found on ceramic figurines change over time?

The large corpus of figurines from Cahal Pech, along with the fact that they were associated with nearly every period of occupation of the site, allows us to examine change in figural representation diachronically. Throughout the world, and Mesoamerica in particular, there appear to have been a wide variety of styles for depicting anthropomorphic figurine appendages and torsos. This question sought to determine whether the figurine faces, torsos, and appendage details changed over time within the long history of occupation at Cahal Pech. This question primarily guided the identification and quantification of specific features such as eye type, ear spool design, hairstyle, and mouth style that are discussed in detail in Chapter 8.

Question 3: Is there a correlation between changes in social and political complexity at Cahal Pech and the uses and deposition of ceramic figurines?

From data available at the time of his writing, Awe (1992) noted a negative correlation between the rise of social complexity and the production and use of figurines, citing the fact that the quantity of figurines appears to lessen from the Middle Formative to the Classic Period. My question guided a comparative analysis of the quantity and types of figurines over time in both the site core of Cahal Pech and the peripheral groups in an attempt to empirically affirm or refute Awe's (1992) suggestion of a correlation between social and political change and the uses and deposition of ceramic figurines. By examining the relationship between both the rise and decline of social and political complexity evident primarily through independent material evidence of growing inequality amongst individuals and kin groups, and the uses of figurines, this question allowed me to elucidate whether and if so, how the use of figurines changed in the face of growing complexity. Awe (1992) discusses the use of figurines as a medium for ancestor veneration. The figurines would be said to embody the spirit of a venerated ancestor for a time, and when the specified time was up, the figurine would be broken and defaced as a way to release the embodied spirit before being discarded (Awe 1992; Lucero 2008). While this research does not explicitly support Awe's contention, neither does it disprove the connection of figurines to animate ancestor spirits; it rather attempts to explore the implications of this type of figurine interaction and deposition.

Question 4: Are Formative Period figurines found in different contexts than figurines dating to the Terminal Classic Period?

At Cahal Pech, figurines have been found in both Formative Period and Terminal Classic contexts. While the Formative and Terminal Classic figurines themselves appear quite different from one another, a contextual analysis sought to examine whether the figurines were used and deposited in the same way. This question guided analysis that not only sought to understand whether differences existed but also facilitated the ability to articulate changes related to figurine use and deposition during state formation and after the site had been abandoned by the ruling elite during the Terminal Classic Period.

Chapter Organization

Figurines can yield important information about how the ancient Maya conceptualized their world and their place within it. How that conceptualization changed over time, and how it correlated to political and economic change is of critical importance in understanding the lived experience of the ancient Maya. This dissertation pulls together theoretical strands related to enchainment theory, embodiment and termination, and Marxist state formation to offer a more detailed interpretation to the use and deposition of ceramic figurines among the ancient Maya than has previously been offered by archaeologists.

Chapter Two examines ideas of enchainment theory and current understanding of the meaning behind ancient Maya ritual termination rituals (Awe 1992; Harrison-Buck 2012; Stanton et al. 2008). Trends in figurine use and deposition are discussed from the

standpoint of enchainment artifacts, and the prevailing assumption that construction fill is simply refuse is challenged. The use of figurine fragments in construction fill is then examined in relation to the culture history of Cahal Pech discussed in Chapter Five, elucidating a pattern of use and deposition correlated with increasing inequality evident in the architecture and burials dating to Formative Period Cahal Pech.

Chapter Three discusses the many conceptualized models of ancient Maya statehood and attempts to redefine what state formation is and how it can be seen in the archaeological record. In particular, Chapter Three argues that, given the evidence at hand, Cahal Pech was not only on the path to state formation, but that this phenomenon initially occurred at an earlier time than has previously been thought. Drawing on the evidence presented in Chapter Three, Chapter Five illustrates what we can see in the archaeological record of Cahal Pech and how that illustrates increasing social and political complexity and institutionalization of inequality.

Chapter Four begins by exploring the natural environment in which Cahal Pech is situated, in an effort to contextualize the site within the larger region, with specific attention paid to the Belize, Macal, and Mopan Rivers and the role that they served as major avenues of trade and cultural communication during the occupation of Cahal Pech. Chapter Four further explores how the Belize River Valley supported a dense cluster of Maya sites. In addition to the natural environment in which Cahal Pech is situated, Chapter Two explores the history of archaeological excavations within the Belize River Valley. The Cahal Pech figurine corpus was collected over the course of 28 years during discontinuous excavation projects, thus it is imperative to understand shifting standpoints

for interpreting archaeological finds in Belize, in an effort to understand what the initial excavators thought of the figurines they found.

Chapter Five examines what archaeologists have learned about the culture history of Cahal Pech through those 28 years. Beginning with the evidence for initial settlement of what became the site core circa 1100 BC and proceeding through the abandonment and reoccupation of the site circa AD 850, this chapter discusses how the settlement of Cahal Pech changed over time through a discussion of architectural changes, changes in burial patterns, trade relationships, the presence and use of figurines, and the use and deposition of figurines. Furthermore, the same material categories enable discussion of social complexity is discussed in terms of architectural changes, including the elaboration of some residential buildings and not others, in addition to the construction of buildings with restricted access; burial treatment in terms of the presence of burial goods and the treatment of the deceased; and the presence of “exotic” imported goods in different places at different times throughout the occupation of the site.

Chapter Six explores some of the many studies of Mesoamerican figurines that inform the approach to figurines taken in this dissertation and how those studies have contributed to both generalized and specific knowledge of the use and deposition of ceramic figurines among the ancient Maya. Chapter Seven details the methodology used to address the questions guiding this dissertation research. Particular laboratory procedures are identified and explained along with an overview of the curatorial process used to fully process the corpus of figurines from Cahal Pech. Chapter Eight details the

results of data collection and uses relative percentages to address the four guiding research questions.

Chapter Nine concludes this dissertation by consolidating the evidence presented for the use and deposition of ceramic figurines at Cahal Pech and what meanings they may have had for the people who called Cahal Pech home. In particular, Chapter Nine discusses evidence for the early process of state formation at Cahal Pech. Furthermore, enchainment theory and termination rituals are connected to kinship and one of their uses as tools for ancestor veneration rituals to argue that fragmented figurines that were placed in construction fill may have been deeply meaningful to the people who placed them there, and they were placed in construction fill for a specific purpose. This purpose, and the meaning connected to figurines is further discussed in the context of increasing social and political complexity coupled with the decline in the autonomy of kin groups.

The site of Cahal Pech, and the figurine corpus collected from excavations at the site core and the peripheral settlements demonstrates how kin groups navigated their social, political, and ritual lives during the process of state formation, and once the power of the state has declined. The use of ceramic figurines and the connections between construction fill and meaningful deposition within such fill challenge assumptions that construction fill is simply trash that it has little archaeological value. By proposing an alternative explanation for a phenomenon that many archaeologists studying the ancient Maya find familiar, this dissertation attempts to reframe a discussion of the lived experience of the ancient Maya and how that lived experience directly related to the process of state formation.

CHAPTER 2: ENCHAINMENT AND TERMINATION

Mesoamerican archaeologists have, traditionally, interpreted material culture found within construction fill as little more than repurposed trash. Construction fill is generally used for dating purposes to the extent that some pottery sherds found within the rubble can elucidate construction chronology, but is largely considered a secondary context that cannot provide the same quality of information that material culture found in primary contexts can (Meskell et al. 2008; Nakamura and Meskell 2009), an idea that has its roots in western notions of industrialism (Hawkins 2006; Newman 2015; Strasser 1999). Some archaeologists recognize the largely fragmented nature of figurines and pot sherds used in construction fill as the product of termination rituals and have suggested that the pieces in question once carried a symbolic, spiritual, or even animistic essence that was transformed upon destruction of the object in question, becoming, essentially, ceremonial trash (Walker 1995).

While this may be plausible in many cases, the assertion that fragmented Formative Period figurines at Cahal Pech may be a form of ceremonial trash is complicated by the deposition of fragmented figurines in elaborate burials and ritually symbolic caches. Curiously, regardless of whether the figurines were placed in construction fill, deposited in ritual caches, or placed in high status burials at Cahal Pech, the figurines at the site were all fragmented, and all are fragmented in similar ways. If fragmented figurines were simply ceremonial trash, they would likely have not been placed in symbolically significant and enduring contexts. Ashmore (2013) noted that

there were likely many layers of meaning involved in acts of remembrance, and while she was speaking of bioarchaeological contexts, it is possible that figurines could have been used and understood in much the same way, that they formed a reference point for contact and remembrance within monumental construction fill, ritual caches, and burials. The presence of fragmented figurines in burials and ritual caches, then, indicates that material culture broadly, and figurines particularly, may not have become meaningless upon breakage. In this sense, I extend Geller's (2006) idea that the molding of the physical human body generates a sense of social identity even upon separation of the parts, to the breakage of figurines as a similar indicator of representation of a type of social identity, even when fragmented. Furthermore, the use of figurine fragments in construction fill may have served a similar function as Geller's (2012) "simple graves" in which physical human remains, whether articulated or not, were placed within construction fill in an act of remembrance and veneration (117). I argue that fragmentation may not have been necessarily related to termination *per se*, rather, that fragmentation may have been related to the construction, reconstruction, and assertion of social identity linked to kin groups (discussed further in Chapter 3).

If this is indeed the case, how then are we to interpret the large quantity of fragmented figurines found in construction fill dating to the Formative Period at Cahal Pech? I suggest that these figurine fragments, through the process of enchainment, not only retained meaning after breakage, but were a highly symbolic form of material culture used to maintain enchainment connections and potentially labor tithes (Mosely

1975; Pauketat 2001; Walker 1995; Zeleznik 1993) between kin groups, the community at large, and community based public construction episodes.

Fragmentation and Enchainment

Material culture, in essence, structures individual perceptions of identity through a recursive relationship. Human beings impart meaning to the objects they interact with, while those objects recursively give meaning to the humans interacting with them. People are enchainment to objects, and vice versa (Bartlett and McAnany 2000; Brittain and Harris 2010; Chapman 2000; Grove and Gillespie 1984; Harrison-Buck 2004, 2012; Joyce 2000; Newman 2015; Pauketat and Alt 2005). It should be noted that a large part of enchainment theory and subsequent research examines the fragmentation of physical bodies in burials, and while this is an important concept that illustrates the idea of enchainment, and much of the critical analysis of enchainment theory discusses alternative interpretations to the partibility of the corporeal body (Brittain and Harris 2010; Chapman 2000; Newman 2015), it is far too broad to be included in this dissertation. As such, the following discussion of enchainment will be placed in the context of the fragmentation and enchainment of ceramic figurines rather than broader categories of material culture or physical human remains (Brittain and Harris 2010; Chapman 2000; Newman 2015).

The social practices connected with materiality help to establish, maintain, and/or strengthen both individual and group identic connections to their material environment

(Chapman 2000:4). In this sense, western notions of refuse as items whose use-life has ended, in this case through fragmentation, fail to recognize that the recursive relationship with material culture and the meaning enchainment to the object does not end once the object has been fragmented. Essentially, as Chapman (2000:5) argues, “the creation of objects contains within it an aspect of personhood [understood here as personal connection] which endures as long as the object remains inalienable,” that is, material culture, even fragmented material culture, retains significance even after fragmentation and deposition because it is enchainment to the people who interacted with them. Enchainment, in this sense, is understood to be the intertwined connection that individuals have with an object and with others who also connect with the same object. This enchainment is not terminated once the object is broken, but, rather, altered, as the individual becomes enchainment to multiple pieces of the fragmented object in potentially different ways, thus both transforming, multiplying, and dispersing the object’s agency and meaning

Chapman (2000) also suggests that figurines, specifically, served as a form of enchainment, essentially a bridge between the living and the ancestors, and as such, were a type of ancestral token that connected individuals to their ancestors. These tokens would have been fragmented, Chapman suggests, “with each fragment forming the basis for a stream of associations in contrast to those of other fragments” (Chapman 2000:74). Essentially, Chapman claims that, even when figurines were fragmented, each fragment retained a distinct meaning. Although speaking to a specific corpus of figurine fragments dating to copper age Balkan social groups, I believe that this broad understanding of the

retention of meaning can be used in the case of the Formative Period figurine fragments recovered at Cahal Pech. A criticism of Chapman's enchainment theory was put forward by Brittain and Harris (2010:584) who suggested that the phenomenon of fragmentation does not imply enchainment in all cases, and is, in fact contingent upon context. While I agree with this critique, I also contend that the fragmentation of ceramic figurines in the case of Formative Period Cahal Pech does, in fact, exemplify the process of enchainment. Enchainment of figurines, in this sense occurs through the process of connecting individuals within kin groups to the kin group through the embodiment of ancestral ties (discussed further in Chapter 3), while simultaneously enchainning the kin group to the larger community and community processes of construction. While this dissertation specifically examines figurines, it is important to note that lithic debitage, ceramic sherds, obsidian blades, and shell beads have also been found in construction fill at Cahal Pech, and these may be enchainned in similar ways.

Lucero (2008) addressed the enchainment of material culture through the ceremonial practices of "the sacrifice of socially significant items" within architecture. In particular, Lucero (2008:188-189, 191) suggests that the placement of socially significant items within architecture may transform the structure into a sacred place in addition to furthering physical claims to places, and further connects evidence of this in the archaeological record to cultural practices enacted today by indigenous Maya. Although Lucero is specifically discussing ritual caches and not construction fill, I believe that the same *general* principle applies to the use of material culture as markers of kin related significance.

If we accept that figurine fragments found in construction fill are meaningful, how, then, are we to interpret that meaning? It is my contention that interpretations of the meaning of figurine fragments in fill at Cahal Pech should examine the fragmented figurines found in construction fill and consider that they were not only enchained to individuals, but to entire kin groups as well as deceased ancestors. Furthermore, the placement of these fragments within construction fill *may* signify community-based support of, or even contribution to expansive construction by the deposition of enchained material culture connecting kin groups to both their ancestors and the larger community.

Fragmented Figurines

Except for two figurines found in ritual caches, all the figurines at Cahal Pech were both fragmented and scattered, that is, they were not simply broken and placed in a specific area, they were broken and the pieces were deposited away from each other around the site. This is particularly visible when examining the large portion of figurine fragments recovered from construction fill in Plaza B. Over the course of excavations at Cahal Pech, Plaza B has been the focus of three major excavation projects; thus a large portion of the major plaza at the site core has been excavated, and all of those excavations recovered figurine fragments. Interestingly, none of these fragments, even fragments from the same excavation unit and stratigraphic level, can be refitted together in any way. Although in some cases this could be due to erosion, the majority of pieces were of different sizes, different materials, and broken in slightly different locations.

Thus, it is clear to me that the figurine fragments from Cahal Pech, particularly those that ended up in construction fill, were both broken and scattered.

Fragmented figurines are frequently believed to have been ritually terminated before being discarded as trash in middens or construction fill. Due to the high frequency of defaced, broken, or otherwise fragmented figurines found throughout Mesoamerica, figurines have been connected to such termination rituals, which frequently involve the intentional breaking of both practical and ceremonial objects.

In their discussion of termination rituals and ritual garbage, Stanton, Brown and Pagliaro (2008) note that the ancient Maya viewed their world as animate (Viveiros de Castro 2004; Zedeño 2008) and as such, many materials in their world could be “manipulated by social agents” and even become social agents in and of themselves (235). They suggest that, in order to release the animate spirits in both architecture and artifacts, the ancient Maya likely conducted rituals intended to release the “spirit” contained within the ritual object. These rituals often included the breaking of objects at the end of their use cycle, effectively transforming the meaning of these objects and depositing them as a form of ceremonial trash.

Joyce Marcus (1998a; 2009) regarded figurines as the domain of women’s ritual connected to ancestor veneration in Formative Period Oaxaca. In doing so, Marcus elaborated on ethnographic evidence from China, Japan, and several West African communities that not only practice forms of ancestor worship, but also use figurines to do so. Figurines, in Marcus’ assessment, were embodied with spirits of ancestors that needed to be maintained. Tying this maintenance to the household for which women

were likely the primary workers, Marcus asserted that rituals involving ancestor veneration were conducted predominantly by women. Other studies of Maya figurine use similarly hypothesized a female fertility “fetish” for figurines found at other lowland Maya sites (Awe 1992; Gifford-Gonzalez 2007; Grove and Gillespie 1984; Willey et. al 1965) and Awe (1992) notes that they also may have been images of lineage heads at the site. It should be noted, however, that although a large portion of Marcus’ Oaxacan figurines depicted women, the same cannot be said for the corpus of figurine fragments found at Cahal Pech. As discussed in Chapter 5, while some figurine fragments clearly depict female bodies and some depict male bodies, by far the largest number of figurine fragments either do not indicate the intended biological sex of the figurine or may have been deliberately created to be asexual and/or agendered, or the figurine was not human. Furthermore, Marcus’ assertion that figurines are connected to ritual which relates primarily to the domain of women is not supported by any evidence at Cahal Pech. Although there is no evidence that the figurine fragments at Cahal Pech were primarily related to women’s rituals, there may be merit to an argument that there was an ancestral veneration component to the use of figurines at the site as discussed below.

Grove and Gillespie (1984), in their analysis of Formative Period figurines from the site of Chalcatzingo, argue that figurines may represent portraits of rulers and thus were tied directly to ancestor cults. Furthermore, Grove and Gillespie attempt to explain the phenomenon of ritual breakage and defacement as a way of neutralizing the embodied power of the ancestor that was present in the figurine (32). Awe (1992) argues that the figurines from Cahal Pech show similar characteristics to the figurines from

Chalcatzingo, and further hypothesizes that the figurines may have depicted lineage heads. In particular, he noted that although the figurine heads at Cahal Pech have very similar facial features, there are slight differences between groups of figurines, which may indicate that the figurines were depicting different individuals, akin to Olmec colossal heads that have similar facial features but contrasting head gear indicating individuality.

In her Ph.D. Dissertation, Christina Halperin (2007) examined Late Classic figurines from the site of Motul de San Jose, Peten, Guatemala. Halperin concluded, based on the centrality of distribution of figurines, that they likely had both official ceremonial and unofficial household usages (324). For Halperin, figurines were not simply tools of religious devotion, they were items “in which religious values, ideologies and social identities were reproduced” (325); however, she notes that, although figurines at Motul de San Jose were used for multiple purposes, it is likely not the case that they were used in the same way or to the same extent in other Maya sites throughout time.

While these studies may explain the treatment of some of the figurines at different Maya sites and at different times, only Halperin’s (2007) study allows for multiple uses and multiple contexts of figurines. Although many figurine fragments were found in construction fill, they have also been found in burials and in dedicatory caches. The multiplicity of contexts in which figurines have been found at Cahal Pech indicates that there were plausibly multiple uses and meanings of figurines both within the site core and the periphery settlements. Additionally, it is likely that the Formative Period figurines

and the Terminal Classic Figurines from Cahal Pech served entirely different purposes (see Chapter 6), such that both Awe's and Halperin's interpretations may both be correct.

Curiously, all the Formative Period figurine fragments that were deposited in construction fill and analyzed for this dissertation were not only intentionally broken, but also intentionally scattered. Unsurprisingly, fragmented figurines appear in construction fill, but they also appear in ritual caches and elaborate burials. If fragmented figurines placed in ritual caches and elaborate burials are meaningful, then it may be argued that fragmented figurines found in construction fill are potentially meaningful as well. The act of fragmentation may not, in and of itself, indicate that the objects lost their original significance. "Even at their furthest remove from their sources of origin, Mesoamerican heirloom items continued to be used in ways consistent with their history as house valuables and repositories with powerful histories" (Joyce 2000:207). Furthering this idea, figurines as heirloom items that were used in construction fill may have also continued to be vessels with familial histories and kinship ties. Geller (2012) discusses this phenomenon related to the physical body in which she claims that the use of body parts by kin groups effectively maintained a dialogue that reaffirmed notions of social and kin cohesion.

I suggest that this understanding of the meaning of partibility may extend to figurine fragments as well, in that figurines, whether fragmented or not, serve a meaningful purpose of enchainning kin groups to the location of placement of the figurine. Essentially, the use of figurine fragments in construction fill may not simply be the repurposing of garbage, rather, it may be that the figurine fragments in question not only

enchained kin groups to one another, but also to the public constructions which they supported. Through this process, it may be that the buildings in question functioned not simply as structures for administrative or residential purposes, but also as monuments to the deceased ancestors whose kin groups formed the basis of the community. Next, we turn to a discussion of state formation and kinship in the Maya context in order to elucidate further the role that enchained figurines played in the increasingly complex social and political life of Formative Period Cahal Pech.

CHAPTER 3: STATE FORMATION AND KINSHIP

Archaeologists have long been concerned with defining and illustrating the concept of “state.” Over the last several decades, many models of ancient Maya states have been proposed, each seeking to answer a fundamental human question – *Why and how do people give both power and authority over their lives to an individual or a family dynasty?* Or to put it another way, *why do we acquiesce to being ruled?* The state models presented here are not exhaustive, rather, they demonstrate a broad range of ideas illustrating how and why state formation occurred in Mesoamerica, particularly among the Maya. While all the models are problematic in different ways, they all implicitly address the institutionalization of unequal social relationships as a central concept. Hypothesizing how unequal social relationships became institutionalized in the Maya case, I turn to more contemporary examples of state formation throughout the world to illustrate a central idea- state formation occurs through a long process involving the erosion of authority of kin groups.

Maya States

In 1967, Morton Fried (1967:235) defined the *state* as “a collection of specialized institutions and agencies, some formal and others informal, that maintains an order of stratification.” Applying this definition to the case of the ancient Maya, as discussed below, it becomes clear that some places within the Maya region show evidence of tribute relations that supported a dominant class by at least 300 B.C., during the

Formative Period (Grube 2012). While the Classic Period florescence, marked by the public use of hieroglyphs, did not begin until around A.D. 250 as our current understanding demonstrates, the precursors for the Classic Period state arose, in most cases, much earlier. The beginning of the Classic Period saw continued construction of monumental architecture that began in the Formative Period, dedicatory stelae and altars, as well as inter- and intra-site conflict on a scale that had not been conceived of during the earlier Formative Period. And yet with monumental architecture being uncovered and explored at an impressive rate, and with the great strides epigraphers have made discerning Maya writing (Grube 2012; Stone and Zender 2011; Vargas et al. 2009; among others), we still know relatively little about Maya states.

Scholars agree that the Maya had a particularly detailed cosmological understanding of their world, and this cosmology framed not only their religious lives, but their social and political lives as well. We know that they kept time, watched the heavens, and created a pantheon of deities with complex narratives designed to explain the natural world around them. We know that the Maya were excellent stone masons, as evidenced by the limestone temples peeking through the rainforest canopies, and we know that, much earlier, the Maya used domesticated maize, squash and beans, hunted, fished, farmed, and utilized the natural resources at their disposal to support large populations. We know that there were royal dynasties, political alliances, warfare, and sacrificial bloodshed. We know that the Maya survived and thrived for thousands of years before being contacted by Europeans bent on conquest. Still at issue is how the Maya organized themselves politically, socially, religiously, and economically, although

the archaeological record does provide some strong indications. How did Maya worldview affect lived experiences; how did leaders lead and rulers rule? How was the ancient Maya state constructed? Is there even a singular state model that can encompass the diversity of ancient Maya experiences? How would a Maya state operate? How would it have impacted the lives of those who lived under it? These questions are not easy to answer. What follows, then, is an analysis of some of the different models that archaeologists have proposed for understanding how Maya states would have operated and an attempt to discern how these models, if accurate representations of Maya statecraft, would have impacted the people who were subject to them.

The various state models that have been proposed to explain the structure of Maya communities, while sometimes conflicting, have become paradigmatic in the sense that archaeologists working at numerous sites in the Maya region use them to understand not just the social and political nature of the sites they investigate, but also the relationship of those sites to others. Following Lisa Lucero (1999), these models may be divided into three broad categories: strongly centralized states, weakly centralized states, and a dynamic hybrid of the two that sees ancient Maya states as cycling through different political forms, indicated by both strong and weak centralization, at different times during their span of occupation. Noting that none of these models are comprehensive enough to be applicable to the entire Maya region, I suggest alternative characteristics that may facilitate a more thorough understanding of Maya states.

Strongly Centralized States

Two models of state fall under the domain of strongly centralized states. These models posit that a few of the major Maya cities, during the Classic Period, held direct power over and manipulated the affairs of surrounding smaller Maya sites. The model of the ancient Maya regional state has been asserted as a likely candidate for Classic Period political organization by Arlen and Diane Chase (1996; 1998) based on their work at the site of Caracol, Belize. Further applications to this model have been made by William J. Folan (1992) and Folan and his colleagues (1995) regarding the site of Calakmul, Campeche, Mexico. A second model of the strongly centralized Maya state, put forth by Simon Martin and Nikolai Grube (1995; 2008), is known as the super state model, which hypothesized that a few of the larger Maya centers existed as super states that “held the lesser ones in sway” (46).

The Regional State Model

Arlen and Diane Chase (1996; 1998) and Richard E. W. Adams (1999) have proposed a model of the regional state. It should be noted that models of this type of Maya state had been initially proposed during the early 20th century, however, Chase and Chase and Adams present a more thorough and complete illustration of the model and their model will be discussed in detail here. Based on their excavations at the site of Caracol, Belize, Chase and Chase (1996:806) assert that larger Maya sites, such as Caracol, were the center of a settlement hierarchy that combined both administrative and

economic functions and were linked by a series of causeways. Adams (1999) makes a similar argument in the case of the Maya site of Rio Azul. Each of these centrally located sites served as the capital of a state-level society in control of the region. Using this model, Chase and Chase argue that the site core of Caracol functioned as both a political and economic center for not only Caracol proper, but also for surrounding linked communities. Through a combination of epigraphic data and the long-term examination of the archaeological record, Chase and Chase have determined that not only was Caracol hierarchically linked to smaller sites in the immediate vicinity via raised roadways (causeways; *sacbes*), but also that its influence stretched past the Maya mountains in southern Belize to some sites in the Belize River Valley.

Based on epigraphic evidence of military conquests, Chase and Chase (1989:19) contend that regional states would not have exceeded a distance of 60 km from the city center, the approximate distance a warrior could travel on foot while carrying enough food to last the journey. This version of the regional state model is predicated on the assumption that major Maya cities were the core of a regional state and Chase and Chase note that the average mid-point between major Maya sites was 63 km. Military battles occurred in areas where two or more regional states overlapped (Chase and Chase 1998:17), and extended military campaigns were not undertaken. Epigraphic evidence links Caracol to several wars found in the region that would have been controlled by the city of Naranjo, which was allied with Tikal. These wars would have taken place within the 60-km distance cited by Chase and Chase in areas controlled by Naranjo. Some scholars believe that Calakmul, which had positive relations with Caracol, encouraged

the site to attack polities in the lowlands that were allied with Tikal (Martin and Grube 2008: 91-92).

A further assertion about centralized leadership at Caracol is based on a tightly structured city layout and the high organizational level of farming terraces in the immediate vicinity of Caracol. This, combined with evidence of battles fought in territory that would have been loyal to Naranjo, led Chase and Chase to believe that Caracol had a strong degree of centralized organization, particularly as it related to food production and resource procurement. Population density estimates for Caracol proper, at its height, are at least 150,000 people, based on residential settlement analyses (Chase and Chase 1998:17). Chase and Chase (1996; 1998) contend that large population densities would have necessitated a high degree of organization to maintain the health and welfare of the population and ensure the cooperation of hinterland communities.

Folan (1992) and Folan and colleagues (1995) discuss the regional state model with respect to the site of Calakmul in Campeche, Mexico. Folan (1992) contends that, due to the large number of stelae along with the presence of lavish royal tombs, Calakmul was a regional central capital. Furthermore, he notes that the presence of stelae and royal tombs show that the site was not decentralized or weakly centralized, claiming that a weakly centralized state would not have been able to, pragmatically, engage in major construction episodes (163), although Pauketat and Alt (2005) and Joyce (2000) disagree with this notion, citing the agency involved in community building events. Noting Calakmul as a “Central Place,” Folan argues that nearby sites of Oxpemul, Sassilha, La

Muñeca, Uxul, Naachtun, and Alta Mira fell under the aegis of the strongly centralized capital of Calakmul, forming a web of alliances and dependencies (Folan 1992:160).

Accordingly, Calakmul could be understood as a regional capital due to the presence of monumental structures, stelae, raised roadways (*sacbes*), and altars that would have necessitated a strongly organized civic/ceremonial city center with a very high degree of internal centralization. Folan and colleagues (1995) contend that the major function of regional state capitals would have been to serve religious and ceremonial purposes. This view is further supported by the assertion that structures closest to the city center appear to be high-status structures as evidenced by more complex and durable construction along with the presence of exotic and other high-status goods within these structures. Folan notes, however, that these types of strongly organized civic/ceremonial centers would have not, based on climatic conditions, developed into production centers (1992:165). In addition to the significant monumental architecture, Folan (1992; Folan et al. 1995) claimed that Calakmul formed alliances with, and extended its sphere of influence to, many sites in the Maya region that had negative or neutral relations with Tikal to strengthen an oppositional force against the polity.

The Super State Model

Simon Martin and Nikolai Grube suggest that some Maya sites were not just capitals of regions, but capitals of “super states.” Sites noted as super states include:

Calakmul, Tikal, Caracol, Naranjo, El Peru, Palenque, Piedras Negras, Yaxchilan, Dos Pilas, and Cancuen. Martin and Grube claim that the status of some Maya sites as capitals of super states is demonstrated by the presence of massive monumental pyramids, long and complicated defensive earthworks, and significant networks of *sacbes* that would have, logistically, required a highly centralized authority (Martin and Grube 1995:42), although as noted above and further asserted by Timothy Pauketat and Susan Alt (2005) and Robert Rosenswig and Richard Burger (2012), the presence of monumental construction does not *a priori* implicate state level government. Citing epigraphic evidence, Martin and Grube also note that the leaders of smaller centers are often referred to in possessive terms by the leaders of the super states, thus indicating a hierarchical relationship with other sites (Martin and Grube 1995:42). This is primarily expressed in texts discussing the seating of new rulers into power.

The distinctions between the regional state and the super state models are most visible in the assertion that, while super states had hierarchical relationships with other sites within their broader boundaries, the relationship between super state capitals was one of equality in the sense that “all Maya rulers laid claim to an identical political rank, regardless of the size or population of their cities” (Martin and Grube 1995:42; 2008). In this sense, the super state centers of Tikal and Calakmul held each other as mutually autonomous, although non-capital cities had hierarchical relationships with their centers. It was this pattern of control and high political rank that ensured that a few Maya states “held the lesser ones in their sway” and manipulated the affairs of the smaller and “weaker” polities (Martin and Grube 1995:46) to “exploit underdeveloped regions under

their patronage” (Martin and Grube 2008:35). The super-state model focuses more on physical scale than the consolidation of power bases, and does not directly address patterns of tribute extraction, domination, and resistance to these super states.

A Critical Analysis of Strongly Centralized State Models

Strongly centralized state models view major Maya urban centers through a Durkheimian lens as “loci for administered economies integrated by organic solidarity” (Fox et al. 1996:797). These models focus on political relationships between major centers, and assume that smaller Maya towns and hamlets located within a certain distance of the major centers fell under the control of those major centers. While this may be true in several cases, there is not enough evidence to claim that this is true for all the communities in the Maya region. Furthermore, the strong centralized state model does not address periods of weakened authority, such as the hiatus of Tikal after its defeat by Calakmul, or the hiatus of Caracol after its defeat by Tikal (Martin and Grube 2008). None of the strongly centralized state models allow for variability in rulership, ideology, or economic structure across the Maya region. Additionally, they all fail to address the process of tribute extraction and compliance with larger ideologies, a phenomenon that Gailey (1987), Gailey and Patterson (1988) and Diamond (1996) note is a crucial aspect of the state formation process. It is not enough to hypothesize the relationship between political entities, rather, any consideration of ancient political structure must directly

address the base of said structures, that is, the people from whom tribute in the form of goods and/or labor is extracted to support those structures.

Chase and Chase's arguments about the regional state do not address the liminal areas between those states. While they argue that spheres of influence of major Maya sites sometimes overlapped, they do not address the social, political, or economic status of sites that fell outside of the maximum distance of 60 km of any major site. By inference, it can be concluded that sites outside of the radius of a regional state would, according to the regional state model, be stateless. Additionally, their analysis is primarily based on their work at the site of Caracol and does not thoroughly analyze the relationships of sites outside of the Caracol sphere of influence, except to say that they would fall under the control of the nearest major center less than or equal to the 60-km radius.

While I believe, as Folan (1992) does, that monumental architecture is a significant consideration in the analysis of major Maya sites, I disagree with his assertion that monumental architecture logistically *requires* a strongly centralized and organized center. This idea has been challenged by archaeologists around the world, particularly as it applies to the Mississippian culture in North America (Pauketat and Alt 2005), the Indus Valley civilizations in Asia (Sen 1992), and Göbekli Tepe in modern-day Turkey (Dietrich et al. 2012), and there is no *fundamental* reason to assume that a site had a strong centralized government just because monumental architecture is present, or that centralization precedes monumental construction. Furthermore, the notion that the areas surrounding major sites, the hinterlands, were loyal to the nearest center is an assumption

that is sometimes accurate, though certainly not always, and does not allow for shifting alliances, outright rebellion, and neutrality. Another assumption implicit in the centralized state models is that the centralized state is a stable system, a point that William Haviland (1997:444) directly addresses and calls into question.

All the models that advocate strongly centralized states are based on what archaeologists believe are major Maya sites. These models interpret relationships between larger sites and do not consider the relationship of smaller sites to one another, or relationships between sites that do not share a regional affiliation, and none of them consider the population base whose work ensures the success or failure of the strongly centralized state at its most basic level. While the assertions made by advocates of this model may be true as they pertain to the specific sites that are studied, and I would certainly support the application of these models in *specific* cases, they cannot be held as accurate for all Maya sites throughout the span of the entire Classic Period, they do not address how these states were formed, and they ignore the people whose tribute forms the core of the state system.

Weakly Centralized States

While many models of weakly centralized states have been employed in analyses of the Classic Period Maya, this section explores three currently in use by archaeologists conducting socio-political analyses of Maya sites. The most salient models that fall under the domain of weakly centralized states are: the galactic polity model, also known

as the theater-state model (Demarest 1992, 1996), the segmentary state model as discussed by Aidan Southall (1988) and adopted by Mayanists (Fox et al. 1996), and the city-state model (Abrams 1995; Webster 1997). Each of these models contends that Classic Period Maya cities were not as centralized as the regional capital or super state models claim, and relationships within *and* between such communities varied.

The Galactic Polity model

The galactic polity model was originally discussed by Stanley Jayaraja Tambia (1976) and Clifford Geertz (1981) as a theater state, and Arthur Demarest (1992; 1996) asserts that ancient Maya social organization was like the theater states of Southeast Asia, in that they were highly volatile and complex, relying on public performance in ritual as the primary means of exercising social control. While he recognizes the mutual autonomy of the major galactic centers, he also recognizes a hierarchical relationship between major centers and satellite centers. This model advocates a principal center that dominated surrounding satellite centers politically, economically, and most importantly in religion. For Demarest, galactic polities have six characteristics: 1) “the organization of hegemonies into capital centers loosely controlling a cluster or galaxy of subordinate centers”, 2) “a redundancy of structure and functions between the capital center and dependencies”, 3) “an emphasis on control over labor and allegiance rather than territory”, 4) “little direct control by the rulers over economic infrastructure”, 5) “an extreme dependency on the personal performance of the ruler in warfare, marriage

alliances, and above all, ritual”, and 6) “the tendency of these states to expand and contract in territory, reflecting the dynamics resulting from all of these features, as dependencies struggle against authority or shift allegiances or as expanding capitals impose short-lived attempts at centralization” (Demarest 1992:150). Demarest notes the expansion of a galactic polity at Dos Pilas during the eighth century A.D. in the Petexbatun region of present-day Guatemala, and the collapse of the center a short while later, as an example of the ability of a polity to both expand and contract, hence the inherent instability of the galactic polity system.

Essentially, the galactic polity model primarily focuses on the shamanistic religious performance of rulers at the dominant principal center and not on territorial claims. In the galactic polity model, the large cities such as Tikal, Caracol, Calakmul, and Dos Pilas, were ceremonial centers. Of primary importance to this model are the personal and ritual characteristics of individual rulers and redundant ritual functions of both the dominant center and the satellite center. Dominant centers exerted control by creating alliances through marriage, and by complex ritual performativity rather than direct economic or territorial control (Demarest 1992:151).

In this model, the leaders of both dominant and subordinate centers laid claim to divine authority, creating an unstable situation that allowed for periodic rebellion of satellite communities and warfare between them (Demarest 1992:151). Because of this, there was a low-to-moderate degree of centralization linking the satellite polities, and the stronger polities vied for religious control over hinterland communities. However, warfare and rebellion did not *necessarily* lead to political domination. Indeed, Demarest

notes that in the aftermath of the rebellion of the satellite center of Quirigua from the dominant center of Copan, Quirigua did not exert political control over Copan. The same situation occurred when the satellite community of Dos Pilas broke from the dominant community of Tikal (Demarest 1992:144). Elite warfare was generally practiced to increase the control of the overall population, and ritual performance was enacted to perpetuate an ideology that bound the individuals to their communities (Demarest 1992:151). While ritual warfare may have been orchestrated by elites, it would have required the participation of all social and economic classes. This, however, did not create stable relationships, and as with Quirigua and Dos Pilas, satellite centers could and did rebel for numerous reasons. When they were victorious in battle, the rulers of both Quirigua and Dos Pilas conducted ritualized captive sacrifice of prisoners from Copan and Tikal, respectively, to increase their divine status in the eyes of the populace and gain favor from the gods (Demarest 1992:145).

Demarest contends that public displays of ritual shaped the political climate and the level of political control that individual rulers possessed over their communities. Because of the primary focus on ritual performativity, and because multiple individuals could claim the divine right to rule, these polities tended to periodically contract and expand as individual rulers would vie for greater power, and as such, the polities were inherently unstable (Demarest 1992:151). In a sense, the galactic polity depended on the theatrical production of a cadre of rulers to both inspire and placate local populations through the manipulation of ritual, and to satisfy the desires of satellite sites prone to rebellion (Demarest 1992:149). The major flaw of this model is that it assumes that

ardent belief in ritual was universal among the tribute base and that this belief structured and encouraged citizen participation in an exploitative system. While it is plausible that there were ardent supporters in the theater state model, the underlying contention that a type of Durkheimian mechanical solidarity existed that fully encompassed all citizens is, at best, unrealistic.

The Segmentary State Model

Originally developed as a model of the political structure of the Alur peoples of Africa by Aidan Southall, the segmentary state model has been adapted and used to explain socio-political development among the Classic Period Maya by John Fox and colleagues (1996) and by Mary Pohl and John Pohl (1994). Southall defined the segmentary state as “one in which there is a central kingship and many peripheral rulers. Political sovereignty is only exercised by the king in the central domain (which is indeed defined by this fact) and is also exercised autonomously by each peripheral ruler in his own domain” (Southall 1988:64). In a sense, the segmentary model views the king as head of a state composed of a larger, dominant city and multiple smaller communities, but the king has direct political authority only within the dominant center. The key role, then, of the king of the dominant community is one of ritual power, as he is tasked with ensuring the overall spiritual wellbeing of the people in both the dominant and smaller communities (Southall 1988:64).

Adapting this model to the Maya region, Pohl and Pohl (1994) note that the massive monumental architecture characteristic of the ancient Maya, along with inscribed stelae and the production sumptuary goods such as painted pottery “were all vehicles for competitive rituals of consumption designed to promote political careers, confirm factional solidarity, and emphasize differences with other political units” (138). The system of ritual consumption supported, and in some cases created, situations that caused different family groups to coalesce into political factions, defined by Brumfiel as “groups whose single function appears to be gaining access to limited physical and social resources” (1994:3), to vie for power within the system (Pohl and Pohl 1994:142).

Elites could and frequently did use this system of ritual consumption to allocate usufruct rights to land as well as endow certain individuals with political office. Fox and colleagues (1996) believe that this competition for political and economic power enticed rulers to construct monumental pyramids and carved stelae to demonstrate their credentials to hold political office. Because of the high incidence of disputes, different factions from different smaller centers would frequently form alliances that were cemented through intermarriage, although competition for marriage partners must also have been a factor in regional instability. Conflict, on the other hand, generally involved warfare (Pohl and Pohl 1994:151). Pohl and Pohl (1994:145) pointed to the conflict between Tikal and Caracol that ultimately involved military action by Naranjo as evidence of regional instability and shifting alliances.

Alliances were built and broken as each faction pursued their own interests within and between different sites (Pohl and Pohl 1994:156). Fox and colleagues (1996) noted

that Maya communities structured local and internally ranked segments at many different levels, and each of these segments appear to have been ranked and/or led by a single dominant lineage within each city, but all levels of all the smaller communities were bound to the ritual center. As demonstrated by the regular rise and collapse of certain centers, Fox and colleagues contend that individual segments could disassociate themselves from the larger ritual center with some degree of regularity (Fox et al. 1996: 798), thus elucidating the inherent instability of the segmentary state system. Pohl and Pohl (1994) viewed this political factionalism as not only arising from segmentary state structures, but also as contributing the climate of continually shifting alliances and coalition building between major and minor Classic Period Maya sites.

The City-State Model

The city-state model has been advanced as the likely political structure of the Classic Period Maya by Elliot Abrams (1995) and David Webster (1997). Both authors advocate a modified version of the Greek *polis*, in which city centers oversee hinterland communities, both controlling and monitoring agricultural production and ritual; however, they differ with respect to the mechanism of control exercised by the city-state. The crux of the city-state model is direct control, over either production or ritual, or both, enacted by leaders of a large city on a hinterland population. Each of the smaller centers, then, is not just affiliated with larger centers, but is also managed by them. In Abrams' version of this model, the ruling elite adopted an agro-managerial role with varying

degrees of centralized organization, depending on agricultural productivity. This model is predicated on the idea that production values define the relationship of the state to the people living outside the urban core, with the idea that state power was initially founded on control of not only the production process, but in the distribution of the final product (Abrams 1995:198). Abrams (1995:203) argued that when the production of a certain product is high, agro-managerial elites exercise less control; however, when production falls below a certain threshold, the agro-managerial elite will more tightly control the hinterland population. This control takes the form of political, economic, and sometimes military intervention in hinterland communities to ensure the survival of the city-state. For Abrams, the elite rulers of the city-states exercise authoritative control over the products of the hinterland.

Abrams has partially adapted this economic model to the Classic Period center of Copan in modern Honduras. Epigraphic data recovered from Copan demonstrates ranked positions of power as noted in the segmentary state model, along with “the repetition of economic functions among spatially discrete lineages” (1995: 205). Furthermore, Abrams notes that the collapse of Copan was “characterized by incremental corporate group emigration that spanned several centuries” and notes as well that this pattern “is indicative of a society structured along mechanical rather than organic solidarity lines” (1995:206).

Webster (1997:136) defines a city-state as “a polity organized around a single, large autonomous central place that is differentiated from lesser places in its hinterland, over which it exerts political, economic, and cultural dominance” and advocates the

adoption of the city-state model for the ancient Maya with a focus on religion and ritual rather than agricultural productivity. For Webster, large Maya cities were regal-ritual cores responsible for the surrounding hinterland communities (1997:140). In this sense, elites in the city center controlled ritual and access to the gods, thereby ensuring the ritual devotion of the smaller towns and hamlets surrounding the center. Webster views the city-state relationship with other sites as oscillating between antagonistic and mutually beneficial ones (1997:136), depending on specific circumstances. While he primarily views large Maya centers as dominating small hinterland communities, Webster also acknowledges that some of these polities occasionally expanded their reach through intermarriage or warfare (142).

Webster cites Tikal as one example of a regal-ritual center, noting the presence of strong rulers who initiated monumental construction projects. Additional clues to the regal-ritual nature of the Tikal city-state include the presence of causeways connecting different regions of the sites along with several large plazas (1997:140). For Webster, the massive pyramids at Tikal, coupled with courtyards large enough to draw thousands of people is consistent with the idea that Tikal was built to inspire awe in many people.

A Critical Analysis of Weakly Centralized State Models

While there are other modes of weakly centralized states that have been used to explain ancient Maya political interaction, I have chosen to present three prominent models being used in present research. All the weakly centralized models place the onus

for control and power on the individual polity rather than a larger super-center. Polities are bound together through ritual or agricultural productivity, rather than through outright domination. While these models allow for, and help explain, the appearance of monumental architecture and carved stelae at smaller sites, they do not address the complex and sometimes hostile relationships between smaller and larger sites, nor do any of these models address clear hierarchical relationships *between* major city centers as identified by epigraphic evidence. Particularly telling is the fact that none of these models provides a *convincing* scenario in which individuals would work to provide tribute for a system that overtly exploits them. While an ideological base for voluntary participation may be convincing in some cases, it is certainly not plausible that all individuals within a community would adhere to an ideology that deliberately exploits their time and labor.

The galactic polity model advocated by Demarest (1992) is also known as the “theater-state” model frequently employed by archaeologists seeking to understand political organization in Southeast Asia, and was initially set forward by Tambiah (1976) and Geertz (1981). In this model, a single large city center exercises ritual control over smaller populations. Contrary to the strongly centralized state models, the galactic polity sees control of smaller centers as being primarily religious in nature. For Demarest, this explains the large public gathering spaces at major city centers: people at satellite centers needed a place to come together to observe and participate in ritual. While it is clear from the epigraphic record that the Maya had a cosmological view that defined their relationships to one another, there is little evidence that this and this alone bound

communities together under the aegis of a religious ruler-priest, nor does it explain why one community would be loyal to one ruler or one large polity over another, especially if both rulers had access to divine ritual. Furthermore, and again, this does not present a convincing argument about how tribute is extracted from the population base that supports the state system.

The segmentary state model overtly allows for hierarchy within and between sites. It also explains the level of political independence seen at smaller Maya polities in a way that other weakly centralized models, and strongly centralized models do not. The notion of competitive rituals convincingly helps explain the rise of Classic Period stela production, along with the production of non-utilitarian objects such as eccentric flints. Additionally, the notion of factionalism does help to explain anomalies in the archaeological record such as smaller polities rebelling against larger polities. This model allows for not only change but also volatile change. What it does not distinctly address, however, are periods of unity. The only mention of alliance building is related to intermarriage, and while we know that such practice occurred, it cannot be assumed to be the only method of creating alliances. Furthermore, this model does not attempt to explain how non-royal individuals along with royal women experienced and in some cases manipulated political intrigue, a consideration that I believe is vital when trying to understand the ultimate base of the power for which factions were vying.

Abrams views control over production, presumably of food, as the main component of control in the city-state model, while Webster views the main component of control as religion. While Abrams' model is convincing, he does not address the

reason that people stay in hinterland communities if their production is controlled by a larger center, nor does he address rituality at all, which has been demonstrated archaeologically to have had a significant influence on the daily lives of the ancient Maya. Webster's view contrasts with that of Abrams, in that it sees control over hinterland communities to be religious in nature. In this sense, it is similar to Demarest's galactic polity model. The problem with Webster's model, then, is the same as with Abrams' model: they rely on one specific type of power as being the only mechanism for control. A more convincing argument for the city-state model should include a combination of control over production combined with control over religion along with an explanation for why people in the hinterlands negotiated this exploitation in the first place.

The Dynamic Model

While initially advocating a model of the strongly centralized Maya state (Marcus 1973; 1976), in recent decades Joyce Marcus (1992, 1993, 1998b) has shifted her position, and now advocates for a dynamic model of the Maya state. Indeed, most state models do not allow for a shifting underlying political *structure* and do not address the crucial issue of tribute extraction. Marcus correctly identifies hierarchical relationships as being a key concept in state structures. Furthermore, she notes that there was generally not one hierarchy, but several hierarchies, related to politics, warfare, religion, and these hierarchies operated at times independently and at times dependently,

frequently overlapping in their scope (Marcus 1993:116). In response to a flurry of state models for the ancient Maya that appeared in the late 1980's and 1990's, Marcus formulated three conditions that ancient Maya state models should demonstrate in order to answer pertinent questions of social and political interaction: 1) they need to be dynamic in that they allow for changing underlying political structures and the negotiation of changing relationships between power-holders, 2) they must have a hierarchy of residential units within the state (such as a capital city, large cities, smaller towns, farming communities, etc.), and 3) they must have a process that allows states to consolidate into larger units and break down into smaller ones (Marcus 1993:133-135).

The process of state *development*, for Marcus, is crucial, in that the earliest states in Mesoamerica arose through the subjugation of neighboring polities. These subject provinces began to coalesce into the larger social groupings that are commonly defined as "states," finally reaching a point of maximum capacity, after which time the consolidated state unit would break down with the subject provinces gaining independence from the state or shifting allegiances. Through the cycle of centralization and decentralization, the subject provinces would eventually become more powerful than the initial polity through the same process of conquering and subjecting other provinces into a state model of their own, before reaching maximum capacity and breaking down, thus creating the dynamic cycle of state centralization and decentralization (Marcus 1992:392). The dynamic model, as Marcus describes it, is "one of stable but competitive provinces periodically consolidating into large regional states to reduce competition at the cost of their autonomy, and periodically breaking down again into autonomous (but warring)

provinces” (Marcus 1993:136-137). It is the oscillation between strong centralization and weak centralization that is the crux of the dynamic model allowing for change in Maya states. These periods of strong and weak centralization, when displayed on a linear graph, are representative of what Marcus calls peaks and troughs. The peaks indicate times when a major Maya city consolidated into a regional or even a super state through conquest, marriage alliances, or trade relationships, while the troughs indicate times when the mechanisms holding the consolidated centers together fell apart (Marcus 1993:133).

In addition to allowing for change within a polity, the dynamic model allows for change between polities, namely primary and secondary centers. This model sees the greatest capability of dynamic action falling not within the primary center of a state, but rather the secondary center. She notes that secondary centers are more likely than primary centers to show: 1) evidence of warfare, either with a neighboring capital or a neighboring secondary center; 2) the presence of emissaries from the primary center in the dynastic record; 3) post-conflict monumental construction within the secondary center; and 4) shifting usage of emblem glyphs, that is glyphs communicating the name of the city, over time. (Marcus 1993:165-166). Furthermore, Marcus notes that these changes would have resulted in a combination of “both coercion and voluntaristic confederacies” (Marcus 1993:165-166), and while it doesn’t directly address the issue of why commoners would remain in an exploitative relationship, it at least acknowledges that the commoner choice would not necessarily have been voluntary and tribute could be extracted by force if necessary.

Marcus' dynamic model goes far in explaining periods of warfare common to many Maya centers. The dynamic model further allows for changing circumstances and adaptability, accounting for the political intrigue and ritual aggrandizement of the segmentary state model, combined with the centralized leadership of the regional state model, noting that people at all levels of society may be forced to participate in the affairs of the state through coercive means and exploitation, all the while calling attention to ritual performance. The problem with the dynamic model is that it only examines the external relationships between Maya sites, not the relationships of groups within a single site and how the population base operates to support the dynamic structure.

Compelling State Models

While each model explains certain phenomena that archaeologists have tried to understand with respect to the Classic Period Maya, none of them is comprehensive enough to explain all facets of Classic Period Maya politics, none of them directly addresses the specific conditions of Cahal Pech, and none of them directly addresses how tribute is extracted from the population base in order to support the rulership, a phenomenon that has been noted is crucial to state formation (Diamond 1996; Gailey 1987; Gailey and Patterson 1988). Strongly centralized state models have difficulty explaining those medium-sized centers that do not appear to have been directly subjugated by any polity. The models advocated by Chase and Chase (1996; 1998) and Folan (1992) and Folan et al. (1995) are based on their own excavations at the sites of

Caracol and Calakmul, respectively. While these models may be appropriate for those sites, it is doubtful that they can be adapted to ALL Classic Period Maya sites, as Chase and Chase and Folan appear to advocate. Similarly, the galactic polity model is highly specific to certain sites and certain situations that may not have been an accurate reflection of the larger Maya world. Abrams' (1995) model of economic control focuses too much on economics with not enough attention paid to the role of religion, ritual, and Maya cosmology. On the other hand, Webster (1997) focuses squarely on the role of religion in shaping Maya political development without respect to economics and the role that production, trade, and craft specialization play in the development of the Classic Period Maya. While the city-state model views Maya political development on a micro-scale, it too does not encompass important economic developments characteristic of the Classic Period Maya, nor does it discuss competitive aggrandizement. While Marcus' model addresses the rise and fall of different kingdoms, it is not comprehensive enough to offer an explanation of the role of production in the process of state development.

While these models have some merit, none of them offers a universal explanation that encompasses all the developments of the Classic Period Maya because they all fail to address the tribute support base for the state system and ignore that state formation is a process in and of itself. Any model of state that is applied to the Classic Period Maya must include not only the role of ritual, but also the roles of economy, craft production, and trade, as well as acknowledging that some Classic Period Maya communities, like Cahal Pech, do not show evidence of warfare or competing allegiances. Furthermore, a convincing model of the Classic Period Maya state must shift attention away from an

elite-centric perspective and address the role of all citizens in the development, rise, and fall of Maya political systems. The primary models of the Maya state do not acknowledge that the ancient Maya formed highly complex communities that consisted of individuals and kin groups who could use their agency in political and social maneuvering, and none of these models adequately explain the specific patterns of the use and deposition of figurines, found at Cahal Pech (Chapters 8 and 9).

The State of the Cahal Pech State

As noted above, none of the proposed models for the Maya state address the developmental trajectory of Cahal Pech. What the archaeological record from Cahal Pech does demonstrate, however, is the growth of conditions over time that led to some form of state structure. Here, and throughout the rest of this dissertation, I broaden the understanding of state by modifying Fried's (1967) definition of state as a series of specialized institutions that maintain an order of stratification to a term denoting any type of social organization with multiple levels of administration structured by institutionalized inequality. I contend that, to be considered a state, the administrative arm of a social group does not simply support a stratified social order; rather the very existence of the administrative bureaucracy is dependent on the institutionalization of the stratification. Furthermore, kin groups that form the base of pre-state social organization are inextricably drawn in to these structured institutions in such a way as to require payment in the form of tribute as a means of survival within the system. Essentially, the

administrative structures of state penetrate every facet of life within the system, such that it would be impossible to function as a kin group without simultaneous reliance on and support for the state structure.

Compared to other definitions of a state, this modified one is deliberately broad in that it encompasses social structures at multiple Maya polities while still recognizing that each region of the Maya area responded to local conditions in a historically contingent way. Thus, I claim, any notion of state among the ancient Maya must maintain a fluidity allowing for both regional variation and the simultaneous adoption of Pan-Mayan features of social, political, and ritual qualities.

It is important to note that the institutionalization of inequality that forms the core of any state does not happen instantaneously, nor does it happen in a vacuum. When state formation happens outside of situations of military or economic conquest, unequal social relations combined with the structuring of the social order into bureaucratic administrative units happens incrementally over relatively long periods of time. In this sense, the process of state development is one in which kin groups, either by coercion or acquiescence, gradually cede community-based control of resources to a single person or a small group of people. In their discussion of the collapse of the Classic Period Maya kingdoms of Piedras Negras and Yaxchilan, Charles Golden and Andrew Scherer are careful to note that many lowland Maya settlements experienced a collapse of the political system before site abandonment. Identifying state collapse as the loss of political legitimacy related to long-term stressors (2012:160; 2013), Golden and Scherer examine the collapsed state to understand the way that the state formed and functioned

prior to the loss of political legitimacy. In piecing together ancient Maya political systems, they claim that the king himself formed the “center of authority” and legitimacy for the community. Golden and Scherer further suggest that the incorporation of otherwise independent households or other corporate groups into the political machinations of the state, such as construction of public architecture and military campaigns, furthered the goals of “building civil society centered on the state and the dynastic center” with the king at the core, ruling based on relationships of public trust (2012:163; 2013). Golden and Scherer suggest that states collapse when the community-based public trust in the office of the ruler becomes eroded and when individual rulers prioritize the expansion of their own power and authority over the maintenance of the public trust (2012; 2013).

Christine Gailey (1987:250) noted that the emergence and *endurance* of class relationships cannot exist without the institutions that support and mediate them. Essentially, for the types of relationships that were common among the Classic Period Maya to develop, the bureaucratic institutions that relied on class-based inequality for their very existence must, as a matter of survival, fracture the function of the kin group within the larger social order. Essentially, kin groups, while once the dominant authority in pre-state societies, must be subjugated to a single ruler or single dynasty and ordered into a class-based system for state formation to occur. In this sense, Gailey’s work on proto-state formation in the Tongan Islands (1987) can provide us with an example of the responses of kinship groups in the face of class formation and increasing institutionalized inequality. In the case of increasing stratification, the authority of the kin groups to

determine the social, political, and economic course of their communities becomes divorced from the groups themselves. Whereas proto-state societies are structured by kinship ties, and *kin groups come together to determine the developmental trajectories of their communities*, in nascent state and state societies, the authority to decide on development strategies is removed from the kin groups and placed in the hands of one individual or a single kin group. While this process does not effectively dissolve the kin group, it does dissolve the autonomy that each group has over their own production (Gailey 1987:262). Kin groups may resist this process in both overt and covert ways, and this resistance is understood as *kin/civil conflict* (Diamond 1996). In the Tongan case, when customary forms of kinship were inhibited by the state apparatus, kin groups effectively created new ways of maintaining their kinship obligations (Gailey 1987:35), and these new ways served as a form of non-militarized resistance to the burgeoning state structure. What is particularly salient about resistance is Gailey's claim that the meaning of cultural symbols may change over time in response to the oppressive changes that occur during and after state formation (Gailey 1987:38).

By drawing attention to the ways in which the bureaucratic apparatus of the nascent state takes effective power away from kin groups by coopting production and creating commodities (1987:253), Gailey provides us with a mechanism for understanding burgeoning inequality among the Formative Period Maya at Cahal Pech. Recall that Cahal Pech was a major trade hub during the Formative Period when it controlled riverine routes from the Caribbean, and it is entirely possible that one of the decisive factors in the development of institutionalized inequality at the site involved

control over the products of trade. Gailey (1987) further notes that state structures were essential to maintaining control over the flow of commodities in the Tongan Islands, and I suggest that the control of trade may have been a significant influence in the development of state-level complexity at Cahal Pech, given the unique positioning of Cahal Pech within the Maya lowlands.

Ancient Maya Kinship

Any discussion of the process of state formation must be grounded in a discussion of the constitution of ancient Maya kinship and the communities that are generated by them. *Kinship* as a term broadly denotes groups of people related by blood or affinal connection or more broadly as groups of variously related individuals who comprise a social unit (Carsten and Jones 1995; Fox 1967; Gailey 1987; Gailey and Patterson 1988; Gillespie 2000a, 2000b, 2000c; Godelier 1984; Leacock 1972; Levi-Strauss 1969; Morgan 1870; Peletz 1995; Sacks 1975; Schneider 1984; Wolf 1982). Although some archaeologists favor eschewing the notion of kinship in favor of the concept of “house,” understood as a type of corporate estate (Gillespie 2000a, 2000b, 2000c; Hage 2003; Levi-Strauss 1979), the notion of a corporate estate called a “house” group is, in itself, a variation on more traditional kinship models and is based on recognition of descent from a particular ancestor (Carsten and Jones 1995; Ensor 2011:213-214, 2013; Gillespie 2000a; Houston and McAnany 2003; Levi-Strauss 1979).

In this sense, kinship groups are constituted by people who share a common identity and are connected through this common identity to one another and to the history of the social group. As a group connected by a common identity, kin groups also embody a sense of “collective memory about the past” (Gillespie 2000a:3), which serves to structure relationships both within and beyond the kin group. In many cases, this takes the form of familial relationships, whether patrilineal, matrilineal, unilineal, or the many other forms that kinship groupings can take. However, blood relation or marriage alliances are not the only ties one can have to a specific social body, therefore, any discussion of kinship must allow for cases of literal or figural adoption, along with fluidity of identity formation in relation to a larger group. Despite historically contingent ethnographic examples of Maya kinship (Gillespie 2000b), the exact structure of pre-state kinship at Cahal Pech is unknown, and will likely never be fully understood; therefore, kinship must be inferred in the broadest terms to contribute to a discussion that is as inclusive of the ancient Maya as possible.

Notions of kinship not only structure the relationship that individuals within kin groups have to the community writ large, but kinship groups comprise the core of the community itself. While kinship might be understood, and practiced slightly differently in different cultures, kinship itself remains a basic structuring concept in pre-state societies (Ensor 2011, 2013; Gailey 1987). It thus can be a heuristic tool that archaeologists can use to interpret the significance of patterns of material culture (as discussed in Chapter 8 of this dissertation) in a pre-state context, even when

acknowledging that kinship is, inherently, a fluid concept dependent upon multiple levels of recursive relationships (Kintz 2004:153).

In non-state societies, kinship practices form a reciprocal relationship with both demography and political economy (Ensor 2011:204, 2013), such that transformations, in any area of this relationship, shape transformations in all areas including economic, political, and demographic transformations cause changes to occur in kinship structure, and vice versa. Furthermore, Gailey (1987) notes that political and economic transformations involving the emergence of exploitation tied to class formation directly affect the relationships that kin groups have to each other as individual units and to the community as a whole. In short, kin groups are not only a feature of a non-state social order, but in effect, they also constitute such an order in that they tend to be the base unit of social organization on which all other forms of social organization in non-state societies pivot.

In the context of Formative Period Cahal Pech, I understand community to be composed of individual kin groups that comprised the social and political structure of the localized group residing in the immediate vicinity of Cahal Pech. This idea of community brings Jason Yaeger and Marcello Canuto's (2000) notions of community within a geographic region to a smaller level, thereby exploring notions of kin groups forming one or more communities within a single site. Marcus (2000) also distinguishes the kin group as the most basic and fundamental social unit of Contact Period Maya social organizations, and further hypothesizes that the roots of the kin group as the base of Maya social organization likely occurred in the distant past as well (235). Likewise,

David Grove and Susan Gillespie (1992) note that Early and Middle Formative Period Mesoamerican societies, other than the Maya, were likely to be structured chiefdoms where kinship was the dominant mode of social organization and is represented archaeologically by a continuum of traits marking social levels rather than sharp distinctions between groups (191), features that are particularly visible among the Early and Middle Formative populations at Cahal Pech and are discussed further below.

Ancestral Ties

A particularly important feature of kin groups among the ancient Maya was their mutual connection to and reverence of ancestors who, particularly in many Mesoamerican cultural groups, tended to be buried underneath house floors (Gillespie 2000c; McAnany 2013). As Gillespie (2000c) notes: “It is a product of the enabling actions of specific impermanent, mortal persons to foster empowering contractual relationships with the generalized, unchanging, energetic force, manifested as ancestors and gods” (139). Essentially, collective memories of revered ancestors form the fulcrum around which the identity of the kin group focuses, along with the identities of individual kin group members. Patricia McAnany (2013:8) recognized ancestor veneration as a mechanism through which the resource rights of a kin group within a larger community were legitimized.

Rosemary Joyce (2000:206) noted that kin groups often possessed valuables connected with a revered ancestor, which were passed to different members of the kin

group at different times in their life cycles to strengthen their connection to the corporate kin group effectively serving as repositories of social memory. McAnany noted the creation and use of ancestor images among the Contact-Period Maya, stating that the Spanish considered these figural representations as “idols” that were, in effect, worshipped by ancestor “cults” (2013:36). Since the use of ancestral images was so deeply embedded in Maya ritual at the time of Spanish contact, it is likely that the practice began much earlier, and McAnany (2013:39) claims as much when she connects Contact-Period ancestral representations to Classic Period iconography, and further connects the Classic Period iconography to Formative Period figural ancestor worship through her work at the Maya site of K’axob, Belize. Considering these assertions, I suggest that figurines may have been connected to and representative of the different kin groups that made up the Formative Period Cahal Pech community that would, by the Late Formative Period, eventually become a state. If this is indeed the case, then those figurines that represented ancestral connections would have been enchainned with meaning (see Chapter 2) that would not have terminated upon deposition of the figurine into construction fill, a phenomenon that appears to have ended with the rise of the Cahal Pech State.

Conclusion

While there have been many hypothesized models of a/the Maya state, very few models recognize and allow for variability in structure related to environment, economy,

and agency within hierarchical relationships. As discussed above, the presence of monumental architecture doesn't *a priori* indicate a state (Dietrich 2012; Pauketat and Alt 2005; Sen 1992). One characteristic shared by all Maya polities that have been variously considered as states is the embedded institutionalization of unequal social relations, demonstrated by material signatures such as highly differential residential architecture, and unequal access to both food resources and exotic goods. This characteristic, I contend, should be considered the primary marker of state among the ancient Maya in that it allows for variability within group relationships, tribute extraction, trade and economic policies, and religious beliefs and rituals that are all products of conditions specific to each area of the larger Maya region.

Having thus defined a state as a political system dependent upon the institutionalization of unequal social relations, the question remains – how do states form? To answer this question, I invoke more contemporary studies of the state formation process that shows that states develop through a long and tumultuous process involving the erosion of the community based authority of individual kin groups. What remains, then, is the larger question of how this phenomenon can be seen in the archaeological record. If, as I argue here and in Chapter 2, figurines are tied to ancestor veneration associated with kin groups and are thus enchainned with meaning that does not disappear upon fracturing, then the erosion of kin based authority related to state formation would likely manifest in changes in figurine use and deposition over time. In order to explore how changes in figurine use and deposition illustrate the process of state formation at the site of Cahal Pech, we must first examine the environmental setting in

which the city lies (Chapter 4), along with the developmental trajectory of the site as interpreted from nearly 30 years of archaeological research (Chapter 5).

CHAPTER 4: SITUATING CAHAL PECH

The site of Cahal Pech is situated in the upper portion of the Belize River Valley where the Mopan and Macal Rivers converge to form the Belize River. The site core itself is on top of a steep hill on the outskirts of the modern town of San Ignacio, in the Cayo District of western Belize (figure 2.1).

Today, Cahal Pech is noted for being an easily accessible and affordable site for tourists to see. In the ancient past, Cahal Pech would have exerted control over extensive riverine trade between the resource-rich Caribbean and the Maya lowlands by controlling or brokering trade via the Macal, Mopan, and Belize Rivers, which collectively define the Belize River Valley. To understand the settlement of Cahal Pech and the use of ceramic figurines in their sociopolitical and economic context, it is critical to understand the broader Belize River Valley and its place in ancient Maya political, social, and economic domains.

The Belize River Valley

Today, the Belize River Valley is an important part of the Belizean economy. It serves as a water source, albeit a polluted one, for agricultural and basic sanitary use. Seasonal flooding allows for the regeneration of soil used in farming. As a major avenue of transport for the ancient Maya, the Belize River connected the Caribbean Sea to the Macal and Mopan Rivers, which in turn flowed to both southern Belize and lowland

Guatemala, respectively. While today the Belize Western Highway running alongside the river is the major route of travel in western Belize, the river continues to be an important source of monetary income and food production.

The Belize River Valley is best described as a fertile swath of land existing between the Maya mountains to the south and rolling hills to the north. Its western edge begins at the modern border of Belize and Guatemala, and its eastern edge is marked by the connection of the Belize River to the Caribbean Sea at Belize City.

The Macal River originates in the Maya Mountains approximately 14 kilometers northeast of the Maya site of Caracol. From there, the Macal flows northward, through the Maya Mountains towards its confluence with the Mopan, at the modern town of San Ignacio. Along the course of the river, several ancient Maya settlements have already been identified including: Dos Chombitos, Guacamayo, Tipu, and Chaa Creek (Chase and Garber 2004:2; Leventhal et al. 2010). The significant number of ancient Maya settlements alongside the river indicate that the Macal and its small tributaries were an important part of ancient Maya life.

The Mopan River originates in Guatemalan and flows northward. The Chiquibul tributary passes by the ancient site of Caracol and joins the Mopan River near the ancient site of Ucanal in present day Guatemala. From there, the Mopan flows northward, crossing the modern border of Belize and Guatemala. The river passes within four kilometers of the ancient Maya site of Naranjo, and crosses the Belize/Guatemalan border again near the Belizean town of Benque Viejo Del Carmen, where it flows directly by the

ancient Maya site of Xunantunich. The Mopan then continues northeast towards its confluence with the Macal River, by the modern Belizean town of San Ignacio. In west central Belize, the Macal and the Mopan Rivers meet to form the Belize River, with the modern town of San Ignacio situated at the confluence of the two waterways. The Belize River then flows eastward, past the modern city of Belmopan where the Belize River Valley ends, and drains into the Caribbean Sea.

The entire river valley consists of a broad geographical zone that is generally divided into two parts. The Upper Belize River Valley consists of the Macal and Mopan Rivers and their interfluvial stretches from the western border of Belize near the modern town of Benque Viejo Del Carmen to the confluence of the Macal and Mopan, forming the Belize River. The Central (or lower) Belize River Valley extends from the confluence of the Macal and Mopan to the coastal port of Belize City where the areas surrounding the river become marshy and drain into the Caribbean Sea (Chase and Garber 2004:1-5).

Ancient Uses of the Belize River Valley

As Fedick (1988:73) notes, the Belize River Valley is a tropical environment with few sharp ecological boundaries. The alluvial banks of the Macal, Mopan, and Belize rivers provided the ancient Maya with a plethora of food resources such as fish, turtle, alligator and shellfish (Awe 1992; Fedick 1988; Willey et al. 1965). All rivers have

seasonal flooding, and this flooding, while sometimes destructive, replenishes the soil used in agriculture (Awe 1992:50).

Ancient Maya settlements in the region followed the course of the river, as the alluvial deposits from seasonal flooding facilitated agriculture, and the river itself facilitated trade (Chase and Chase 1989; Chase and Garber 2004; Garber 1989). Chase and Garber (2004) note that settlements in the central Belize River Valley tend to consist of a large quantity of small mounds that are spread out over the landscape, while settlements in the upper Belize River Valley consist of compacted and distinct site cores such as Xunantunich and Cahal Pech.

The unique concentration of both ancient Maya cities and settlements within both the Upper and Lower Belize River Valleys (figure 2.2) makes this a particularly important region in which to study ancient Maya lifeways. Archaeological evidence situates the first permanent Belize River Valley settlements in the Early Formative period, circa 1000 BC (Awe 1992; Chase and Garber 2004; Healy et al. 2004), and the valley shows signs of continuous occupation into the Post-Classic period, circa AD 950 (Chase and Garber 2004; Healy et al. 2004), providing archaeologists access to information on over 2 millennia of human history.

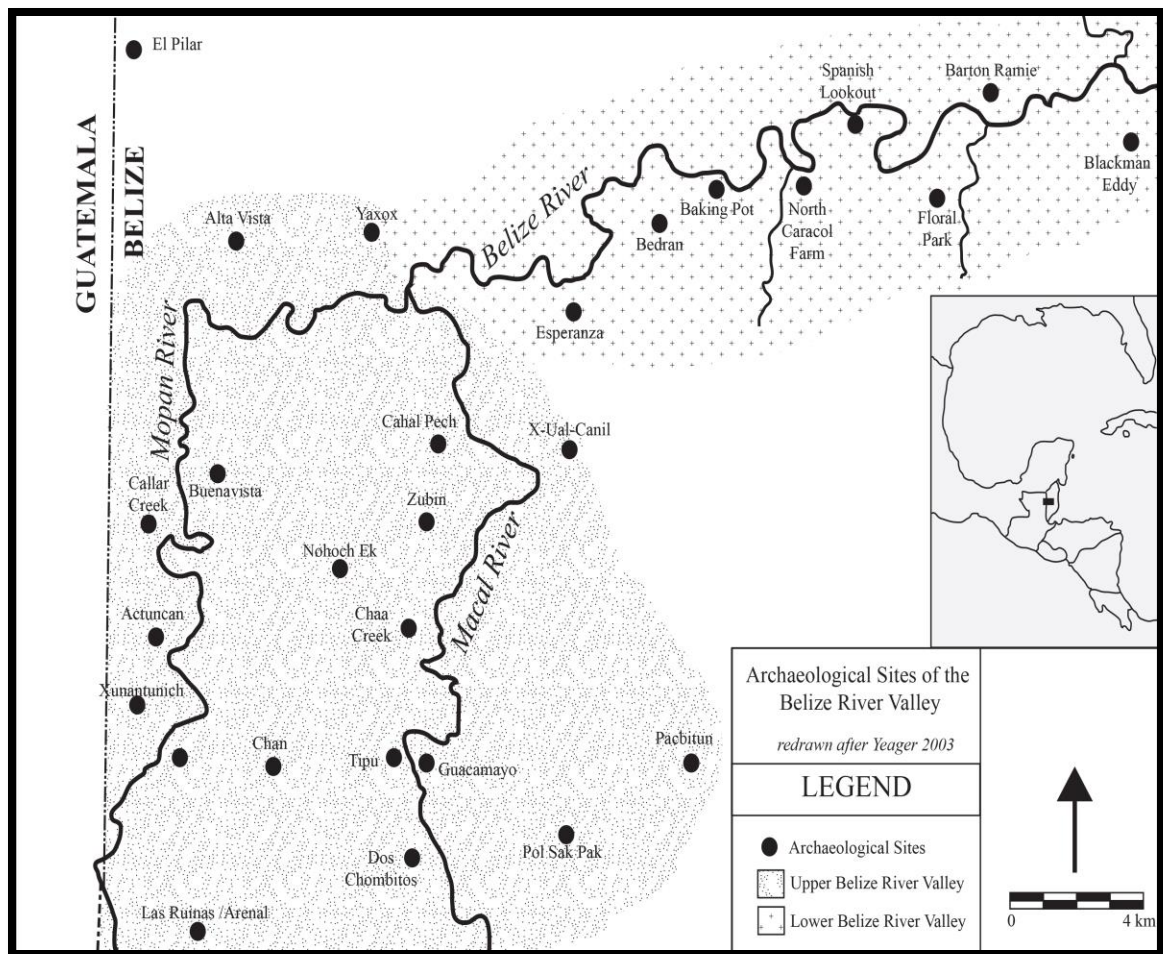

Figure 4. 1 - Archaeological Sites of the Belize River Valley

History of Archaeological Research in the Belize River Valley

Following the work of David M. Pendergast (1993) the history of archaeology in the Belize River Valley can be categorized as a series of phases marked by major changes in research paradigms, funding, excavation goals, and research scale, culminating in an archaeological approach that examined sites in the valley as pieces of an integrated landscape. The research projects highlighted below elucidate the changes in Maya

archaeology over time, including the social trends that influenced later interpretations of the archaeological record.

Phase 1: 1809-1924

The first mention of ancient Maya sites in Belize¹, or British Honduras as the colony was called, was published in 1809 as part of a larger colonial analysis of the region. In 1809, Captain Henderson of His Majesty's 5th West India Regiment reported, for the first time, his exploration of British Honduras. Captain Henderson's account of British Honduras was a broad-based descriptive work addressing the geography, natural resources, natural history, meteorology, the experiences of the British settlers, glimpses of native Maya, and the enigmatic monumental architecture in the colony (Henderson 1809:ix-xi). It is important to note that the archaeological developments that occurred during the early nineteenth century in British Honduras did not occur in a vacuum. To detail the characteristics of the indigenous population in British Honduras, Captain Henderson reported several stories handed down from British settlers, painting an exotic picture of the indigenous population. These natives, whom we now know to be indigenous Maya, were described by Henderson as "peculiarly ferocious" and prone to theft and to aggressive behavior when challenged. Henderson contrasts the indigenous Maya with the ingenuous populations of North America and states that the indigenous

¹ The nation of Belize was officially recognized as a commonwealth country of Great Britain in 1981. Prior to this, Belize was known by its colonial name, British Honduras. Both names are used here in reference to the appropriate name of the country during the time frame in question.

populations of British Honduras do not have “their personal bravery, nor characteristic hardihood” (Henderson 1809: 19). The British perception of the indigenous Maya of the time, took the form of the “un-noble savage”, giving the colonizers, among other things, a justification for later looting of Maya artifacts, which would be sold to museums and art collectors. Henderson’s 207-page tract contains only one paragraph devoted to the mounds lining the Belize River. While detailing environment surrounding the Belize River, he noted the presence of the “Indian-hills” (Henderson 1809:43) and stated that these mounds were found in the immediate vicinity of rivers and creeks. He further described the human bones and pottery sherds that were frequently uncovered when the mounds were physically excavated. The importance of this passage by Henderson cannot be understated, as it is the first written record of artifact collection in the colony and gives archaeologists today an understanding of how the culture history was understood by the colonial authorities.

Similar exploratory accounts were written throughout the nineteenth century, the most famous of which, *Incidents of Travel in Central America, Chiapas, and Yucatan* by John Lloyd Stephens (1993[1841]) inspired many adventurers and explorers to traverse the jungle to see the ancient Maya sites. Under the auspices of official governmental business for the United States of America in 1841, John Lloyd Stephens and artist Frederick Catherwood travelled about the Maya region, viewing and describing major Maya cities in the Yucatan, the southern Peten including sites in present day Belize, the Pacific highlands, and Honduras (Stephens 1993[1841]: 6). Although many of his site descriptions, as well as assertions of Maya culture based on the sites were later proven

false, his descriptions of the enigmatic wonders of the Maya world enticed a generation of explorers to trek through the jungles all throughout Central America (Stephens 1993[1841]:7).

Stephens' account was a major source of knowledge about the region and an inspiration for explorers to follow in his footsteps, however, relatively little is written about further expeditions and artifact collection until the late 1800s. It was during the Victorian period when explorers and antiquarians from Great Britain, those interested in artifacts from long vanished cultures, began to publish descriptions of artifacts recovered during their travels to the region.

By this time, scholars from the Society of Antiquaries of London were attempting to classify the different types of mounds in British Honduras based on their shape and contents (Gann 1894). A significant effort during the early exploration of the history of British Honduras was dedicated to describing and explaining the mounds and the artifacts that came out of them.

Thomas W F Gann, a physician who undertook archaeological explorations “under the aegis of the British Museum,” conducted the first antiquarian investigation of Maya sites in British Honduras (Rice 1974: 2). Antiquarianism in British Honduras was predominantly practiced by European nobility, who were interested in finding and preserving the past. A large portion of British archaeology focused on what was considered at the time to be the preservation of artifacts (Johnson 1993:249). To preserve the artifacts from this long-lost civilization, British antiquarians took them from the

archaeological sites and brought them overseas where they were studied and displayed by various British museums and in private collections. Between 1809 and 1924, wealthy British patrons would finance expeditions into Central America, effectively paying the explorers who would then loot the mounds and tombs extracting the interesting artifacts within to display for antiquarian societies, a common British and American colonial practice of the time. Aside from the work of Thomas Gann, little effort was made at what was then considered systematic exploration, and large-scale projects aimed at learning about the people who inhabited the region were not conducted, although an interest in British Honduras was growing.

At the end of the first quarter of the 20th century, major organizations such as the British Museum, The Carnegie Institution of Washington, and the Smithsonian Institution's Bureau of American Ethnology began funding archaeological expeditions in the Belize River Valley with the major goal of creating culture histories of ancient Mesoamerican societies while simultaneously collecting material from this culture to display in associated museums.

Phase 2: 1924-1939

In 1924, the institutions noted above funded explorations in the Belize River Valley. The Belize River Valley had largely been ignored by major institutions that focused on deciphering the glyphic inscriptions and exploring the major pyramids of sites such as Uaxactun and Chichen Itza (Kidder 2006[1930]: 90). When the Carnegie

Institution expanded its influence in the larger Maya region in 1924, it supported scientific and professional expeditions to the Belize River Valley, and professional archaeology, aimed at creating and refining culture histories, replaced antiquarianism (Hammond 1982:483).

In 1924, sponsored by the Carnegie Institution and Harvard's Peabody Museum, Oliver Ricketson carried out a single field season of excavations at the Belize River Valley site of Baking Pot (Ricketson 1931: 3). The partial excavations included two major groups of plaza complexes and adjacent mounds. The bulk of his excavation report notes the details of the excavated structures and an account of the skeletal remains recovered within the structures and mounds (Ricketson 1931: 17-24). Owing to a lack of stone stelae, Ricketson concluded at the end of the field season that the site of Baking Pot was "never an important center" (Ricketson 1931: 25) and did not return for another field season.

In 1928, J. Eric S. Thompson first reported on the site of Mountain Cow in the Belize River Valley. No systematic excavations occurred until 1930, when they combined epigraphic and architectural survey (Rice 1974: 52). In 1938, Thompson again conducted excavations in the Belize River Valley with his exploration of the ruins of Xunantunich (then known as Benque Viejo). This excavation was aimed at uncovering evidence that would explain disparities in stylistic design of pottery found in different sites within the region as a result of expanding excavations. Using the results from his research at Xunantunich, Thompson helped develop a sequence of ceramic styles that aided in the creation of a system of ceramic seriation, dating specific to the region, that

would be in place until the end of WWII when American archaeologists would descend on the Maya world in vast numbers (Hammond 1977:182).

The most notable archaeological events in the Belize River Valley during this phase were the preliminary work of Oliver Ricketson that established the presence of multiple secondary sites or peripheral settlements in the valley and the work of J. Eric S. Thompson, which helped to establish the sequence of ceramic styles in the region. In addition to the emphasis on culture, American anthropologists were often concerned with uncovering the historical development of a particular population (Patterson 2010: 20). Data uncovered during this phase, namely ceramic information, was formulated into stylistic linear trajectories that charted the sequence in popularity of different types of ceramics through time. These seriation diagrams were then used to make specific assertions about the historical development of the ancient Maya, such as technological advancement, trade relationships, and artistic development. It is clear from the site reports at this time that archaeologists had moved beyond the collecting and displaying artifacts that occurred during the first phase of research in the Belize River Valley to examination of the sites themselves to understand ancient Maya social organization.

Expeditions during this time included detailed mapping of highly visible monumental architecture within the larger site landscape. The research conducted between World War I and World War II sought to uncover elements of Maya social organization, with specific attention paid to monumental architecture, epigraphy and burial evidence found at the much larger sites throughout the Maya region. The results of these excavations were synthesized into a broad analysis of ancient Maya culture.

Hiatus: 1939-1948

During World War II, archaeology in British Honduras experienced a wartime hiatus. Indeed, it was not until 1949, four years after the war had ended that archaeologists returned to pursue study of the Belize River Valley.

Phase 3: 1949-1960

The immediate post-war era influenced a major theoretical shift in social thought by some scholars, and a series of theories about the motors driving social change arose in the American academy. Anthropologists such as V. Gordon Childe (1951) began exploring the relevance of Marxist theory to the ancient past, while other scholars sought to further refine pre-existing typologies and cultural chronologies. The environment, population growth, agriculture, endemic warfare, and resource competition were all used in various forms to explain how human behavior started from savagery and reached its pinnacle at the western notion of civilization. Social evolutionary theories of human development viewed societies and cultures as existing on a single linear trajectory, with different cultures at different points on that trajectory, while historicists viewed development and change as dependent on several factors, such as contact with other cultures and the availability of resources. A prominent focus of social theory sought to explain development in different parts of the world and in the past, to which anthropologists were uniquely qualified to contribute. Many social scientists focused on

finding “prime movers”, that is, the primary mechanisms and causes for large-scale social change, for the development of different social groups.

Influential anthropologist Julian Steward (1955) explained the world and its history through a series of stages that began when foragers adopted agriculture and continued adopting complex practices through the growth of the modern world (Patterson 2010: 21). Archaeologists using this cultural ecology theoretical approach examined their data for evidence that would place the society along the linear trajectory proposed by Steward and other sociocultural evolutionary proponents. In short, social theorists of this time were grappling with explaining how the world came to be the way it was.

The post-WWII era brought about official government intervention in archaeological expeditions in many parts of the world, partly due to the impetus to preserve and maintain culture in the wake of the cultural destruction that occurred during the war. In 1949, A. H. Anderson, working for the government in British Honduras, began salvage excavations at the Baking Pot site in response to damage caused by a public works project (Audet et al. 2004:49). From this point forward, the British Honduran government began to take an active role in the excavation and salvaging of archaeological sites. In 1953, Gordon Willey, under the auspices of Harvard University and the Peabody Museum, conducted a large-scale project in the Belize River Valley (Pendergast 1993:7-8; Willey et al. 1965). Willey set out to examine Maya settlement patterns, which he defined as: “total archaeological site layouts, not only temples, palaces, and public buildings, but residences, their natures, numbers, and distributions” (Willey 2004: 16). Until that time, Mayanists knew of residential mounds scattered

around the edges of notable sites, but had paid little attention to them, focusing instead on the large ceremonial centers dominated by pyramid temples and large plazas (Willey 2004: 16-17).

Willey conducted preliminary surveys of different sites in the Belize River Valley to determine which site would best support his settlement survey (Audet et al. 2004:50). In the Belize River Valley, the Barton Ramie plantation caught Willey's attention, not for the large pyramids or stelae at the site, but precisely because those elements were absent. Barton Ramie, Willey discovered, contained none of the markings of a large site; instead, it contained numerous mounds representing individual households (Willey 2004: 22). In the summer of 1954, Willey and his team broke ground there. This study was the first excavation in the Belize River Valley that focused not on pyramids and stelae, iconography and calendrics, but on the lives and houses of the common people who had once lived in the region. Willey (2004:23) noted that, on days when he was not excavating, he would travel to other sites in the valley to try to understand the placement of individual sites within the larger valley. The Barton Ramie excavations were highly organized and the official reports were extremely detailed. The official excavation report was published in 1965 by the Peabody Museum and not only lists exhaustive stratigraphic detail of each mound but also describes the artifacts and skeletal elements found within the many mounds. Indeed, "Willey repeatedly urged that settlement patterns be studied jointly with artifacts and contexts" (Ashmore 2007:53). Willey's overall focus of the Barton Ramie excavations, on what the humble mounds could tell us about the people who lived in the hinterlands of the major Maya ceremonial centers, is

widely considered seminal work in settlement archaeology (Ashmore 2007:41; Sabloff and Ashmore 2001).

The approach that Willey and Phillips (1958) espoused was structured around the belief that civilization was marked by a wide variety of artistic styles and religious practices that occurred within the center of a settlement. Those who lived in the center held authority over those who lived in the hinterlands (Patterson 2010: 23). To understand the relationship between those who lived in the center of a city and those who lived in the hinterlands, one must examine the settlement in its entirety. While studying the major structures in the city centers had the potential to yield considerable information, it was only with the study of the settlements in the hinterlands that one could genuinely understand the social organization of the people who lived there. While other social theorists were using Mesoamerica as a backdrop for the larger ideas about the nature of civilizational change and the mechanisms that drove it, Willey investigated civilization as a historical relationship among individual social actors. In his effort to understand the whole of a complex civilization, Willey began a long tradition of comprehensive archaeological investigations in the Belize River Valley, a practice that continues alive and well today.

Willey's work at Barton Ramie "opened a major new research campaign to examine Maya settlement traces along the lines of his analysis of the field" (Ashmore 2007: 43). Archaeologists studying in the region today no longer focus solely on the larger ceremonial centers; rather, they examine the different facets of the entire valley as a landscape system of interrelated sites. The "Belize Valley project tested the new

method, in a new cultural and environmental setting [an open river valley], even as it boldly expanded the range of inquiry” (Ashmore 2007:47).

In 1955, British Honduras established the Department of Archaeology “as an official unit of the Belize government to protect the nation’s ancient Maya and historic monuments and antiquities” (Graham et al. 1980: 153). The Department acted as the official arm of the British Honduras government to facilitate excavations and publicize results at Maya sites, but also to protect Maya cultural heritage. During 1959 and 1960 field seasons, Euan MacKie conducted excavations at the Maya site of Xunantunich (also known as Benque Viejo) where Gann had reported several structures in his 1894 report (MacKie 1985:9). Not only did MacKie’s work at Xunantunich clear the larger buildings, but also drew on project data to create the general site map and construct a regional history. This study helped to determine that Xunantunich was a major ceremonial center for the Belize River Valley, and may have been allied with other major Maya centers to the west (MacKie 1985:8-9).

Phase 4: 1961-1970

The 1960s brought major changes to anthropological and archaeological theory; of particular importance in the U.S., as theoretical changes differed among European and Latin American scholars, was the development of a “new” or processual archaeology. Processual archaeology examined publicly observed behavior and eschewed the idea that mental processes such as intention or ideology could be ascertained based on the

distribution of material culture. Through a combination of methodological objectivism, objectification of the subject, economic rationality, methodological individualism and a narrow, ahistorical understanding of culture, processualists “pursue[d] objectivity by applying the same logical methods, observational techniques, standards of evidence, and criteria of validity used in the natural sciences” (Patterson 1990:190). During this phase of Belize research, much of the major processual archaeological research was conducted at sites to the north of the Belize River Valley, such as Lamanai and Altun Ha.

In 1961, The Royal Ontario Museum sponsored two large-scale excavations in British Honduras. The first project would eventually encompass the Maya site of Altun Ha in northern British Honduras (Pendergast 1993:9) and cave excavations just south of the Belize River Valley (Graham 1980:156; Palacio 1976b:2). The second project consisted of a single season of research at Baking Pot, in 1961. The research, conducted by William and Mary Bullard focused on structures within the site, and the roles that their occupants [?] may have had within the polity itself (Audet and Awe 2004:50); however, no one returned to the site to conduct further study for several years. These projects attempted to further refine culture histories and site chronologies but did not engage with then contemporary social theory to understand the larger processes driving Maya social organization.

Phase 5: 1971-1991

In the late 1970s and early 1980s, discontent with processual archaeology within the academy, coupled with political discontent with economic development theory (Rostow 1967), led to a new paradigmatic approach in archaeology. This approach, called Postprocessual archaeology (Hodder 1982, 1985), argued that the processual paradigm did not pay “sufficient attention to its object of inquiry, to the implications of its theoretical and methodological foundations, or to the context in which archaeological research was carried out” (Patterson 1990:191). Advocates for this approach attempted to ascertain not just the “nuts and bolts” of material culture, but the mental processes behind the material culture and focused on how concepts such as meaning, ideology and power were made manifest through material culture. While many archaeologists throughout the world began to interpret new finds and reinterpret old finds through a postprocessual lens, archaeologists working in the Maya region, including in British Honduras, lacked a strong theoretical foundation and continued to focus on expanding and elaborating on culture history.

During this time, archaeology in British Honduras took several new directions, although in general, it still lacked a strong theoretical basis. In addition to excavations at sites in the Belize River Valley, archaeologists mapped and excavated caves in the region to preserve the artifacts that were being destroyed by the tropical environment and looters (Graham 1980: 155), the tourism industry blossomed, and technologies such as radiocarbon dating were becoming commonplace in archaeology. Topics, such as settlement, agricultural techniques, building techniques, and the use of space, to name a

few, have dominated Maya archaeology in the Belize River Valley since (Hammond 1982:484).

By 1976, “the intensified interest [in archaeological projects] ...revolutionized the place of Belize within the whole Maya area” (Palacio 1976b:4). To ensure the protection of Maya sites within Belize, the government established major archaeological reserves surrounding the sites (Palacio 1976b: 4). In effect, the major archaeological sites became national parks that both ensured government protection and bolstered tourist access to the region. Within the site of Xunantunich, most of the work was directed at salvage and the repair of damage done by looters (Foster 1992:38).

During the 1970’s, archaeological research began to address specific questions. Rather than examine a site in its entirety to understand the gamut of social activity present, archaeological excavations aimed at answering specific questions related to subsistence practices, production techniques and intrasite relationships, although the answers to these questions were framed tangentially through a processual lens. In reaction to what was perceived to be the limits of Processual Archaeology, the Postprocessual paradigm advocated an interpretive archaeology, one that allowed for, and even encouraged, the study of artifacts for mental processes such as intent and agency. This paradigmatic approach allowed for expanding the scope of archaeological research to encompass questions of gender, kinship, domination, and resistance, not to the extent that they structure social organization, but rather how those trends were manifestations of specific mental and cognitive processes around which people structured their lives (Hodder 1985; Patterson 1990; Shackel and Little 1992). Although new ways of thinking

were making their way through academia, it would be another decade before they were applied to Maya archaeology in British Honduras.

On September 21, 1981, British Honduras gained independence from Britain and was renamed Belize. The Belizean Institute of Archaeology supported significant excavations aimed at promoting tourism of Maya sites during the 1980's and in subsequent decades.

During the 1986 and 1987 field seasons, the Trent University- Pacbitun Archaeological Project excavated the site of Pacbitun extensively. This work aimed at “outlining the development and evolution of this Classic Maya center and determining the role of intensive terrace agriculture” (Healy 1990:249). Beginning in 1983, Anabel Ford began the long-term Belize River Archaeological Settlement Survey (BRASS). Aimed at investigating the relationship of the many settlements and the environment in the Belize River Valley (Ford 1987:2, 1990), BRASS used archaeological investigation to examine the landscape of the region as an integrated whole within a larger sphere of interaction rather than a series of mutually exclusive and independent sites (Ford 1987:9, 1990) and published site reports until 2005. In his 1988 doctoral dissertation, Scott Fedick, while working with Ford on the BRASS project demonstrated that each Maya site in the Belize River Valley was not a wholly independent political polity; rather, the sites formed an integrated region that depended on the agricultural development of specific areas within the valley.

Fedick used a multi-scale approach to the regional study of ancient Maya agriculture within the Belize River Valley. “The level of analysis at which land evaluation is conducted greatly affects one’s perception of resource heterogeneity vs. homogeneity, and this in turn can influence interpretations regarding agricultural development and management decisions” (Fedick 1995:17). He advocated a “bottom up” perspective on the study of land use and agriculture in the Belize Valley and further demonstrated that the study of local household settlement and land use is a crucial component to the overall study of the political economy within the Belize River Valley (Fedick 1995:17). In essence, Fedick placed household settlements in the larger context-- he examined how individual households were placed within and intersected both the urban areas and the farming landscape in the Belize River Valley. He was one of many archaeologists during this time that drew attention to the system of Maya settlements in the Belize River Valley.

In 1988, Jaime Awe conducted the first major archaeological excavation at Cahal Pech, a Classic Period Maya site northeast of Xunantunich. Although the site had been noted in passing by several archaeologists working in the region, it was not immediately excavated and it fell prey to looters until Awe could delineate boundaries for the site and worked to establish it as a national park (Awe and Campbell 1989:5).

In 1990, the Southwest Texas State University Belize Valley Archaeological Project began excavations at the site of Blackman Eddy. One part of the study focused on understanding the ideological components of social structure and leadership as expressed through architecture and ritual deposits (Brown 2001:22). The research project

spanned more than a decade and investigated multiple aspects of Maya life, including the ecological relationship of the polity to the greater Belize River Valley region. From 1990 through 1992, Lisa Lucero used the ceramic data recovered by the BRASS project to conduct a regional examination of “social, economic, and political interaction” in the Belize River Valley (Lucero 2001:vii). Lucero was interested in exploring “the three strategies the elite use[d] to attain social integration...legitimation, control, and distribution of prestige goods, and funding of public works” which can all be found through an analysis of material culture (Lucero 2001:5).

In the 1980s and 1990s, the Belize River Valley, along with the rest of Central America experienced a tourist boom. (Leventhal et al. 2010:2). During this time, the government of Belize developed many archaeological sites into tourist attractions, drawing people from the coast in the east and the larger Maya cities in the north and west. In addition to sponsoring excavations at new sites within the valley, the Belize Department of Archaeology also conducted salvage operations to repair and restore many of the sites that had been damaged by time and looters.

Phase 6: 1991 to present

Interest in settlement studies continued into the 1990's with the Xunantunich Archaeological Project, a multi-season approach that examined settlements in relation to the large site on the western edge of the Mopan River. This settlement study examined

the multiple, intersecting relationships of the residents of Xunantunich and its hinterlands.

In 1991, the multi-year Xunantunich Archaeological Project (XAP) was launched to survey, excavate, and conserve the site as tourism in the area grew (Leventhal et al. 2010:2). The project continued through 1997 and expanded to encompass both the core and the periphery of Xunantunich. Throughout the preceding century, work at the site had occurred intermittingly and consisted mainly of buttressing and repairing specific structures (Leventhal et al. 2010:4-5). Research and mapping projects at the site of Xunantunich sought, among other things, to understand the combination of factors that influenced settlement choices of the individuals living in the periphery of the site (Leventhal et al. 2010:7), how those settlement choices related to others made elsewhere in the valley, and how all related to the larger Belize River Valley settlement system.

During the mid-1990's, Jason Yaeger investigated the settlement site of San Lorenzo as part of the XAP, not just to examine how the people within the site existed at the core, but expanded to include how the entire settlement of San Lorenzo interacted with the larger polity of Xunantunich (Yaeger 2000:127). This shift in focus from examining the core of the settlement to the relationship of the site to other places is a hallmark of the relatively recent developments in Maya archaeology in the Belize River Valley and a continuation of the work Willey began in the 1950s, as did Cynthia Robin's work on the Xunantunich periphery site of Chan Nòohol (Robin et al. 2004:37, 2012).

In 1992, a long-term regional archaeological project called the Belize Valley Archaeological Reconnaissance Project (BVAR) began. This project has been involved in the excavations and preservation of multiple sites in the Belize River Valley. In 1999, the Belize Valley Archaeological Reconnaissance Project (BVAR) began to conduct excavations at Cahal Pech and recovered many artifacts, which are still being analyzed.

The 2001, 2002 and 2003 BVAR field seasons saw renewed research at the Baking Pot site. The aims of this research are emblematic of the overall direction of archaeology in the Belize Valley--interpreting the architecture and settlement of the site within the larger relational context of an integrated Belize River Valley (Audet and Awe 2004: 50). The first portion of the BVAR research at Baking Pot examined both survey and excavation of the peripheral settlement at the site. The second phase of BVAR investigations at Baking Pot examined both house mounds and the connections of ritual structures (Audet et al. 2004). Further evidence of a comprehensive intraregional system can be found in Kay Sunahara's 2009 report of petrographic analysis of ceramics found throughout the Belize River Valley region. She used chemical analysis to locate the clay sources of different ceramics found throughout the entire region. Her results demonstrated that the settlements in the Belize River Valley formed a regional system (Sunahara 2009) in which interaction occurred on multiple levels and, presumably, affected not only how goods flowed throughout the region, but also artistic and architectural style and possibly ritual practices.

From the start of this phase, archaeological investigations in the Belize River Valley moved from a singular landscape study to one of overlapping landscapes. Sites

such as Baking Pot and technological developments such as Sunahara's petrographic analysis not only examined the physical and ecological landscape, but also incorporated analysis of landscape ideology, landscape cosmology, and the relationship of multiple landscapes, which both directly connected and overlapped in some places and cases.

The Site of Cahal Pech

The archaeological site of Cahal Pech is situated on a hilltop adjacent to the Macal River that winds northward from the Maya mountains past the site, and joins with the Mopan River to form the Belize River approximately three km north of the site core (Chase and Garber 2004:4). South and west of the site core, limestone hills supported smaller settlements spatially distinct from the site core (Awe 1992:51). Cahal Pech is located on the outskirts of the modern Belizean City of San Ignacio. San Ignacio proper

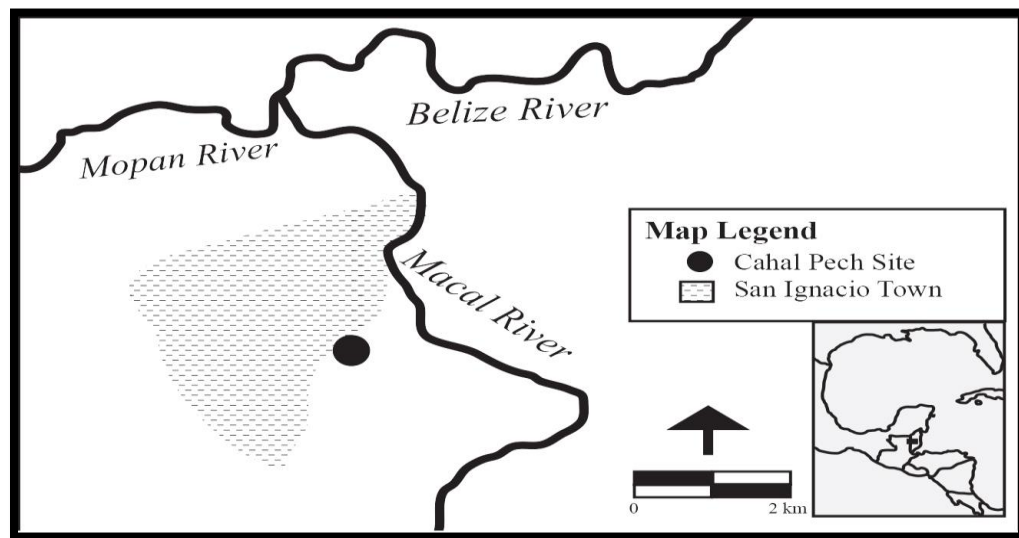

Figure 4.2 - Map of Cahal Pech and San Ignacio Town

extends from the boundaries of the Cahal Pech archaeological preserve northward to the Macal River, effectively inhabiting the northern and eastern alluvial plains of the region that would have been settled by ancient Maya residents of the community of Cahal Pech (figure 2.3).

The Cahal Pech Site Core

Today, the site of Cahal Pech consists of the remains of monumental architecture, strategically placed on a steep hilltop near the banks of the Macal River. Although the modern town of San Ignacio was constructed just north of the site core of Cahal Pech, effectively destroying much of the settlement evidence, we know that in ancient times, the site of Cahal Pech would have extended the area south of the site core, and north to the confluence of the Macal and Mopan Rivers (Dorenbush 2013; Ebert 2015; Willey and Bullard 1956). The settlement of Cahal Pech, then, would have been situated at the spot that the Belize River split, making it an important site for importing goods from the Caribbean. The location of the site implies that the site of Cahal Pech would have exerted some measure of control over riverine trade into the central Maya lowlands.

The Cahal Pech site core (figure 2.4) is organized spatially on an east-west axis and consists of eight plazas (A-H) surrounded by architecture on nearly all sides, and 34 large structures (Healy et al. 2004). While the construction of Cahal Pech took place over almost 2,000 years, the present state of architecture at Cahal Pech generally reflects the last construction episode, dating to the Late Classic Period, circa AD 600-800 (Healy

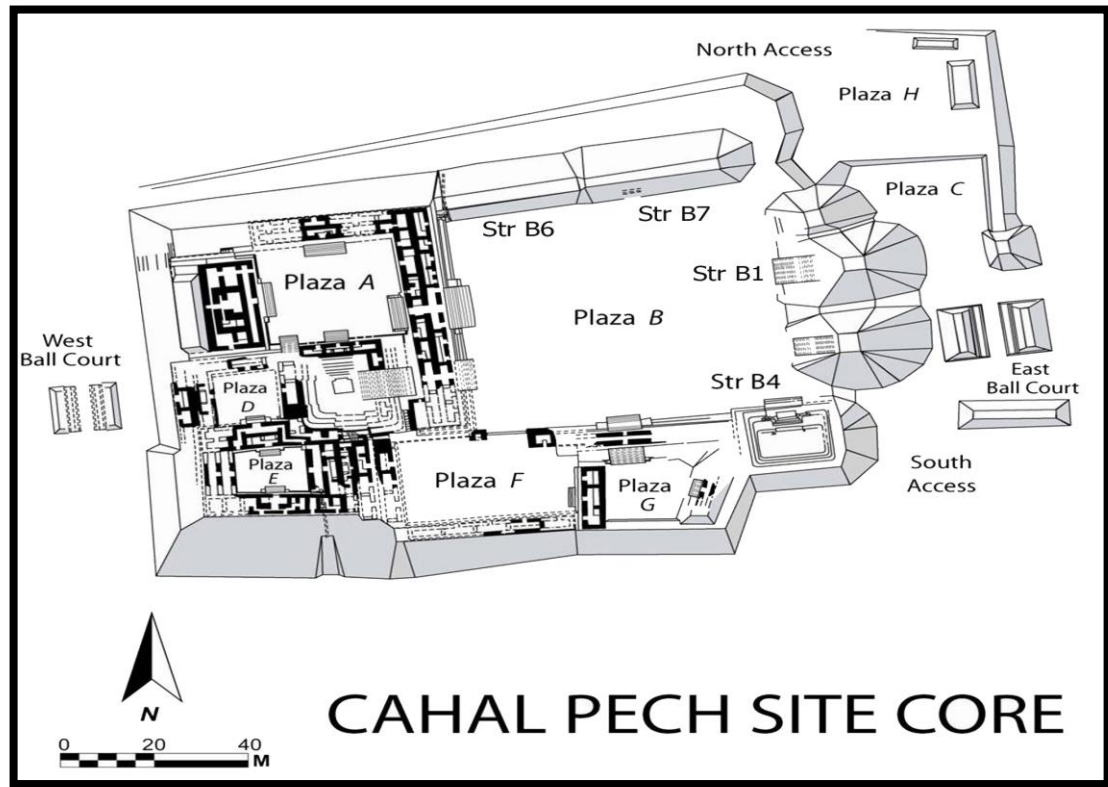

Figure 4.3 – Map of the Cahal Pech Site Core (Map Courtesy of Jaime J. Awe)

et al. 2004). A triadic pyramid group occupies the eastern side of Plaza B, and probable administration buildings flank its north and south borders (Cheetham 1996). East of the triadic pyramid group is Plaza C and the Eastern Ball Court, the latter of which is flanked by now-ruined buildings that likely served an administrative function with an entrance to the plaza on the south side of the site (Pritchard et al. 2010). Plaza B directly connects to Plaza F in the southwest corner, and Plaza F directly connects to Plaza G.

The western portion of the site, believed to be the palace complex, is not readily accessible, save for a large staircase in Plaza B. To enter Plaza A, one must climb the steps in Plaza B and go through a series of doorways before descending steps again into

Plaza A. On the south end of that plaza is a single room with a bench, situated at the base of the largest pyramid at the site. Inside the room, near the bench, Awe (1992) discovered glyphs indicating the seating of a ruler, and suggests that was likely the location of the royal throne. Plaza D can be accessed by a staircase in the southwest corner of Plaza A, and Plaza E can only be accessed through Plaza D, leaving Plaza E as the most restricted area in the site. To the east of Plaza E is a series of rooms that likely would have served as sleeping quarters for the royal family at Cahal Pech. To the west of Plaza D, and down a steep embankment, is the Western Ball Court.

Access to the eastern portion of the site would have been easy, once the hilltop was climbed, indicating that this geographic area was where the public would gather. The western portion of the site is significantly restricted, and it is here that affairs of state (as it were) would have been conducted. In general, it appears that the site core of Cahal Pech functioned as a city center of administrative and religious function.

History of Major Research at Cahal Pech

Although residents had been familiar with the site of Cahal Pech for centuries, it was not until the mid-twentieth century that scholars took notice of this Maya center. In 1951, Linton Satterthwaite named the site Cahal Pech, Maya for “Place of Ticks,” created a preliminary map of the hilltop site, and conducted minor excavations at the site core, which had previously served as a cattle pasture (Awe 1992:56). Despite awareness of the site, no further archaeological investigations were conducted, and the site fell back into

obscurity. While excavations at Cahal Pech have taken place nearly every field season since 1986, I have chosen to highlight the major projects conducted there, as these excavations not only recovered the most significant number of ceramic figurines, but also provided the greatest information about site history, construction episodes, and ritual practice.

In 1986, Joseph Ball and Jennifer Taschek conducted excavations at the site of Cahal Pech and partially restored several of the structures in the site core. Because of their excavations, Ball and Taschek concluded that Cahal Pech was likely a medium-sized city that was ultimately under the authority of a nearby regional state headquartered at the site of Buenavista del Cayo (Ball 1993; Ball and Taschek 1991). What we now call the Cahal Pech site core was, in Ball's view, a "hilltop citadel-home" (39) for the leader of a local kin group and the residents of the citadel likely served as administrators over the local farmers (41).

In later work, Ball and Taschek (2003) note that, based on ceramic assemblages that the initial inhabitants of the Belize River Valley, including Cahal Pech, may have been from two distinct ethnic groups and different pottery styles developed at the same time, calling into question the homogeneity of the occupants in the Belize River Valley.

In 1988, Jaime Awe, under the auspices of the Belize Tourism Industry Association and the University of London, began to excavate the site to preserve and develop it for tourism. In subsequent years, excavations of the site core continued, and salvage excavations examined several periphery hilltop groups to save the archaeological data from the rapidly growing town of San Ignacio.

Although Awe's early dissertation research focused on the Formative period occupation of Cahal Pech, the creation of the Belize Valley Archaeological Reconnaissance expanded excavations to include the Classic and the Terminal Classic Periods. To determine the temporal limits of site occupation and to understand social and political changes occurring during the Formative period, Awe conducted excavations of twelve structures within the site core, placed test pits in Plazas A-G, and investigated 24 mounds in various periphery settlements (Awe 1992:69).

During the mid-1990s, David Cheetham excavated structure B-4 as well as the adjacent plaza area (Cheetham 1996) to determine the temporal limits of site occupation as well as construction sequences. Awe's (1992) dissertation previously excavated around structure B-4 and determined that this was the area of the site core with the oldest discernable occupation history. Cheetham's excavations further defined the preliminary occupation as occurring circa 1000 BC, with the possibility of even earlier occupation at the site. Later, Cheetham conducted research on Terminus Groups (peripheral structures connected to the site core via causeways) in the Belize River Valley, including the Terminus Zopilote Group at the end of Martinez sacbe at Cahal Pech (Cheetham 2004). Cheetham found that, like the other periphery groups, the Zopilote Group was first built in the Middle Formative period and was subject to repeated construction episodes through the end of the Terminal Classic, circa AD 950.

During the 1992 and 1993 field seasons, Gyles Iannone began excavating the Zubin Group as part of his doctoral dissertation (Iannone 1993:10). Iannone set out to explore what he called "middle level" settlement units, that is, settlements that are not as

complex as major Maya centers, but are more complex than house mound groups (Iannone 1993:12).

Beginning in 1991 and continuing until 1993, Terry Powis excavated the Tolok periphery group to determine how the Tolok group was situated within the chronology being developed from data recovered by Awe at the site core (Powis 1992:35). Powis found that the area was first settled in the late Middle Formative, Kanluk phase (650-350 BC) (Powis 1992:48) and major construction episodes at the Tolok group were synchronous with construction at the Cahal Pech site core through the Terminal Classic. He further determined that, due to the low frequency of exotic goods, the Tolok group was likely home to a “residential farming community (Powis 1992:48).

From 2004-2009, James Garber trenched Plaza B from north to south, and excavated several additional units adjacent to or outside the trench. These excavations were undertaken as a multi-season project to more clearly define the Formative period occupation at the Cahal Pech site core to determine the extent of the earliest architecture under the plaza floor.

From 2011 to 2014, Nancy Peniche May (2014) excavated the southern side of Plaza B to ascertain the construction sequence on the south end of the plaza and the implications it has for the political economy of Cahal Pech during the Middle Formative period. These excavations produced a detailed construction history indicating that the south side of Plaza B was extensively used during the Middle Formative period.

Conclusion

This chapter explored both the environmental setting of the Belize River Valley and environmental implications for ancient Maya settlement in the valley. It then moved on to a brief discussion of archaeological projects conducted in the valley, exploring what and how these projects and research trends have influenced excavations and interpretations of the site of Cahal Pech. The figurines analyzed in this dissertation are not simply a part of the culture history of ancient Cahal Pech, they are also a part of the excavation history of the Belize River Valley. The environment of the Belize River Valley, and the excavation history at Cahal Pech are critical to understanding the environment that the figurines were created and used in, as well as how and when they were found.

CHAPTER 5: THE CULTURE HISTORY OF CAHAL PECH

What became the site core of Cahal Pech was initially occupied circa 1000 BC and appears to have been continuously occupied until around AD 950. The nearly 2,000 years of continuous cultural history and development at the site of Cahal Pech allows archaeologists to explore diachronic political, social, and technological change at this important site. The fact that figurines were present from the beginning of the settlement until the Terminal Classic and reoccupation allows us to explore potential correlations of social and political change to figurine use and deposition. Beginning with the evidence for the initial settlement of what became the site core circa 1000 BC and proceeding through the abandonment and reoccupation of the site circa AD 900, this chapter explores how the site of Cahal Pech changed over time through a discussion of changes in architecture, burial patterns, trade relationships, the presence and use of figurines, and the use and deposition of material culture. Although recent research has indicated that humans occupied the eastern Mesoamerican lowlands possibly as early as 13,700 BP (Gonzalez Gonzalez et al. 2008; Horn 2015:15), this chapter considers the cultural history of the Belize River Valley beginning with the earliest definite evidence of sedentary occupation at the site of Cahal Pech.

Early Formative Period (1000 – 850 BC)

Radiocarbon dates indicate the earliest architecture and associated artifacts date to the Cunil Phase, a period between 1000 and 900 BC (Healy et al. 2004:105). These

radiocarbon dates are associated with the earliest construction at the site, providing evidence that the initial occupation of the site core occurred at least by 900 BC, if not before, by sedentary agriculturalists (Awe 1992:345).

The earliest architectural evidence for occupation at the Cahal Pech locale is found in the southeast portion of what became the site core, where an apsidal structure, B4-sub 13, supported a wattle and daub structure (Healy et al. 2004:107). During the Early Formative Period, structure B4 underwent five distinct construction episodes, with calibrated two sigma (95.4% confidence) radiocarbon dating of materials recovered from construction fill showing the five phases as taking place at various time spans between 1275 BC and 795 (Healy et al. 2004:106). Evidence of Cunil Phase occupation also occurs elsewhere in Plaza B, as Cheetham (1995:20) located as many as four distinct residential units at Cunil Phase levels in Plaza B (Healy et al. 2004:108). Awe (1992) noted that Cunil Phase dwellings have been found on either slightly raised, tamped marl floors or on house platforms. Dwellings themselves were constructed of wattle and daub and had thatched roofs. Excavations have uncovered Cunil Phase daub fragments containing a red pigment, so it is probable that some of these early wattle and daub structures were painted (Awe 1992:345-346).

Cunil Phase structures were determined to be residential, and were also associated with ritual caches that were inferred to be from termination rituals. These caches contained jadeite mosaic pieces, obsidian, marine shell, chert and drilled pendants made of animal bone (Healy et al. 2004:121). Although some ceramic figurines have been

found associated with the Cunil phase at Cahal Pech, they are not as common at the site as they are in later Middle Formative Period contexts (Awe 1992:346).

From the initial sedentary occupation of the site onwards, the residents of Cahal Pech were likely engaged in long-distance trade. This is evidenced by the presence of obsidian from highland Guatemala and marine shell resources from the Caribbean present at very early stratigraphic levels (Awe 1992:346-347). The end of the Cunil Phase is generally marked by the end of the residential occupation of Structure B4, and its initial renovation for use as a public building (Healy et al. 2004:107).

No definitively Cunil phase burials have been found at Cahal Pech. Human remains have been recovered in Cunil phase construction fill, however those remains cannot be definitively determined to be purposeful interments. The earliest purposeful burials found at Cahal Pech date to the Middle Formative Period, however, it is unknown if this is because burial customs changed between the Early and Middle Formative Periods or if it is because Cunil phase burials simply have not been located yet (Awe 2013:34).

Middle Formative Period (850 – 350 BC)

The Middle Formative Period (850-350 BC) in Mesoamerica is believed to be a time of increasing growth of social complexity throughout the Maya lowlands, and Cahal Pech is certainly no exception. It is generally divided into two sub-periods, the Early Middle Formative (850-650 BC) and the Late Middle Formative (650-350 BC). The period is also known by its ceramic associations as the Kanluk Phase, with designations

of Early Facet Kanluk (corresponding to the Early Middle Formative) and Late Facet Kanluk (corresponding to the Late Middle Formative) when data are available.

Several trends are evident in the archaeological record of the Central Belize River Valley broadly, and Cahal Pech in particular, including: population increases (Awe 1992a, 1992; Ford 1990; Ford and Fedick 1992), the construction of monumental architecture (Awe 1992a, 1992; Estrada-Belli 2003; Hansen 1998; Inomata et al. 2015), the development of visible social inequality (Awe 1992), along with increasing long-distance trade (Awe 1992; Hammond 1991; Hohmann 2002; Horn 2015). Not only do these trends first appear clearly in the archaeological record during the Middle Formative Period, but relatively quickly they became widespread across the Maya lowlands (Horn 2015). This is evident in new forms of pottery that emerged during this time. Beginning in the early Middle Formative, new pottery styles across the Maya lowlands indicate both increasing interaction between communities as well as the development of pan-Mesoamerican symbolism (Ball and Taschek 2003; Horn 2015).

In his research on Middle Formative spheres of interaction in the Belize River Valley, Horn suggests that these networks of interaction were a critical component to the development of social complexity with the Belize River Valley, particularly as participation in these interaction spheres “drove the increasing social differentiation in the Middle Formative record” (Horn 2015:73-74). Furthermore, Middle Formative communities in the Belize River Valley were, per Horn, “loosely organized networks of households or corporate groups that are interconnected by economic, kinship, political, and other special relationships” (Horn 2015:88-89). Horn further cites variability of

exotic goods found within different residential groups as indicative of unequal participation in these spheres of interaction with other communities, and suggests that participation in interaction spheres involving trade played a significant role in the development of social stratification at Cahal Pech (Horn 2015:134-135), such that “active manipulation of exchange relationship, and the goods, information, and status they provided may have allowed brokers in the Middle Formative small-world network to accrue substantial quantities of both material and social capital” (Horn 2015:681; Powis and Cheetham 2007; Pye and Demarest 1991; Rice 1976; Sanders 1974; among others).

Around the beginning of the Middle Formative Period at Cahal Pech, the residential units in the central precinct of the hilltop site were deliberately collapsed and plastered over to create the first Plaza B floor (Healy et al. 2004:108), a building technique that quickly became normative during this time (Awe 1992:350). Furthermore, this large open space that was previously residential appears to have been transformed into a public ritual space (Healy et al. 2004:108-109) and full masonry buildings were first constructed (Awe 1992:350).

The Early Middle Formative Period also saw the first major increase in the population of the site, and new residential structures were erected surrounding the site core (Awe 1992:351). Along with this growth in population, there appears to have been significant increase in the presence of “exotics” such as obsidian and jade. Of great significance for this dissertation, figurine production rose dramatically. Although figurines were recovered in Cunil Phase levels, by far the most figurines found at Cahal Pech (n=553) were recovered from Middle Formative Period levels. These figurines are

nearly all in the same style, and provide a diagnostic example of Formative period figurines from the Belize River Valley. Healy et al. (2004:114) note that the figurine corpus from Cahal Pech was, at that time, “the largest collection of hand-modeled figurines from any Lowland Maya site.” Since that publication, the collection of hand modeled figurines from Cahal Pech has grown considerably, with the clear majority of figurines coming from Middle Formative Period contexts.

Awe (2013) notes that the first (and earliest known) burial at Cahal Pech was placed within one of the first masonry structures in Plaza B, and while the cranium and the body were placed in two separate burial crypts upon which a square platform was constructed, they are believed to have belonged to the same person, an early leader of the Cahal Pech community (Awe 2013:34). Compared to later, Classic period burials, this early Middle Formative burial “lacks several of the indicators for high-ranking elite Maya burials” (Awe 2013:36), however, when compared to other Middle Formative Period burials, the post-mortem treatment of interment within a square structure with caches established at each of the corners indicates that the individual was of significant status, and in Awe’s view, may have been one of the earliest rulers of Cahal Pech (Awe 2013). Of interest to this dissertation is the fact that two Middle Pre-Classic fragmented figurines were found associated with this burial and interred in the northwest and northeast corners of the newly constructed burial platform (Awe 2013:36). This Early Middle Formative construction coincides with the Kanluk ceramic period denoted by several new pottery types that show up in the Belize River Valley (Awe 1992:351), and these diagnostic pottery types were found within the platform burial in Plaza B (Awe

2013). Significantly, many of the new pottery styles and designs that appear in the archaeological record of the Early Middle Formative period were decorated with pan-Mesoamerican symbolism that demonstrate interregional contact between different Maya groups, while still retaining specific markers of community identification (Ball and Taschek 2003; Bartlett and McAnany 2000; Horn 2015).

Of the 23 individual sets of recovered skeletal remains dating to the Middle Formative Period at Cahal Pech, most showed some level of skeletal pathology, including periodontal infection, minor trauma, some examples of osteoarthritis, along with deliberate skeletal modification such as artificial modeling of crania and teeth. Although the pathologies may initially seem severe, they are, in fact, much less severe than the skeletal pathologies noted in Classic Period remains. Healy and his colleagues (2004) suggest that this indicates some social stratification in the earlier times, as indicated by lack of nutritional resources for some individuals, but not a significant level of stratification to conclude a drastic difference in access to nutritional resources (120-121). Skeletal evidence combined with architectural and artefactual evidence indicates that during the Middle Formative Period, social stratification was well underway

It is important to note that social stratification does not develop in a vacuum. During the Middle Formative period throughout the Maya world, maize production intensified influencing not only access to nutritional resources, but also the ability of individuals to devote time to the production of material culture. Furthermore, ritual structures were being constructed to mark solar calendar and agricultural cycles. This, combined with changes in ritual behavior related to increasing populations likely played a

large role in the development of social stratification at Cahal Pech and beyond (Ball and Taschek 2003; Bartlett and McAnany 2000; Coe 2011; Estrada-Belli 2011; Grove and Gillespie 1992; Grube 2012; Hansen 1998; Inomata et al. 2015; Powis and Cheetham 2007; Pye and Demarest 1991).

The Late Middle Formative saw a series of intensive construction episodes designed to renovate the civic-ceremonial structures of the entire site (Awe 1992:352-354; Healy et al. 2004:109;) including several new structures erected around the borders of Plaza B. During this time, social ranking became more prominent, as residential architecture, value of burial goods, and types of tombs became significantly differentiated (Awe 1992:354). Population continued to increase dramatically (Awe 1992:355). Significantly, figurine deposition mingled with evidence of feasting, such as high concentration of vessel sherds and high quantities of faunal remains combined with ritual debris such as obsidian blades and shell beads (Garber et al. 2005). The archaeological evidence for feasting was found to be concentrated in the site core near structures, such as B-4, suggesting that these structures likely supported special ritual functions (Awe 1992:355). This contention is further supported by evidence of ritual feasting prior to several different construction episodes (Garber et al. 2005; Healy et al. 2004:121).

During the Middle Formative Period, several large periphery groups (the residential units of Tzinic, Tolok, Zubin, Cas Pek, and the non-residential terminus Zopilote Group) were constructed, providing evidence of a large support population of residents in the immediate periphery of the site core (Awe and Campbell 1991; Healy et al. 2004:110). Awe (1992) suggests that the periphery groups likely consisted of small

family groups who moved out of the site core to establish homesteads and exploit agricultural opportunities outside of the site core.

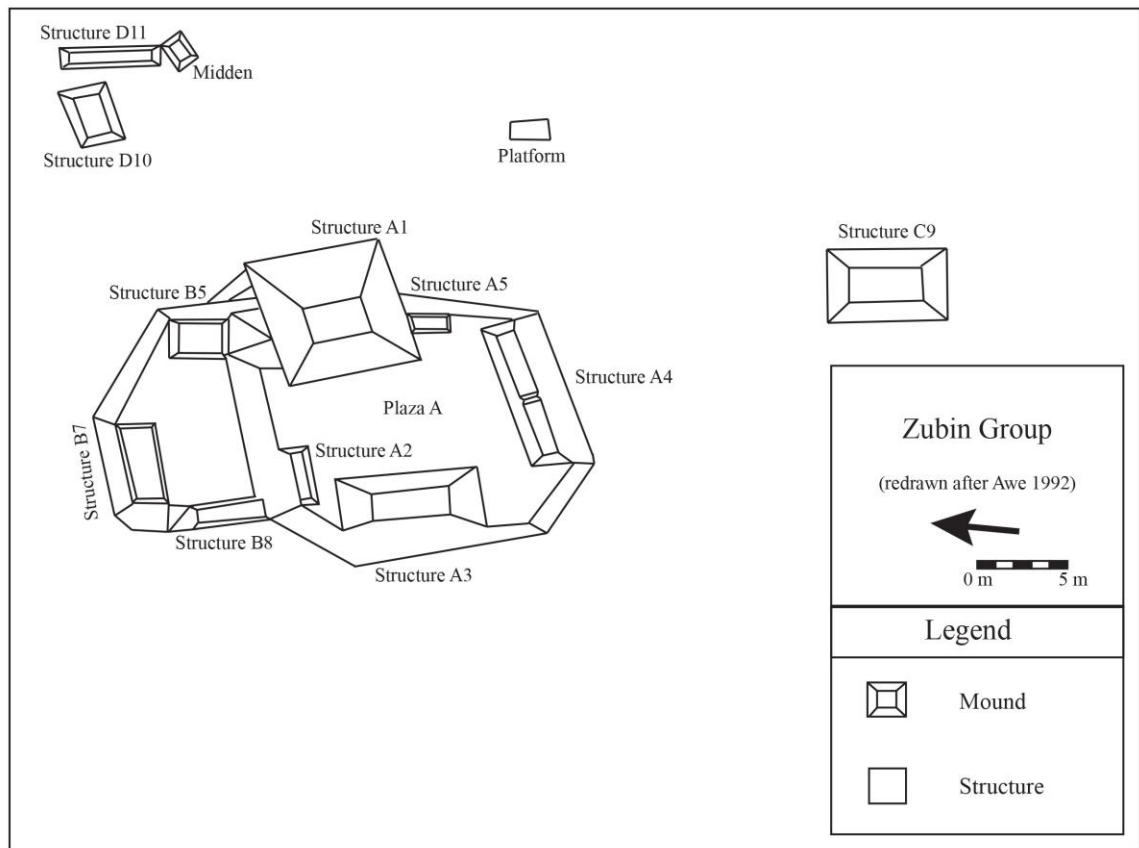

Figure 5. 1 - Map of the Zubin Group

The Zubin periphery group was located approximately two kilometers south of the Cahal Pech site core (Sunahara 1993:63). Iannone (1993) noted that there were three large plazas, one large pyramid, and long range-type structures surrounding both plazas. Additionally, Iannone notes the presence of several small mounds with small open spaces between them in the immediate periphery of the Zubin group (Iannone 1993:10). Based

on ceramic seriation of sherds found in plaza construction fill, Iannone placed the original construction of the Zubin group to the Late Middle Formative period, circa 600 – 350 BC. Construction continued periodically through the Terminal Classic period, circa AD 800 – 850 (Iannone 1993:19) as new buildings and new plazas were added during the Early, Middle, and Late Classic periods.

Another important periphery group, the Tolok group, was in the southeastern periphery, approximately 350 meters away from the Cahal Pech site core. In addition to 11 individual structures, archaeologists excavating this peripheral group located four distinct chultuns, or underground features generally, although not exclusively, used as storage, as well as a surface midden apparently unrelated to the chultun dating to the Late Classic period a short distance away from the structures (Powis 1992:36). During excavations, archaeologists uncovered several figurine fragments from Chultun D (Powis 1992:39). Their presence in this storage area indicates that not only were they important to the residents of the Tolok group, but also that they were not used daily. While the initial construction of the Tolok group took place during the Middle Formative period, successive construction episodes are evident through the Late Classic period (Powis 1992:42). Based on the “lack of substantial monumental architecture” and the paucity of prestige goods found within the Tolok group, Powis (1992:48) believed that the residents of this large group were likely agriculturalists living within a small farming community. It should be noted that contextual information for the specific location of figurines found in the Tolok group is missing, therefore, I was unable to determine which figurines came from residential contexts and which figurines were stored in the chultuns.

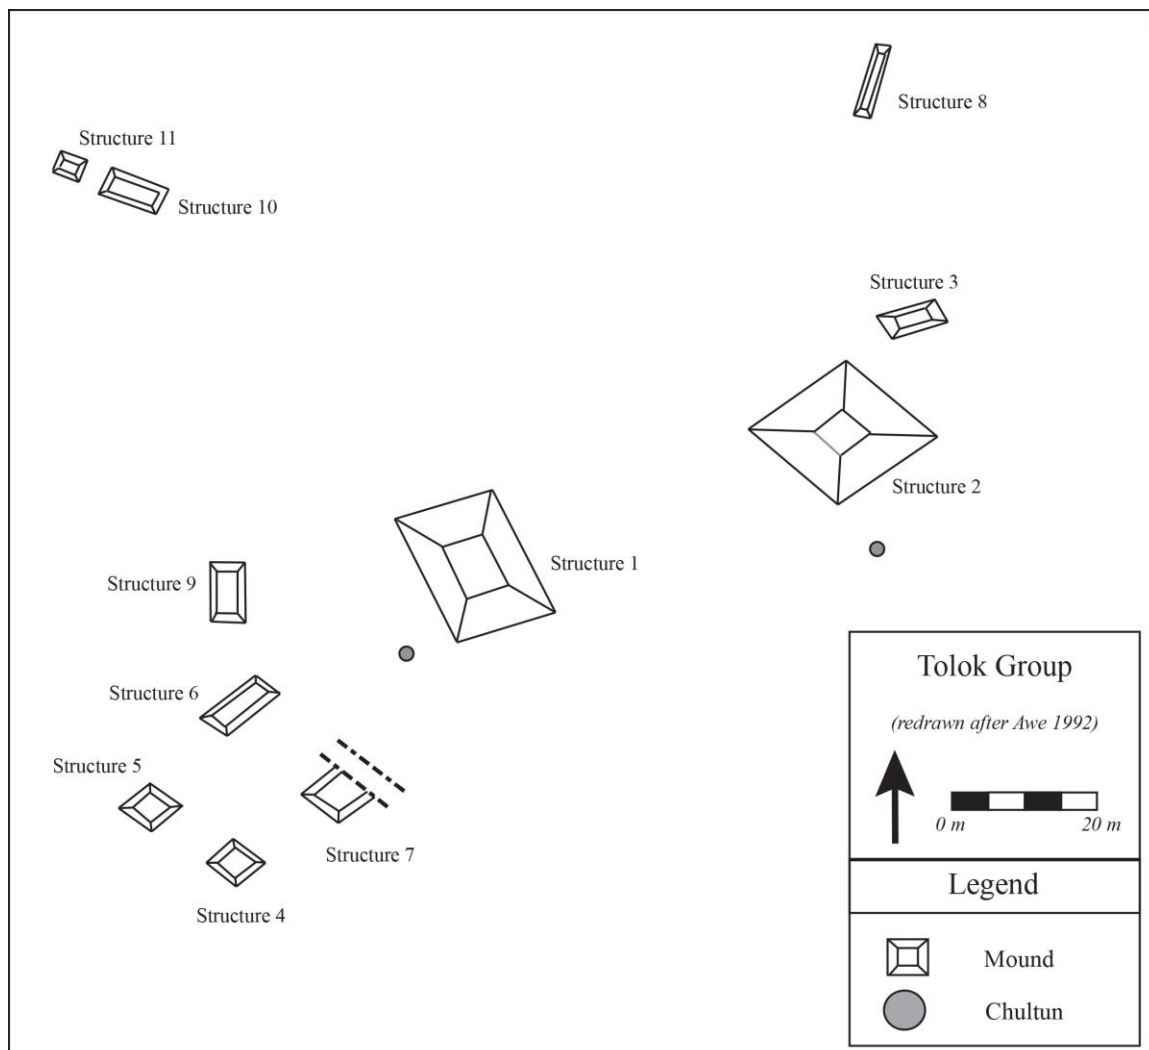

Figure 5. 2 - Map of the Tolok Group

In contrast to the relatively meager goods uncovered within the Tolok group, the Tzinic group was likely inhabited by wealthy elite, possibly royal individuals. The central plaza of the Tzinic group contained two large pyramids along with three long platforms of varying lengths, and a single stela. A sacbe, or road, connected the large plaza to a smaller platform that supported two long structures (structures 6 and 7)

positioned due south of the larger plaza. Within Structure 1, excavators discovered a jade pectoral that had been inadvertently left behind by looters, and it is believed that the pectoral likely came from a relatively well-furnished burial within the structure (Conlon 1992:73). The earliest occupation of the Tzinic group occurred during the Middle Formative period, and construction continued through the Late Classic period (Conlon 1992:73-79).

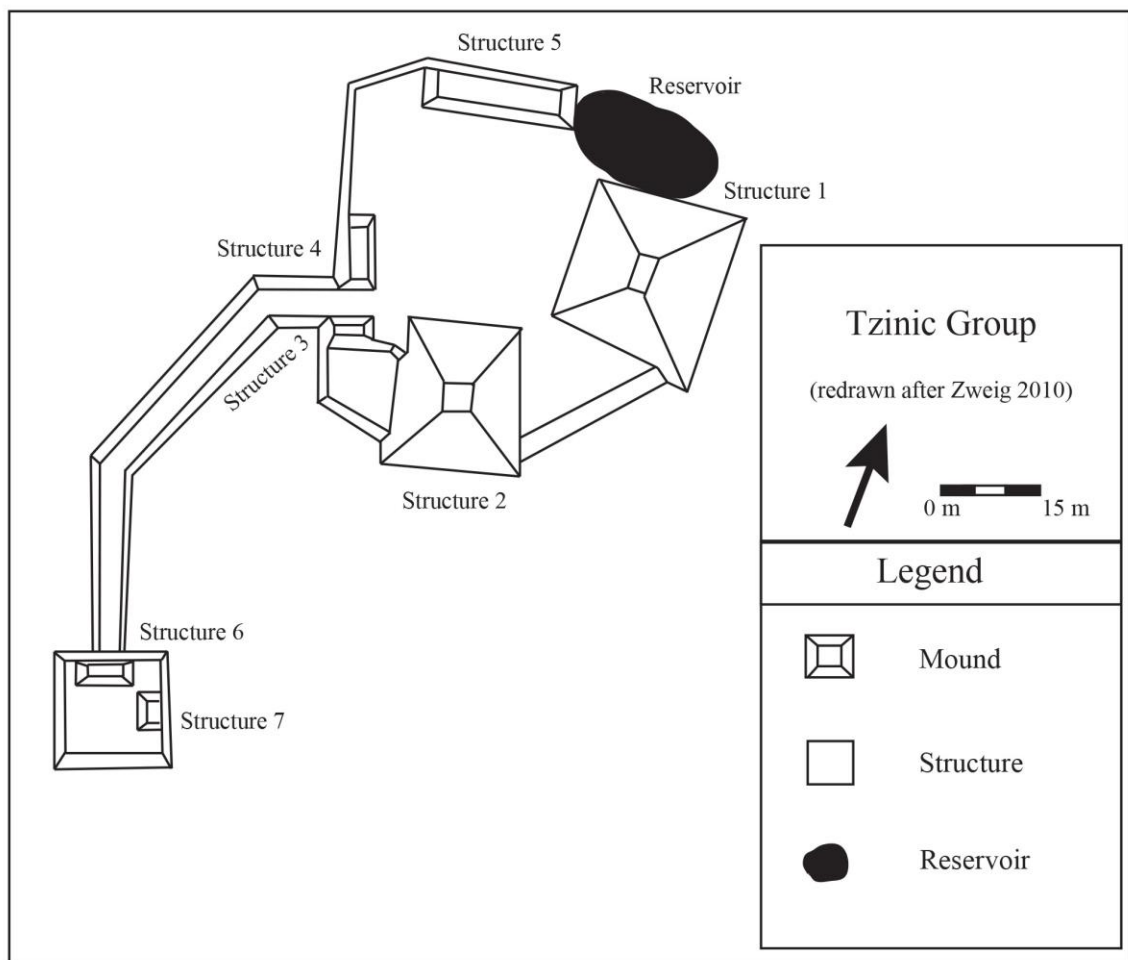

Figure 5. 3 - Map of the Tzinic Group

The Cas Pek group is one of the few peripheral groups found on the western side of the Cahal Pech site core. A large platform marks the center of the group, and supported four distinct structures. Surrounding this platform were seven distinct structures along with a water reservoir. Construction at the Cas Pek group began during the Middle Formative expansion and continued through the Late Classic period (Awe et al 1992:55), with modifications of different structures occurring at different times (Awe et al. 1992:56). A significant number of figurine fragments (n=47) were found at the Cas Pek group, primarily in construction fill dating to the Middle Formative expansion.

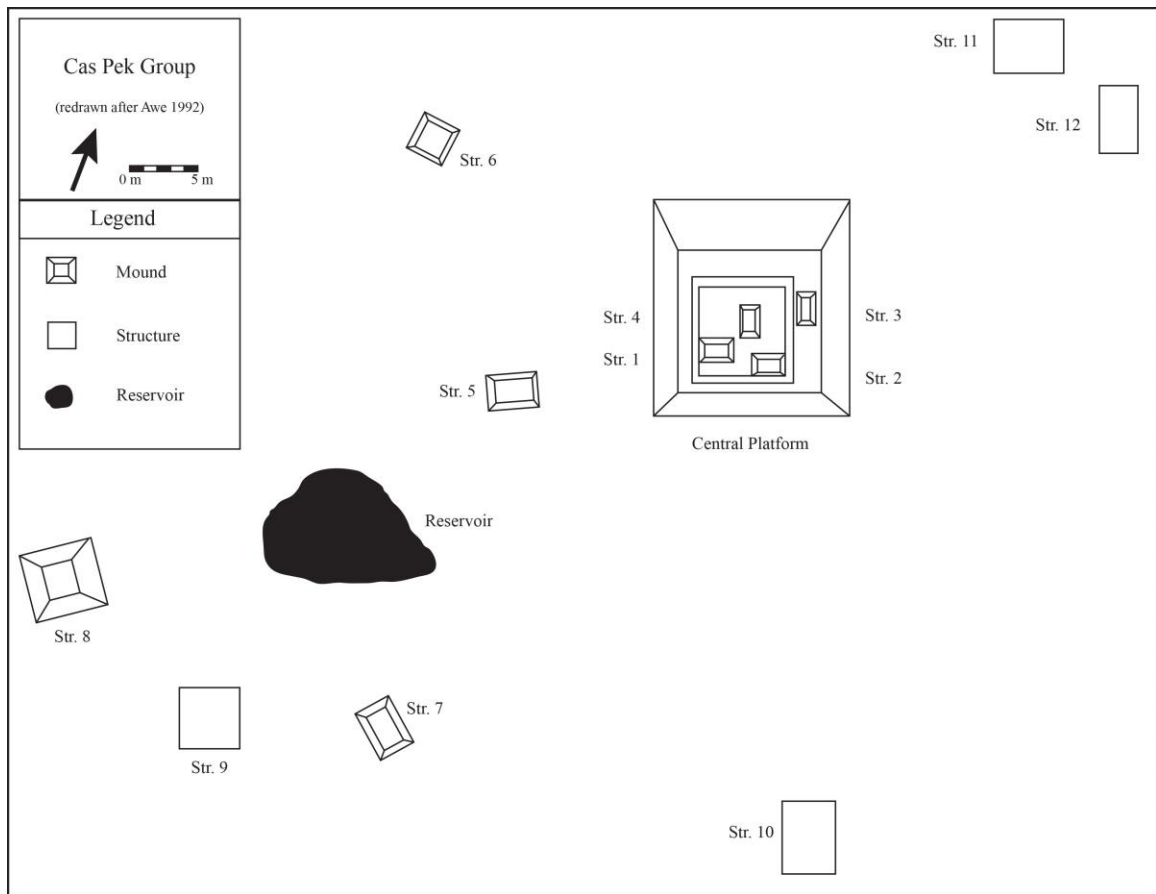

Figure 5. 4 - Map of the Cas Pek Group

The diachronic durability of these groups, from their establishment during the Middle Formative to their abandonment sometime in the Terminal Classic, hints at the importance of kin groups and descent among the Maya of Cahal Pech (discussed in detail in Chapter 3). Indeed, it is possible that the importance of the kin grouping that likely structured Maya life from the earliest occupation of Cahal Pech (discussed in detail in Chapter 3) continued for nearly two thousand years until these periphery groups were abandoned at the end of the Terminal Classic. All the excavations of the highlighted periphery groups yielded ceramic figurines dating to the Formative period, and are discussed in greater detail in Chapter 8.

In conjunction with the rise of periphery groups during this time, we also see evidence that the site core of Cahal Pech was being continuously remodeled such that what had, in the Early Formative period, been residential structures in the center of the hilltop site became a large public plaza adjacent to public, administration-style buildings (Cheetham 1995; Healy et al. 2004; Horn 2015). The creation of formal public space during this time, coupled with the construction and expansion of monumental architecture in the site core indicate that during this time, civic and ritual activities became more important (Horn 2015:175).

While most of the Cahal Pech periphery groups founded during this time were likely residential, the Zopilote group was probably not residential, as extensive excavations have not yielded domestic artifacts commonly found in or around residential structures (Cheetham 2004; Ebert 2015). As discussed in Chapter 4, the Zopilote group stands as a terminus group the southern end of the Martinez sacbe, which runs north from

the Zopilote group directly to the western ball court at the base of a steep incline leading to the palace complex at the western edge of the site core.

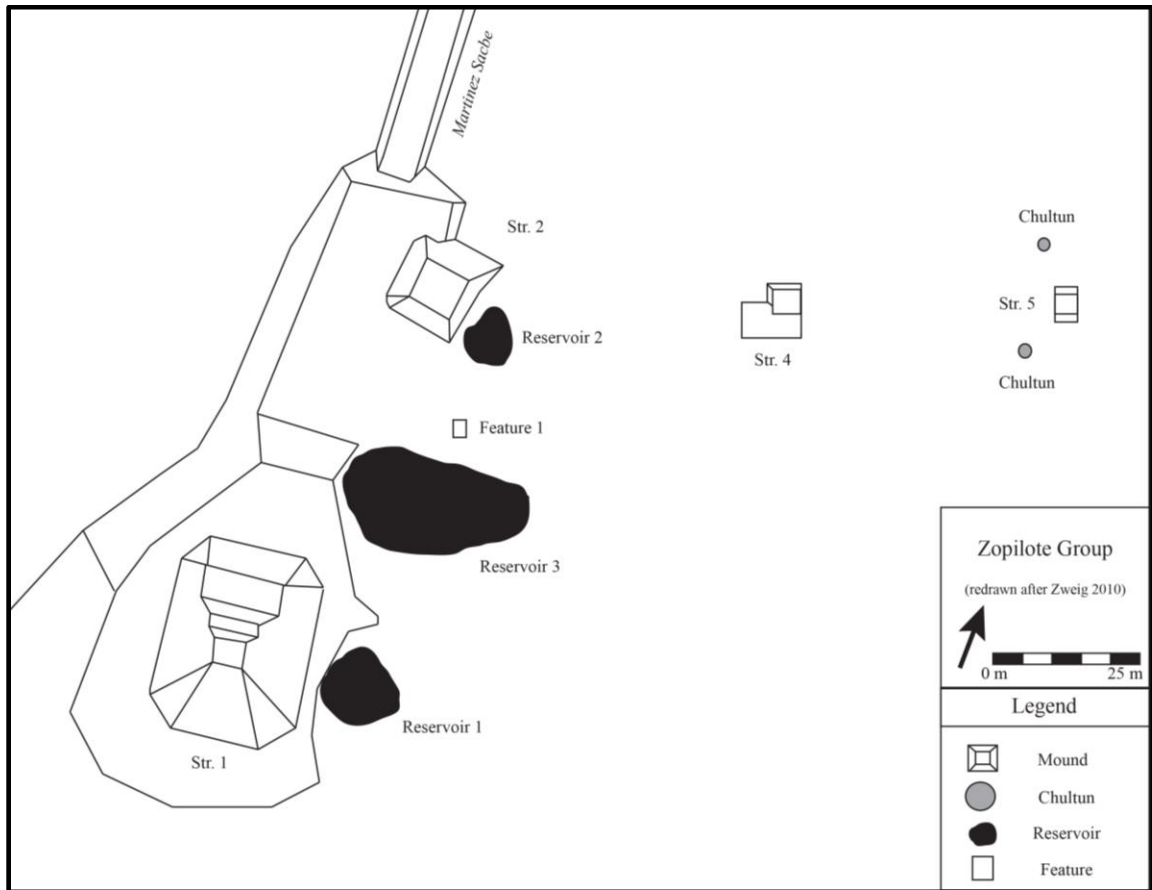

Figure 5. 5 - Map of the Zopilote Group

The cultural, political, and economic developments of the Middle Formative Period in the Maya lowlands were crucial to the later developments in the Late Formative and Classic Periods. Indeed, the archaeological record shows that the antecedents of the Classic Period Maya splendor began to coalesce during the Middle Formative period such that, by the beginning of the Classic period, the social, economic, and political

characteristics that define the broader Maya cultural arena were firmly entrenched in eastern lowland Maya social groups.

The Late Formative Period (350 BC – 250 AD)

During the Late Formative Period (350 BC – AD 250), Cahal Pech established itself as one of the pre-eminent sites in the upper Belize River Valley (Awe 1992:356). Settlements stretching to the confluence of the Macal and Mopan River likely continued to control trade to and from the Petén lowlands and the Maya mountains, as communities in those areas were beginning to flourish. New industries and technologies developed, including the production of pyrite plaques, or mirrors, and obsidian sources shifted from El Chayal to San Martin Jilotopeque (Awe 1992:356-357).

Marked changes in burial patterns occurred during the Late Formative Period. While simple burials with few grave goods were common in the Middle Formative Period, and continue to a small extent during the Late Formative Period, elaborate cist type burials came into fashion. These cist burials generally contain elaborate grave goods and are lined and capped with cut limestone (Awe 1992:357).

At the northern face of the Zopilote group Structure A1, archaeologists discovered an unusual “stela” burial with the earliest interment dating to the Middle Formative period). The vertical burial consisted of a large carved stela that was broken into two pieces. The area immediately surrounding the broken stela consisted of a ring of approximately 200 finger bowls containing 206 distinct bones (Awe 2013; Cheetham et al 1994). It has been estimated that, at minimum 25 to 27 individuals, and at maximum

206 individuals, are represented by contributions to the finger bowls. At the base of the stela on the northern side, archaeologists recovered a large quantity of mandibular incisors (MNI= 9, Max = 40) (Awe 2013:38). Although the stela is highly eroded, it, along with the finger bowls and teeth indicate to Awe (2013:38) that the “tomb” dates to the Late Formative period. Although the stela burial does not contain a human interment, the burial has been interpreted as a form of sympathetic magic with the stela likely representing a Late Formative Period leader or lineage head of Cahal Pech. Awe (2013:39) notes similarities between the Zopilote stela burial and burials found at Caracol to the south of and Pacbitun on the south-eastern portion of the Belize River Valley.

A second elite burial dating to the Late Formative period consisted of a cache-like burial found within the first permanent structure at Cahal Pech (Structure B4 at the south-east corner of the site core). Awe (2013:38) notes that the burial was dug into the construction fill of the structure, and the individual was interred as a cache interment rather than the standard prone burials found in the Belize River Valley. This burial consisted of two Late Formative ceramic bowls set lip-to-lip. The bottom bowl was placed upright while the top bowl was inverted and placed on top of the bottom bowl forming a container lid. Within the bowls, archaeologists found large fragments of a human cranium and two jade beads (Awe 2013:38). Next to the bowls, in a quadripartite arrangement were four human long bones accompanying four fragmented figurine heads and chocolate vessel spouts. Directly beneath the bowls was a crocodile figurine carved from conch shell and containing holes for jewel inlays. The skeletal material in question lacks several smaller bones typically found in burials, indicating to archaeologists that the

interment is a secondary burial, and may have been a ritual performer (Awe 2013:38-39). Awe has variously interpreted the figurine fragments as likely deified ancestors, ruler portraits, tools used in divination rituals, or representative of Pawatuns (Awe 2013:39), and it is possible that the individual interred in this manner was a diviner. Awe further connects the patterns found in this interment to mythological stories illustrated in the Popol Vuh creation story of the Quiche Maya (Awe 2013:39), and the mere presence of such a symbolic ritual burial hints at a highly developed and considerably structured ritual behavior. Although a lack of evidence is not evidence in and of itself, *a priori*, the absence of other burials with similar ritual components hints at the likelihood that some individuals were set apart from others, but that some individuals likely had stronger connections to the divine, a concept used to justify notions of divine kingship.

Two other burials dating to the Late Formative Period were located in the middle pyramid of the eastern triadic shrine adjacent to Plaza B. Burial B1-10 was a tomb burial located inside Structure B1, the center and largest pyramid of a triadic temple group marking the eastern boundary of Plaza B. This burial contained the remains of an adult male who was between 30 and 50 years of age. Not only was this male interred on top of ceramic vessels but, as well, two additional vessels were placed in a niche slightly above the remains. This burial was contained within what would likely have been considered a ritually important pyramid structure and as such, suggests that the male likely had an important role within the Cahal Pech community during the Late Formative Period. A second burial B1-8, located above burial B1-10 contained a male in his 30's who was interred with ceramic vessels, jade beads, and a figurine fragment (Awe 2013:40).

Interestingly, the figurine fragment found in this burial is a face that is shown in profile and has a “rough” textured back indicating that it was attached to another piece of ceramic at one point, possibly as a vessel adornment. This is the only case of a figurine being created to be viewed in profile at Cahal Pech (see appendix B).

Construction episodes continued, and during this time, truly monumental architecture, the pyramids and palace complex, are constructed. Awe (1992) notes that the increase in construction signifies not only that there was a system of stratification, but also that the people at the top of the system had the ability to “mobilize large groups of people for the construction of public and special function structures” (Awe 1992:357-358). While monumental construction is not indicative of social stratification in and of itself, the presence of monumental architecture combined with the evidence of highly ornate and differential burials indicates the presence of persistent and significant social stratification by the Late Formative period. The system of social stratification that appears to have begun in the Early Middle Formative, was deeply entrenched by this time, and can be seen not only in the differences between domestic and public architecture, but also in the deposition of artifacts signifying wealth and differential access to resources (Awe 1992:360). In keeping with the Middle Formative burials, the grave goods in Late Formative burials lack the elaborate ornamentation that often accompanied grave goods found in later Classic period burials, however the burial locations, inside the relatively newly constructed ritual structures indicate that even before the Classic period, and likely even before the Late Formative, people were differentiated based on social status. Both burial and architectural evidence from the Late

Formative Period are consistent with the inference that a form of divine leadership, whose roots can be found in the early Middle Formative, was firmly in place by this time and at the start of the Classic period, Cahal Pech had become a regional center (Awe et al. 2014:268; Horn 2015:56).

The Early Classic Period (250 – 600 AD)

By the Early Classic period (250 – 600 AD) the population of Cahal Pech had grown dramatically (Awe and Helmke 2005:44). During this time, both the site core and each of the periphery groups experienced major construction and modification episodes. Within the site core, the semi-private administrative and royal residential center located around Plazas A, D, and E were modified, as were the administrative buildings adjacent to the much larger and more public Plaza B, which, as the largest plaza at Cahal Pech, likely continued to host community-level functions and visits by foreign dignitaries (Tsukamoto and Inomata 2014) throughout the Classic Period. Whereas during the Middle and Late Formative periods, Plaza B was likely an open residential area, by the Classic period, the relatively open Plaza B likely changed to serve a public function. The eastern portion of Plaza B is bordered by an “In-line Triadic Eastern Shrine,” within which several elite burials have been located, suggesting to Awe that these triadic shrines functioned as shrines for ancestor worship (Awe 2008:162). In addition to the major construction of both public and administrative buildings during the Early Classic period, the eastern ballcourt was constructed (Awe and Helmke 2005:45).

Speaking to cultural changes during this time, Awe and Helmke (2005:49) note that by the Early Classic period, mortuary assemblages began to show significant stratification, even as the positions in which the deceased were interred remained the same. This indicates that social stratification had developed significantly, but may not be related to a new cultural group coming to the site or other extra-community factors, rather, the continuity of burial positioning indicates a cultural continuity while the increasing differentiation of status goods found in some burials hints at growing social stratification within this cultural continuity.

Excavations (and looting) at Cahal Pech have uncovered Classic period burials. Relatively little is known about the looted burial, designated as Burial A1-1, and although the perpetrator offered a confession and a Teotihuacan style vessel was found in his possession, he refused to provide any information on the burial or corresponding grave goods (Awe 2013:41). During the Classic period, elite continued to bury their dead within the eastern triadic shrine, as Burials B1-11 and B1-7 attest. Burial B1-11 contained the remains of a male at least 40 years old interred with multiple grave goods, including a large ceramic bowl, a stingray spine, several jade beads, a Spondylus shell, and two shell discs that were likely used as ornamentation.

The second Early Classic period burial found at Cahal Pech, B1-7, consisted of a large tomb housing the remains of at least three individuals. The first individual was likely disinterred and then reinterred later, the second individual was placed on top of the first individual, and the third individual was placed on top of the second. This tomb contained the most elaborate and ornate burial found at Cahal Pech. Accompanying

several ceramic polychrome bowls were painted shell beads, a halved conch shell containing the remains of paint pigments, a large quantity of carved and shaped jade beads, ear flares, celts, carved jade rings and a jade figurine. Accompanying those were several carved clay vessels and carved animal bones (Awe 2013:41-44). Mark Zender translated the glyphs on one of the rings to read “the ring (?) of K’awiil Chan K’inich, K’an ? Bahlam” possibly referring to the royal title of a group of rulers at the site (Awe 2013:43; Santasilia 2012).

Culturally, the Early Classic construction episodes created clear boundaries between public and private realms, effectively solidifying the separation of elites from other citizens (Awe 2008:169). Given the difference in grave good quantity and quality in Classic period tombs, it is likely that the aggrandizement of Cahal Pech’s ruling elite became increasingly important during this time. Awe (2008) further supposes that, given the large number of apparent residential structures in the Cahal Pech site core, there may have been many differentially statused elite kin groups (169).

Interestingly, while figurine fragments were an extremely common construction fill material during the Middle and Late Formative periods at Cahal Pech, they significantly decreased in quantity by the beginning of the Early Classic period. Indeed, only a handful of the figurine fragments found at Cahal Pech came from Classic period contexts, even as monumental construction increased significantly during this period. All the figurine fragments found in Classic period contexts are stylistically related to Middle Formative period fragments and may have been created during the Middle Formative period. Awe (1992) discusses one such fragment located in Classic period stela cache.

The fragment, a seated torso with no head or arms, was placed in the cache during the Classic period; however, the stylistic design and construction material are representative of the Middle Formative period and as such, may have been a family heirloom (Awe 1992).

The Late Classic Period (600 – 850 AD)

By the beginning of Late Classic period, circa 600 AD, the major center of Tikal had been defeated by its rival Calakmul, and numerous Maya cities that were previously allied with Tikal shifted (or were forced to shift) allegiances to Calakmul. For the Belize River Valley, influence from the powerful kingdom of Tikal was replaced by influence from the Calakmul-aligned city of Caracol. There is no evidence of military conflict at the Cahal Pech site core, and Awe believes that Cahal Pech voluntarily aligned itself with Caracol to continue prosperous trade relationships (Awe, personal communication, 2015).

Dating to the Late Classic Period, a single adult male was buried at the apex of Structure B1. The burial, titled Burial B1-2, was excavated in 1969 by Peter Schmidt. The male was interred with lavish grave goods indicating that the man was likely a ruler, or at least a man of high status. In addition to eight ceramic vessels, the burial contained jade celts, commonly suspended from a king's belt, along with beads, a jade funerary mask, ear flares, two shell masks, and several obsidian blades (Awe 2013:45).

During excavations of the non-residential terminus Zopilote group, Cheetham et al. (1993:152-172) uncovered a burial containing the remains of two individuals. The first individual was an adult male who had extensive dental modification, complete with

jade inlays. The second set of remains consisted of the cranium of a young male placed inside of a ceramic dish. Since the interment did not contain any other remains related to the second individual, Awe hypothesized that the second individual was the victim of a decapitation event (Awe 2013:45). Within this burial, a rare wood fragment was recovered, along with several highly elaborate polychrome vessels, several pieces of carved jade, Spondylus ear flares, a stingray spine, a large conch shell, and a high quantity of decorated stucco fragments. Awe notes (2013:46) that this type of burial is typical of burial traditions found at Caracol, further supporting the hypothetical link between the two sites.

Terminal Classic Period (850 – 1000 AD)

Towards the end of the Classic Period, known as the Terminal Classic Period (AD 850-950), state level social complexity began to unravel across the Maya region. The precise reason for the decline, also known as the collapse of the ancient Maya, remains unknown, but it has been variously suggested that the ultimate cause was related to endemic warfare related to dynastic disputes (Demarest 2013), over-population causing an extreme depletion of resources (Demarest 2013), widespread epidemics (Coe 2011:169), and long-term extreme drought (Kennett et al. 2012). Although the ultimate cause or causes of the Terminal Classic social and political decline is beyond the scope of this dissertation, Awe and his colleagues note that by the end of the tenth century AD, there appeared to be severe population decline at multiple sites in the Belize River Valley (Awe et al. 2014:268-269). Cahal Pech was not immune to the unraveling of state-level

society. Throughout the Belize River Valley, ceramics dating to the Terminal Classic period were found in contexts that suggested that groups of people began to reside inside structures that had been abandoned at the end of the Late Classic Period (Aimers 2004; Culbert 1973). In his analysis of Terminal Classic and Postclassic ceramics from the Belize River Valley, Aimers notes that much of the Terminal Classic ceramics found in the region appear to be elaborations of types that were common to the Classic Period (Aimers 2004:313).

Terminal Classic construction at Cahal Pech was “limited and small by Late Classic standards” (Douglas et al. 2015:218). Construction occurred only in the eastern portion of the site, in Plazas C and H. Sometime during the early Terminal Classic, the final residents of Cahal Pech undertook a large construction project- renovating all buildings bordering Plaza H (Douglas et al. 2015:219). The stones used in this construction tended to be uncut or unmodified and varied in size from cobblestones to large boulder type rocks.

At Cahal Pech, eight burials dating to this time have been found. All but one of these burials were intrusive, that is, buried inside various structures long after the structures were built. The non-intrusive burial, designated as H1-1, was discovered within the Terminal Classic H group, located at the north-east corner of the Cahal Pech site core. This interment consisted of a large tomb constructed by cut stones that had been removed from a Late Classic structure that was dismantled for its building material (Awe 2013:46), with a five-step staircase descending from plaza level to the tomb (Douglas et al. 2015:220). Tomb staircases, which were uncommon in the Belize River

Valley, were common at Caracol, further supporting Late and Terminal Classic ties between Caracol and Cahal Pech (Douglas et al. 2015:221). The young adult male was interred with 11 ceramic vessels, perforated bone tubes, a jade pendant representing the corn god, one set of jade ear flares, dog teeth, a shell bead, a modified conch shell, and the bones of a small feline. Only one of the vessels in this burial was a decorated polychrome vessel, although the color and decoration are not as complex as earlier Classic Period polychromes. The remaining vessels were a mixture of bichrome vases, or simple, unslipped dishes (Awe 2013:47). Awe hypothesizes that this was the final royal interment at Cahal Pech before the site was abandoned (Awe 2013:47). An examination of the grave goods associated with this burial clearly indicate that the quality of what was considered sumptuary goods was greatly reduced from its Classic Period splendor by the time of the Terminal Classic period. Like the Early and Late Classic occupations, the Terminal Classic occupation of the H group, including burial H-1, did not yield any figurine fragments. It is apparent that, whatever circumstances led to the termination of figurine usage in the Late Formative/Early Classic period, continued into the Terminal Classic period, at least until the site was initially abandoned by the ruling elite.

After a relatively short hiatus of around 50 years, represented by a lack any discernable activity at the Cahal Pech site core (Awe, personal communication 2015), people came to the site and began burying their dead within the major structures in the site core. These burials, known as intrusive burials were, in many cases, literally carved out of existing monuments and structures. These intrusive burials effectively re-introduce figurines into the archaeological record of Cahal Pech, as some of the

individuals were interred with mold made, polychrome painted figurine fragments and musical instruments. Additionally, during this time, construction material, including construction fill, was pilfered from the buildings surrounding Plaza C to construct the Terminal Classic buildings surrounding Plaza H (Douglas et al. 2015).

Conclusion

Sometime around 1,100 BC, Cahal Pech began as a small community of a few houses nestled on top of a hill overlooking the confluence of two rivers. From that auspicious beginning, the community grew exponentially, both in population and over geographical space. During the Middle Formative Period (900 – 300 BC), Cahal Pech blossomed to become a dominant center in the Belize River Valley. By exerting control over the confluence of the Macal and Mopan rivers, thereby influencing trade between the Caribbean on the east, the Petén lowlands to the west, and the Maya mountains to the south, Cahal Pech established itself at an early date as a hub for riverine trade while also simultaneously establishing contacts with communities over land.

As seen in the architectural and burial evidence from this time, individuals and kin groups began to accumulate wealth in the form of exotic goods and access to resources in an uneven manner. By the end of the Middle Formative Period, this uneven access to exotic prestige goods, coupled with the creation of public plazas and restricted palace groups indicates that social and economic stratification was firmly entrenched.

By the Late Formative period, public buildings became larger, while private buildings became even more restricted in access. The peripheral house groups were differentiated by not only construction type but also by access to resources, creating a stark division between social groups. Grave goods became even more elaborate, and, taken together, the social and economic stratification that became entrenched by the end of the Middle Formative period reached new levels during the Late Formative period.

The Early Classic period burials generally contained dramatically more prestige goods than ever before, and the restricted architecture that had been renovated during the Late Formative period was remodeled and access to the inner sanctum of the palace became more restricted in access than ever before. By the Late Classic period, however, luxury and wealth declined in the Maya lowlands, for reasons that are still debated; and sometime before AD 850, the ruling elite at Cahal Pech abandoned the site core. Why they left and where they went remain matters of conjecture; however, there is no indication of warfare in the Cahal Pech site core, and no other evidence to indicate a forced or violent confrontation. At least fifty years later, around AD 900, local, lifelong residents of the Belize River Valley (Friewald 2011) began to dig intrusively into the various abandoned architecture throughout the site core and inter their dead. During this time, construction material was pilfered from the administration buildings adjacent to Plaza C, and the H group on the northeast corner of the site core was constructed, however, sometime later, the residents of the H group left the site, and the hilltop citadel fell into disuse.

It is important to note that the trends discussed in this chapter are not isolated to Cahal Pech, or the Belize River Valley. In fact, during these time periods, similar changes were occurring throughout the Mesoamerican world. It is widely recognized that the antecedents of state formation, where they occurred, happened at least by the Late Formative period, if not earlier: Evidence includes differential access to prestige goods, changes in burial patterns, changing architecture patterns including the enhancement of some residential units, and elaboration of preexisting ritual and artistic conventions (Awe 1992, 2008, 2013; Coe 2011; Estrada-Belli 2011; Fois, 2013; Grove and Gillespie 1992; Grube 2012; Hansen 1998; Houk 2014; Kowalewski 1992; Lucero 1999; McKillop 2004; Powis and Cheetham 2011; Pye and Demarest 1991; Rice 1976; Sanders 1974, Tsukamoto and Inomata 2014; Yaeger 2000).

What is unique about the case of Cahal Pech is the treatment of material culture, in particular, figurines, in conjunction with the social and political changes throughout the Maya world. In some places, figurines undergo stylistic changes by the Early Classic period but continue to be used, while in other places, figurines begin to be used more during the Classic period (Halperin 2007; Hendon et al. 2014; Lopiparo and Hendon 2009). In the case of Cahal Pech, we see figurine use drop off significantly, if not ceasing altogether, by the beginning of the Classic period, a phenomenon that I link to the change in importance of the kinship system through the phenomenon of enchainment (Chapter 2) as local leaders were transformed into kings of divine origins during the state formation process (Chapter 3).

CHAPTER 6: FIGURINES IN PREHISPANIC MESOAMERICA

Ancient figurines have long fascinated scholars and the lay public. The abundance of figurines at sites around the world not only provide us a glimpse into how ancient peoples conceptualized human, supernatural, and animal bodies, but also provide a comparative tool with which we can examine seemingly disparate cultural groups.

This chapter reviews studies of figurines in Prehispanic Mesoamerica, examining how figurines have been typed and classified, if and how figurines may depict biological sex and gender ideologies, and how past interpretations of the meanings and uses of figurines inform our current understanding of the use of figurines in Prehispanic Mesoamerican lifeways. Attention is paid to hypotheses of the function of ceramic figurines in ancient Mesoamerican ritual life and iconographic interpretations of political, social, and kinship identities. This chapter is not an exhaustive discussion of Mesoamerican figurines; rather, it is meant to highlight specific studies that are of specific relevance to the broader research questions outlined in Chapter One and, as such, have influenced the interpretation of figurines found at the site of Cahal Pech.

Tracing the origin of the ceramic figurine tradition in Mesoamerica, Prudence Rice (2015) notes that figurines appeared in highland Mexico as early as the Archaic-Formative transition (c. 3000-2500 BC) and spread relatively rapidly across the entire region. Indeed, ceramic figurines have been found in every region in Mesoamerica that is associated with Prehispanic cultural groups. Rice calls attention to the phenomenon that

Mesoamerican figurines, particularly those relating to the Formative period, are highly variable from site to site, and even within sites. Even performative activity, what activity the being in the figurine is depicted as engaged in, is, as Rice noted, variable, in that “the positions [vary] with date, location, age, and sex” (Rice 2015:6). Essentially, for Rice, Formative period figurines from Mesoamerica tend to be variable in how performative activity is shown. This variation highlights the fact that there was no single Mesoamerican cultural group, and although figurines were used by nearly all, if not all, cultural groups in Mesoamerica, they may not have been used in the same way, or have carried the same meaning. Additionally, although abundant, figurines in Mesoamerica were not universal, as they can be classified in many ways, may have been used in different ways, and depict the human, supernatural, and/or animal body differently.

Typologies and Classifications

The initial Mesoamerican figurine typologies were attempts to find cultural and Prehispanic associations between ancient Mesoamerican cultures and figurines found in both museum collections and at archaeological sites throughout the world (Butler 1935; Covarrubias 1957; Gamio 1924; Vaillant 1932, 1938). In 1924, Manuel Gamio published a sequence of cultures that occurred in the Valley of Mexico based on work that he had started at the site of Atzacapotzalco, Mexico, in 1911 (Adams 1960). Gamio’s work established an initial chronology of cultural change that occurred over the centuries of occupation in the Valley of Mexico. In 1938, Vaillant created a typology to encompass

the early archaeological periods uncovered in stratified excavations in the Valley of Mexico. The Hays-Vaillant figurine types existed within the noted areas and the types themselves were named after the major cultural groups in the region at the time. Placing these periods in a chronological sequence aided in the establishment of a coherent ceramic typology that is still in use today (Christmas 2011). The resulting typology became the standard for which dating ceramic figurines in the Valley of Mexico derived, and continues to be used in figurine studies for the region for both relative dating and classification, and for the purposes of comparing figurines from different cultural groups. This typological classification system was an attempt to understand how figurines not only changed over time, but how those figurines illustrated differences between cultural groups.

Mary Butler (1935) shifted the focus of figurine research in Prehispanic Mesoamerica when she recognized at an early date that many mold-made figurines at the Maya site of Palenque were essentially mass-produced during the time that would later be defined as the Early Classic Period, gradually declining in numbers until production ceased at the end of the Late Classic Period (638). Although Butler was careful not to assign a purpose to early mold-made figurines from the Maya region, she recognized that many were likely used as whistles; she further noted that, at Palenque at least, many figurines were also found in construction fill, although she did not conduct additional analysis this phenomenon. She further hypothesized that, given the presence of figurine fragments located in and near residential structures, figurines were likely used at a household level, acknowledging a near absence of (as of 1935) figurines recovered in

either burial or ritual cache contexts (641). Although she recognized trends that would, for the most part, later be affirmed by further archaeological evidence, Butler's work focused mainly on establishing quantifiable iconographic categories of figurines and tying those categories to specific cultural regions and time periods.

As archaeological excavations continued, the use of figurines to establish chronological sequences became relatively commonplace. In the early 1960's, Gordon Grosscup (1961:390-391) published a chronological sequence of ceramic figurine types from the West Mexican site of Amapa, Nayarit. Grosscup established specific figurine types based on iconographic features and chronologically correlated those sequences to the Classic Period. Additionally, Grosscup tied the iconographic features of the Amapa figurines to finds at other sites in Nayarit, the Valley of Mexico, and the Michoacan area and found an abrupt shift in figurine iconography between the Early and Late Classic periods (404), and used this break in figurine iconography to hypothesize the introduction of a new cultural group to the region at the beginning of the Late Classic Period (405). Thus, Grosscup argued that trends in figurine iconography and usage could be indicative of social, economic, and/or political change.

These early typological studies remain highly influential to Mesoamerican archaeologists who continue to study figurines. Vaillant's typology represents one of the earliest attempts to understand social organization in Prehispanic Mesoamerica through an examination of ceramic figurines. As early as the 1935, Butler recognized variability in contextual deposition of figurines and hinted at the possibility of multiplicity of meanings and uses. A quarter of a century later, Grosscup suggested that figurine

iconography could indicate social, economic, and political change – effectively suggesting linkages between the creation, decoration, and use of figurines to the broader social, economic, and political climate of ancient Mesoamerican communities. These three studies, in various ways and to various degrees, continue to influence Prehispanic Mesoamerican figurine studies seeking to type or classify figurine styles, and/or examine the role of figurines in depicting social, economic, and political change.

Sex, Gender, and Figurines

In Prehispanic Mesoamerica, figurines typically depict a wide range of beings. Primarily, figurines are anthropomorphic in depiction, but many figurines and musical instruments depict zoomorphic or supernatural figurines, or some combination thereof. While there are several zoomorphic and supernatural figurine and ocarina fragments in the Cahal Pech figurine corpus, the primary consideration of figurine iconography in this dissertation considers those figurines depicting anthropomorphic beings.

Ceramic figurines are frequently considered a way to understand gendered ideologies in ancient societies, to varying degrees of success. Marija Gimbutas (1974) influenced the interpretation of ceramic figurines throughout the world by hypothesizing that many ancient figurines found in Eastern Europe depicted women, and her work on these figurines demonstrated, per Gimbutas, that early humans worshipped women and her reproductive potential as the “great goddess.” Although Gimbutas’ assertion of an early goddess complex evidenced by the prevalence of female figurines has been

thoroughly debunked by modern archaeologists (Conkey and Tringham 1995; Tringham and Conkey 1998), many still tie figurine use and production to female biological and fertility processes. Practically speaking, the idea that female figurines represented a cult of fertility was “an easy way to account for female figurines” in an androcentric world (Lesure 2011:14). Despite this dualistic approach about sex and gender, many figurine studies discuss, tangentially, a subset of figurines that cannot be identified as either male or female, or even human in some cases. These figurines are often explained as anomalies rather than expressions of alternative sex assignments. Lesure (2011:14) points out that these studies tend to essentialize women by inadvertently laying a “claim that there is a universal essence that is everywhere their most fundamental characteristic”, that of reproductive ability. Knapp and Meskell (1997:183) similarly argue that when the focus of figurine analysis predominantly relies on assigning male or female status to figurines, the result is that embodied experience, individuality and conceptions of agency are downplayed or even ignored completely.

Diane Gifford-Gonzalez (2007) claims that artistic depictions of women of the past are fraught with essentialized notions of domesticity. At Çatalhöyük, Turkey, she found that women are primarily depicted in the background of those images engaged in domestic tasks such as caring for children and hide working. The interpretations of these images, she claims, are a product of an academia that is focused on the role of women as background figures, responsible for daily drudgery and reproduction and little else. Similarly, Nakamura and Meskell (2009) similarly state that ideas relating human figurines to reproductive ability or goddess veneration are grounded in Euro-American

stereotypes, and hence are highly problematic. Nakamura and Meskell note that while features such as large breasts, rounded stomachs and narrow waists may be highly sexualized in the present day, they may not have been perceived as such by the people who made and used the figurines (208). Analyzing ceramic figurines from Çatalhöyük, Nakamura and Meskell claim that female figurines may be representative of life cycle or abundance rather than stages of reproduction (222). Furthermore, they call attention to a simple but often overlooked feature of figurines, that “figurines are often materializations of idealized or projected types rather than direct reflections of reality” (227), discussed further in Chapter 9 of this dissertation.

While research in Mesoamerica predominantly considers figurines to be an implement of ancestor veneration rituals, some studies consider figurines as intimately tied to fertility rituals by the presence of female sexed figurines; however, assignment is more difficult in Mesoamerica because of the general (although certainly not universal) Mesoamerican stylistic convention against portraying detailed sexual characteristics directly on figurines. For example, Grove and Gillespie (1984) noted that many figurines from Central Mexico emphasized hips and thighs that indicated femaleness, and as such, were likely tied to fertility rituals, a view that Nakamura and Meskell challenge when discussing figurines from Çatalhöyük.

In their study of Honduran figurines from the Ulua Valley, Hendon, Joyce, and Lopiparo inferred that many identifiable Formative Period figurines were “either explicitly female or likely female, based on such features as dress and body proportion” (Hendon et. al 2014:12). Hendon does note that the paucity of Formative Period

figurines precludes assigning a function to these objects. They do discuss, however, the later use of figurines in the Classic period to both celebrate and cement social bonds within and between house groups, a phenomenon discussed in more detail in Chapter 9 of this dissertation.

Zweig (2010) noted extreme difficulty in using primary sex characteristics (genitalia) to determine the sex of the figurines at Cahal Pech, due to the universal absence of those characteristics in the Formative Period assemblage there. Zweig resorted to examining overall torso shape including constricted waists, round bellies, and curved hips to denote women and the opposite of each trait to denote men to determine figurine sex, but also stated that this methodology is subjective at best. Although she could use the expanded criteria to determine sex in roughly half of the figurines, Zweig concluded that there may have been gendered costume elements worn on figurines and that these have not survived over time.

The absence of recognizable, clearly defined sex characteristics in the figurine corpus from Cahal Pech could indicate that: 1) the sex of the figurine was not important; 2) the sex of the figurine was displayed in ways that we can no longer determine, such as clothing; 3) the figurine was purposefully asexual; and/or 4) sex is displayed but in a way that we do not fully understand. While some Mesoamerican figurines in other regions do clearly indicate biological sex through detailed clothing visible on mold-made figurines, this is primarily a Classic Period phenomenon across Mesoamerica, connected to the use of figurine molds to create highly detailed figurines. Formative Period figurines are

generally hand-made and lack the detailed elements of the later mold-made samples, making it difficult, at best, to determine if and how biological sex is being represented.

Across Mesoamerica, the difficulty in assigning biological sex to many Formative Period figurines makes it even more difficult to speak of figurines in terms of gendered iconography. Although biological sex and socio-cultural gender constructions are not the same phenomenon, with respect to the ancient past, they are highly intertwined phenomena. Ardren (2002:69) aptly calls attention to the fact that when looking for gender, archaeologists tend to look for evidence of performing gendered activities rather than an individuals' understanding of their own gender identity (69). With respect to figurines and gender, we cannot use figurines to make inferences about ancient Maya constructions of gender and gendered ideologies without understanding what biological sex, if any, the figurine manufacturer and user intended it to be- that is how the manufacturer intended to convey "the social reproduction of gender identities" (69).

The Meanings and Uses of Figurines

Over the past 80 years, and contrary to Butler's (1935) early assertion that figurines were not linked to ritual activities, figurines have frequently been found in ritual caches as well as elaborate burials in some Prehispanic Mesoamerican sites. Figurines remain most frequently found, especially in the case of the Cahal Pech figurine assemblage, in association with construction fill (see Chapter 2). Typically, these figurines are fragmented with most, but not all, broken at structurally weak points of the figurine such as the neck, shoulders and hips. Although they have mostly been found in

association with Middle and Late Formative Period construction fill, figurine fragments at Cahal Pech have also been found in stela caches and burials from the same time period. In every context in which they have been encountered the figurines are fragmented. Some figurines show signs of deliberate defacement and breakage such as patterned scratches across the face, while other figurines show no evidence of being defaced. Purposeful breakage, as opposed to breakage occurring during normal taphonomic processes, is indicated by the fact that most of the figurine fragments from the same or adjacent excavation units and levels cannot be refitted in any fashion. It would appear, based on the excavation unit placement, that the figurines were not simply broken, but also that the pieces were scattered around a large area. Analyses of this phenomenon has been sparse at best, due to the assertion by archaeologists that construction fill is not a primary artifact context, although I believe that construction fill may be a primary context (Chapter 2). We now turn to hypotheses about the function of figurines in their use-life, before they were deposited in construction fill.

Awe (1992) discusses the use of figurines as a medium for ancestor veneration. The figurines would be said to embody the spirit of a venerated ancestor for a time, and when the specified time was up, the figurine would be broken and defaced to release the embodied spirit before being discarded (Awe 1992; Lucero 2003; Marcus 1998; Rice 2015). This idea is common among Mesoamerican archaeologists and has merit in ethnoarchaeological studies showing that even today, many indigenous Maya still practice forms of ancestor veneration, a phenomenon that lends weight to assertions of ancestor veneration in the ancient past.

In their discussion of termination rituals and ritual garbage, Stanton, Brown and Pagliaro note that the ancient Maya viewed their world as animate and as such, many materials in their world could be “manipulated by social agents” (2008:235). They suggest that, to release the animate spirits in both architecture and artifacts, the ancient Maya likely conducted rituals intended to release the animate “spirit” contained within the ritual object. These rituals often included the breaking of objects at the end of their use cycle to release the animate spirit and depositing these broken, now inanimate objects as ritual trash (Walker 1998).

Harrison-Buck (2012) discusses the use of Maya imagery as representing animate persons that had a specific life cycle. Through processes of ritual birth and ritual death, artifacts such as figurines may have possessed a “life” that mirrored that of its owners/users. In contrast to Stanton, Brown and Pagliaro, however, Harrison-Buck concludes that the ritual defacement of images of rulers may have been a form of harm inflicted upon the soul of the person in the representation (104) as a kind of sympathetic magic, which may explain why many of the figurines appear to have been defaced and/or ritually broken.

Joyce Marcus (1998; 2009) regards figurines as the domain of women’s ritual connected to ancestor veneration in Formative Period Oaxaca. To do so, Marcus elaborates on ethnographic evidence from China, Japan, and several West African communities that not only practice forms of ancestor worship, but also use figurines to do so, an assertion that strengthens the possibility of figurine use for ancestor worship in the Maya case. Figurines, in Marcus’ assessment, were embodied spirits of ancestors that

needed to be maintained. Tying this maintenance to the household for which women were likely the primary workers, Marcus asserts that rituals involving ancestor veneration was conducted predominantly by women. As stated earlier, Gifford-Gonzalez (2007) criticized this highly westernized view of gender roles in that it essentializes women into roles of domestic denizens but leaves little room for agency or power outside of the home, while simultaneously divorcing males from any connection they would have had within the household.

Triadan (2007) echoes these sentiments in her discussion of figurine fragments found in elite contexts in the rapidly abandoned site of Aguateca, Guatemala. Triadan called attention to the fact that figurines were recovered within households and from middens associated with these households and linked the household context directly with women and their presence in the domestic sphere. Connecting ethnohistoric activities of food production and weaving to the large presence of figurine fragments in these contexts, Triadan supposes that women were the primary users of figurines, however, she does leave room for the possibility that males used figurines as well (2007:285). Triadan further comments that the lack of depiction of elite women participating in domestic tasks in both figurine media and in large-scale public imagery could indicate that the roles and responsibilities of elite women from Aguateca were not linked solely to domesticity, but also had social, ritual, and political roles “in the same realm as that of elite men” (286).

Other’s studies of Maya figurines similarly hypothesize that figurines served a function in fertility rituals at other Mesoamerican sites (Awe 1992; Grove and Gillespie 1984; Willey et. al 1965) and Awe (1992) notes that they also may have been images of

lineage heads at the site. It should be noted that there is little evidence for the gendered use of figurines, that is the use of figurines primarily by women for domestic purposes, and even less evidence for the gendering of figurines as it is much more common for figurines to lack plausible indicators of biological sex. An exception to this assertion is noted by Cyphers Guillen (1993), who used figurines to examine women's roles related to social complexity and power in Middle Preclassic Chalcatzingo. Cyphers Guillen viewed figurines as related to "the formation of gender hierarchy, the tendency toward the institutionalization of hierarchical kin-ordered relationships, and the organization, operation, and manipulation of reciprocal systems in that society" (1993:209). Particularly salient to her discussion, Cyphers Guillen demonstrates that figurines at Chalcatzingo indicate women at various life-cycle stages. Although genitalia are not directly depicted on Chalcatzingo figurines, in her view, secondary sex characteristics such as distended abdomens, rounded breasts, and small waists compared to hip size all indicate female physiology (214-216). While not speaking directly to lowland Maya cultural phenomena, Cyphers Guillen's research on the non-Maya Mesoamerican site of Chalcatzingo examines broader notions of how figurines may depict the values of a social group. Cyphers Guillen ties figurine production to webs of social interaction that linked households to one another. These links were likely formed during life-cycle ceremonies (218). Calling attention to the seeming contradiction of figurines being placed in dedicatory caches while also being used in construction fill, Cyphers Guillen discussed the meaningful use of figurines, which were predominantly found in elite contexts, as

being related to increasing status differentiation and the shifting of kinship obligations in a society that was growing more complex (219).

Likewise, Hendon and colleagues discuss Honduran marriage figurines in the context of representing female life cycles and were created for specific events, being “discarded immediately after the event for which they were made” (2014:91). They also, however, acknowledge that, at least some Prehispanic Honduran figurines, particularly those found at the site of Travesia, may have represented ancestors and ancestral connections to animal spirits (121). Hendon and colleagues (2014) ultimately interpret double figurines, that is, figurines that depict two individuals standing next to one another, as deeply connected to family groups and connections between them, implicitly highlighting the importance of both the female life cycle and ancestral worship within these family groups.

A royal burial at the Maya site of Yaxuná yielded a single figurine known as La Muñeca (Ardren 2002:84). The figurine, a rare find at Yaxuná, was found in the arms of a princess who was buried with two other women and nine men. The overall interpretation of the burial suggests that a usurping lineage had killed and buried heirs to the throne of Yaxuná. As Ardren notes, this figurine was clearly made near Yaxuná, but evokes elements of Teotihuacan style imagery and may have been used “as a symbolic statement of control and appropriation” by the usurpers (85). Thus, although figurines were not nearly as common in the Yucatan as they were in the southern Maya lowlands, they could have been created and used for ritual purposes involving identity formation and continuation, and the appropriation of power.

Grove and Gillespie (1984), in their analysis of figurines from the site of Chalcatzingo (see also Cyphers-Guillen 1993), argue that figurines may represent portraits of rulers and thus were tied directly to ancestor cults. Furthermore, Grove and Gillespie attempt to explain the phenomenon of ritual breakage and defacement as a way of neutralizing the embodied power of the ancestor that was present in the figurine (32). Awe (1992) argues that the figurines from Cahal Pech show similar characteristics to the figurines from Chalcatzingo, and further hypothesizes that the figurines may have depicted lineage heads. He notes that although the figurine heads at Cahal Pech have mutually similar facial features, there are slight differences between groups of figurines, which may indicate, such as in the case of Olmec colossal heads, that the figurines were depicting different individuals. The fact that many figurine fragments were found within construction fill in the oldest monumental building at Cahal Pech furthers his idea of figurines being connected to ancestor worship (283-285) in that the figurine embodied the spirit of the ancestor but was then broken and discarded at the end of their use cycle to release the spirit.

Christina Halperin (2007) examined Late Classic figurines from both the site and peripheral settlements of Motul de San José, Petén, Guatemala. Halperin concluded, based on the centrality of distribution of figurines, that they likely had both official ceremonial and unofficial household usages (324). For Halperin, figurines were not simply tools of religious devotion, they were items “in which religious values, ideologies and social identities were reproduced” (325), however she notes that, although figurines at Motul de San José were used for multiple purposes, it is likely not the case that they

were used for the same purposes or to the same extent in other Maya sites throughout time.

Halperin and colleagues (2009) discuss figurine distribution at and near the Late Classic Maya site of Motul de San José and noted that figurines were found in multiple household contexts regardless of settlement rank (465) and were likely distributed from the center of the Motul polity (468). They further qualified that assessment with data demonstrating that elite architectural groups generally yielded a higher density of figurines than non-elite groups (467). Overall indications, however, seem to be that in the case of Late Classic Motul de San José, figurines were iconographically standardized and this standardization cross-cut social and political status groups (469).

That figurines may be tied to social and political concerns is not a new idea (Cyphers Guillen 1993; Grove and Gillespie 1984). Brumfiel (1996) called attention to multiple meanings of figurines. In particular, Brumfiel noted that distance from the Aztec capital of Tenochtitlan seemed to be the most relevant factor in figurine depiction. Curiously, the farther away that a site was from the Aztec capital, the more diverse the iconography of figurines. Tying this observation to Aztec state dominance, Brumfiel suggested that household based figurines were used by citizens of the Aztec empire as a way of resisting state sanctioned dominance related to idealized gender norms that were displayed in public for wide audiences to view. Thus, for Brumfiel, figurines at the household level operated as a tool of resistance to the publicly idealized state notions of gender.

It is important to note, however, that although figurine fragments have been found in construction fill at many Mesoamerican sites, they have also been found in burials and in dedicatory caches, and this is the case at Cahal Pech. The multiplicity of contexts in which figurines have been found at Cahal Pech indicates that there were likely multiple uses and meanings of figurines both within the site core and the periphery settlements, and that the meaning of a single figurine may have changed over time. Rice (2015:5) argues that, from a pan-Mesoamerican perspective, categories of figural representation, sizes, and the medium in which they are expressed are quite variable as are the archaeological contexts in which they are found. Although, as Brumfiel also states, large scale sculpture is generally understood to be a type of public display, she noted that portable figurines, like the figurines discussed in this dissertation, were likely used in a wide range of contexts and probably had a wide range of meanings encoded into them.

Conclusion

The similarities and differences found in figurines across Mesoamerica and illustrated by typologies and classification systems demonstrate some, though certainly not all, cross-cultural stylistic conventions in how certain body parts are represented on ceramic figurines. The similarities in stylistic convention are an important consideration for understanding how different culture groups throughout Mesoamerica used and discarded figurines. Not only are similar trends of household ritual use found in Oaxaca (Marcus 1998) and Chalcatzingo (Grove and Gillespie 1984), but also at Cahal Pech (Awe 1992b). As Rice (2015) notes, there are differences in figurine depiction, use, and

deposition as well. Those differences range from specific regional styles to performative action, to pre-depositional treatment. Additionally, the salience of figurines in a culture is largely dependent on the particular time period and circumstances that the cultural group experiences. Simply put, figurines may mean different things at different times to the same cultural group. These differences are sufficient enough to clarify that, although there are similar trends in figurine depiction, use, and deposition across a wide span of Pre-Columbian Mesoamerican cultures, there is not a single, universal explanation for the depiction, use, and deposition of ceramic figurines throughout Mesoamerica.

CHAPTER 7: METHODOLOGY

This dissertation project was initially divided into two phases, the Curation Phase and the Analysis Phase. The Cahal Pech figurine fragments were located during excavations as early as 1988 and as late as 2015. While archaeologists have commented on the individual fragments uncovered during their excavations, the information was not, until now, compared with figurine fragments from other excavations. Over the course of two field seasons (2014 and 2015), figurine fragments from the site of Cahal Pech and neighboring small settlements, and a comparison sample from the sites of Blackman Eddy, Pacbitun, Santa Rita, Baking Pot, and Xunantunich were removed from long-term storage and were processed as a single artifact collection, resulting in one of the largest and most documented collections of figurine fragments in the eastern Maya lowlands totaling 1,001 individual figurine fragments.

The Curation Phase

This phase involved removing figurine fragments from long term storage and consisted of creating a catalog of all figurine fragments. The Curation Phase consisted of several components: assigning catalog numbers to all figurine fragments, taking multiple photographs, reconstructing fragments where possible, taking three-dimensional measurements, entering the information into a database created for this purpose, and designing and implementing long-term storage of the fragments for future study.

Catalog Numbers

All figurine fragments were assigned catalog numbers based on the site where they were recovered and the order which they were processed. Each site was assigned a three-letter code: Cahal Pech (CHP), Blackman Eddy (BME), Pacbitun (PCB), Santa Rita (STR), Baking Pot (BKP), El Pilar (ELP) and Xunantunich (XUN). The designated catalog number contained the site code as a prefix, followed a 5-digit numerical sequence indicating the order of processing, starting at 00001.

Figure 7.1- Labeled Figurine Fragment

The assigned catalog number was then noted on the accompanying artifact provenience card and was printed out on a standard inkjet printer in 6-point font. The

number was then cut out from the paper and affixed to each artifact using a 50% concentration Paraloid B-72 compound base coat to which the label was affixed, and a 25% concentration Paraloid B-72 compound applied to the top of the label as a waterproof sealant (Figure 7.1). I chose to use Paraloid B-72 as its chemical concentration does not harm artifacts, and can be easily removed with acetone. When figurine fragments that were assigned separate catalog numbers were later found to be part of the same figurine, the catalog number for the largest piece was taken as the primary number, and the catalog numbers of the other pieces were nullified in the database using a –Z suffix to the artifact catalog number. The numbers assigned to each figurine fragment was arbitrarily chosen based on the order in which the figurines were collected from storage.

Photographs

All figurine fragments were initially photographed with the accompanying artifact identification card. All figurines were photographed with a minimum of three views and without the artifact card (Figure 7.2). Initial photographs containing the provenience card were labeled with the catalog number that was assigned to the artifact and included the suffix –X (for example: CHP-00001-X). Subsequent multi-view photographs were labeled with the catalog number assigned to the artifact in addition to a suffix containing

Figure 7.2- Multiple View Figurine Photographs

information about the view angle of the photograph. File name suffix 1 denotes a frontal, primary photograph, while suffix 2 indicates a posterior secondary photograph showing the catalog number placed on the artifact. Subsequent suffixes detail right, left, and vertical angles from which the photographs were taken.

Reconstruction

Fragments were pieced together to reconstruct figurines that had been broken. When figurine fragments fit together, they were secured in place using a 50% concentration Paraloid B-72 and left to dry overnight. When figurine fragments that were assigned separate catalog numbers were found to be part of the same figurine, the catalog number for the largest piece was taken as the primary number, and the catalog numbers of the other pieces were nullified in the database using a -Z suffix to the artifact catalog number. A total of 15 fragments were fitted to other figurine fragments, however, most of the breakage of matching fragments likely occurred in storage, and figurine fragments found in different excavation units were not able to be refitted.

Measurements

Standard measurements were taken of each figurine fragment. Digital calipers were used to determine length, width, and height of the figurine and measurements were noted down to the hundredth of a millimeter (mm). All measurements were taken with the anterior side of the figurine facing the researcher. The length measurement was determined as the longest portion of the figurine on the horizontal (x) axis. The height measurement was determined as the longest portion of the figurine on the vertical (y) axis. The width measurement was determined as the longest portion of the figurine on the depth (z) axis. All measurements were noted in millimeters. If the figurine was unidentifiable and the anterior side was not able to be determined, the three-dimensional measurements were taken and the largest measurement was used as an indication of the horizontal (x) axis (Figure 7.3).

After measurements were taken, all figurines were weighed on a digital scale. Figurine weight was noted in grams (g) down to the hundredth of a gram. Due to the limitations of the scale, any figurine fragment over 100 grams was not able to be weighed accurately. Future work on the collection will include weight measurements for fragments that were unable to be initially measured.

Figure 7.3- Figurine Measurement Index

Data Entry

The provenience information along with the photographs and preliminary analysis were then entered into the Microsoft Access database (Figure 7.4). Provenience information was entered into the database, including structure/area found, operation used, excavation unit, unit level, excavation date, excavation supervisor, and excavation personnel, along with any comments by the excavators that were noted on the accompanying artifact card.

Storage

The figurine fragments were then stored in custom-cut foam pockets lined with a Tyvek curatorial acid free paper and placed inside a custom metal cabinet to keep the fragments both preserved and secure. Each drawer of the cabinet was numbered, and the drawer number for the artifact was noted in the database. Additionally, drawer maps were created for each drawer to assist in locating a specific figurine within each drawer. The figurines that were removed from the Cahal Pech Visitor's Center were returned before the end of the field season. To control for moisture in the enclosed space of the

cabinet, I purchased 10 packages of Indicating Silica Gel in hard plastic containers to be placed in each of the cabinet drawers.

The Analysis Phase

Analysis of the figurine fragments included an analysis of the following characteristics: form, type, morphology to include anthropomorphic, zoomorphic, or other morphology, body part, sex as determined by the suite of primary and secondary sex characteristics (described below), hairstyle, clothing, position sitting or standing, eye form, ear spool presence, ear spool decoration details, mouth presence, mouth decoration details, the presence of primary sex characteristics, primary sex characteristic details, the presence of secondary sex characteristics, and the details of secondary sex characteristics.

Form was assessed by appearance as being hand-formed, mold-formed, or a combination of both. Type was assessed by appearance as being a figurine, an ocarina, or a portion of a vessel. Morphology was assessed as either anthropomorphic or zoomorphic. Primary Sex Characteristics include the presence or absence of defined breasts or genitalia. Secondary Sex Characteristics included widened hips combined with a small waist for females and overall torso shape. Characteristics that merit further exploration were noted in the database as well. Due to figurine variability and the necessity of quantifiable features, I compiled a descriptive typology of each feature type including: formation processes, type, morphology, body part distribution, biological sex

characteristics, hairstyle type, clothing type, positionality, eye form, ear spool form, and mouth form.

Due to the varied features on each figurine fragment, it was important to define key terms to denote unknown or unknowable relevant data. As such, I use the following terms and definitions: 1) Not Available: the data are not present on the artifact and is used only for fragments where the requisite pieces are missing; the whole piece might have contained the information but due to breakage, the information is no longer present; 2) None: the data are not present due to the manufacturing process because the figurine was created without the feature; 3) Unknown: the fragment in question does not allow a determination as to the presence or absence of a specific feature (See Appendix A).

While the clear majority of figurine fragments were located at Cahal Pech, a significant number of figurine fragments were located at other sites in the Belize Valley area, specifically at the sites of Baking Pot, Blackman Eddy, El Pilar, Pacbitun, Santa Rita, and Xunantunich (Table 7.1).

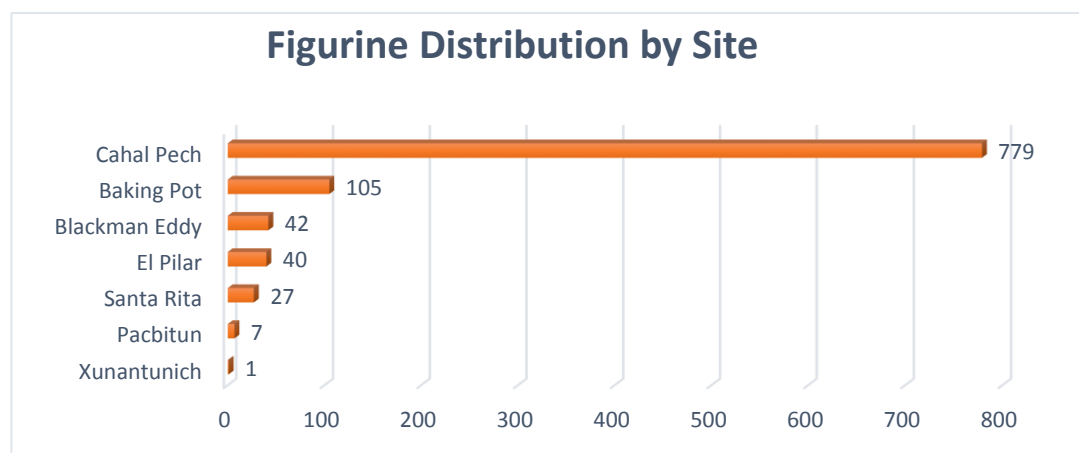

Table 7.1- Figurine Distribution by Site

Formation Process

The formation process categories include: Hand Formed, Mold Formed, a combination of hand and mold formed, and unknown (Figure 7.5). Hand formed figurines (Figure 7.5A) tend to be less elaborate than mold-formed figurines, presumably due, in part, to the fact that it takes less time to create a single figurine from a pre-made mold with significant elaboration, rather than hand-crafting multiple figurines with elaborate features.

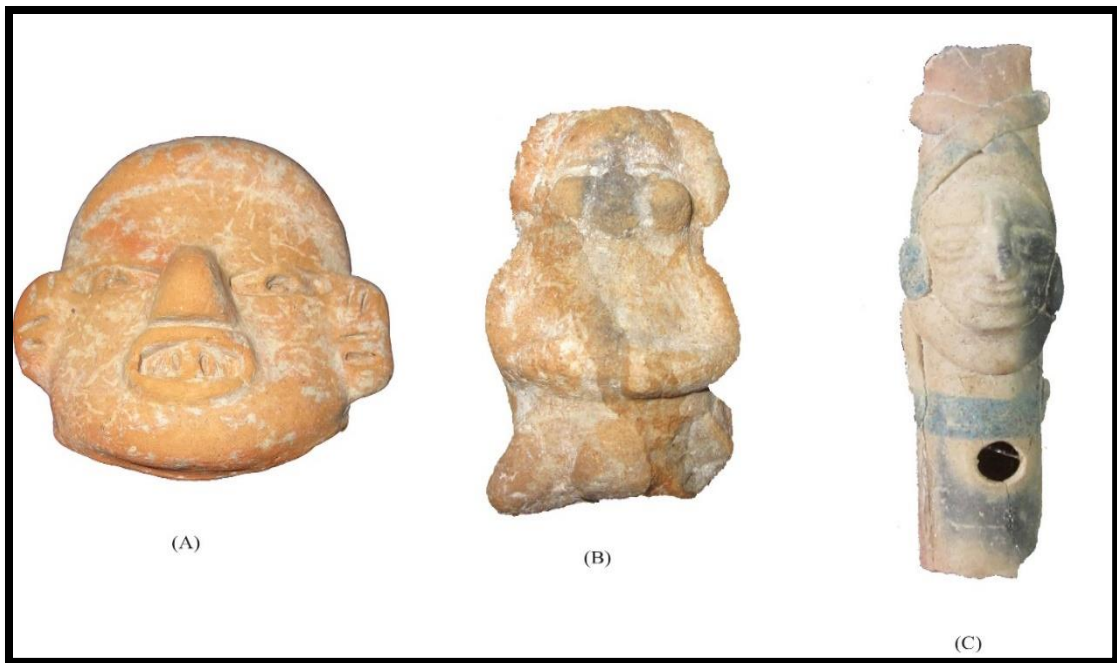

Figure 7.5- Examples of Different Formation Processes: (A) Hand-formed figurine head, (B) Mold-formed ocarina, (C) Combination-formed flute

Hand formed figurines also tend to have deeper incisions and punctations in the clay, which resist the type of near total erosion that is seen on mold-formed figurines. The depth of features on hand molded figurines can rarely be achieved by using a

ceramic mold. Figurine molds were, presumably, used for mass production. Mold-made figurines (Figure 7.5B) appear to have a more elaborate set of features. However, these features generally are not deeply inscribed in the clay as they are with hand-made figurines. This lack of depth in mold-made features allows for much greater erosion damage. Combination formed figurines (Figure 7.5C) typically have a mold made face, (usually, although not exclusively) with hand applied decorations.

Formation	Cahal Pech	Baking Pot	Blackman Eddy	El Pilar	Santa Rita	Pacbitun	Xunantunich
Hand Formed	614	31	38	19	12	5	1
Mold Formed	16	13	1	9	6	0	0

Unknown	142	51	3	10	0	2	0
Total	779	105	42	40	27	7	1

Table 7.2- Distribution of Figurine Formation Processes by Site

Type

In addition to ceramic figurines, this collection also contains musical instruments and vessel fragments with anthropomorphic imagery. All fragments in the collection were analyzed by type. Figurines included solid and hollow pieces with no evidence of air holes denoting musical instruments. Musical Instruments including both ocarina whistles and long flutes were determined by the identification of air holes cut into a

hollow body. Vessel fragments were determined based on the shape of the piece, including curved walls that likely extended from the edges of the vessel.

Type	Cahal Pech	Baking Pot	Blackman Eddy	El Pilar	Santa Rita	Pacbitun	Xunantunich

Table 7.3- Distribution of Figurine Type by Site

Morphology

Morphology was considered in broad categories of anthropomorphic, zoomorphic, and unknown. All figurine fragments were analyzed based on these categories when possible. Anthropomorphic figurines include any pieces that resemble a human being or supernatural beings while zoomorphic figurines denote any non-human animal.

Morphology	Cahal Pech	Baking Pot	Blackman Eddy	El Pilar	Santa Rita	Pacbitun	Xunantunich

Table 7.4- Distribution of Figurine Morphology by Site

Body Part Distribution

Except for one figurine, the entire collection consisted of fragmented figurine parts. Possible reasons for this fragmentation were addressed in Chapter 6. Due to breakage patterns, some figurine fragments were categorized as having multiple parts.

Part Distribution	Cahal Pech	Baking Pot	Blackman Eddy	El Pilar	Santa Rita	Pacbitun	Xunantunich

Table 7.5- Distribution of Figurine Part by Site

Biological Sex Characteristics

Each anthropomorphic figurine fragment was examined for biological sex indicators. None of the figurine fragments displayed genatalia, so other indicators were used to make a determination. These features included: raised breasts, distended abdomens, and narrow waists. A large portion of figurine fragments could not be sexed, and it should be noted that, due to the absence of genatalia, all biological sex assignments must remain tentative.

Biological Sex	Cahal Pech	Baking Pot	Blackman Eddy	El Pilar	Santa Rita	Pacbitun	Xunantunich
Female	46	1	0	2	0	0	0
Male	22	0	2	0	0	0	0

Total	779	105	42	40	27	7	1

Table 7.6- Distribution of Figurine Biological Sex Characteristics by Site

Hairstyle

All applicable figurines were examined for hair and hairstyles. Of the 1,001 figurine fragments, there were eight distinct hairstyles: 1) Central Lobe/Full Head: a full head of hair, pulled up into a central top-knot; 2) Face Frame: hair is present all the way around the head, but is short and frames the face, typically presented with bangs; 3) Full Head: full head of hair with no knots; 4) Undefined Top: the top of the head, above the

forehead, has an all-around hairstyle with no striations.; 5) Side Ponytails: long lobes of hair spanning the entire height of the head on each side; 6) Central Top Knot: the hair is expressed as a knot at the top of the head above the nose; 7) Side Knots: the hair is expressed as knots on both sides of the head; and 8) Triple Knots: the hair is expressed as top-knots on either side of the head and in the center.

Hairstyle	Cahal Pech	Baking Pot	Blackman Eddy	El Pilar	Santa Rita	Pacbitun	Xunantunich

Clothing

All anthropomorphic, zoomorphic, and supernatural figurines in this collection were examined for clothing. Jewelry and other accoutrements were additionally

classified as clothing. For those figurines that had more than one type of clothing, a separate typological category was created to encompass the full range of possibilities.

Clothing	Cahal Pech	Baking Pot	Blackman Eddy	El Pilar	Santa Rita	Pacbitun	Xunantunich
Bracelet	0	0	0	1	0	0	0

Table 7.7- Distribution of Figurine Clothing by Site

Positionality and Orientation

Each applicable fragment was examined for positionality and orientation. Using a combination of leg, hip and thigh positions, as well as examining flattened pieces, I was able to discern if the figurine was likely intended to originally stand upright or seated before it was deposited in the archaeological record. There were no figurines depicted as lying down.

Table 7.8- Distribution of Figurine Positionality and Orientation by Site

Eye Form

Each figurine fragment was examined for eye type. Of the figurines that expressed eye form, I was able to define twelve distinct eye forms: 1) Closed Dual Incised: the eyes appear to be closed and each eye is formed by two incisions into the clay; 2) Closed No Incision: the eyes are closed with no specific incisions demarcating the boundaries of the eye; 3) Closed Single Incision: the eyes are closed with a single incision demarcating the eye lid; 4) Dual-Ovate Punctate: the whites of the eyes are depicted by gouging out a triangular shape on each side of the iris, with a deep

punctuation representing the pupil, while the iris is represented in relief; 5) Fully Incised Punctate: the entire shape of the eye is constructed by gouging out the clay and creating an almond shape while the pupil is shown as a single punctuation. This differs from the dual-ovate punctate style in that the iris is not represented in relief; 6) Open Dual Incision: the eyes are opened and are represented by an upper and a lower incision demarcating the eye lids; 7) Open Single Incision: the eyes are opened and are represented by an upper incision demarcating the top eye lid; 8) Single Applique: the eyes are formed by adding a clay applique to the face with no incisions or punctuations; 9) Single Applique Punctate: the eyes are formed by adding a clay applique to the face, then punctated through the applique into the clay body; 10) Single Punctate: the eye is formed by a single hole punctated into the clay; and 11) Triple Punctate: three horizontal holes represent each eye, with the middle hole representing the pupil and the outer holes representing the whites of the eyes.

Eye Form	Cahal Pech	Baking Pot	Blackman Eddy	El Pilar	Santa Rita	Pacbitun	Xunantunich

Table 7.9- Distribution of Figurine Eye Form by Site

Ear Spool Form

I identified ten distinct representations of ear spools: 1) Simple Punctate: the ear spool is represented by a single hole punctated into the clay; 2) Dual Flat Disc: the ear spool is represented by two flattened discs of clay; 3) Flat Disc: the ear spool is represented by a flattened disc of clay; 4) Complex Punctate: the ear spool is represented by a single punctate with either horizontal, diagonal, or vertical incised striations above the punctation; 5) Single Applique: the ear spool is represented by a single applique ball of clay; 6) Single Applique Punctate: the ear spool is represented by a single applique ball of clay with punctation going through the applique; 7) Single Punctate Disc: the ear spool is formed by a flattened disc with a single punctuation through the center.

Table 7.10- Distribution of Figurine Ear Spool by Site

Mouth Form

All figurines were examined for mouth shape. Twelve distinct mouth types were identified, including: 1) Closed Decorated: mouth is closed and a decoration, likely fangs, protrudes from the closed mouth; 2) Closed Double Punctate: the mouth is closed and the lips are indicated by two punctuations; 3) Closed Dual Incised: the mouth is closed and the lips are delineated by two incisions into the clay; 4) Closed Incised: the mouth is closed and the lips are delineated by a single incision into the clay; 5) Closed Puckered: the lips are pursed together and the cheeks are bulging, primarily found in ocarinas; 6) Open Complex Buck Teeth: the mouth is shown as being open with the inner mouth gouged out. Teeth are represented by a clay nub attached to the upper lip with vertical striations; 7) Open Decorated: mouth is open and a decoration, likely fangs, protrudes from the open mouth; 8) Open Dual Incised: the mouth is open and the lips are delineated by two incisions into the clay; 9) Open Incised: the mouth is open and the lips are delineated by a single incision into the clay; 10) Open Punctate: the mouth is open and formed by a single punctuation indicating the mouth; 11) Open Simple Buck Teeth: the mouth is open and vertical striations show the presence of prominent incisors; 12) Triple punctate: the mouth is demonstrated by three punctuations.

Table 7.11- Distribution of Figurine Mouth Form by Site

Conclusion

Methods for this dissertation project consisted of two parts: the first part consisted of multi-stepped curatorial processing similar to curatorial processes in many museums. Additionally, the figurines were stored and preserved so that future generations can access and perform further analysis on the collection.

CHAPTER 8: RESULTS

This project focused on the use, deposition, and meaning of figurine fragments over time to ascertain whether the figurines could provide insight into growing social and political complexity from both diachronic and synchronic perspectives. Figurine fragments had been recovered in excavations at Cahal Pech and the periphery settlements since 1988, when Awe (1992) began his dissertation research. These excavations revealed that figurines were in use from the establishment of the community of Cahal Pech at the end of the Early Formative Period, 1100-850 BC through the end of the Terminal Classic Period, AD 850-1000. Although we see what may, perhaps, be a hiatus of figurine production during the Classic Period, a handful of figurine fragments likely dating to the Middle and Late Formative Periods have been uncovered in Classic Period contexts.

Examination of the figurine fragments sought to answer the following research questions: 1) Is there a difference in the treatment of ceramic figurines found at the Cahal Pech site core versus the Cahal Pech periphery groups? 2) Do the features found on ceramic figurines change over time? 3) Is there a correlation between changes in social and political complexity at Cahal Pech and the use and deposition of ceramic figurines? and 4) Are Formative Period figurines found in different contexts than figurines dating to the Terminal Classic Period?

Due to changing archaeological recording procedures over the past 28 years, some figurines lack provenience and contextual information. In these cases, the figurine will have a value of “UNKNOWN” for context and period categories and will not be included in analyses requiring either context or time period.

Question #1: Is there a different in the treatment of ceramic figurines found at the Cahal Pech site core versus the Cahal Pech periphery groups?

The periphery groups at Cahal Pech were initially constructed during the Middle Formative Period, and it has been suggested that these settlers consisted of small family groups who moved out of the site core so that they could exploit agricultural opportunities (Awe 1992:56). Because the periphery groups did not exist during the Early Formative Period, figurine fragments dating to this phase have been excluded from the analysis of this question. The initial settlement of periphery structures may have been in response to the construction of masonry structures and public buildings at the southern end of the site core. Table 8.1 shows the contextual distribution for all figurine fragments dating to Middle and Late Formative levels found in the Cahal Pech site core.

Context	Quantity	Percentage
Burial	8	2.21%
Household	1	0.28%
Midden	9	2.49%
Fill	339	93.65%
Ritual Deposit	4	1.10%
Other	1	0.28%
Total	362	100%

Table 8.1- Contextual Distribution of Figurine Fragments Dating from the Middle and Late Formative Periods at the Cahal Pech Site Core

By far, the most figurine fragments (339) were found in construction fill used in public structures and plazas at the site core. A single fragment was in a residential context at an early house mound (Garber 2005), while nine fragments were associated with a midden (Cheetham 1996). A total of 4 figurine fragments were found within a ritual deposit that has been interpreted by Garber (2005) to be a ritual cache near the center of Plaza B.

Table 8.2 shows the distribution of Middle and Late Formative figurine fragments found at the Cas Pek, Tolok, Tzinic, and Zubin residential periphery groups, and the Zopilote terminus group. Although several Formative Period burials were found within the periphery groups, none of them were associated with figurine fragments. Additionally, although all of the periphery groups contained excavated house mounds, with the exception of the Zopilote terminus group, no figurines were found within a household context. A large midden at the Tolok group was excavated to bedrock, yielding nine figurine fragments. Similar to the distribution of fragments at the site core,

the largest portion of figurine fragments by far were used in construction fill for both buildings and plastered floors. Interestingly, there were more figurine fragments found in ritual deposits, such as caches, in the periphery groups (the Zubin group in particular), than there were at the site core, even though the total number of fragments dating to the Middle and Late Preclassic found in the site core (362) was much higher than the total number of fragments dating to the Middle and Late Preclassic found in the periphery groups (42).

Context	#	#	#	#	#	Total	Percentage
	Cas Pek	Tolok	Tzinic	Zubin	Zopilote		
Burial	0	0	0	0	0	0	0%
Household	0	0	0	0	0	0	0%
Midden	0	9	0	0	0	9	21.42%
Fill	14	6	0	4	3	27	64.29%
Ritual Deposit	0	0	1 *	5	0	6	14.29%
Other	0	0	0	0	0	0	0%
Total	14	15	1	9	3	42	100%

** The figurine fragment, a torso, is Middle Formative in design and material, but was found in a stela cache that was likely placed in the Early Classic Period. Awe (1992) has interpreted this piece to be a possible Middle Formative family heirloom.*

Table 8.2- Contextual Distribution of Figurine Fragments dating to the Middle and Late Formative Periods at the Cahal Pech Periphery Groups

Throughout Mesoamerica, figurine fragments have been found in construction fill for both buildings and plazas. The fact that the majority of figurine fragments found at Cahal Pech is congruous with other Mesoamerican sites exhibiting the same phenomena. As discussed in Chapter 2, figurines used in construction fill are thought to be related to termination rituals, explaining that the reason that most, if not all, figurines found in construction fill accompanied with pot sherds and lithic debitage, was because they had

reached the end of their use life and were terminated, releasing the animate spirit connected to them.

While most Middle and Late Formative Period figurine fragments appearing in construction fill were broken, the same is true of figurines found in the burials and ritual deposits and caches. If figurines were imbued with an animate spirit that was released upon breakage, leaving the figurine fragment an empty vessel appropriate for disposal as ritual garbage, we would not expect to find similarly broken fragments in highly meaningful contexts such as burials and ritual caches.

Cahal Pech Plaza B- Burial 1 (Figure 8.1) contained individual caches at each of the four corners of Platform B, with an accompanying burial at the southeast corner of the platform.

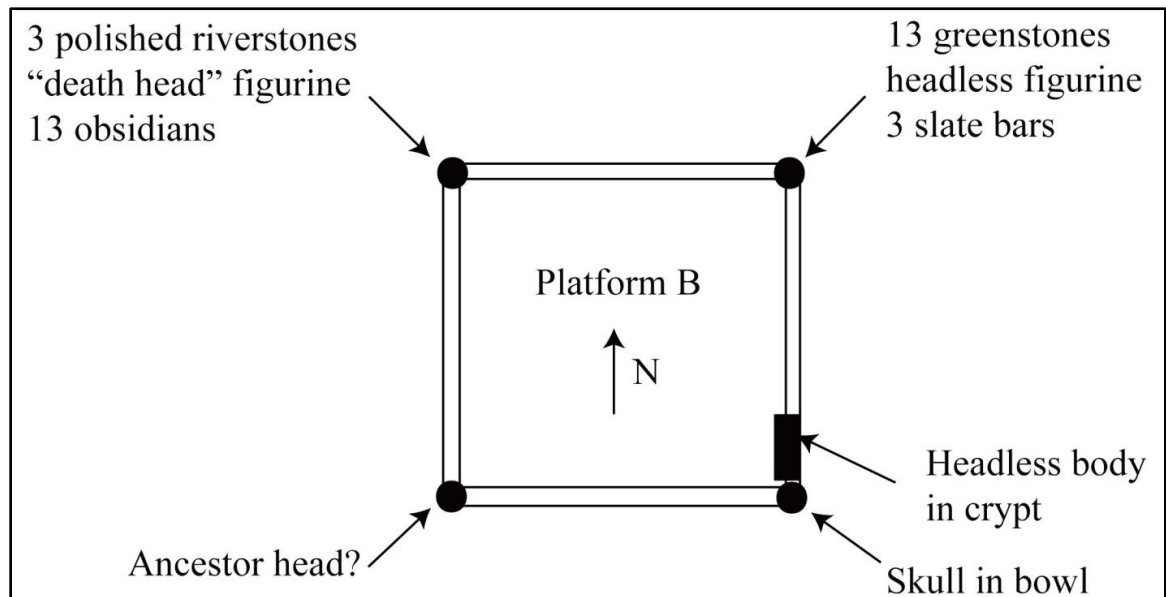

Figure 8.1- Plan map of Plaza B- Burial 1 (Awe 2013:35)

Burial B4-3 (Figure 8.2), located within structure B4 in the Cahal Pech site core, is a decidedly ritualized cache, featuring a cranium and mandible placed inside a round bowl with a second bowl inverted and placed on top. The bowl was then surrounded by fragmented ceramic figurines and placed on top of a series of long bones and an alligator carved out on conch shell. Awe (2013) has connected the symbolism of the burial to the

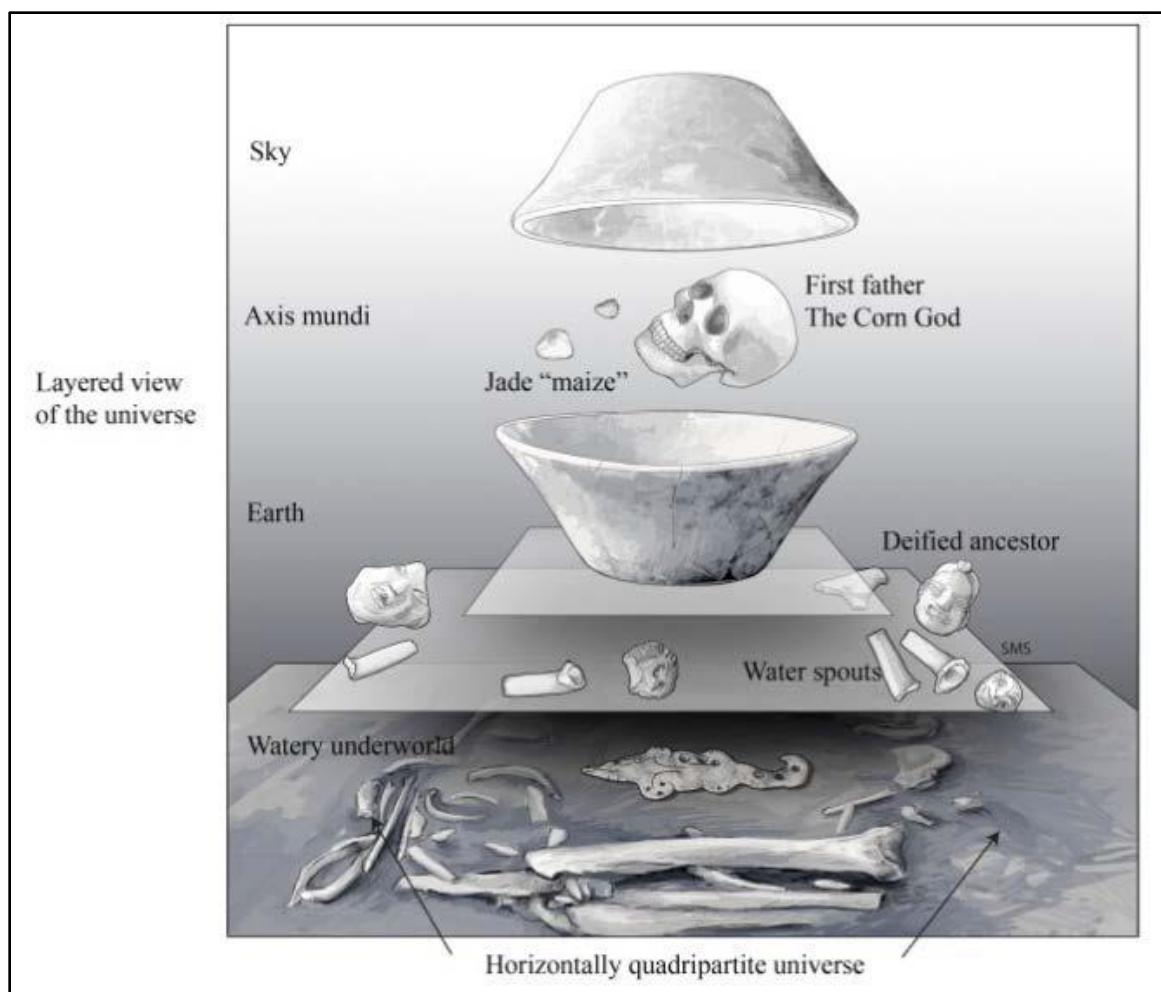

Figure 8.2- Cahal Pech Burial B4-3. Reconstruction by Jaime Awe (Awe 2013:38).

Maya view of the quadripartite universe. Considering this dissertation project, what is significant about both of these ritual deposits is that they are deeply meaningful AND contained fragmented figurines. If the fragmented figurines were considered ritual trash, there likely would be no reason for their inclusion in either ritual caches or burials, or both, rather, they would have been disposed of in a different manner. It may thus be concluded that, even when figurines are fragmented, they may have retained significant meaning for the ancient Maya of Cahal Pech as tokens of ancestor veneration (Chapter 3). Interestingly, most of the figurine fragments found in the site core were collected from excavation units that were directly next to other excavation units where figurines were found. Should the figurines simply have been broken at structurally weak points and discarded, it would be expected that the approximate 6 broken parts (two legs, two arms, one torso and one head) would be found somewhat close together. This is not the case. In attempting to refit the figurine fragments, I found that none of the collected fragments, even fragments found within the same excavation unit and at the same level fit together. It would appear, then, that the figurine fragments were not only broken, but also broken and scattered (Tsukamoto and Inomata 2014), further implying a level of significance to the distribution of figurine fragments used in construction fill.

Question #2: Do the features on ceramic figurines change over time?

Analysis of the Cahal Pech figurine fragment assemblage included quantifying stylistic similarities and differences (see Chapter 7). This analysis focused on eye form,

hairstyle, ear spool style, and mouth style in addition to clothing and sex, which were infrequently present on the figurines and are not discussed in detail in this chapter.

Eye Form

Eye form is, perhaps, one of the most regionally distinctive traits. I have identified several eye forms present on Formative Period figurines from Cahal Pech.

Table 8.3 shows labels and definitions of the different eye styles.

Classification	Definition
Single Punctate	Eye is formed by a single punctation
Single Applique	Eye is formed by a single applique
Single Applique Punctate	Eye is formed by an applique ball with a single punctate
Closed Single Incision	Eye is formed by a single incision and is closed
Open Single Incision	Eye is formed by a single incision and is open
Open Dual Incision	Eye is formed by two incisions that delineate the whites of the eye
Dual-Ovate Punctate	Eye is formed by two gouges representing the whites of the eye and a single punctate representing the pupil. The iris is shown in relief
Triple Punctate	Eye is formed by three separate punctations that indicate the whites of the eye and the pupil
Fully Incised Punctate	Eye is made up of a fully incised ovoid shape with a punctation in the center representing a pupil. The iris is not shown in relief

Table 8.3- Eye Style Classification and Definitions

Of the nine fragments located in Early Formative Period levels (1100 – 850 BC), only one depicts eyes, and the eyes are in the dual-ovate punctate eye style. By far most of the figurine fragments date to the Middle Formative and Middle Formative transition

periods (553) (Table 8.4). Of these, 76 figurine fragments show one or more eyes in such a way as to allow a determination of eye style. Of these 76 fragments, 53 have the dual-ovate punctate eye form, which Awe (1992) has suggested is a stylistic design unique to the Belize River Valley. The second most prominent eye feature is the single punctate eye style, consisting of 15.79% of the Middle Formative and Middle Formative Transition Period assemblage.

Eye Style	Quantity	Percentage
Closed Dual Incised	1	1.32 %
Closed Single Incised	1	1.32 %
Dual-Ovate Punctate	53	69.73 %
Fully Incised Punctate	1	1.32 %
Open Single Incised	3	3.94 %
Single Applique	2	2.63 %
Single Applique Punctate	2	2.63 %
Single Punctate	12	15.79 %
Triple Punctate	1	1.32 %
Total	76	100 %

Table 8.4- Distribution of Eye Styles of Middle Formative and Middle Formative Transition Period Figurine Fragments

In contrast, the total number of figurine fragments that have at least one eye visible and dating to the Late Formative Period is much smaller (15). There are fewer eye styles (Table 8.5) represented in the Late Formative Period in comparison to the Middle Formative Period; however, this could be due to the much smaller sample size.

Eye Style	Quantity	Percentage
Dual-Ovate Punctate	11	73.34 %
Single Applique Punctate	1	8.66 %
Single Punctate	2	1.33 %
Triple Punctate	1	8.66 %
Total	15	100%

Table 8.5- Distribution of Eye Styles of Late Formative Period Figurine Fragments

Overall, although the sample size greatly decreased in the Late Formative, the very high quantity of fragments in the dual-ovate punctate style, the presence of the dual-ovate punctate style in the earliest figurine associated occupational phases of the site, coupled with the lack of any “new” eye styles in the Late Formative Period demonstrates a continuity of eye styles from the Early to the Late Formative Periods, the implications of which will be discussed further in Chapter 9.

Excavations at Cahal Pech have recovered only 14 figurine fragments associated with the Classic Period (250 – 850 AD), 11 of which were recovered in Classic Period construction fill and three of them were found in unknown contexts. Of the 14 total fragments, three show the presence of eyes (Table 8.6), and two of them are in the dual-ovate punctate style. One figurine greatly resembles the Middle and Late Formative Period figurine head fragments and may be a family heirloom that was placed in fill after being handed down from the Formative Period. The two remaining figurines found in Classic period contexts were heavily eroded.

Eye Style	Quantity	Percentage
Dual-Ovate Punctate	2	68.67%
Single Punctate	1	33.33%
Total	3	100%

Table 8.6- Distribution of Eye Styles of Classic Period Figurine Fragments

By the Terminal Classic Period (850 – 1000 AD), figurines throughout Mesoamerica were constructed via ceramic molds and sometimes accentuated with handmade appliques. The resulting figurines dating to the Terminal Classic Period (26) are much different than the figurines found in Formative Period contexts, except for three fragments found in construction fill in structure H1. In this case, construction material, including limestone blocks, was removed from nearby structure C6 and reused to build structure H1, and it is likely that the construction fill associated with the Late Formative construction of structure C6 was utilized in addition to the limestone blocks.

Eye styles of Terminal Classic figurines are, much different than the eye styles from the Formative Period. Seventeen figurine fragments depicting one or more eyes were found in contexts dating to the Terminal Classic Period (Table 8.7). Of these 17 fragments, 11 showed closed eyes.

Eye Style	Quantity	Percentage
Closed Single Incised	11	64.71 %
Open Dual Incised	2	11.76 %
Open Single Incised	1	5.88 %
Single Applique	3	17.65 %
Total	17	100 %

Table 8.7-Distribution of Eye Styles of Terminal Classic Period Figurine Fragments

The differences between the Formative Period figurine eye styles and the Terminal Classic Period figurine styles is not surprising, given the length of time that separated the two time periods (roughly between 600 and 1800 years) and the widespread adoption of figurine mold technology during the Classic Period.

The figurine assemblage from Cahal Pech demonstrates Formative-Period continuity in the depiction of eyes in figural representations, indicating that the way eyes were depicted remained an important consideration and an integral part of figurine creation during the long Formative Period. The most significant change occurs between the Formative Period figurines and the Terminal Classic Period figurines.

Hairstyle

The depiction of hairstyle among Maya figurines has, perhaps, the greatest potential for establishing elements of individuality among figurines that frequently display eyes, ear spools, and mouths as relatively homogeneous. I have identified 70 figurine fragments from Cahal Pech, including Formative Period and Terminal Classic Period fragments, that depict a total of eight distinctive hairstyles. Table 8.8 lists the hairstyles and the descriptions of each.

Classification	Definition
Central Lobe/Full Head	There is a full head of hair, pulled up into a central top knot.
Face Frame	Hair is present all the way around the head, but is short and frames the face, typically presented with bangs.
Full Head	Full head of hair with no top knot
Undefined Top	The top of the head, above the forehead, has an all-around hairstyle with no striations.
Side Ponytails	Long lobes of hair spanning the entire height of the head on each side.
Central Top Knot	The hair is expressed as a topknot at the top of the head above the nose.
Side Knots	The hair is expressed as topknots on either side of the head.
Triple Knots	The hair is expressed as topknots on either side of the head and in the center.

Table 8.8- Hair Style Definitions

Of the nine figurine fragments found in contexts dating to the Early Formative Period, only one shows a hairstyle, determined to be the full head style. Significantly more fragments were found in Middle Formative and Middle Formative Transition contexts. Of the 553 total fragments found, 45 show a hairstyle (Table 8.9).

Hair Style	Quantity	Percent
Central Lob/Full Head	1	2.22 %
Central Top Knot	18	40.00 %
Full Head	9	20.00 %
Side Knots	1	2.22 %
Side Ponytails	1	2.22 %
Triple Knots	10	22.22 %
Undefined Top	5	11.11 %
Total	45	100 % (99.99 %)

Table 8.9- Distribution of Middle Formative and Middle Formative Transition Hairstyles

The most commonly occurring hairstyle in Middle Formative and Middle Formative Transition fragments is the Central Top Knot style, followed by the Undefined Top style and the Full Head hairstyle. Although there are considerably less figurine fragments that depict hairstyle (10) found in Late Formative Period contexts, the general distribution appears similar to those of the Middle Formative and Middle Formative Transition fragments. The primary hairstyle found in contexts relating to both time periods is the Central Top Knot style, with the Full Head and Undefined Top styles forming the second and third most common hairstyle. This lack of significant change in figurine hairstyle implies a continuation of standard hairstyles throughout the Middle and Late Formative Periods.

Hair Style	Quantity	Percent
Central Top Knot	5	50.00 %
Full Head	2	20.00 %
Triple Knots	1	10.00 %
Undefined Top	2	20.00 %
Total	10	100.00 %

Table 8.10- Distribution of Late Formative Period Hairstyles

Only one of the fourteen fragments found in Classic Period contexts shows hair, and this hairstyle is in the Central Top Knot fashion, however, this fragment was found in very early Classic Period construction fill associated with a burial inside structure B1. It is possible that the fragment was created during the Formative Period and was part of construction fill. This construction fill had likely been reused or was placed in the fill

during the earliest part of the Classic Period, when familial ties to the Formative Period were significant (Chapter 3).

A total of 26 figurine fragments were recovered in Terminal Classic contexts, including intrusive burials and termination rituals. Of these 26 fragments, nine show hairstyles (Table 8.11).

Hair Style	Quantity	Percent
Central Top Knot	2	22.22 %
Face Frame	3	33.33 %
Full Head	2	22.22 %
Side Ponytails	1	11.11 %
Undefined Top	1	11.11 %
Total	9	100 % (99.99%)

Table 8.11- Distribution of Terminal Classic Hairstyles

While the figurines found in Terminal Classic contexts were primarily mold-made figurines, they depict a comparable range of hairstyles as found on Formative Period figurines. The Central Top Knot style, Full Head, Side Ponytails, and Undefined Top styles are still present on figurines; however, the most common style that appears in the Terminal Classic period fragments is the Face Frame style that does not appear in Formative Period figurine fragments. It would appear, then, that there is a continuous use of certain hairstyles, but the dominant style changed from the Formative Period to the Terminal Classic. Due to the small sample size, this may be either a more or less pronounced change and any conclusions relating to hairstyle will be significantly enhanced with the discovery of additional Terminal Classic period figurine fragments.

Ear Spools

Ear Spools are very common among anthropomorphic depictions in Mesoamerica, and the figurine assemblage from Cahal Pech is not an exception to this. I identified eight different types of ear spool depictions on the figurine fragments from Cahal Pech (Table 8.12).

Classification	Definition
Single Punctate Disc	Applique flattened disc with a single punctation through it
Flat Disc	Flattened applique disc with no punctations
Single Applique	Applique ball of clay, not flattened
Dual Flat Disc	Flattened disc with a smaller flattened disc inside
Single Applique Punctate	Applique ball of clay with single punctation through it- ear spool is not part of a larger ear
Simple Punctate	Single punctation, no striations above the spool- ear spool is part of a larger ear
Double Punctate	The ear spool is made by two vertical punctations
Complex Punctate	Single punctation, with striations above the spool

Table 8.12- Types and Descriptions of Ear Spools

Of the nine figurine fragments found in Early Formative Period contexts, only one shows an ear spool. This fragment shows the ear spool in the Complex Punctate style, formed by a single punctation indicating the center of the spool and a series of striations above the spool. Of the 553 figurine fragments found in Middle Formative and Middle Formative Transition contexts, 51 depict ear spools (Table 8.13).

Ear Spool Style	Quantity	Percent
Complex Punctate	33	64.71 %
Simple Punctate	10	19.61 %
Single Applique Punctuate	8	15.68 %
Total	51	100 %

Table 8.13- Distribution of Ear Spools from Middle Formative and Middle Formative Transition Period Contexts

During the Middle Formative and Middle Formative Transition Period, a large percentage of ear spools are in the Complex Punctate style first found in the Early Formative Period figurine, a trend that continued into the Late Formative Period (Table 8.14). Figurines dating to Late Formative Period contexts show a similar distribution as those found in Middle Formative and Middle Formative Transition Period contexts, although there is the addition of the Single Applique Punctate style, a variation of the Single Applique style with a single hole punched through the center.

Ear Spool Style	Quantity	Percent
Complex Punctate	4	57.13 %
Simple Punctuate	1	14.29 %
Single Applique Punctate	1	14.29 %
Single Applique	1	14.29 %
Total	7	100 %

Table 8.14- Distribution of Late Formative Ear Spool Styles

Two figurine fragments found in Early Classic Period contexts had ear spools. Of these two spools, one was in the Complex Punctate style, however, this fragment was found in very early Classic Period construction fill associated with a burial inside

structure B1, and it is possible that the fragment was created during the Formative Period and was part of construction fill that had been reused or was placed in the fill during the earliest part of the Classic Period when familial ties to the Formative Period were likely a significant structuring factor in ancient Maya society (Chapter 3). The second fragment showed an appliqued flattened disc ear spool in a fashion not found on any earlier figurine fragments.

By the Terminal Classic, the depiction of ear spools had completely changed (Table 8.15). Neither the Simple Punctate nor the Complex Punctate styles were used at all. Figurine fragments depicting ear spools dating to the Terminal Classic Period tend to be mold made with the addition of an applique representing the ear spool. Half of the six Terminal Classic figurines shows ear spools in the Single Applique punctate style, while 2 show a Flat Disc applique and one shows a Double Punctate style.

Ear Spool Style	Quantity	Percent
Flat Disc	2	33.33 %
Double Punctuate	1	18.66 %
Single Applique Punctuate	3	50.00 %
Total	6	100 % (99.99%)

Table 8.15- Distribution of Terminal Classic Ear Spool Styles

Due to the small sample size, this may be either a more or less pronounced change and, similar to discussions of hairstyle, any conclusions relating to ear spool will be significantly enhanced with the discovery of additional Terminal Classic period figurine fragments.

Mouth Styles

Mouth styles are very distinctive in the Belize River Valley. A large proportion of anthropomorphic figurines show dominant maxillary incisors. Although the way these are depicted is slightly varied, nearly all of them have this feature. It had been proposed by Awe (1992) that figurine fragments could be ancestor portraits. However, no burial or other imagery has yet been found indicating any individual at Cahal Pech had dominant maxillary incisors (buck teeth) (Awe 2015, personal communication; McKeown 2015, personal communication). Although lack of evidence is not evidence in and of itself, it does call into question early conclusions that the figurines depict a variety of ancestors important to the people of Cahal Pech. What may be more likely is that the depiction of buck teeth is along the lines of early depictions of the maize or sun deities (Miller and Taube 1993:106), both of whom are depicted in Formative Period imagery as having buck teeth, while still being connected to ancestor veneration.

My analysis of all of the figurine fragments in the Cahal Pech revealed thirteen distinct mouth styles (table 8.16). Of the nine Early Formative Period fragments, only one depicts a mouth, and that mouth is in the Open- Complex Buck teeth design.

Classification	Definition
Open, Incised	Mouth formed by a single incision and appears open
Open, Punctate	Mouth formed by a single punctate and appears open
Closed, puckered	Mouth appears to be puckered and is closed (for whistling ocarinas)
Closed, Double Punctate	Mouth is formed by two punctates and appears closed
Closed, Incised	Mouth is made by a single incision and appears closed
Closed, no Incision	Mouth appears to be closed but no incision is present
Closed Dual Incised	Two sides of the mouth are represented by incisions, but the incision doesn't completely create the mouth
Open Dual Incised	Two sides of the mouth are represented by incisions, on either side of the center of the mouth
Open- Simple Buck Teeth	Mouth is open and buck teeth are present taking up the entire space of the mouth
Open- Complex Buck Teeth	Mouth is open and buck teeth are present protruding from the top of the mouth and delineated by vertical striations
Open, Decorated	Mouth is open or slightly open and a decoration protrudes from the mouth
Closed, Decorated	Mouth is closed and a decoration protrudes from the mouth
Triple Punctuate	Mouth is represented by three punctations

Table 8.16- Types and Descriptions of Mouth Styles

Analysis of the figurine fragments associated with Middle Formative and Middle Formative Transition contexts revealed 68 pieces depicting mouths (Table 8.17). Twenty-nine of these fragments are in the Open- Complex Buck Teeth style demonstrating continuity with the Early Formative Period piece that also depicts a mouth. The second most common mouth style is the Open Incised style in which the mouth is created by a simple incision into the clay that is then separated slightly to make it appear that the mouth is open.

Mouth Style	Quantity	Percentage
Closed Incised	2	2.94 %
Open- Complex Buck Teeth	29	42.65 %
Open- Dual Incised	6	8.82 %
Open Incised	21	30.88 %
Open- Simple Buck Teeth	10	14.71 %
Total	68	100 %

Table 8.17- Distribution of Middle Formative and Middle Formative Transition Mouth Styles

Figurine fragments dating to Late Formative Period contexts (12) show continuity with early Formative Period fragments with the distribution percentages being very close to the Middle Formative and Middle Formative Transition Period pieces. The Open-Complex Buck Teeth style remained the most popular followed by the Open Incised style (Table 8.18). Two new styles appeared during this time, the Open Punctate style and the Triple Punctate style. It should be noted that the Triple Punctate style is consistent with a single piece that has Triple Punctate eyes which might be a variation of the Dual-Ovate Punctate style.

Mouth Style	Quantity	Percentage
Open- Complex Buck Teeth	5	41.67 %
Open Incised	3	25.00 %
Open Punctate	1	8.33 %
Open- Simple Buck Teeth	2	18.67 %
Triple Punctate	1	8.33 %
Total	12	100 %

Table 8.18- Distribution of Late Formative Mouth Styles

Classic Period fragments showing mouth styles show one fragment with a mouth in the Open- Simple Buck Teeth style and one fragment with the Open Incised fragment.

Although both styles are found on Formative Period figurines, there are not enough fragments dating to the Classic Period to examine trends of representation. By the Terminal Classic Period, all the figurine fragments (16) were mold made, apart from five fragments that may have been created in the Formative Period. Table 8.19 shows the distribution of mouth styles during the Terminal Classic Period and shows that the most prevalent mouth styles among Terminal Classic fragments are in the Closed Incised and Open Incised styles.

Mouth Style	Quantity	Percentage
Closed Incised	7	43.75 %
Closed Puckered	1	8.25 %
Open Dual Incised	1	8.25 %
Open Incised	6	37.50 %
Open- Simple Buck Teeth	1	8.25 %
Total	16	100 %

Table 8.19- Distribution of Terminal Classic Mouth Styles

During the Formative Period, mouth styles demonstrate continuity, not only in specific style, but also roughly in the percentage of the recovered pieces displaying these types. During the Classic Period, we see the development of new styles that eventually became dominant during the Terminal Classic Period, when the dominant Formative Period mouth styles ceased to be made. It should be noted that the Classic Period samples may in fact have been created during the Formative Period and deposited in the archaeological record during the Classic Period, thus explaining some of the overlap. Additionally, the proliferation of the incised mouth is consistent with the adoption of ceramic mold technology for facial features, a trend that likely appeared here during the

Classic Period, as it did in other parts of the Maya world (Halperin 2007; Lopiparo and Hendon 2009).

Taken as a whole, the data indicate that during the Formative Period, there was continuity in the display of specific features of anthropomorphic figurines, such as the eyes, mouth, ear spools, and hairstyles, with some new styles appearing in the Late Formative and reappearing in the Terminal Classic. The main differences between the collections correlate with their ages, but this may be due several factors such as the adoption of new ceramic mold technology for figurines, the establishment of new trends and designs. While it is possible that a new group of people moved into Cahal Pech during the Terminal Classic period after the initial abandonment of the site by the ruling elites, the osteological evidence does not support this contention, and Friewald (2011) has shown that individuals who were interred at Cahal Pech likely grew up and lived in the Belize River Valley.

3) Are the figurines found in Formative Period (1100 BC – 250 AD) contexts found in significantly different contexts than those figurines found in Terminal Classic Period (AD 850-1000) contexts?

Figurine fragments at Cahal Pech have been found in multiple contexts, including burials, construction fill (both buildings and plazas), middens, households and ritual deposits. Ritual deposits encompass burials, caches, and are what are considered

termination deposits. When ritual deposits contain human remains, I have classified them as burials for the purposes of this research.

Of the nine figurine fragments dating to the Early Formative Period, all were recovered in construction fill. Extensive excavations at Cahal Pech have not recovered any Early Formative Period ritual caches or burials and it may be that there are figurine fragments in both Early Formative ritual caches and burials that have not been recovered yet. By the Middle Formative and Middle Formative Transition Periods, the contexts of figurine fragments are more varied, although they continued to mostly found in construction fill (Table 8.20).

Context	Quantity	Percentage
Burial	2	0.36 %
Fill	507	91.86 %
Household	1	0.18 %
Midden	30	5.43 %
Ritual Deposit	12	2.17 %
Total	552	100 %

Table 8.20- Distribution of Middle Formative and Middle Formative Transition Period Figurine Fragments by Context

By the Late Formative Period, the use of figurine fragments in construction fill declined, and the use of figurines in burials increased significantly (Table 8.21). By this time, figurine fragments are no longer found in household or residential contexts, and are only sparsely found in ritual deposits and middens. The architectural history of Cahal Pech demonstrates a large amount of public construction beginning during the Late Formative Period and extending into the Classic Period. The implications of the change

of data from the Middle Formative and Middle Formative Transition Periods will be discussed in further detail in Chapter 9.

Context	Quantity	Percentage
Burial	10	9.90 %
Fill	89	88.12 %
Midden	1	0.99 %
Ritual Deposit	1	0.99 %
Total	101	100 %

Table 8.21- Contextual Distribution of Classic Period Figurine Fragments

Of the 14 figurine fragments found in Classic Period contexts, 11 of them were found in fill and three had no available context information. By the Terminal Classic Period, the inclusion of figurine fragments in fill had largely been abandoned, apart from three fragments found in the Terminal Classic structure H1. It should be noted, however, that these figurines were Formative Period in style and were found associated with Formative Period ceramics. Douglas and colleagues (2015) concluded that structure H1 was constructed with building materials taken from the Formative and Early Classic Period structures surrounding Plaza C and the eastern ballcourt, and it is highly likely that the figurine fragments and ceramic sherds came from the Formative Period fill of these structures.

Context	Quantity	Percentage
Burial	11	42.31 %
Fill	3	11.54 %
Ritual Deposit	12	48.15 %
Total	26	100 %

Table 8.22- Contextual Distribution of Terminal Classic Figurine Fragments

The figurines noted as ritual deposits were found in association with what Awe (2003) has deemed as termination deposits flanking the north stairwell of Plaza A. These fragments were either mold made or a combination of mold and hand made. It should be noted that none of these fragments appear to be stylistically related to the Formative Period, indicating that they were made during the Late or Terminal Classic Periods. A number of figurine fragments were found in association with Terminal Classic intrusive burials. While it is currently unknown exactly who the population was that buried their dead in the site core after it had been abandoned by the ruling elite, Friewald (2011) has noted were likely residents of the Belize River Valley based on strontium isotope analysis of the remains. Of further interest is the collection of figurine and ocarina fragments found associated with the intrusive burial of a child in structure A3. Many of these fragments appear to be toys and musical instruments and are richly painted. It would seem, then, that there might have been a shift in the purpose of figurines between the Formative to the Terminal Classic, an idea that will be explored in further detail in Chapter 9.

4) Is there a correlation between the rise of state level social and political complexity as demonstrated through architectural and burial assemblage changes and the use and deposition of figurine fragments?

Archaeological investigations situate the initial permanent settlement of Cahal Pech in the Early Formative Period (Awe 1992; Cheetham et. al 1994; Horn 2015; Garber et. al 2005). A relatively small portion of figurine fragments were found relating to this

time period, and there is no evidence of any public structures; it might be that the initial settlers were one or two small kin groups residing on the hilltop. By the Early Middle Formative Period, however, public masonry buildings were constructed and population grew significantly, prompting even more construction episodes, including the establishment of at least five periphery settlements, and likely many more for which evidence has been lost due to the encroachment of the current San Ignacio town. During this time, when separations between public and private seem to be gaining strength, figurine fragments appear in a large quantity in construction fill. Indeed, most of the figurine fragments recovered at Cahal Pech were found in Middle Formative Period construction fill, with more fragments dating to the end of the Middle Formative Period. By the Late Formative Period, the separation between public and private is fully entrenched, as are status differences demonstrated by differential residential structures and burials. The population continued to rise, and public construction took on a new fervor; however, fewer figurines appear in construction fill. Table 8.22 Reflects the overall distribution of figurine fragments by time period at Cahal Pech. A total of 703 figurine fragments have provenience information, and most were dated based on a combination of associated artifacts including ceramics and carbonized samples yielding radiocarbon dates. Due to changes in record keeping since excavation work at Cahal Pech began, I was unable to find provenience for 77 fragments; therefore those fragments are not included in the calculations below.

Period	Quantity	Percentage
Early Formative (1100 – 850 BC)	9	1.28 %
Early Middle Formative (850 – 650 BC)	205	29.16 %
Late Middle Formative (650 – 350 BC)	320	45.53 %
Middle Formative undifferentiated (850 – 350 BC)	28	3.98 %
Early Late Formative (350 BC – 1 AD)	71	10.10 %
Late Late Formative (1 – 250 AD)	23	3.27 %
Late Formative undifferentiated (350 BC – 250 AD)	7	0.99 %
Early Classic (250 – 600 AD)	6	0.86 %
Late Classic (600 – 850 AD)	8	1.13 %
Terminal Classic (850 - 1000 AD)	26	3.70 %
Total	703	100 %

Table 8.23- Distribution of Figurine Fragments by Time Period

The abundance of figurine fragments in the archaeological record dating to the Middle Formative Period, in particular the Early Middle Formative Period, appears to coincide with the initial construction of public buildings and each of the periphery groups. During the Early Middle Formative Period, the site core of Cahal Pech was significantly remodeled as the once small cluster of residential structures gave way to public buildings surrounding a large plaza (Cheetham 1994; Healy et. al 2004; Horn 2015). It is in the construction fill of these initial public buildings, connected with civic and ritual activities (Horn 2015:175), that we find a large portion of figurine fragments dating to the Early Middle Formative. Perhaps even more significantly, by the Late Middle Formative Period, public construction expanded at a rapid rate, with the construction of even more public buildings and extensive renovations of existing structures using construction fill in which we find the largest collection of ceramic figurines at the site. In addition to the architectural changes happening at the site, there is evidence of increasing social and economic differentiation, based on the relative access to

imported goods and the differential quality of living structures between the site core and periphery groups (Horn 2015), and Middle Formative burials generally consist of simple internments with little grave goods.

By the Late Formative Period, the elaborateness of burials at Cahal Pech rose, along with the differentiation between burials, indicating not only economic stratification, but also social and perhaps political stratification (Awe 1992; Horn 2015). While it is likely that these types of stratification had their roots in the Middle Formative Period, it is during the Late Formative Period when these status differences become fully entrenched in Cahal Pech society. During the Late Formative Period, the first truly monumental architecture was constructed, including the four pyramids at the site and the initial palace complex, indicating links to what would become dynastic development. Furthermore, Awe (1992) notes that the increase in construction signifies not only that was a system of stratification, but also that the people at the top of the system had the ability to “mobilize large groups of people for the construction of public and special function structures” (Awe 1992:357-358).

The system of social stratification that appears to have begun in the Early Middle Formative was deeply embedded by this time, and can be seen not only in the differences between domestic and public architecture, but also in the deposition of artifacts signifying economic wealth and differential access to resources (Awe 1992:360). By the time that these status differences had become institutionalized in the Late Formative Period, figurines were seldom used at the site, especially in comparison with earlier Middle Formative Period use. By the Classic Period, with some notable exceptions of

fragments being found in ritual deposits, figurine fragments appear to have links to Middle Formative Period traditions for figurine manufacture.

Figurine fragments were also found in certain deposits dating to the Terminal Classic Period. One group of figurine fragments found in construction fill in the Terminal Classic H group were Formative Period in style. Significantly, the limestone blocks used to construct the H group were removed from nearby buildings surrounding Plaza C. The buildings whose materials were reused for construction material were all constructed during the Middle Formative Period, and the presence of Middle Formative ceramic sherds in conjunction with Middle Formative style figurine fragments indicate that both the limestone blocks and accompanying Middle Formative construction fill were harvested to construct the Terminal Classic structure.

A second group of Terminal Classic figurine fragments were found associated with the intrusive burial of a young child (Friewald 2011) under a bench in structure A3. These figurines were largely mold made and many were musical instruments or other accoutrements and may have been toys. A third group of Terminal Classic figurine fragments were associated with a “Termination Ritual” in Plaza A, in which artifacts that had been intentionally broken and burned were found in a very high density flanking the northern stairwell. Perhaps not surprisingly, it would appear that figurine use and possibly meaning changed during the long occupation at Cahal Pech, with figurines found in Terminal Classic deposits being found in much different contexts than figurines found in Formative Period deposits. Furthermore, iconography changed, such that by the

Terminal Classic, the figurine fragments that were being produced show few, if any, characteristics similar to the Formative Period assemblage.

Conclusion

What the figurine fragment assemblage clearly indicates is that figurines were created and used since the beginning of the settlement of the small hilltop that would later become Cahal Pech. During the initial transition from community based to public based community structure, figurines were widely used in construction fill, a trend that continued during a period of strengthening status differentiation. By the time status differences were fully entrenched, relatively few figurine fragments were found in construction fill. On the surface, it would appear, then, that there is a correlation between the rise of complexity and the decline of figurine usage, the implications of which will be discussed in the next chapter.

CHAPTER 9: CONCLUSION

The figurine corpus at Cahal Pech tells a story of diachronic social and political change. Beginning with the initial settlement of the hilltop now known as Cahal Pech, and ending with the post-abandonment reoccupation, the presence of figurine fragments over the course of nearly 2,000 years illustrates the long process of state formation and the effects of state formation on kin groups as power and authority was negotiated on multiple, intersecting levels. The story that these figurines tell include discussions of enchainment and termination, of state formation and kinship, and of diachronic social and political change, painting a new picture of Formative Period Maya social organization.

Change at Cahal Pech

During the Early Formative Period, marked by the initial settlement of what became the site core (c. 1100 BC), a group of people settled on a hilltop in the Belize River Valley. They built relatively similar structures, likely dwellings constructed of wattle and daub, painted red, with thatched roofs (Healy et. al 2004:121). While the residential structures, in particular structure B-4, underwent as many as five distinct construction episodes during the late Early Formative Period, there is no architectural evidence of differential social status. The archaeological data indicates that the residential structures were not markedly different from one another, and there was no significant distribution of status goods that would distinguish one group of people with access to more resources than any others. Obsidian sourced to El Chayal in present-day

Guatemala was found in Early Formative Period contexts, indicating long-distance trade relationships with communities outside of the Belize River Valley. This is further supported by the presence of marine shell from the Caribbean Sea, which would have been brought to the site via the Belize River (Awe 1992:346-347). Nine figurine fragments dating to the Early Formative period were located, all within the construction fill of the later plaza floor.

Around 850 BC, the first public structure at the site core was created, thus inaugurating the Middle Formative Period (850 – 350 BC). The Middle Formative Period will be discussed in two parts, the Early Middle Formative Period from 850 to 650 BC, and the Late Middle Formative Period from 650 BC to 350 BC. The distinction between the Early Middle Formative and Late Middle Formative is primarily based on the initiation of large scale construction episodes in the site core along with the initial settlement of the periphery groups.

At the beginning of the Early Middle Formative, the first public structure was erected, and by the start of the Late Middle Formative, construction of multiple public structures as well as localized periphery groups had commenced. Yaeger and Canuto (2000) suggest that public works projects, such as building construction, constitute a meaningful practice in the formation and maintenance of community identity, visible at Cahal Pech. Essentially, the building of structures and monuments serve as a cooperative community-based project that enhanced the cohesion of multiple kin groups during the Middle Formative Period.

The early Middle Formative saw the initial development of what would later become monumental architecture, a significant increase in long distance trade, and for the first time at Cahal Pech, the development of social inequality visible in the archaeological record. Differential access to resources is evident in the artefactual distribution of prestige goods such as obsidian and jade both within the site core and in the periphery settlements. These status differences are more apparent in an analysis of the residential periphery groups rather than at the site core. The Tzubin group, for example, not only contained two distinct plazas but had its own pyramidal structure, while the Zotz group consisted of a single square raised platform supporting four small structures.

While we see these indications of social stratification at this time related to artifact distribution and architecture, a Middle Formative period burial, determined to be a high-ranking individual due to burial style (see Chapter 5), lacked many of the exotic goods that differentiated later high-status burials. Additional skeletal remains dating to the Middle Formative period at Cahal Pech have some indications of social stratification through differential access to nutritional resources: however, these indications are not as drastic as those related to nutritional deficiencies from later remains (see Chapter 5). McAnany (2013:115) notes that emerging inequality among ancestor-focused descent groups is most clearly expressed in the “differential treatment of the dead.” It would appear, then, based on both skeletal and architectural developments, the Middle Formative Period saw the initial separation of public and private realms, differential residential structures and access to prestige goods, and some differing access to food resources. However, the lack of ornate burial treatment, even among individuals of likely

high-status, seems to indicate (although not conclusively) that social inequality, while certainly in existence, was likely not fully institutionalized.

The recovery context of Middle Formative Period figurine fragments from the Cahal Pech site core showed that the vast majority (339) were deposited in construction fill, however, some were included in burials and ritual deposits discussed in detail in chapter 6, and a few (n=9) were located in a household midden context, indicating that, during this time, people were still residing in the site core, even as the populace expanded as evidenced by the construction of at least five periphery groups. During the initial construction phases of the periphery groups, figurines were deposited in construction fill, although the percentage of the total assemblage in fill varies. Periphery group occupants placed figurines in ritual deposits as well, but only the Tolok group, yielded figurine fragments from the group midden. Interestingly, the periphery groups that have the largest and most extensive architecture, such as full pyramids (the Cas Pek residential group and Zopilote terminus group), are also the groups that placed figurine fragments in no other context but construction fill. This may indicate that the deposition of figurine fragments in construction fill may have been tied to the development of complexity at the site. The Zopilote group was not a residential group, but rather a ritual terminus group linked to the western ballcourt of the site core via the Martinez sacbe (see Figure 1.1). The deposition of figurine fragments in construction fill in the Zopilote group is consistent with the deposition of figurine fragments in construction fill in the site core. The Cas Pek group was the largest of the periphery groups, containing no less than twelve structures, including a large raised platform supporting three structures and a

pyramid. The largest number of figurine fragments located in periphery group construction fill come from early construction episodes at the Cas Pek group (n=14). Although the sample size of figurine fragments is small, possibly due to excavation techniques, the fact that figurine fragments were located in greatest number in construction fill from public buildings at the site core, the public periphery group, and the largest and most elaborately constructed residential periphery group may indicate that the deposition of figurine fragments in construction fill may be connected to the growing social and political complexity at the site.

Changes in iconography can indicate changes in overall ideology or contact with external groups (Stone and Zender 2001; Viveiros de Castro 2004; among others). Alternatively, and perhaps problematically, iconographic changes could simply be a function of changing aesthetic concerns. An examination of the Middle and Late Formative Period figurine iconography, including eye type, hair style, ear spool type, and mouth style, indicate that between the Middle and Late Formative Periods, there was no significant difference in the distribution of figurine feature styles, although this may be due to sample size rather than any actual significance. If the overall distribution of figurine traits is significant, it could indicate a continuity in figurine manufacture related to aesthetic ideals.

I suggest that Cahal Pech became a state during the Late Formative period. It did so, in part, through the cooption and manipulation of community-based ancestral veneration rituals by a single kin group that would eventually emerge as the royal family in the early Classic Period. By the Late Formative Period (350 BC – 250 AD), Cahal

Pech was a large and thriving trade community utilizing its strategic location at the confluence of the Macal and Mopan Rivers to engage in long distance trade with the now flourishing communities in the Petén lowlands and the Maya mountains. Significantly, while burials from the Middle Formative Period tended to be comparatively very modest with few grave goods, Late Formative Period burials were lined with specially cut limestone and contained elaborate offerings, indicating that, by this time, status differentiation had become entrenched in the social order of Cahal Pech and true monumental construction began. Four distinct pyramids were constructed in the site core: the eastern triadic group along with the large palace pyramid, as was the highly restricted palace complex. Changes in mortuary practice, coupled with a dramatic increase in monumental construction indicates that Late Formative Period social relations at the site were marked by inequality. This institutionalization of this inequality is demonstrated by many factors, including but not limited to the restriction of access to new buildings and highly differential burials. As discussed in Chapter 3, I contend that, by this time, Cahal Pech had evolved from a community to a state system. The inequality on which the state system relied may have arisen from the manipulation of specific ancestor veneration practices by a single kingship group in order to sanction elite power and authority as has been demonstrated in other parts of the world (Awe 1992; Gailey 1987; McAnany 2013).

During the Late Formative Period, figurines were deposited in fill, but not nearly to the extent that they had been in the Middle Formative. The total number of figurine fragments encountered in Middle Formative Period fill (442) was significantly higher

than the total encountered in Late Formative Period fill (64). Essentially, the decline in figurine deposits in construction fill corresponds to the establishment of institutionalized inequality at Cahal Pech, although this correspondence should not be taken to mean that one phenomenon directly caused the other.

By the end of the Late Formative Period, the nascent institutionalized inequality that had been slowly developing over centuries reached its peak with the solidification of consolidated social classes, evidenced by the construction of highly differential residential and ceremonial structures within the site core and within the periphery settlements. While institutionalized inequality was in effect at this time, kin groups still operated, although their authority had significantly diminished relative to the power of the state apparatus. Correspondingly, we see a sharp decline in the use and deposition of figurine fragments. If, as discussed above, these figurine fragments were enchained to particular kin groups, it would indicate that the authority of individual kin groups to support and contribute to monumental construction was no longer a requirement of the social order. Indeed, the figurine fragments located in Classic Period contexts may be fragments originally from the Formative Period, as stylistic designs and material construction are very similar and, as Awe (1992) notes, may have been curated family heirlooms.

The sharp increase in social differentiation correlated with a sharp decrease in the use and deposition of figurine fragments in construction fill hints at a possible relationship between the two (Chapter 8). The evidence of a causative relationship between increasing social differentiation and the decrease in the presence of figurine

fragments in construction fill does not allow us to assert, definitively, that this occurred. However, the evidence of a correlation between the two is sufficient to merit a discussion of the implications of a hypothetical relationship.

Before the state at Cahal Pech began to form, the social structure would have likely been marked by multiple kin-based groups working cooperatively to maintain a small but growing trade-based community that utilized the Macal and Mopan Rivers to import goods from the Caribbean, modify them, and export them to sites further inland and vice versa (Awe 1992). We know from the presence of figurines found at Early Formative levels that, from the earliest settlement of the site, figurines were made and used. With the rapid population increase of the early Middle Formative and the initiation of the production of several large residential groups in addition to the first public buildings in the site core, we see figurine use sharply increase, as they are fragmented and deposited en masse in construction fill for buildings erected during this time. Working from the standpoint that fragmented figurines are not simple trash, but meaningful objects connected to kin groups through ancestral ties, we can begin to see an overall picture of kin groups purposely fragmenting and depositing their figurines within the base of new structures. I suggest that this act may have provided a sense of community and kin based legitimization of such construction and functioned as a sort of ritual cache containing fragmented figurines and craft production debitage, albeit not the type of cache that is typically understood in Mesoamerican archaeology. Eleanor Harrison-Buck (2004) notes that in Formative Period Mesoamerica, “a person’s right to land was legitimized through personal offerings” (67), and I further suggest that the

Middle Formative deposition of potential heirloom figurine fragments in construction fill functioned as a sort of offering on behalf of the kin groups to the construction project and the community as a whole.

By the Late Formative Period, we see a sharp increase in status differentiation, as indicated by burial goods, the initial construction of restricted buildings, and the distribution of exotic goods, and an effective restructuring of the kin-based community identity that had likely characterized the Early and Middle Formative Periods. Within a regional context, Bartlett and McAnany (2000) discuss the importance of community identity formation and solidification against a backdrop of increasing institutionalized inequality characteristic of the Late Formative. In particular, they claim that the development of unique pottery styles within a region may be the response of a community trying to maintain a unique identity and cohesiveness during a time when Maya sites were becoming larger, more stratified, and more diverse (Bartlett and McAnany 2000:102-103), although this interpretation is not without its critics (Hegmon 1992, 1998; Hodder 1997). The use of specific community-oriented pottery styles within ritual contexts may be understood as “a medium for the expression of social identity...meant to symbolize community affiliation” (114). For Bartlett and McAnany, the deposition of community stylized pottery indicates that group cohesion and the expression of community identity in the face of increasing stratification was an important consideration in negotiating social status within a larger community (117).

Considering the question of community identity at a regional level, I believe that Bartlett and McAnany's (2000) assessment of the importance of group identity and

cohesion in the face of increasing social complexity may be seen at the smaller site level at Cahal Pech expressed through a lens of community being comprised of multiple kin groups.

Corresponding to the rise of differentiation and inequality at Cahal Pech, we see a decline in the placement of figurines in construction fill (Chapter 8). It is not a matter of fewer construction episodes; in fact, it appears that construction episodes increased greatly (Awe 1992; Healy et. al 2004) during the Late Formative Period. What is significant is that figurine deposition in construction fill drastically declined during the same time that status differentiation was increasing and inequality was becoming institutionalized. It is important to note that, although construction accelerated in the Late Formative Period, the total number of figurines recovered from Late Formative Period contexts is drastically smaller than those recovered from Middle Formative Period contexts. Yaeger and Canuto (2000) suggest that public works projects, such as building construction, constitute a meaningful practice in the formation and maintenance of community identity. Essentially, the construction of structures and monuments serve as a cooperative community-based project.

It may be that the same kin groups that legitimized community-based construction episodes by depositing their enchaind ancestral symbol at the base of new constructions were no longer in a position of authority that required their sanction of new construction episodes. Kin groups were rendered, for political purposes, ineffective in the face of an emergent ruling class that propagated the institutionalization of inequality and formed the Cahal Pech state.

By the start of the early Classic Period, Cahal Pech was a fully established state marked by institutionalized inequality. During this time, the separation between public and private, and divisions of class became much more pronounced, as royal and administrative buildings were modified to be both larger and to restrict access even further than they had during the Late Formative Period. Plaza B, the area that had originally been the location of the earliest residences and first masonry buildings, became a large public area, but it was bracketed on the north, west, and south sides by administrative buildings and on the east side by a triadic pyramid group that was the site of several elite and highly elaborate burials. It is clear from burial evidence (discussed in detail in Chapter 5) that, during the Classic Period, the ruling elite sought to aggrandize themselves to a much greater degree than they did during the Formative; it is likely that kin groups may have sought to establish and/or maintain connections to the ruling elite.

A total of nine figurine fragments were found in stratigraphic levels dating to the Classic Period, and all of them were in construction fill associated with Plaza B construction and construction fill associated with a burial in structure B1. These may have been placed in construction fill as a means of a type of covert resistance to state domination through the continuation of earlier kinship based practices as Gailey (1987) described. Elsewhere in the Belize River Valley, particularly at the site of Baking Pot, many Classic Period figurines have been found (Hoggarth 2015, personal communication). The fact that figurines were produced and used at other sites in the Belize River Valley during the Classic Period in greater numbers than at Cahal Pech would seem to indicate that conditions at Cahal Pech were such that figurines were not

needed. In either case, the presence of a few Formative Period figurines in early Classic burials and caches indicate a sense of continuity with the past that had, perhaps, dwindled considerably over the course of the Late Formative to Early Classic Period (Chapter 8).

By the Terminal Classic period, most figurine fragments (23) were found in ritual termination deposits (mostly in Plaza A flanking the north stairwell) and in intrusive burials that were placed within architecture that had been constructed long before.

Although three figurine fragments were in construction fill of the Terminal Classic Plaza H group, this may be because the construction materials for this group were repurposed from buildings adjacent to nearby Plaza C that were constructed in the Middle Formative Period. In addition to the changes in figurine deposition, iconography changed significantly. By this time, the use of ceramic figurine molds allowing for more complex stylistic designs was widespread in the Maya region. It is clear by examining the figurine fragments found in Terminal Classic contexts that the use of figurines changed significantly over the Classic Period at Cahal Pech. By the Terminal Classic, some figurines appear to have been used as toys, as a majority were found in the intrusive burial of a young child and were associated with musical instruments and other toys. The changing function of figurines from the Formative to the Terminal Classic period is not surprising, given the 550-year time span coupled with technological advances and increasing social interaction with other parts of the Maya region. It may be, then, that the corpus of Formative Period figurine fragments from Cahal Pech, particularly those found in construction fill, demonstrate how community-based kin groups responded to political

change that effectively disenfranchised them from control of their community and placed them within a state system defined by the institutionalization of inequality.

Concluding Remarks

Figurine fragments at the site core were primarily found in construction fill, although some were included in ritual deposits. Figurine fragments from the periphery groups were also associated primarily with construction fill. In contrast to the figurine fragments found at the site core, however, they are conspicuously lacking in burials and in household contexts. While nine fragments were found associated with a buried midden in the Tolok group, most figurine fragments recovered from construction fill in the periphery groups illustrates the importance of deliberately placing figurines within construction fill during the Middle Formative Period. Furthermore, the fact that these figurines were scattered throughout the site could indicate the importance of depositing enchainned fragments from the same figurine in multiple buildings, connecting each building to both kin groups and one another.

The figurine fragments dating to the Early, Middle, and Late Formative Periods were all formed in similar ways, that is, they do not appear to change throughout this period. The figurines dating to the Terminal Classic Period are significantly different, primarily in that they are mold made, which allows for much more detailed features. Although the changes appear to be drastic, it is important to note that the time span between the Late Formative Period and the Terminal Classic Period was roughly 600 years and may be related to changing ceramic technologies throughout the Maya region.

Furthermore, most figurines found in Terminal Classic contexts were in either burials or ritual termination caches. Three figurine fragments were located within construction fill of the H group, which was constructed during the Terminal Classic Period, but these fragments are stylistically linked to the Formative Period. These fragments are likely present in the construction fill because construction material for this group was repurposed from buildings surrounding Plaza C which were originally constructed in the Middle Formative Period. The fact that they were included in construction fill of the H group may be an acknowledgement on part of the Terminal Classic residents that figurine fragments were linked to the construction and construction material of earlier buildings.

I suggest that Formative Period figurines, particularly at Cahal Pech, may have functioned within kin groups as familial totems or keepsakes, and outside of kin groups, served as physical proxies for these groups. The placement of figurine fragments in the construction fill of public and administrative buildings may be understood as an expression of collective identity during a time when formal social and political institutions and inequality was nascent within the burgeoning state was becoming stronger. The act of placing figurine fragments within construction fill may speak to a form of group expression effectively making a claim about the support of kin groups to increasing complexity and inequality made manifest by the rapid construction episodes of the Middle and Late Formative Periods.
