Volume I

This dissertation will explore virtual reality (VR) as a "spatialized" environment for artistic expression and creation, focusing particularly on the composer's creative process when working with it. VR environments are already expanding and reformulating the concept of immersivity and interaction, as those terms have been

understood to date. The motivations and goals of the creative impulse responsible for generating works of art will be considered not only from the perspective of composition but also as an underlying force common in artistic expression—a reflection of the need to communicate between individuals at a deep abstract level.

VR provides a new space, analogous to the physical world, but with the potential to become more flexible and adaptable to the purposes of the composer or artist, and to theoretically present the opportunity to recreate what the artist mentally imagined more faithfully. Beyond a space, VR is also a communication and artistic medium still in the process of developing a unique aesthetic identity.

Volume II

The second volume of this dissertation consists of two works, *Meeting* and *Hillary*, each conceived since their inception to have concert hall performance and VR version. *Hillary* has a version which is a combination of acoustic and electronics. *Meeting* has both acoustic and spatialized electronic concert hall versions. Whereas the concert hall format has been premiered in both cases, their VR versions are projected here though a description according to the format presented at the end of chapter 4 of volume I. These descriptions follow the score for each piece.

This dissertation of Tomàs Peire Serrate is approved.

ACKNOWLEDGMENTS

I would like to express my most sincere gratitude to Professors David S. Lefkowitz and Ian Krouse for the opportunity they gave me, and for the trust and guidance I have continuously received from them during my doctorate years. Their mentorship is a reference and will always accompany me.

I would also like to thank Professors Rebecca Allen, Jocelyn Ho, and Neal Stulberg, for their generosity serving in my doctoral committee and for their valuable feedback.

To Professors Mark Carlson, Peter Golub, Bruce Broughton, and Richard Danielpour, and to the rest of the faculty, staff and colleagues of the UCLA Herb Alpert School of Music for enriching my life.

Finally, to my family, and to my wife Sara, who has patiently listened to and read everything I have created, and who has been with me through this adventure every day and every step.

VOLUME I

INTRODUCTION

This dissertation will explore virtual reality (VR) as a "spatialized"

environment for artistic expression and creation, focusing particularly on the

composer's creative process when working with it. VR environments are already

expanding and reformulating the concept of immersivity and interaction, as those

terms have been understood to date. The motivations and goals of the creative

impulse responsible for generating works of art will be considered not only from

the perspective of composition but also as an underlying force common in artistic

expression—a reflection of the need to communicate between individuals at a

deep abstract level.

VR provides a new space, analogous to the physical world, but with the

potential to become more flexible and adaptable to the purposes of the composer

or artist, and to theoretically present the opportunity to recreate what the artist

mentally imagined more faithfully. Beyond a space, VR is also a communication

and artistic medium still in the process of developing a unique aesthetic identity.

Chapter 1 will discuss how, historically, music has interacted with physical

space. This has implications for the "abstract" space, which is created in the

human mind. Moreover, due to its immersive qualities, artistic expression has

used space in different ways to create compelling experiences but also to allow

for temporary escapes from the actual physical world to explore and redefine its limitations. The composer Richard Wagner's (1813-1883) idea of total art will be referenced here as a crucial philosophical change in both the conception of art and the limits of the artist.

Chapter 2 will consider the hypothesis that the boundaries of artistic disciplines are arbitrary, conditioned and pre-established by the development of societies. The creative impulse has to push the boundaries of the medium in question to achieve its goals. Technology and interdisciplinary work are very useful when seeking to generate new artwork and, therefore, new ways to communicate. Additionally, this chapter investigates understanding artistic expression from a communicative perspective with the goal of explaining how VR as a new medium of communication will affect it. Marshall McLuhan's (1911-1980) ideas about media as an extension of the human body and mind will provide a theoretical framework from which to approach the implications of using VR.

Chapter 3 will review recent VR and mixed reality (MR) experiences and experiments that feature music prominently, with the goal of exploring the developments in VR musical works to date. Immersivity and interaction are almost inescapable elements of VR experiences, but the degree to which they are implemented or used can vary hugely. Furthermore, while VR is visually immersive, the development of truly musical immersion has not been adequately explored yet. Film and video games have a palpable influence on VR because they are at the core of most VR experiences and their respective industries generate the funding for project development while being driven by the need to make profit.

Chapter 4 will explore what a truly immersive VR musical experience must be able to offer, and the way the creator or the participant would interact with the environment. I will propose a set of guidelines or considerations for approaching musical creation within VR, with particular emphasis on the challenges that composers face and also the enormous opportunities that they are presented with. To complement this, I will include a description of a new VR music work that explores all the aforementioned considerations.

Finally, in the context of this dissertation, I consider it necessary to establish a dialogue between different artistic expressions at different times, as shown in Chapter 1 and 2 (and 3 but less so) so that, ultimately, we can see VR as a logical step in the evolution of art rather than just as an artifact or ephemeral trend.

CHAPTER 1

SPATIAL CONSIDERATIONS IN MUSIC AND ART

This chapter will discuss how space has important implications in music. On the one hand, there is the "physical" space, which refers to the world we physically inhabit—where music is performed, where it resonates, and where it is perceived—and this chapter explores how this can affect the creative process of the composer as well as the notion of immersion. On the other hand, I will refer to "abstract" space, that is, the space that the composer creates internally, and that, via artistic expression (music in this case), is directed and shared with others in the physical space. Since this is not exclusive to music, I will show connections with other artistic disciplines in terms of their underlying creative process and the urge to use and explore space artistically.

THE PHYSICAL SPACE

Music, as organized sounds through time and therefore as a compound of propagating waves, has the inherent property of expansion through space. It is also omnidirectional and therefore it has the potential to fill spaces both directly from its source and indirectly by interacting with physical objects—bouncing off walls and creating reflections until the vibrational energy is completely absorbed and dissipated. Thus, music has the capacity to momentarily fill the space in which it is played, potentially reaching every corner of it. Of course, many factors

intervene in this process and can have an infinite number of results. It is not the goal of this dissertation to discuss them from a purely physical or scientific point of view. However, this explanation illustrates an essential characteristic of music, one we could call "fluid" or, more appropriately, "immersive," that allows it to unify the space it occupies, and therefore to reach and surround everybody and everything in it while it lasts.

Although sometimes overlooked when talking about music, the fact that a good number of composers—beyond the common practice— have explored the implications of using space as a relevant part of their work is nonetheless significant. If music propagates and can potentially reach everywhere, particularly in performing spaces, why is it appealing to composers to deal with the practical problems that spatialization, as the intentional localization of sound, may generate? The answer to this question may be found in nature. We receive sounds from everywhere, a constant stream of acoustic information that we process by default, often unconsciously, allowing us to be aware of and somehow understand the world around us. We mentally recreate it in a unique personal way, coding and decoding all the information received so that we can retrieve it when needed. Hence, it is understandable that composers, being sensible to this phenomenon, would feel the need to replicate it in their own creations, for multiple possible purposes, and with different degrees of depth and consistency. So, we could conceive a musical work as a world in itself, created by a composer to potentially be explored and shared. This idea will be revisited in the second part of this chapter.

The intentional use of space in music has a long documented tradition. For example, Jewish psalm recitation often involved responsive singing between a soloist and a choir, as was the case in early Christian singing practices.[1] We know that in ancient cultures and through the medieval period, music was used to accompany ceremonies and celebrations, both in sacred and secular situations, and of course as entertainment in association with other social activities or artistic expressions. In the Renaissance, the sophistication of the Venetian antiphonal choir music performed at St. Mark's Basilica became a phenomenon. The *cori spezzati*[2] that Andrea (1532/3-1585) and Giovanni Gabrielli (1554/57-1612) helped popularize deployed different groups of singers and performers around the complex architectural space to create a unique, compelling, and immersive sonic effect.[3]

In connection with the Venetian spatial explorations, Thomas Tallis' *Spem in Alium* is an intriguing case. The piece could have been commissioned as a reaction to the sensation that the performance of *Ecce Beatam Lucem,* by the Italian composer and diplomat Alessandro Striggio (1536-1592), had upon its English audience, probably around the year 1567.[4] Along with William Byrd (1539-1623), Tallis (1505-1585) was a leading English composer of his time, and he was challenged to match Striggio's piece. *Spem in Alium*, first performed in 1573, was

[4] The date is uncertain but Striggio visited the Elizabethan court that year, after a diplomatic tour around different European countries. During the trip, he arranged a few performances of his music, including *Ecce Beatam Lucem*.

composed for eight choirs, each one comprised of five singers: a total of 40

different voices for which Tallis wrote 40 different parts. Although it is difficult to

certify how this work was premiered, it is believed that it was first performed at

Arundel House in London,[5] a palace with an octagonal hall on two levels. This

would have made it possible for Tallis to distribute the eight choirs around and

above the audience, surely achieving an impressive immersive effect.

In 2001 *Spem in Alium* inspired and was used by Janet Cardiff[6] to create an

art installation, which premiered at the Nelson Atkins Museum in Kansas City.

Cardiff, a Canadian artist working with sound and immersive installations,

replaced the singers with speakers distributed in a circle around the space so that

the visitors could walk around while the music was played.

[5] In Fleetwood Sheppard, H. Tallis and his song for forty parts, in The Musical Times and Singing Class Circular (Harley, 2015:149)
[6] Cardiff, J. "The Forty Part Motet." 2001.

The piece played from a 40-track recording, with each singer on an individual track. It offered the possibility of looping the music, so that people could appreciate it while moving freely around the space. Cardiff's piece was very successful and was presented in many venues in subsequent years, thereby contributing to the popularization of Tallis's work. However, it certainly raises questions such as how much the digitalization of the voices affects the resulting experience or, since the voices had to be recorded separately, whether that removes the interactive element between the singers of an ordinary performance. Regardless, this case is interesting because it demonstrates a direct interaction between two artists, separated by more than four centuries, with artistic sensibilities dealing with space.

In conjunction with theatre and particularly with the development of opera in the 17th century, the use of spatialized musical elements in performances for dramatic purposes pushed the limits of the stage space. The placement of performers offstage to emulate distance or movement in relation to the action on stage is a clear example. However, the creative use of space in musical works did not become common until the 20th century, stimulated by technological advances in electronic reproduction and amplification—for example in *musique concrète* and in electroacoustic compositions from the 1950s onwards, with Pierre Shaeffer (1910-1995)[7] as one of the pioneers. Some works tried to emulate not only the sonorities emerging from electronic sounds, but also the spatial location that it

---

[7] Founding the GRMC, *Groupe de Recherche de Musique Concrète*, in 1951. Later it became the *Groupe de Recherches Musicales* (GRM), founded by Shaeffer in 1958.

was possible to achieve with the use of speakers. As examples, *Gruppen* (1955-57) or *Carré* (1956-60) by Karlheinz Stockhausen (1928-2007) places the audience in the middle of three and four orchestras respectively, each one independent, conducted by a different conductor, but interacting with each other in a deliberate and organized way.

Stockhausen's spatialized orchestral works, like those from other composers such as Henry Brand, John Corigliano, Marc-André Dalvabie, or Georg Friedrich Haas, are exceptional examples not normally found in live concerts. Historically, music performance has tended to be organized in space for different reasons. The traditional opposition between stage and audience in concert halls was a response to social organization initially and later to commerce strategies, and was, therefore, often a standardizing and constraining element to the composer's intent. In contrast, popular and folk music evolved along different parameters until they were commercially exploited and became a mass phenomenon in the 20th century. Pop and folk music have their roots in gatherings and shared experiences, which allowed for participation and inclusion. As a matter of fact, the aural and oral method of transmission are at the core of these styles of music since they need the frequency of regular shared experience to guarantee their survival.

These musical references exemplify the interest in using spatialization with immersive intentions. This is an important trend in the 21st century, particularly in the entertainment industry, and it is an essential part of the VR experience. However, it is also transcendent in other artistic expressions.

The art historian and media theoretician Oliver Grau, in his book *Virtual art: from Illusion to Immersion* (2003), argues that the quest for immersive experiences (understood as placing the physical body in spaces removed from an actual real place) has always been part of the human creative mind. As an example, he refers to the *Villa dei Misteri*[8], in the south of Italy, close to Pompeii, where frescoes in one of the villa's rooms have been preserved: all its walls are decorated on the theme of the Dionysian mysteries, a set of religious and mythological rituals. It is difficult to say what the intentions were behind these paintings, but whether decorative, reverential or for entertainment, there is no question that they have an immersive impact.
Fig. 1.2. Villa dei Misterii, Pompeii, Italy.

The painted walls at the *Villa dei Misteri* are an example of mural painting, which can be traced back to parietal art. Cave paintings such as those in Altamira (Spain) or Lascaux (France) reveal at least a need to represent or communicate

---

[8] Villa of Mysteries.

something as well as the existence of a developed technique and sensibility to do it. The scenes represented may not have happened in that particular moment and place and could be recollections of the past or projections and hopes for the future. Furthermore, their size, detail and placing, beyond technical considerations such as materials or surfaces available, create such a deep immersive impression in us nowadays that they raise the question of the aesthetic experience perceived at the time of their creation, more than sixteen thousand years ago.[9]

Fig.1.3. Altamira Cave. Soria, Spain.

Fig.1.4 Lascaux Cave, Montignac, France.

Another art related to mural painting with immersive potential is tapestries, of which there are samples preserved from as far back as the 3rd century BC. These were used to cover walls and helped mitigate the low temperatures in wealthy houses, and they also functioned as decoration and possibly as entertainment. Additionally, their portability made them a practical choice for use in different properties or for specific occasions.[10] Blurring the distinction between craft and textile art, they were often sumptuous, detailed, and rich in mythological,

---

[9] There are other examples of Upper Paleolithic paintings from more than forty thousand years ago.

[10] Le Corbusier called them "the mural of the modern age" and "nomadic murals."

religious, and historical references. In some cases, their gigantic size generated a similar effect to the frescoes referred to before, just like those that can be found in churches, palaces, temples, *trompe-l'oeil*, etc.

Panoramic paintings, portraying landscapes or historical events, became very popular during the 19th century in Europe and the United States.[11] Interestingly, Robert Barker (1739-1806), the artist who, in 1792, used the term panorama, the wide-angle view of a physical space, to refer to his paintings, enjoyed great success in what he conceived as immersive experiences. He designed and constructed a building with a circular space, a rotunda with two levels, with the sole purpose of exhibiting his work. Situated in Leicester Square, London, the cylindrical space allowed the display of two panoramas, one in the lower and another in the upper circle. The spectator could pay for admission to walk around the space, observe, and *"…fairly imagine he is present at the display of the real scenery…"* as explained in a guidebook of London entertainment of that time.[12] These types of works—forms like the cyclorama or the diorama, which were subsequently influenced by the panorama—enjoyed a warm reception until the development of "moving pictures."

In painting, but in a different format and time, Rembrandt's (1606-1669) *Girl in a Picture Frame* (1645) or Murillo's (1618-1682) *Self Portrait* (1673)—in both of which the subject has seemingly placed a hand on the frame of the painting

---

[11] Hand scrolls like *Qingming Shanghe Tu*, Along the River During the Quingming Festival, by Zhang Zeduan (1085-1145), are earlier examples of forms related to these larger panoramic paintings.
[12] As in the first edition of the guidebook "The Picture of London," 1803.

itself—show this attraction to investing in strategies to deceive the eye of the observer and to convey the idea that art could serve as a small window to another world, as a way of seeing a different world through the eyes of the artist.

Fig. 1.5. *Girl in Picture Frame*, by Rembrandt.   Fig. 1.6. *Self-portrait*, by Murillo.

Those works by Rembrandt and Murillo express an artistic unwillingness to adhere to the limits of their medium. In the 20th century, these limits or boundaries were broken in many ways, including the separation between art and its audience; the so-called fourth wall in film and TV was trespassed, like in the paintings referred to above. It is in fact a provocation to the audience, an invitation to abandon the passive role in the artistic dialogue and to become an active part of it. This immersive and participatory conception of a work of art has been expressed in installations and happenings, and has found its way into other media, such as video games, VR/MR experiences, theme parks, etc.

The idea of projecting an extension of our world may well be an impulse inherent in human nature. The product of what we now categorize in different artistic disciplines has been an intrinsic part of human existence. The interpretation of what has remained until now helps us to understand our own history and origins. Sculpture, for example, shows the need to honor or maintain the physical presence of somebody, or something, beyond its existence, somehow filtered by the sensibility and skill of the sculptor, even if he or she is unaware of it. Poetry, theatre and literature in particular, ever since the distribution of written text became possible with the invention of printing, offer this temporal escape from the present time and reality, not necessarily always with the physical use of space, but certainly on a mental or abstract level.

THE ABSTRACT SPACE

If a musical work can be understood as a small world created by a composer and if space is a creative aspect in composition, then it is logical to think that spatialized elements could and should be found in it. The original version of the work as imagined internally in the composer's mind may recreate some of the dynamics that we are used to perceiving aurally in every instant of our lives, and therefore are natural in the creative process. The common practice and other constraints may push music to become simplified as it goes through the different stages of its codification, first in setting the piece into the score and

finally into a performance. Consequently, we have to assume that very likely there will be a loss of fidelity in respect to the imagined original.

Regarding the conception of a musical work as a world in itself, the title of Béla Bartók's (1881-1945) piano pieces and learning method, *Mikrokosmos*,[13] somehow exemplifies this idea. All the little pieces contained in the collection are particles that form a unity, a cosmos, while each piece is a unit in itself in which the pianist immerses himself or herself for a few seconds, gaining a unique aesthetic and learning experience. All the pieces relate to the rest of the composer's piano output, to his whole catalogue, to his musical influences, and, ultimately, to the world he lived in. Thus, the chain of small cosmoi contained within larger ones continues possibly ad infinitum. As a matter of fact, since the composer provides a space to be experienced by the performer, it is also likely to be shared by an instructor, and potentially an audience. Clearly this is applicable to any piece of music by any composer, but the title choice by a composer like Bartók makes it less arbitrary and rather allows connections with the subject of this chapter (space) and that of chapter 2 (which deals with the philosophical question of the creative impulse and communication).

Far from finding an optimal use of space, in recent centuries artists have been seeking to achieve immersive effects on audiences and to find new modes of expression. Technological developments have been critical in the reformulation of the limits of artistic disciplines and in enabling further interactions and the

---

[13] 153 Progressive piano pieces published between 1926 and 1939. Gathered in six volumes, the first two are dedicated to his son Peter.

generation of new expressive formats. Photography, for example, may be derived from painting, initially surpassing the fidelity of which reality might be recreated and presented. However, most interestingly, what probably was initially perceived by some as a threat, turned out to be more of a liberation; it was an opportunity for painters, for example, that stimulated and transformed the expressive strategies and techniques used up to that point and opened the way to new ideas that generated styles or currents such as impressionism, expressionism, cubism, or all the avant-garde trends of the early 20th century that would reinvigorate not only the painting medium but ultimately all media.

The dialogue between art and technology can be exported to other artistic disciplines, since technological developments provide allies and stimuli to regenerate each discipline's own language and expand its possibilities. In addition, another successful way to find new artistic expression has been the combination of different arts to create interdisciplinary works. The exploration of new combinations has been prolific, even more so in the 20th century, with technological developments in electricity and electronic devices. In these combined or multimedia projects, with the ultimate intention of achieving more powerful and immersive results, music is almost always present. Unsurprisingly, it seems that the immersive quality discussed earlier is a factor of utmost importance to achieve the desired goals. Opera, particularly in the 19th century, is the epitome of this interaction and combination of different disciplines. This is demonstrated by Richard Wagner (1813-1883) and his concept of the

Gesamtkunstwerk.[14] What Wagner's conception and process explains is how what we understand now as "interdisciplinarity" could be seen in fact as a process of liberation from the classifications self-imposed upon our society at practically all levels.

Wagner, by defending the idea of total art, composed the music, wrote the libretto, intervened in the staging and every creative decision, and ultimately even designed a building for his work to be performed in to ensure the most faithful rendition of the product of his creative impulse—that which he imagined in the abstract space. In doing so, he demonstrates that this creative impulse goes beyond the pre-established limitations and attributions of a discipline. In our world, we are driven to specialization for social and economic reasons. However, although it may appear to be a convenient and efficient system to which we can adapt, it is not necessarily a true reflection of human nature. On the contrary, it may have become a burden from which we may be trying to free ourselves.

In the 2003 compilation by Randall Packer and Wen Jordan *Multi Media: From Wagner to Virtual Reality*, the first chapter is *The Artwork of the Future* by Wagner (1849), in which he proposes the aforementioned idea of *Gesamtkunstwerk*. It is significant in the context of this dissertation to find this article in a book dedicated to advancements in the field of virtual reality, perhaps as a precognition of the virtual space. Wagner's thinking will be discussed in the

---

[14] Different translations as "universal artwork" or "total work of art," first used in 1827 by German philosopher K.F.E. Trahndorff, and later by Wagner in his two 1849 essays.

next chapter for further considerations regarding the creative impulse and

interdisciplinary ways of expression.

CHAPTER 2

CREATIVE IMPULSE, INTERDISCIPLINARITY AND COMMUNICATION

The creative impulse pushes the artist to explore the limits of his/her

imagination to produce a work of art. This process eventually reaches the point

where the realization of the work of art needs more than what a single framework,

medium, or artistic discipline can offer, and consequently the artist feels the need

to go beyond any established boundaries. This phenomenon can be seen as the

consequence of the inclination that humans have to organize, classify and

categorize everything, including creativity. Within the same discipline, for example,

a dramatic situation like the appearance of vocal soloists and the choir in the last

movement of Beethoven's Ninth Symphony could be explained by the composer's

need to break the rules in order to reach his desired climax, making the

performance of his artistic intent possible with the appropriate means so it could

be conveyed to the world. Here the boundary broken is the traditional

instrumentation of the symphony via the introduction of a choir and soloists. As

we can conclude now, that adventurous and dramatic leap, premiered in 1824,

expanded the concept of what was (until then) the framework of a symphony as a

musical form. Nowadays choir, soloists, electronics, projections, and much else

besides are not unusual in works using the word "symphony" in their title.

Wagner's concept of total art is an expression of this inexorable creative

impulse, a striving for expressive freedom that goes beyond artistic boundaries.

As explained in chapter 1, Wagner was not alone in this exploration, and its logical

19

continuation was the rise of interdisciplinary works in the 20th century. Like him, other composers experienced the same instinct in their compositions, resulting in works that incorporated text in different forms, physical movement, and staging, as well as elements that were traditionally less common, such as lighting.

Arnold Schoenberg (1874-1951), for example, after completing his Opus 18, *Die glückliche Hand*,[15] a piece he catalogued as *"Drama mit Musik,"*[16] expressed the possibility of exporting the piece to cinematic format, as cinema was in its early days at the time.[17] The piece (for which he wrote the libretto unlike his previous operatic work *Erwartung)*[18] calls for baritone, a large orchestra including an offstage ensemble, two miming characters, and a chorus of Sprechstimme.[19] But what is striking is the degree of precision and control that he tries to achieve by detailing actors' movements as well as the colors and intensity of the illumination, which are to synchronize closely with the developments in the music and drama on stage. The lighting directions focus particularly on transitions and dynamic changes through time, such as crescendos, decrescendos, tempo changes, and textural changes in the music.[20]

---

[15] *Die glückliche Hand* (The Hand of Fate or The Happy Hand upon different translations) was written between 1910 and 1913. Its premiere was at the Vienna Volksoper in 1924.
[16] Drama with music.
[17] Referred to in various sources including Sanchez-Verdú's dissertation, Reich, W. Arnold Schoenberg oder Der konservative Revolutionär, DTV, Münich, 1974 and Marjana Veselinovic-Hofman's paper *Drama with Music. Die glückliche Hand by Arnold Schoenberg as a Multimedia Project*.
[18] Opus 17, 1909, with a libretto by Marie Pappenheim.
[19] Spoken singing.
[20] This increasing interest in multisensory experiences extending music compositions became a trend for many composers all around Europe from these early years of the 20th Century.

Schoenberg considered himself an amateur painter, but when he was working on *Die glückliche Hand,* he was painting intensively, which may partially explain the obsession with color and light in the piece. Furthermore, the subject has a strong connection with the trauma in his personal life after the affair that his wife Mathilde and the painter Richard Gerstl had a few years before. Perhaps this is an indication that the extreme control over all the details in the work was motivated by a drive to achieve emotional freedom and a need to externalize or communicate a turbulent inner state to the outside world. To succeed in his goal, Schoenberg drew upon all possible artistic resources; thus, it is not surprising that, as mentioned above, he considered using a medium such as cinema to convey his vision better.

Around the same time, Alexander Scriabin (1871-1915) developed a system to connect music and colored lighting in his piece *Prometheus: The Poem of Fire*, a 20-minute symphonic work for piano, orchestra, choir and *clavier à lumières.*[21] The piece was premiered in Moscow in 1911, but it was not performed with the colored lighting until 1915 in New York at Carnegie Hall. Scriabin meant to deliver an experience beyond music alone by intimately relating it to another sense besides hearing. In that regard, and without attempting to delve deeply into the subject, it is worth mentioning the phenomenon of synesthesia, a condition that causes the joining of senses that are not normally connected. Studies show that

---

[21] Also *Chromola*, by Preston Millar, upon the invention of the *Color Organ* in 1893 by the painter Alexander Wallace Remington. A mechanical device built to represent sound and accompany music in visual medium.

synesthesia is perceived in multiple and very personal ways, which makes it difficult to explain from the point of view of aesthetic perception, and even harder to share in artistic contexts particularly. The term synesthesia has been used in reference to multisensory experiences without the connotation of the condition that generally is scientifically approved. However, some researchers and studies[22] in progress are considering the hypothesis that connections between different senses in our brain could be common in humans at the moment of birth and during the first years of life, suggesting that this capacity is abandoned as humans get older. Following that hypothesis, though, there is a possibility that the instinct pursued by many artists in combining different artistic disciplines to achieve more compelling and immersive experiences may have a deeper organic foundation than was previously thought.

Similar to these extended explorations in composition, and around the same time as Schoenberg's and Scriabin works, the Russian artist Wassily Kandinsky (1866-1944) created his opera, or experimental theater piece, *Der Gelbe Klang.*[23] This piece, which has neither conventional plot nor dialogue, had a central focus on color, one of Kandinsky's obsessions. As a matter of fact, by that time he had just published *Concerning the Spiritual in Art,*[24] where he elaborates on his theory about abstraction, form, color, and synesthesia. *Der Gelbe Klang* had original music by the Russian composer Thomas de Hartmann (1885-1956),

but it was unfortunately lost. Its premiere had to be postponed due to the

outbreak of World War I, and it was not until 1972 that it took place at the

Guggenheim Museum in New York. This production used music created by

Gunther Schuller (1925-2015) based upon notes on the original work by de

Hartmann, but later performances in different locations used other music, both

pre-existing and original. Kandinsky's interest in synesthesia, a trending topic in

artistic circles in this period, is palpable in the four "color-tone dramas" (of which

Der Gelbe Klang was the first)[25] that he created between 1909 and 1914 as an

experiment in blending different art forms.

Significantly, one of the failed attempts to premiere *Der Gelbe Klang* in the

years after World War I was in Germany at the Bauhaus,[26] an experimental and

interdisciplinary school in which all the arts, including design and architecture,

were meant to be interrelated in a sort of *Gesamtkunstwerk* utopia. Kandinsky

taught at the Bauhaus from 1922 to 1933. There, artists and designers combined

their work, sometimes in shows and presentations incorporating music and

dance. Although the school never had a music department, composers like

Schoenberg, Igor Stravinsky (1882-1971), and Karol Szymanowski (1882-1937)

presented different works in it. In 1923, under the direction of Oskar Schlemmer

(1888-1943), the Bauhaus dedicated a week-long festival to the *Celebration of*

[26] A German art school, including crafts and fine arts, operating from 1919 to 1933 in Germany, located chronologically in Weimar, Dessau and Berlin. Kandinsky was part of it almost until its demise in 1933, due to pressure received from the Nazi regime.

New Music,[27] where Stravinsky's *A Soldier's Tale*[28] was performed in the presence

of the composer, and Paul Hindemith (1895-1963) premiered *Life of the Virgin*

Mary.[29] Ferruccio Busoni (1866-1924) attended the festival accompanied by Kurt

Weill (1900-1950) and Stefan Volpe (1902-1972), his pupils in Berlin at that time.

The aforementioned concept of striving for freedom in relation to the

creative impulse has a philosophical foundation in the thinking of the German

philosopher Arthur Schopenhauer (1788-1860). Discussing the duality between

the real world and the perceived world, as explained by Immanuel Kant (1724-

1804), Schopenhauer finds in the idea of will "the innermost essence"[30] that is

intrinsic to human nature and the sole connection between the real world and that

perceived by the senses. This essence is, according to Schopenhauer, the

endless urging and desire for freedom, truth, or what for some may be God, or a

form of godliness. Schopenhauer was influential in Wagner's philosophical and

spiritual concerns and was also convinced that music had the sublime power to

convey such a concept.

Schopenhauer's "innermost essence" is relevant because it associates the

idea of art as the impossible attempt to express an impulse or will and therefore

the necessity to expand one's resources to keep trying due to the need to

exteriorize it and the yearning to share or communicate it to others. Art, thus,

[27] Fest Neuer Musik.
[28] L'Histoire du soldat, 1918.
[29] Das Marienleben, song cycle on 15 poems by Rainer Maria Rilke.
[30] From "The World as Will and Representation," published in 1818.

could be understood as the compound of media with which humans try to communicate each other's inner selves.

Many composers, such as Stravinsky or Pierre Boulez (1925-2016), have stated that music means nothing; that it is unable to transfer a concise message—at least nothing that can be coded or transferred into words. Whether provocations or honest statements, this kind of ideas emphasize the abstract nature of music in an artistic, expressive and communicative phenomenon. Since music has the capacity to connect humans at some level, and it operates as a medium of communication in the context of sharing and inner world, we must consider how it can be articulated in the context of media studies. The ideas of the Canadian philosopher and media ecology theorist Marshall McLuhan (1911-1980) can be elucidating, at least from the perspective of western societies.

McLuhan conceived media as extensions of the human body and mind, and of our capability to communicate with and to reach other people.[31] By extending human capability, each medium modifies the relationship or balance between the human senses, affecting not only the individual but also the social environment, hence modifying society. McLuhan describes the history of humankind as a series of Ages, culminating in the Electric Era, which we are now in.

The Tribal Age, the first stage, is predominantly acoustic, and hearing is the primary sense. Humans were organized in communities; communication was oral

---

[31] McLuhan, Marshall. Understanding Media.1964.

and therefore immediate and ephemeral. It existed only when heard and only

through the spoken word, which led people to be more aware of the present and

in the surroundings. The Literate Age, the following stage, is characterized by the

development of the phonetic alphabet and a switch toward the eye as the primary

organ. This contributed to great progress in sciences and philosophy since, for

example, ideas and knowledge were easier to set in a durable format (or medium)

to be transmitted. Communication was codified in writing, and therefore emotions

and nuances idiosyncratic to the oral communication had to be abstracted and

incorporated in the written word. The third stage, The Print Age, is the product of

the invention of the printing press in the 15th century,[32] and a critical point for

humankind. It signals the transition from an oral/aural culture to a visual culture.

The chance to present ideas and knowledge visually and make them available to a

mass audience initiated a homogenization of society, a standardization of culture

and a transition towards individualism.

With printing, books could be transported and read in privacy, therefore

becoming a contributing factor to the isolation of individuals. Regarding this visual

culture or world, McLuhan wrote: *"Such [a] world is alien to the resonating*

diversity of spoken words. So, language was the last art to accept the visual logic

of Gutenberg technology, and the first to rebound in the Electric Age."[33] The quote

is meaningful here for two reasons: on the one hand, it hints at the importance of

hearing, in this case through language and words, as an efficient and natural way

---

[32] McLuhan, M. The Gutenberg Galaxy: The Making of Typographic Man. 1962.
[33] McLuhan 1962, p 136.

to communicate and connect humans; on the other, it signals the turning point

toward the next era: The Electric Age, which in McLuhan's view reverses the

exploding dynamic up to that point. If in the Literate Age knowledge and

philosophy found the right conditions to develop, the Print Age was the necessary

environment for technology to evolve and to take the western world into the

modern era, introducing societies to the capitalist system and propitiating political

and religious ideologies and emancipation.

The Electric Age then turns into an implosion, where electronic media and

communication replace the visual culture. For McLuhan, "…*the world has become*

a computer, an electronic brain, exactly like an infantile piece of science

fiction…"[34] and *"as electrically contracted, the globe is no more than a village."*[35]

We have evolved relentlessly to what McLuhan called the "global village": the

notion that the world is at the tip of our fingers, whether we want it or not, where

everything happens globally and instantaneously—a society of continuous mass

media consumption, where what was private or hidden now is public and

revealed. In a way this is a return to the community described in the Tribal Age.

Although McLuhan published and explained his theories in the 1960s and

1970s, it is interesting to see how much of all this is current nowadays and how it

can help us explain our society, considering the media developments and the

influence that these theories have in our everyday life. It certainly seems

impossible for most of us to escape or disconnect from communication we send

---

[34] Ibid. p. 32
[35] McLuhan 1964. p. 5

and receive daily, whether written or visual information, advertisements, etc.

Similarly, the entertainment industry seems to have adapted to the Electric Age to

the last letter. If, with the turn into the 20th century, cinema initiated an

unstoppable development toward hegemony among the entertainment media, at

the end of the century and the beginning of the 21st, the video game industry

seems to be jeopardizing this privileged position.[36] While film has been slowly

evolving towards better theatrical systems, but also toward streaming platforms

that increasingly substitute the traditional production companies or push them

into business models that bypass theatrical releases and distribution, the video

game industry has developed a model of entertainment that prioritizes more

immersive and interactive experiences that are more global in terms of the actual

participation in multiplayer experiences that are potentially enjoyed by thousands

of players simultaneously.[37]

In this context, the development of VR as a medium with many possible

applications and functions has been astonishing in the last few years. It is a

medium that can be more immersive, interactive and creative than any other seen

before; in a way, it is a virtual version of the "global village" referred to before.

McLuhan is once more pertinent here through his famous phrase "The medium is

the message"[38] insomuch as, for him, it is not only the content that a medium

---

[36] According to different sources, in 2018 video games generated US $152.1 billion, whereas film box office earned $40.1 billion and music $19.1 billion.
[37] Like in MMO or MMOG, Massively Multiplayer Online Game. In 2013, World of Tanks set the Guinness Record for the "Most Players Online Simultaneously on one MOG server" hitting the mark of 190,541 players on the RU2 server in Russia.
[38] McLuhan. 1964.

carries and delivers that is relevant, but also the medium itself. Societies are also transformed by the characteristics of the medium. Furthermore, *"…the content of any medium is always another medium…"[39]* which in turn happens to have been replaced by a new one.

The visual element has a crucial role in what VR is evolving into. This is understandable since its starting point is purely visual and its immediate ancestors are the television, film and video games of the digital era. However, there is a problem within the development of this new medium: the conditions under which the expressive explorations and consequent technological developments are happening. The majority of labs working on VR technology and implementing better devices are funded by large corporations such as Facebook or Microsoft, and their goals are essentially motivated by profit.[40] Developers of VR experiences might depend a great deal on grants and particularly on the potential economic success of their products, and therefore they behave and play around with the complicity of the market and these large companies. This creates an environment that, although certainly changing at great speed, might be focusing attention in the direction that least relates to the artistic impulse discussed above, and may therefore be taking VR towards a territory of superficiality—of distraction through experiences focusing on the entertainment value. In that context, VR needs to be explored, developed, and understood to find expressive, artistic ways to be

---

[39] Ibid. p. 8.
[40] Additionally, the origins and continuous investments in developments and explorations in VR, as well as with the Internet, are in the army. Training simulations and internal communications respectively, with defense and war purposes, were the goals for implementing these tools initially, and in part continue to be today.

meaningful, rather than replicating or enhancing models imported from other visual media.

If we can understand art as a medium of communication and connect it with McLuhan's views on media, then art becomes an extension of a human's physical, sensorial, intellectual, and emotional attributes. Considering that virtual reality as a new medium is competing and challenging the success of other media such as film and video games, it may be presenting a unique opportunity for artists to develop a new artistic approach within an environment that provides a whole new set of possibilities. In connection with McLuhan, the ideas of the Scottish philosopher and professor at the University of Edinburgh, Andrew Clark (b. 1957), are relevant here as a further elaboration on conceptualizing art, and music in particular, as an extension of the human mind.[41] According to Clark's "extended mind" hypothesis, cognition is produced in a dynamic cycle running from the mind, or brain, to the outside world through our physical body. Clark states that the human body is not necessarily the limit with the outside world, a sort of unique and final interface with it, and that when we use external tools or devices (pencil and paper or a computer, for example) we are just extending the cycle, so that it is arbitrary to limit cognition to a closed package of mind and biological body. Furthermore, Clark foresees logical steps in this extended cognitive model with the development and use of EBEs[42] or cognitive prosthetics.

---

[41] In an interview, Clark declared that although he had never read McLuhan, he may have been influenced by him through secondary sources.
[42] Electronic Brain Enhancements.

Although Professor Clark's interests and projections in human-electronic integration may seem a little futuristic, the reality is that experimentation with brain implants, for example, has been moving in this direction since the 1950s. In 2006, a man with spinal cord paralysis received the first brain implant through which he interacted with a computer by controlling its cursor,[43] and on July 16, 2019, engineer and technology entrepreneur Elon Musk unveiled publicly some of the developments that his neurotechnology company Neuralink[44] is pursuing to connect human brains to machines. As a consequence, it is conceivable that the opportunity to encode and transfer abstract thinking, perhaps including music composition, with a high degree of accuracy and at an acceptable and useful speed of transmission, into a digitally-generated system like VR is not that far away. Music and electronics have already been fused in many electro-acoustic works including pre-recorded and live interaction, incorporating the latest technological devices, allowing more flexibility and parameters of interaction, and foreshadowing a possible cybernetic era of intimate communication between electronic devices, computers, and organic organisms.

Finally, as a preparation for the next chapter focused on VR experiences and in the philosophical and technological context of the present one, it is necessary to refer to the concept of virtualization, a term used in computer science as the act of creating a virtual version of something physically real.

---

[43] Matthew Nagle played Pong on the computer using only his mind.
[44] Neuralink Corporation, founded in 2016.

According to Frank Popper,[45] contemporary art has become virtualized (virtual art) by the convergence of art and technology in the late 20th century. Popper emphasizes that the virtualization of art in recent years is showing a humanizing approach to technology that underscores immersion, multisensorial experiences, and interactivity as the research of the real and the virtual within the medium.

Thus, virtuality is the term designating one end of a continuum with reality on the opposite side (a scale going from the completely real to the completely virtual), as shown in the following diagram (fig. 2.1.)
Fig. 2.1. Virtuality continuum

I believe this spectrum may be extended by incorporating the concepts of "abstract" and "physical" space discussed in chapter 1. If so, the "physical" space would be coincidental with the real end of the continuum, whereas the "abstract" space would extend it beyond "reality" in the opposite direction of virtuality, leaving it in the center. Arguably, the "abstract" space should be closer

---

[45] In "Origins of Virtualism: An Interview with Frank Popper conducted by Joseph Nechvayal" (2004).

to "virtuality," since both may contain the notion of an ideal impossible in reality but in fact real, since they exist. Therefore the line from the abstract space to virtuality, through real/physical space, could be almost circular, as shown in the diagram of figure 2.2.
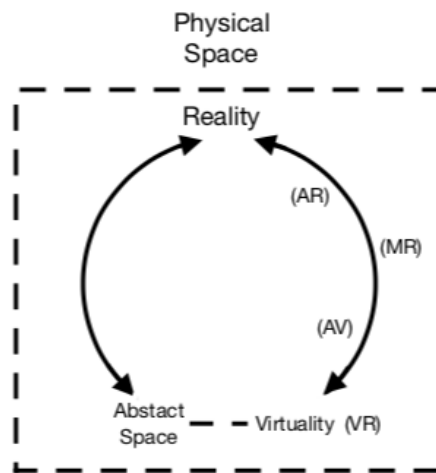

Fig. 2.2. Virtuality continuum circle.

In the spectrum of possibilities, mixed reality (MR), augmented reality (AR), and augmented virtuality (AV) belong to the extended reality family (XR), which includes all the environments and interactions between humans and machines in the virtuality continuum.[46] Additionally, they overlap and share similar technology. Some devices can be used in different types of XR. MR merges both the real and virtual worlds where objects exist in both simultaneously. AR is the real world enhanced by computer-generated objects or data. AV is a virtual environment

---

[46] The concept of virtuality continuum (VC) was first introduced in 1994 by Paul Milgram in: Milgram, Paul; H. Takemura; A. Utsumi; F. Kishino. "Augmented Reality: A class of displays on the reality-virtuality continuum" *Proceedings of Telemanipulator and Telepresence Technologies*. Pp 2351-34.

manipulated by the user from the real world. It also implies that the participants or

objects from the real world have a representation in the virtual world. Both AR and

AV have real-time interaction but whereas AR happens in the real world where the

participant is in, AV does it in the virtually represented, which may be distant. VR

completely replaces the real world by a simulated one. The next chapter will

present different virtual experiences belonging to different parts of this continuum.

CHAPTER 3

MUSIC AND VIRTUAL REALITY

Technological developments in visuals, sound, and interactive interfaces have led the entertainment industry to look for more immersive and interactive experiences. In film, this has been achieved by implementing enlarged screens, IMAX, 3D, or by using a higher frame resolution in shooting and projection.[47] Surround audio systems have extended the possibilities in music-mixing and have increased the importance of sound design, sometimes compromising music appreciation or resulting in an amalgamation of music and sound effects which are difficult to discern. This is certainly affecting the music in film in terms of sonorities and style. There is a discernible influence of electronic music, primarily from popular genres but also from more experimental fields.

Both film and video games (the two more dynamic branches in visual media entertainment in the last few decades) have incorporated these strategies. The latter however, by its very nature, has evolved more in terms of interactivity, at least in its physical aspect.[48] Extensive narratives and game worlds are created with thousands of possible alternatives and variables in terms of sound and

---

[47] The standard being 24fps. Peter Jackson's *The Hobbit: An Unexpected Journey* (2012) was the first feature film commercially released at 48 fps. Other resolutions have been used since then, although it depends on the equipment available in each theatre. Although less standardized, the video game industry considers anything between 30-60 fps acceptable.

[48] Intertextuality, quoting, referencing, honoring, parody, etc., can be seen as a type of interactivity, intellectual in this case, between the artist and the audience.

music, thanks to the processing power in game engines that allows a degree of detail and flexibility never seen before.

In terms of sound, audio in VR systems uses binaural stereo in combination with the Head-tracking technology of the VR Head Mounted Display (HMD) to emulate a three-dimensional sound field around the head of the participant. The tracking data from the VR HMD is used to place sound sources according to the movement of the head and body of the participant around the space. These sound sources could also be in motion themselves and therefore this data has to be rendered to generate the desired spatialized and immersive effect.[49] This solves the problem that stereo or surround have to simulate the positioning of sound sources above and below the audience. VR audio requires not only this panoramic three-dimensional sound, but also the possibility of reacting to the interaction that the movement of the participant in the VR world requires. Ambisonics, a technology for both recording and reproducing 3D audio and existing since the 1970s, has been used to achieve this: it creates a surrounding sphere of sound around the participant. It reproduces sound captured with specific Ambisonics microphones[50] and allows for the positioning of additional sounds within its spherical field. It can be reproduced via speakers or binaural headphones.

---

[49] In VR systems different audio plugins, such as dearVR Pro, Amber HRTF, or Google VR, to mention a few, have been designed to process Head-Related Transfer Function (HRTF) data from the HMD.

[50] Ambisonics microphones are non-directional, treating equally any source from any direction. There are different degrees of accuracy in this process, depending on the number of loudspeakers to reproduce it, the computer power, storage capacity, etc. The technique to achieve this degree of accuracy is known as Higher Order of Ambisonics (HOA).

Immersive audio is a field of growing interest not only in relation to VR but also for live concerts, for example, as demonstrated by the L-Isa project created by L-Acoustics, a leading company in terms of live sound in large venues and stadiums. L-Isa is a technology enabling multidimensional sound experiences, or as the company promotes it: "Immersive Hyperreal Sound." As immersive experiences like VR continue to evolve, we should expect to see projects combining these technologies. More interestingly, this technology should inspire and increase the creative possibilities for composers.

In that context, the implementation of VR systems has evolved from purely experimental projects in universities or private companies' labs to devices and experiences available to the general public. In order to properly describe the opportunities that VR offers for composers today, in this chapter I will review significant VR experiences showing the use of music in the 1990s, more recent uses of VR in the field of music, and finally describe in more detail three recent works I believe have approached the medium in an innovative way and which use music as an important, if not central, element alongside some commercial ones.

The Sound of One Hand

Jaron Lanier (b. 1960) is considered one of the founding fathers of VR. A visionary, computer scientist, and visual artist, Lanier is also a composer and an improviser, owner and performer of many instruments, some of them rare, unique, or invented. It is significant for this dissertation that such a relevant authority in the field of VR attaches great importance to music as an agent for innovation. In 1992,

Lanier gave a public performance of *The Sound of One Hand*, a VR music improvisation experience that he created and which consisted of a virtual world created with three instruments in it: the Rhythm Gimbal, the CyberXylo, and the CyberSax. The instruments could be played with a single hand using a DataGlove as an interface and the Head Mounted Display (HMD) XVR EyePhone by VPL[51] for the visuals. The audience watched the performance live on a big screen, a 2D version of what Lanier was seeing, and listened to the music resulting from the improvisation with the virtual instruments through a stereo system. As he explains in his paper "Virtual Instrumentation,"[52] the sound of the instruments was generated by two samplers/synthesizers, and he decided not to use 3D sound because it would not have been possible for the audience to appreciate it without the use of headphones.

Although there is not much footage available, the experience presents the instruments generated in 3D and suspended in space while a hand makes them move and sound as it touches them. The instruments have some autonomy and continue sounding even if the hand has moved towards another instrument. The result is an amalgamation of the three instruments, with the Rhythm Gimbal as background and the choice of the CyberXylo or the CyberSax as soloists. The CyberSax has a hybrid sonority between a wind instrument and an electric guitar, whereas the CyberXylo sounds very similar to a regular xylophone.

---

[51] VPL Research, founded by J. Lanier in 1984. One of the first companies for research, development and sale of VR devices.
[52] http://www.jaronlanier.com/instruments.html.

The piece had a few performances around the world, always with Lanier as performer-improviser. Interestingly, for Lanier at that time the CyberSax was *"the most sophisticated virtual hand tool yet designed,"*[53] with a surprising number of options such as controlling the mix, timbre, volume, and even the placement of the tone in space. In Lanier's words, *"the purpose [of this experience] is to play music in an intensely gestural style."*[54] This emphasizes that interaction and embodiment are essential elements of VR.

SonoMorphis

This computer-based interactive installation was presented in 1998 by the ZKM[55] researchers Bernd Lintermann, an artist who focuses on interactive and generative systems, and Torsten Belschner, a sound designer and media artist. *SonoMorphis* combined 3D visuals and generative composition[56] processes in a multidimensional experience. The participant could interact with the visuals by choosing a model—an abstract graphic object, such as an organism with a familiar shape—and choosing from different mutation patterns with which the visualization of a "creature" could be manipulated in real time. The angle of perception could be rotated so the visuals could be viewed from different perspectives. The processes applied to the graphic visualization were inspired

---

[53] Ibid.
[54] Ibid.
[55] *Zentrum für Kunst und Medien*. Center for Art and Media in Karlsruhe, Germany.
[56] Music created from a set of rules or conditions causing the composer's will to be removed from the creative process and aiming to make the music ever-different. Brian Eno popularized the term in the 1970s, but there are numerous composers working with the idea and a range of approaches to the concept.

and extracted from similar processes in nature and studied in genetics. On an

acoustic level, the parameters used to define and create the visuals were also the

source for the musical output. Thus, sound and visuals relate to the same

underlying data structure. Generative composition and sound synthesis

techniques implemented in Max[57] were used to create musical structures,

reinterpreting the data used for the physical objects to define the appropriate

parameters for the music, such as pitch, register, amplitude, etc., as well as all the

information needed to generate different types of sounds to define the color and

density of the compositions. Lintermann explains how the installation was

conceived as being as flexible as "[...] *a musical instrument, consisting of an image*

and a sonic component. Observation of the system's behavior during exhibitions

has shown its ability to respond to users' varying approaches, playing styles, and

temperaments in a differentiated and recognizable way."

Although a direct relation between visuals and sound was not intended, the

authors explain how they tried to find a middle way to provide the participant with

connective elements in the experience, something between total separation and

complete coordination. They established certain rules, such as changing sound's

quality when the visual structure was clearly changing. Interestingly, one these

rules was spatialization, mapping musical elements with visual structures so that

the participant´s mind naturally associated them.

---

[57] Max/MSP/Jitter, a visual programming language for music and multimedia developed by Cycling
'74 upon Miller Puckette's work on *The Patcher* at IRCAM, later Max/FST and the Opcode
Systems's commercial version.

The installation could be accessed from its real exhibition point as well as remotely via the World Wide Web, both affecting the visual and acoustic results simultaneously. In that sense, and in the creators' conception, *SonoMorphis* was an implemented approximation to the idea of an "open artwork,"[58] potentially infinite both in time and space.

Murmuring Fields

Between 1998 and 2000, Monika Fleischmann, an artist and researcher of visual arts, and Wolfgang Strauss, an architect and media artist, experimented with the idea of physical immersion, defining an area where visitors could interact with virtual space and objects as they moved freely around thanks to a camera recognizing their movements.

Murmuring Fields was shown as a CAVE[59] installation, a cube with all six inner surfaces available as screens for projection (though not the "ceiling" in this case) with the aim of surrounding the participants with images and sound. Participants were asked to wear shutter glasses so they could appreciate 3D images of the environments as well as images generated by their movements within the space. Two or three participants were allowed in at a time due to the limited area (10 by 10 meters) and the need to have space to move around. The interesting aspect of this installation was the idea of embodiment and awareness

---

[58] From Umberto Eco's *Opera Aperta*, 1962.
[59] Cave Automatic Virtual Environment, an immersive VR environment where projectors are directed to between three and six of the walls of a room-sized cube.

of the participant being the avatar in the virtual space. Since the participant did

not have to wear uncomfortable gear other than the shutter glasses, the

movement around the space could be quite spontaneous, facilitating the process

of understanding the environment and the consequences of movement in it. Thus,

the participant's movement had a two-fold response in the system: a visual

abstract representation projected on the wall-screens, and an aural response

generated by the movement of the avatar, activating sounding areas in the CAVE,

which were represented by 3D symbols in the projection. The sounds emitted,

though they seemed like random bits of audio recordings, were actually acoustic

references to the response to the environment, hence a clue for the participant to

develop an understanding of the mechanism of the system—an interactive

communication between the participant/avatar and the virtual world. The sounds

in *Murmuring Fields*, recordings of statements by different thinkers,[60] are virtually

positioned around space with a decreasing density from the center: in the center

the statements overlap, the sound field is collapsed, but as the participant moved

towards the edge of the space, these are broken, sounding incomplete until just

parts of words or just phonemes could be heard. According to the authors, this

represented a travel "from noise to silence."[61] The freedom of movement of the

participant allowed him/her to create meaning, in that case not only attached to

sound but to actual bits or complete sentences somehow freely associated.

---

[60] Paul Virilio, Villem Flusser, Marvin Minsky and Joseph Weizenbaum. In Fleischmann, M. Strauss, W. Ramsgaard Thomsen, M. And Novak, J. "The making of *Murmuring fields* – developing e-Muse."
[61] Ibid.

As previously seen in *SonoMorphis*, *Murmuring Fields* featured the possibility of additional participants intervening in real time in the environment via the Internet, utilizing once again the idea of being simultaneously in different places. This remote intervention could manipulate the type of sounds that the acoustic responses made. The whole experience was interesting because it reserved an important role for music and sound in the process of learning the "laws" or rules of the new environment. However, the randomness with which the sound was implemented made it more difficult to trace whether the results were effective or disorientating.

Dinner Party

At a convention about the intersection of new technologies and art called *The Engadget Experience: Alternative Realities* in November 2017 in Los Angeles, a presentation of the promotional trailer for the VR movie *Dinner Party* directed by Angel Manuel Soto took place. It is based on the story of a couple that discovers that in 1961 they have been abducted by aliens. The couple hosts a dinner party with friends and, at some point, the wife decides to play a tape containing the recording of the hypnosis session in which they explain, in a hypnotized mental state, their experience with aliens. Before initiating the experience, the participant

sits at a real table, set for a fictional dinner, with a group of 15 other participants.

On the plates, the VR headsets (Occulus Rift[62]) were "served."

The experience lasted around six minutes, beginning with a bird's-eye view

of the dining room. In fact, the angle of the shot is decided by the participant,

thanks to the use of VR headsets and the 360° camera used to shoot the film.

However, the movement of the camera around the space was predefined and,

after a short time, the events in the scene make you stop looking around and

compel you to witness the action, as in a regular movie. The music here was

meant to induce a sense of weirdness. There was also diegetic music coming

from a record player, and sound design to create an immersive feeling. The scene

then switches to the inside of a car with the couple driving at night. It is a

flashback to the moment when the abduction happened. An intense increase of

white light indicates that something unnatural is about to happen. Then "The

End." The experience was intense but prompted a certain sense of dizziness due

to the movements of the camera as well as the impression of not having achieved

much more than what could have been done with a regular movie in 3D or IMAX.

In the presentation of the project, the director explained that their idea was to

suggest that the audience would enjoy the perspective of the aliens, who follow

the events as an invisible presence.

[62] A virtual reality headset developed and manufactured by Oculus VR, since 2014 a division of Facebook, Inc.

Recent VR Music Application

Many of the more recent VR experiences, in which music has a role beyond accompanying the visuals, do not have a truly innovative and artistic approach. Rather, they adapt or import formats from other media. For example, the use of 360° video in music video clips seems to be a new trend, particularly since YouTube incorporated this option in its video-sharing platform. Some of these videos incorporate binaural spatialization of the music, meaning the motion of the screen affects the way that the audio is received. Composers, performers, and bands have started to release singles using the traditional video clip format but considering the capabilities of a VR device to experience it. The 360° video format allows the participant to constantly look around, regardless of what is going on in terms of the narrative of the video clip. Some are static, like U2's *Song for Someone*[63] in which the participant sits in the middle of the band performing the song whilst the band moves to different places in the world to meet other people joining them singing. Others are dynamic or in motion, like *Squarepusher's Stor Eiglass,*[64] where a cartoon-like version of a huge body that the participant is placed on top of travels as if on a rollercoaster through a dystopian world in which human bodies are wired to VR devices and are sucked in and collected by gigantic machines. This is a surprising reflection upon the idea of a medium within a medium. Similarly, the English rock-band Muse used VR as a promotional

---

[63] U2 *Song for Someone*, 2015, VR video promotion:
https://www.engadget.com/2015/10/29/apple-vr-u2-video/
[64] *Squarepusher's Stor Eiglass*, 2015, Marshmallow Laser feast collaboration with the illustrator Rob Pybus, and the animator Blue Zoo: https://pitchfork.com/news/59563-squarepushers-stor-eiglass-crazy-virtual-reality-video-will-make-you-dizzy/

medium for their 2015 album *Drones*. The single *Revolt* was turned into a 360°

video to be enjoyed with a VR headset. The video is set in a futuristic world with

rebellious activists confronting the authoritarian regimes' cyber police, and

meanwhile the band is performing onsite at the confrontational events. The

participant can decide what to follow in this highly agitated scene. Significantly,

Matt Bellamy, the leader of the band, declared in a later interview that *"…VR is*

genuinely the next step in terms of getting that immersive feeling that people

maybe felt in the early 20th century when they first saw motion pictures."[65]

These types of projects do not necessarily require a different

compositional approach than the equivalent for traditional media. The themes and

lyrics might refer to the VR medium, like in *Squarepusher*, or in some cases sound

design might be attached to objects that react to placement positioning when

using the VR headset, so attention is directed to a different point in the space.

Film projects in VR seem to approach the possibilities of the new

environment by taking a step back towards immersive theatre and placing the

participant in the action of the scene as an invisible spectator in a privileged

position, as seen in *Dinner Party*. In that regard, some experiences propose a non-

linear narrative beyond the classical approach and leave some decision-making to

the participant.

[65] "Muse's New Album Comes to Life in Virtual Reality." *Microsoft In Culture*,
https://www.microsoft.com/inculture/musicxtech/muse-vr-games-simulation-theory-tour/.

Another growing format consists of attending live shows through a VR platform, like LiveNation[66] or NOYS VR.[67] The main attraction here is to be able to enjoy the concert from perspectives not hitherto experienced, including even being on stage with the performers. Similarly, electronic music concerts in VR spaces can be attended, and, by the use of avatars, it is possible to interact with other participants, dance, talk, etc. The telepresence element, inherent in VR technology, will play an important role in music and is likely to have many applications as well as ramifications for performing, conducting, and teaching music in the near future.

The educational aspect of music and VR is attracting a lot of attention from institutions interested in developing new ways to make music more approachable to everybody, but in particular, to young people. It is possible to explore music from the classical repertoire in a virtual environment while learning about the instrumentation, the composer, the structure and other theoretical elements of the piece, such as its history, and essentially anything related to it, if desired. It is also possible to play some of the instrumental parts of the piece, replacing the performer, or to follow a tutorial, lesson, or demonstration of how to do it. With the 2015 project VAN Beethoven, the LA Phil provided a visual experience based on an excerpt of Beethoven's Fifth Symphony, with the intention of introducing symphonic music to new audiences. More recently, the VR Sound Stage by the Philharmonic Orchestra has experiences promoting music appreciation in an

---

[66] By NextVR.
[67] A social platform for VR live streaming concerts.

innovative way: a VR experience in which the participant hears music through an 18-speaker Ambisonics sound system, which faithfully reproduces the placing of the instruments within an orchestra and enables the participant to perceive the orchestral sound from inside the group of performers.

In his recent book *Experience on Demand*,[68] Professor Jeremy Bailenson, from the University of California, Berkeley, explains how VR has the potential to be helpful to society in many ways and different areas: from experience to promote empathy regarding environmental issues, to VR trainings of all kinds that help individuals to achieve goals faster and reduce risks. In health, programs including VR experiences to treat psychological issues, traumas, and pain-related conditions have been demonstrating outstanding results. In this context, a recent project in Ireland called "Conductology,"[69] seems to combine different areas from those referenced above: in a music experience, composition and interaction are the main elements of connection to help groups of people with special needs to explore creativity and expression in a new way. The experience, initiated by the Royal Irish Academy of Music (RIAM), uses adaptive instruments and VR tools via easily accessible technology (such as midi instruments and laptops) to rehearse and perform music created by their participants. Besides contributing to the socialization of the participants, which is frequently a challenge or impossible due

---

[68] Bailenson, Jeremy. *Experience on Demand: What Virtual Reality Is, How It Works, and What It Can Do For You*. 2018.
[69] An initiative from Creative Ireland Programme and the Royal Irish Academy of Music that started on October 2018.

to their severe difficulties, the creative side of the project seems to generate temporary relief from their afflictions.

What is interesting is that in the publication where the first concert of this group was announced,[70] Brendan Breslin, Head of RIAM Connect,[71] stated regarding the plans for the project that *"The virtual reality is the next step and it means that everybody can access the same amount of performance as others, specifically for people with physical challenges. We have a member with quadriplegic cerebral palsy and it means that he can engage on a musical platform…"*[72] Besides the encouraging opportunity that experiences like this can provide for a group of people outside of the radar of other commercial developments, they also demonstrate the significant influence music can have as a communication and therapeutic medium while also yielding an artistic output.

In comparison with all the visual research and output produced by visual and multimedia artists, the musical explorations in VR to produce new formats seem a little less creative. Some experiences, however, do present innovative visions on what the future of music in VR might be. To close this chapter, I will refer to three works that use music and VR environments in very different ways and that present ideas to keep pursuing in the next steps in VR creation in general and in composition in particular.

Carne y Arena

This VR experience, created by Alejandro González Iñarritu in collaboration

with Industrial Light & Magic xLab,[73] was premiered at the 2017 Cannes Film

Festival. The experience recreates the ordeal that individuals and families have to

go through in trying to cross the Mexican-US border in order to seek a viable

future. Participants become part of one of these families, walking through the

desert at night and eventually being spotted by a helicopter and detained by a

border patrol. It all happens in a large space, like a hangar, with sand to walk on

to imitate the desert. The participant walks in barefoot with a headset, and two

assistants take care of the cables constantly from behind, following the

participant's movements so that the feeling of free motion is guaranteed. Along

with the sand, the low temperature and the fans displayed and programmed to

react and produce airflow according to the conditions and events of the virtualized

world turn it into a very physically powerful experience, notwithstanding its

psychological intensity.

Carne y Arena tries to be a highly realistic recreation and as such, sound

plays an important role in making it convincing. The sound design is carefully

thought out, but understandably it might be verging on a hyper-real experience,

where the real and fictional or virtual are seamlessly blended. Most likely, the

majority of participants have never been themselves in such a situation, and

possibly they have no experiences in their lives that could be analogous and

---

[73] An immersive entertainment studio, division of Lucasfilm. Founded in 2015.

relatable. For that reason, there is an intentional use of sound and music to enhance and replicate the emotions that people suffered in real situations. In preparation, the creators drew upon hundreds of interviews and testimonials to better understand the drama and psychological effects on the people who have undergone this traumatic experience.

The music is the work of the composer Alva Nolto (b. 1965), who collaborated before with Iñarritu in *The Revenant* (2016) when co-composing the score with Ryuichi Sakamoto (b. 1952). In *Carne y Arena*, the aesthetic of the music is very close to sound design. The impression is that it is an extension to it, creating subtle ambiences resulting from electronic elaborations that blend the diegetic sounds that are linked to the visuals. Thus, the music is almost indiscernible when the participant is immersed in the experience. However, it certainly works on an almost unconscious level and helps to enhance the tense emotions arising as a result of the events that have to be confronted.

Carne y Arena shows how the virtual environment can be a powerful device to create empathy in audiences with a sensitive and dramatic subject. In that case, music plays a very psychological role, avoiding the diminishing effect on realism of a potential non-diegetic type of score.

Tónandi

Tónandi is a remarkable MR experience that intends to put at the same level music, visuals and interactivity together. It is the result of a collaboration between the Icelandic avant-rock band Sigur Rós and Magic Leap, an American

startup company founded in 2011 which focuses on developing MR experiences

for their own head-mounted virtual retinal display, the Magic Leap One.[74]

Essentially, *Tónandi* presents visuals inspired by the acoustic qualities of sounds

and musical elements created by Sigur Rós, which the participant can interact

with and, by doing so, alter. These visuals, a combination of abstract shapes,

particles, creatures and objects that recall vegetal nature (such as leaves of grass,

algae, or trees) are superimposed on the surfaces of the real space. They have a

"natural" movement, recreating that of an imaginary living ecosystem, but also

following elements of the music (rhythm or texture, for example). The visual

elements can also mutate or evolve, changing colors as well as the light they

reflect, and they do it particularly when the participant interacts with them.

Besides the obvious directional sight-tracking, the interaction with the visuals and

the music is possible through Hand-Tracking, a system developed to recognize

discrete hand poses through the head-mount without the need of any additional

device or control. Different hand poses (up to eight)[75] cause different effects that

trigger subsequent visual and aural reactions. These can be done continuously

and simultaneously, with both hands, multiplying the possible output to a

potentially infinite number of responses, since the sound and the visuals keep

evolving regardless of the interference of the participant.

---

[74] First announced in December 2017, the Magic Leap One Creator's Edition started shipping in July 2018.
[75] In version 0.21.0, from October, 24, 2019.

It is worth noting, and it is part of the language used in the musicians' and developers' presentation of the experience, that the role of synesthesia in *Tónandi* is at its core. As discussed in chapter 2, this condition plays an important role in musical works in the 20th and 21st centuries, and the concept is sometimes used to denote not a singular condition present in some individuals, but to indicate experiences that, by combining different artistic expressions often involving sound and color, generate an enhanced experience in some way amplified or taken beyond what could be seen as the sum of its parts. Mike Tucker and Stephen Mangiat, the creative and technical leads of *Tónandi*, explain how the interaction with music and sound by virtually touching the creatures in motion and therefore triggering a reaction at all levels, creates almost a tactile sensorial illusion—the feeling of touching music.

Music in *Tónandi* has an electroacoustic experimental air, a combination of synthesized rhythmic patterns, textural backgrounds, and sound effects. Whether the experience is successful or not in terms of its public acceptance and commercial impact,[76] it is a fine attempt to implement an experience that focuses on real-time interaction with musical elements, something that will have to be further explored in both MR and VR musical experiences as an intrinsic feature of the medium.

---

[76] Magic Leap One's current retail price is above $2000 and therefore not yet a product available to a wide audience.

Eight

Premiered at the Holland Festival, *Eight* is probably the most adventurous VR, or MR to be more precise, musical experience I have found until now. It is a piece that perfectly exemplifies the possibilities that the virtual environment can offer to composers. Its composer, Michel Van der Aa, revisits the story of a woman's life backwards. After a brief musical introduction, an old woman appears, singing and inviting the participant to go through her memories with her. The virtualized singer encourages you to move around different spaces that recall and recreate passages of her life. In the different sections of the piece, she keeps disappearing and reappearing, each time younger, until she reaches her childhood. The virtual space integrates objects that can be touched in the real world, hence the MR extension of the work. The design of the experience combines sections where the participant is invited to walk with more static scenes where they are to stop, listen, and contemplate the visuals. This is achieved using a semi-circular corridor and a room-like area (all constructed within a larger space) to allow different types of simulated freedom for the participant. The path followed takes advantage of the static scenes to promote free contemplation of the virtual world and to reverse the direction of the walking path, thus breaking the potential monotony of a repeating pattern as well as creating a sense of moving around a much wider space with a lot of physical freedom.

The musical conception of the piece is aesthetically eclectic, ranging from a classical contemporary and operatic style to almost electronic pop music. This is reflected in the way the featured singer, Kate Miller-Heideke (a singer-songwriter

with a very versatile voice and operatic background) sings, but also in the type of arrangement and instrumentation used, which combines acoustic and electronic instruments and effects, both mixed and produced, featuring a good degree of spatialization. Van der Aa also incorporates choral music, recorded by the Nederlands Kamerkoor, clearly featured in one of the scenes and blended with the accompaniment of the singer in others. The overall structure of the piece combines sections from solo music, recitative, or solo accompanied singing, to fully orchestrated including the choir. This cleverly makes the piece varied and balanced, managing to hold the attention of the participant very well.

What *Eight* exemplifies is that the visual and acoustic possibilities of a VR and MR environment inspire topics that have to do with the psyche and emotions from an individual's perspective. This does not mean that it cannot be successfully tackled or achieved using other approaches; however, the explorations of an immersive and progressively more interactive virtual environment signal the possibilities of embodying other people's minds and experiencing other people's feelings and emotions from a singular and unique perspective. The interactive part, which the MR implementation of the piece proposes, is incidental. In the virtual corridor, the walls are made of a synthetic fabric that, when touched, create a sort of visual effect. There are a few places where a fence can be touched and grabbed while watching different scenes and that have a visual correlation in the digital design of the environment. Towards the end, the participant is invited to hide underneath a table with a big tablecloth on it

that the participant can touch. It is in fact a table under which the participant has

to hide towards the end of the piece in order to listen to the child singing.

CHAPTER 4

THOUGHTS AND CREATIVE CONSIDERATIONS FOR VR.

"4": A VR COMPOSITION.

This final chapter will raise some thoughts and ontological questions

regarding what it means to create art in VR spaces. From a composer's

perspective and as a reflection of what has been explained in the previous

chapters, I will present what creating music in VR entails artistically in an itemized

list. It is important to highlight that this list of considerations is the result of the

reflection and research done in chapters one through three, which have been

necessary as historical, philosophical and conceptual foundations on which to

formulate it. Furthermore, although there were some intuitive ideas or hypotheses

about composition in VR, this research not only expanded the scope of the

implications of the new medium for composers, but revealed important aspects

regarding the creative process and the goals for artistic expression in VR. Finally,

I will include a description of a VR composition that will incorporate each of these

items. This will serve as a model that could be the starting point for actual

implementation in VR.

The discussion about art finding its way to be expressed through different

disciplines or media can unleash the idea that the world we have created around

us is an expression in itself: a collective product of our creative brain, cooperating

willingly or not with other humans. Is, then, virtual reality an analogue version of it?

As a digital medium that can be expanded and modified very quickly, is it a more

flexible version of the world we inhabit right now? VR spaces can behave like hallucinations to us,[77] replacing, or leaking into, our world for a certain amount of time. As technology is rapidly evolving, virtual environments are becoming more convincing, intense, and appealing, reducing the gap between what we perceive as real and what we perceive as virtual. Consequently, the "embodiment" of VR experiences are more intense and seemingly "real," enhanced by immersive and interactive strategies and provoking sensations that have lasting effects upon us.

The role of the body in experiencing VR is essential to the medium, but it also raises the question of whether, and how far, our bodies are the physical encapsulating interface of our minds, so that we can operate in the surrounding physical world—in other words, that we perceive the world outside our mind through our full bodies. Thus, if our mind is able to experience and recreate other realities, is our brain the repository of a powerful entity, mind, soul, will, etc., that is trying to find a way to escape?

The output, resulting from what we appreciate as art and technology, could be a by-product of intense research that finds in VR a suitable way out toward another plane of existence. This feeling of perpetually searching or striving, an unstable state in which we can project our individual and collective lives, may propel us forward: a consistent nonconformist attitude perhaps toward a utopia of peace, pleasure, truth, or freedom. However, would this be possible only in our minds, or are our bodies essential parts of it? Since our physical bodies are

---

[77] From program notes of Rebecca Allen's INSIDE, 2016 art installation
http://www.rebeccaallen.com/projects/inside

sensitive, painful, far from perfect, and definitely not immutable or eternal, are our

minds promoting the creation of alternate realities from which to escape? Are our

minds enslaved or locked into a brain within our bodies? Perhaps VR is just

another attempt in an endless succession, one trying to approach the challenge

by merging art and technology intimately.

Besides the considerations above, which perhaps project the subject of this

dissertation a little bit further away from its core topic, what VR is currently

promoting is the creation of new spaces, worlds or cosmoi, by individuals or

collectives, with extraordinary immersive possibilities and with such an increasing

degree of interactivity that not only observation and participation are possible in

them, but artistic creation is becoming a real option.

Currently, it is still necessary to design and create the VR environments

from outside the medium (although to validate the design and predict how it will

function already requires multiple tests from the inside). What is fascinating is the

resulting appearance of these designed environments or worlds, ranging from the

mere recreation of the world "outside" in which we physically live, to the most

fantastic, surreal or imaginative areas. Rebecca Allen, an artist and VR pioneer,

used MRI scan data from a real human brain to create the environment of her

piece INSIDE,[78] a metaphor of what our brain is trying to achieve through VR.

What this revealed is that the task that the designer-artist of VR worlds is facing is

that of developing an aesthetic unique to the medium. So far, what is undeniable

---

[78] ibid. Allen

59

is that there is a solid connection with the visualization of these environments. Without objects, colors, or shapes, it seems impossible to create the VR space; everything else—immersion, interactivity, sound—is waiting for a secondary level for implementation.

Thus, what would a musical VR piece mean to the participant? And would this environment provide the opportunity for the composer to communicate a closer version of his/her original artistic vision? Will this artistic vision be modified by the possibilities offered by virtual reality? In the next section I will outline important considerations regarding the creation of a VR composition. As will be explained, this does not necessarily mean that the work is exclusively for the hearing sense, but that music is the generator that calls for other elements to participate. Composing in VR requires considering immersivity and interactivity (essential elements of the medium) as part of the work. These have to be regarded differently as we do in the real world, since we have the possibility of defining the laws that apply to the virtual world or space created. The composer is able to design the appropriate rules for his/her artistic intent and define if the participant can interact with it and how. This raises questions like how consequential this interaction will be for the final output and perception of the piece. Although there might not be a clear answer to that problem yet, it is possible that as more musical works in VR explore this possibilities, composers will find new solutions to incorporate these elements in ways not imagined yet.

The following outline is intended as a reference for composers when initiating the realization of a VR piece of music to evaluate the pertinence of the medium about to be used and its potential.[79]

CREATIVE CONSIDERATIONS IN VR

The following is an itemized list of what creating music in VR entails artistically. Although all of them have to be considered in the composition process, the items in the list are divided with reference to the participant's experience and to the composer's conception of the piece.

Participant:

- **Interaction** A VR musical work should consider the use of interactive elements; the participant may eventually be able to touch, modify, move, or manipulate as many elements of the music as possible, or as defined by the composer based on his/her creative intent.

- **Participant's experience** The perception of a VR musical work may be unique for each participant. Many participants experience the work at the same time and in the same place. Their positioning may be identical, even overlapping

---

[79] Before composing an orchestral piece, a composer should be aware of the possibilities of the ensemble. The composer could decide (for example) not to use strings at all, or any other instrument or group of instruments. However, this should be a decision based upon an artistic intention, and not borne out of ignorance or laziness.

with each other, but it is unlikely that they will interact with the piece in exactly the same way.

- **Participant's movement** The participant or participants could perform alongside the VR musical work, improvising or following instructions set by the composer. There could be a virtual score for them to follow.

- **Participant's location** Participants may be in different parts of the world and the potential number of attendees is infinite, or rather limited only by technology/creative decision.

- **Scope** Participation in a VR musical work may imply active artistic creation by the participant. This could be recorded and assimilated in imaginative ways into the original work, and consequently the piece would be constantly changing and would be left unfinished, or open.

- **"Opera aperta"** A VR musical work may have no end; it is constantly evolving and possibly dependent on feedback by the actions of the participant or participants.

- **Appraisal** It might not be possible to listen fully to a VR musical work.

- **Multidimensionality** A composition may occur in different places simultaneously and the participant should be able to move around or travel through them while the piece lasts. In that case, the conception of a multidimensional piece of music will raise questions regarding structure, non-linear narratives, and intertextuality within and beyond the actual work.

- **Multiple participants** If a piece is shared between two or more participants, and interactivity is available, a decision has to be made regarding the

perception of others' interactions, and whether they affect the perceptual experience of the work by the rest of the participants or not. As a matter of fact, this could be an element of choice, a decision available to be made by the participant.

- **Participant-performer** A composition should consider if one or more parts should be performed in real time, for example by a participant-performer (or composer-participant-performer); the equivalent of a pre-record + live performance composition. That creates a specific level of participation between the composer and the participant (participant-audience in this case). If so, the piece would have limitations in terms of its accessibility (upon participant-performer availability). If the participant-performer's performance is recorded, it could generate a fixed version of this particular performance.

- **Customized VR instrument** If the piece allows the participant to perform on it, the instrument can be predefined or let open to customization. If so, there could be already some preset instruments available or allow the participant (particularly if a participant-performer), could bring in one of his/her own.

- **VR concert/jam** Upon the previous considerations, a performance space/section would be allowed within the piece, where multiple participant-performers interact playing and/or improvising.

- **Avatar** Participant/s may or may not have an avatar representation in the VR composition based upon composers criteria. If so, it should be considered how this avatar is chosen.

Composer:

- **Abstract Space**   A VR composition should aim to faithfully reproduce the

  original that inhabits the composer's mind, the abstract space, so that the

  participant can expect to experience something very close to what the

  composer perceived internally.

- **Interaction**   The composer may anticipate different interactive options on the

  piece by participants. In that case, the experience becomes intentionally

  unpredictable and open-ended, according to the composer's plan.

- **Time**   A piece of music can be limited or unlimited in time. We have seen

  before how both compositions and proto-VR experiences have used

  generative strategies to create a potentially infinite stream of music or sound.

  In an environment with endless possible ramifications and extensions, this

  needs to be taken into consideration and open to the participant's decision.

- **Instrumentation** A VR piece of music may have as many sounds as desired

  (including recorded or virtual instruments). The exponential increment of

  processing power, speed, or storage, is close to allowing this. Thus,

  composers will have the opportunity to explore acoustic combinations that are

  currently not feasible in the physical world. Additionally, as in the participants

  Customized VR Instrument, a composer may create his/her own VR instrument

  for unique sounds/characteristics, etc.

- **Projecting sound** Sources may project in a spherical way, not necessarily

  directionally as with a traditional speaker. All combinations of sources are

  possible, and each may potentially have different acoustic responses, not

linked to a specific acoustic space but to the discretion and artistic intent of the composer.

- **Motion of sound** Any source of music—which could include a single instrument, a full orchestra, or pretty much anything—can be in motion through the VR space of the piece. The participant will perceive that they are moving toward or away from the source if he/she decides to remain still or if motion is not permitted at that moment.

- **Source Fragmentation** A source of music can be fragmented, deconstructed, appear or disappear, mutate or evolve, following any rule or set of rules chosen by the composer.

- **Combinations of Works** Upon the previous idea, a musical VR work could share its limits with other pieces, whether they belong to the same work or not. These other pieces may or may not be directly connected. For example, a musical VR work may contemplate the notion of several pieces of music occurring at the same time,[80] but because the distances in space are potentially infinite, this might not be automatically evident to the participant and will depend upon the placement/location of the participant in the VR experience and the decisions made by the composer in terms of the rules that govern the composition.

- **Rules** Any rule or set of rules may include changes to the rules at any time and as many times as desired.

---

[80] As in Charles Ives Fourth Symphony.

- **Use of art forms** The composition may not be limited solely to use of sound. We have seen before how the creative impulse often demands the complicity and participation of different artistic elements and media. The idea of a composer working exclusively with sound is as limiting as it was limiting to use only a tonal system for expressive purposes in the common practice era. Thus, color, shapes, lights, textures, motion, interaction, etc. can be resourceful at any given moment in order to achieve the artistic goal. Of course, technological limitations will establish certain boundaries, but in time these will be progressively removed, and therefore other senses, like smell or touch, will be incorporated in the palette or resources available to the composer.

- **Immersion** A VR musical work has to consider immersion as a primal element, understood as the surrounded position of the participant. This does not imply that every work necessarily has to be acoustically spatialized. Discrete decisions such as the absence of sound or spatial response in specific moments may be artistically necessary and should be evaluated in each case.

- **Composer's catalog** Since elements in a VR musical work may be interconnected, as in the *Mikrokosmos* idea discussed in chapter 1, a composer may be writing another part of his piece, a chapter or a new space for appreciation. In a way, this links with a conception of the complete works of a composer being his/her "opus," and therefore all his/her works can be interconnected to a certain extent. Some of them may be more distant and others more closely related, but, in the end, they all contribute to the artistic

personality of the composer. This idea could be taken further by including

influences, contemporary and associated colleagues, etc.

- **Exceptions** A VR musical work does not always have to do any or all of the

above.

Fig. 4.1 Creative Considerations in VR chart.

"4" — DESCRIPTION OF A VR COMPOSITION

In the following lines, I will describe a composition for a VR environment. Its title is "4." It departs from music and sound as its primary element, considering space and the participant's interaction as fundamental parts of the work.

In the piece, immersivity will be achieved by the spatialization of each musical element, which will consider all possible positions in a sphere around the space (or around the participant) for the placement of the source. These musical elements (or any sound) are not attached to any acoustic response in particular; the space does not have necessarily a specific reverberation. Thus, different responses can be used creatively and simultaneously, as will be described in particular moments within the piece.

In addition to music, light, color, visuals, and haptic responses are also included. They complement the composition and serve as guide to the participant's interactive experience. It is important to note that these are part of the creative process of the piece, and not just mere additions *a posteriori*.

"4" is conceptualized as a single participant experience. However, the possibility of a multi-participant version could be considered. In that case, each participant could access the experience from different places in the world simultaneously and have a singular perception as described, without interaction with the other participants except for one of the "additional spaces" (space C) described in page 72.

The piece can run between 6 and 12 minutes, depending on the decisions of the participant.

To guide the reading, I have color-coded the description as follows:

- Music and sound. Its description, spatialization, and modulating effects.
- Participant's interaction.
- Lighting, color.
- Visual
- Haptics
- EXIT (closing section of the piece, a sort of Escape/Coda)

"4" BEGINS

Black.

Progressively, from silence, a sensation of emptiness develops. It is suggested by the reverberation of a large empty space, unclear whether indoor or outdoor, and by a very soft and subtle breeze, almost nothing.

A sustained sound, one note, mid-register, begins to emerge. First without vibrato (light bowing pressure too) so it is difficult to identify an instrument yet. While getting louder very slowly, the sound source begins to move around the participant, as if drawing a circle of sound. A violoncello is now identifiable. There is a bit of reverb in the sound, so it leaves a trail. As the sound source continues to move, the rest of a virtual string quartet's instruments join the same note, allowing tiny microtonal deviations so the sound gets thicker.

The participant can wait or move.

If he/she decides to move, the sound source will react by moving in the same direction slightly afterwards, as if trying to keep a safe distance. (Still black.)

Increasing vibrato, bow pressure, and volume as the circular movement slows down until each instrument stops at every quarter of an imaginary circle (radius = ca. 10 meters) around the participant. The sound stops and immediately each player is visible.

Only warm light on the players. Soft yellow-orange. Slightly different for each.

Each instrument is at a slightly different height (above and below) in relation to the participant, but there is no obvious plan for the arrangement of the musicians. The rest of the space is dark. The musicians are staring at the participant, with a neutral expression and in resting position (not about to play).

Nothing happens until the participant begins to move:

1. If the participant does not move at all for more than 30-40 seconds, each player will begin to move slowly, as if in an invisible platform, distancing themselves from the participant, each musician is going in a different direction. As they get farther away, the image will also lose definition or disintegrate.

    They'll disappear completely in 3-4 minutes. Go to EXIT.

2. If the participant moves, the musicians stop. Then:

Wherever they are in the space, the four musicians begin to play an arpeggiated pattern. This is a repeated chord progression, constant, rhythmic, and at a medium-fast tempo. Notes and rhythms are constantly added or

removed from the pattern, to make it less predictable and always in a smooth harmonic transformation.

The piece played by the string quartet has a total duration of 5 minutes. However, it contemplates the extension of up to four sections that will be played/revealed depending on the participant's action.

If the participant does not do anything, when the piece is done, go to EXIT.

The sound is dry now only for the instruments of the quartet, not at all affected by the acoustic characteristics of the space. The breeze may continue, independently, so both sounds, instruments-dry and space-wet, coexist.

The participant may interact with one player at a time, independently of the other players, and choose from the following options:

a. Increase/decrease tempo up until a ratio of 1:2 of the original

b. Extend or reduce the number of notes in the chord

c. Drag up/down the register of the chord both by transposition and/or inversion (only chordal in that piece)

d. Increase/decrease dynamic

e. Change articulation: shorten/lengthen the notes preserving their duration (staccato-legato)

f. Move the spatial position of the player far away/towards and 360°.

g. Vary the lighting on the performer, by increasing/decreasing intensity as well choosing the color.

At any moment, the participant may decide to get closer to a player. If so, the other players will start playing less notes in their patterns, like filtering out subdivisions of it, and therefore creating the perception of playing slower. The ratio at which the notes will be dropped will be relative to the distance participant-player.

If the participant gets close enough to a player, an access to another space will be revealed (different light coming from each of these spaces).

The spaces can appear in any order. Each of these spaces can be entered at any moment (once revealed), or be ignored.

Every time the participant explores a new space, the string quartet piece is prolonged by 1-2 minutes.

The participant can always return to the main space and interact, or not, with the players until the piece they are playing has finished. Then go to EXIT.

Additional Spaces

The four spaces are:

A) Filled by a mass of granulated sound, soft, like constant white noise, completely dry. The space between the grains, grain size, should be high, noticeable. If the participant moves around he/she will discover that his/her presence acts as a dynamic equalizer, or frequency filter. The sound will change with any movement of the participant (for example raising an arm, stepping forward, jumping, etc.) cutting out frequencies so that a dense, cluster-like, chord will be heard.

A vibrating haptic response is produced with the movements in this space. If the participant does not move, the vibration is not perceived or progressively disappears. Similar to the one in EXIT.

The lighting of the room will respond to the movement by changing color and intensity.

The string quartet is hearable coming from the other space but above the participant's position. It keeps playing through the piece, more legato, or with more reverb than before, as a contrast with the granulated sound of this space.

B) There is a virtual score of the music the string quartet is playing in the initial space. It is possible to follow what the performers are playing. The music continues to be heard but from this space, so it sounds as if it is coming from the "other space." Now it has a long cathedral-like reverberation.

If the participant wants to look forward or backwards in the piece, the performers will follow, slightly increasing their temp to catch up, but without altering abruptly the flow of the piece. In that regard, the response feels slow.

C) A large empty space. Black. Similar to the one at the beginning. Another piece (optional: a previous work written by the composer) sounds as if it is far away, blending with the quartet—coming from the other space.

The participant can move towards the sound, so it will get louder until he/she is "on" it (the initial string quartet will then be inaudible), and it will get softer if she/he moves far away from it.

When this piece ends, go to EXIT, unless the participant has returned to the initial space.

(Optional: if the piece is intended as multi-participant, this could be a shared space in which participants could roam or wander around, deciding whether to "attend" the performance of the other piece or not. There is a visual representation, avatar, of each of them, and a certain degree of interaction/communication between them should be possible.)

D) An old grand piano, not black, and without lid is placed in the middle of the space. The string quartet will keep playing; ignoring anything the participant does in this room. There is a bench by the piano.

    a. If the participant sits on it, a score will be revealed. It is a tune with an accompaniment. The participant can play it: right hand, left hand, or both, as long as the playing is close to what's written in the score.

    b. If the participant plays anything else, the lid of the keyboard will fold down. The participant can open it and try again.

    c. The participant can play inside the piano as much as and whatever he/she wants. (No score here.) As the quartet approaches the end of the piece, if the participant is still playing

inside the piano, the volume of the sound will be decreasing until silence.

When the quartet reaches the end of the piece, then go to EXIT.

EXIT

Black.

The same sensation of space as at the beginning, which should now be familiar, but with slightly more breeze.

A drone-like sound, with the same pitch as the initial cello sound, begins to emerge. It is unclear whether the sound is electronically generated or by an acoustic instrument.

As it circles and gets louder, the rest of the instruments join it in the same way as the beginning. However, the sound keeps gaining mass, as if turning the quartet into a small string orchestra first, and gradually into an impossible number of string instruments. It should feel like a continuous stream of sound surrounding the participant. It will last around 1 minute.

If he/she decides to reach out or move in any direction, a continuous haptic response, like a soft vibration, should occur. Moving in any direction should feel like walking in between/through the supposed players (not visible) playing the same sustained note.

The "noise" of the bowing should be very present.

Suddenly only the noise remains, and vanishes slowly, blending with the breeze.

END of "4"

CONCLUSIONS

My interest in exploring composition in virtual reality in this dissertation has been informed by my activity as a composer, which in the last few years has been focused around concert and media projects. In mid-2018, when I had the opportunity to collaborate with Professor Rebecca Allen in her VR work *Life Without Matter*, I already had an intuition regarding the transformational power of this new medium. My participation in the project confirmed that feeling, but also raised many questions regarding how immersivity and interaction could be explored artistically from the composer's point of view.

Chapters 1 and 2 were instrumental in establishing a logical connection between traditional acoustic composition and the possibilities of VR through the underlying concept of the artistic impulse. "Physical" and "abstract" space relate to the creative possibilities in VR as a new environment. Furthermore, VR seems to merge both of them into one, since, potentially, the performative space can be the creative one as well. Similarly, the need to express this impulse through the work of art has been pushing artists, with the aid of technological developments, to find new media and combinations of media in interdisciplinary works to better represent the original work that they imagined. The notion of media as extensions of the human body and mind, as seen in McLuhan and Clarke, also place VR in the context of communication and media ecology in that, within the next few years, it will change not only the way we communicate but also the way we create and the artistic output we produce.

Nowadays composers use all sorts of electronic devices and sound sources to create their compositions. It is not unusual to find works created by more than one composer, or a composer in collaboration with one or more specialists in technological areas that might be obscure to the composer in terms of the process, such as programming or digital design, but necessary to achieve the artistic vision. I believe that VR will require this kind of collaborative effort from composers until a quasi-zero-loss interface between the human mind and computers (or whatever is in use then) is finally implemented. In the meantime, synergies in collaborative projects might result in new art forms, which, in VR, may find a conducive environment ready to be shared by different people participating from different parts of the world—something that otherwise would have been less likely to happen.

After reviewing some of the work done in VR with an important music component, it was clear that the visual element has been predominant, due to the influence of the entertainment industry. Immersion and interaction are fundamental elements of VR so that the experiences can be embodied and are therefore more engaging and compelling. Although understanding that the visuals in VR are also inherent, I believe that composers can find more flexible and artistic ways to compose a VR work and to open new possibilities for them to share and for participants to explore. Furthermore, and alongside the aforementioned remote participation, the notion of a composition, or a work of art, can be extended to the collective creation in VR. The engagement of the participant in a composition can

be explored in a similar way that improvisation or aleatoric music has been explored before, dramatically increasing the possible outputs.

Finally, I proposed a series of guidelines to be considered when approaching composition in VR. Far from being intended as rules of any sort, the hope is that they work as a reminder of the potential of the medium, and stimulation for creation, to challenge and expand musical expression. One of these considerations, the "use of art forms," indicates the possibility of using visuals, haptics, and essentially any other sensory response or artistic form available: a VR *Gesamtkunstwerk*. Implied in this consideration is the idea that VR could be the medium for a purely musical work or experience, including or not including interaction, and exploring immersivity from just an acoustic perspective. Thus, in composing for a truly immersive space, such as the one VR can provide, a composer should consider not only the spatialized positioning musical or sound elements, but the possibility of moving them in space, their individual acoustic responses, or possible modulations of their timbral qualities throughout the piece.

Volume II

The second volume of this dissertation consists of two works, Meeting and Hillary, each conceived since their inception to have concert hall performance and VR version. In its first version, Hillary combination of acoustic instruments and and electronics. *Meeting* has both acoustic and spatialized electronic concert hall versions. Whereas the concert hall format has been premiered in both cases, their VR versions are projected here in a description according to the format presented at the end of chapter 4 of volume I. These descriptions follow the score for each piece.

HILLARY

The idea of creating a monodrama based on the United States presidential election of November 8, 2016 was born the same night. After the victory of Donald J. Trump was confirmed, the expected concession speech was postponed. It was John Podesta, the chair of Hillary Clinton's campaign, who took the microphone and announced that Ms. Clinton would not speak until later that night. This reaction made me think about the precise instant in which Ms. Clinton, probably following the vote count in the news with her team, realized that she had lost. For many, that was an unexpected defeat, but it was also a missed historical opportunity (of having a female president) and practically a 180° direction change from the policies and character of President Obama. I had the feeling that this

event was more than just disappointing, particularly because very few people believed this would happen. The situation made me consider a piece that would scrutinize the various reactions she might have had and would provide an anatomy of the instant in which, in my imagination, many thoughts and feelings unfolded at the speed of light.

The opportunity to compose and premiere a concert hall version of the piece came with the commission of a short voice work including an opera singer to be premiered at the OffLiceu Series on June 1, 2018. It was a perfect opportunity, since the performance would take place in the Foyer of the Gran Teatre del Liceu in Barcelona—a large space that includes a stage, round tables and chairs for the audience, three large screens with projectors, a surround sound audio system, and programmable color lighting. These resources made it possible to place the audience in different parts of the space, give them different perspectives such as among the supporters waiting for her victory or defeat speech or journalists in a conference room, or alternatively to put the audience in her mind and to provide them with the opportunity to experience some of her feelings.

The piece is written for soprano, piano, cello with live electronics, surround pre-recorded electronics and sound design, video projection and lighting. The score details all these elements and provides guidelines for my collaborators who created the visuals (Ferran Masip), the libretto, the lighting and the stage direction (Jordi Pérez Solé).

Since its inception, the multimedia aspect of the piece, along with the

emotional and psychological characteristics of the libretto, made me think that

this could be turned into a VR musical work—a piece where the participant

experiences the range of emotions of the main character very closely. The music

would be the same as the concert hall version, while the guidelines in the score

would be adapted for the VR experience. Following the score of the piece

presented here, a description of the proposed VR version is included.

For both VR version descriptions, I have used the color coding as in

chapter 4 (except for EXIT, which is not needed here). As a reminder:

- Music and sound. Its description, spatialization, and modulating effects.
- Participant's interaction.
- Lighting, color.
- Visual
- Haptics

Tomàs Peire Serrate

Hillary

*Electoral monodrama for soprano,
violoncello, piano, electronics, and video.*

2018

Hillary was premiered at the OFFLiceu Series
on June 1st 2018, at the Foyer of the Gran Teatre del Liceu, in Barcelona.

Elena Copons was Hillary.

Àlex Rodríguez Flaqué, violoncello.
Lucas Peire Serrate, piano.
Ferran Masip, video.
Tomàs Peire Serrate, electronics and musical director.
Jordi Pérez Solé, libretto and stage director.

Monodrama in one act

Music by Tomàs Peire Serate
Libretto by Jordi Pérez Solé

Sections:

1. Intro
2. cngrt
3. Water
4. What Is This?
5. The Cellphone
6. The Message
7. You Haven't Been Able to Connect
8. Enough
9. Mother
10. What Happened?
11. Outro

All sections are performed attacca

Original in Catalan.

English translation by: Tomàs Peire Serrate

Duration: ca. 18 minutes.

Version: 1.20 12/3/2019

Hillary

Electoral monodrama for soprano, violoncello,
piano, electronics, and video.

Music: Tomàs Peire Serrate
Libretto: Jordi Pérez Solé
(2018)

1. Intro

Lights / Video / Scene

Dark.
On the screen/s appear images from the news about electoral defeats from all over the world, from different moments in history.
Reporters in different languages show data about participation, images of people in the street waiting for speeches, repercussions in the stock markets ...

Electronics

The sound reflects the images but not necessarily synchronously.
Messages appear fragmented, from different positions and volumes. Gives the impression of an overwhelming amount of information, impossible to assimilate.

3

Light / Vid / Scn

Images always have interferences, as if
something technically failed. Maybe it's saturation ...
Maybe also channel changes, unexpected advertising,
Some cut of a movie ...

Lights fade in slowly. Hillary's (H) silhouette on stage.

Electr.

Apart from the news sound, there is a heartbeat, but subtle,
and the sound of the interferences.
This could be synchronized with the images.

The sound is filtered progressively until it seems that
it comes from outside, from another room.

Vc.

(♩ = ca. 108)
pppp

vib. ad lib. - - - - - - - - - - - - - →   MV - - - →   NV

Repeat fading in,
poco cresc. before m5.

pp

2. cngrt

5   ♩ = c. 90

Light / Vid / Scn

Light slowly increasing.

Senza tempo

Lights off suddenly. Flash of the previous images,
very brief and fast.

The light returns little by
little, maybe with
some blinking.

H (cat)

Com   va el   re - comp - te

H

(sprech.)   *mf*   3

How   is   the   re - count   go - ing?

Listening from earpiece:
**"2 points below.
Are you OK?"**

She suffers a scare, like a
whiplash that runs through her body.

Electr.

There is a bit of resonance of the accumulated sound that fades out.
pp

Lash, like a lighting bolt, and then its resonance.

7. You Haven't Been Able to Connect

Senza tempo

Ambience / lights "unreal".
First shots of her face are projected. Perhaps overlapping shots that seem like Hillary's. Not very defined.
The mouths can be cut. Interest on the gaze/eyes. Maybe they look at her to the center of the stage. They must have the
effect of a Greek choir. Perhaps the first images can be mixed with those of an expectant crowd, as if scrutinizing her, to increase the pressure that is being inflicted upon H.

125

Light
Vid
Scn

H is in shock. At first she can not articulate a word. The makeup is half gone, as if she were crazy.
In the middle of the stage, she tries to recompose her hair, dress, makeup..., very slowly, with her gaze lost.
Listens to the heart beats, to herself with everything she has done wrong, without reacting. Little by little,
she may start to "hunt" words, in an apparently unconnected way, as trying to process what they are saying.

H

Maybe amplified to match the choir, a little reverb.

The recorded voices of H begin to be heard, coming from all possible directions. They can start whispering and gradually say their phrases in singing voice.
As the choir progresses, the voices accumulate and overlap. Echoes are heard, phrases begin at one place and end in another.
There should be a fairly clear division of messages coming from the right and the left.

Electr.

Deep reverb, giving the impression of an immense and empty space.

Recorded voices. The text is sung repeating the same note until the next sentence,
mechanically, without too much emotion. Cold truth.
Record each sentence:
1. like a spoken whisper,
2. singing the note assigned with free rhythm but slow and constant, and *p*
3. holding the note, *p* , 4 -5 seconds

126

So listen, listen to me, everybody should head home, you should get some sleep..."

Los Angeles, May 2018.

Hillary VR

The experience is intended for one participant at a time.

However, if desired, different participants could share the experience at the same time without seeing each other, or interacting, except in two sections of the piece, **1** and at **10**.

The section labels are used for reference only to indicate the corresponding part in the score. They will not have any particular visual effect, and they follow each other seamlessly.

It has an approximate duration of 10 minutes.

"Hillary" Begins

Black

1. Intro

Fragmented sounds from news programs from all over the world begin to emerge. Sound is spatialized coming from all directions and positions in space. It should feel like an overwhelming amount of information. Random sound effects of interference are also part of this.

[*If multiple participants allowed: they can see each other, their avatars, as members of the crowd expecting news from Hillary.*]

Surrounding the participant, images from news programs appear and disappear, in a mosaic way. Images are also spatialized.

The participant can interact with the images. If the participant reaches the images, they will glitch, bend, or move from their position. It will be obvious that behind the images there are more, projecting a sense of deep space. The

interference sound effects also have a visual counterpart. Image and sound do not have to match.

There is to be a haptic response when touching the images.

The rest of the space is dark and empty.

A mid-high pitch emerges while the other sound is filtered. It is located in the center of the space.

2. cngrt

Previous sounds fade out while reverberation increases. Visuals dissolve.

We hear Hillary's voice (singer) "How is the recount going?"

WHIPLASH (this will happen multiple times in similar ways with variations of: Lash sound, sudden and very resonant. In sync, a visual response: everything white, and visual noise, and a tail to return to black. Haptic response accordingly.)

Dark

Music continues, only the recorded instruments and the voice. Dynamic spatialization. Each phrase comes from a different place.

Sounds of interference appear as indicated in the score. Visuals are in sync but spatialized differently.

As the music evolves and Hillary goes through different emotions, the space should show different soft tonalities of color.

WHIPLASH

3. Water

Burst of sound and images as at the beginning. A heartbeat is audible, and superimposed on the rest of the sound. It feels omnipresent.

The sound of falling water replaces the heartbeat. Like being under a cascade, with ocean waves coming from everywhere.

The visuals of light interferences emerge slowly and Hillary's face (digitalized singer) begins to be discernible.

Dark background gradually changes to soft lighting.

4. What Is This?

Hillary is now fully visible (a digitalized version of the singer), standing before a lectern with a written paper on it: her "epitaph."

During this section, the participant can move around Hillary, observing from any angle and distance. The sound is focused on her position, so it will be perceived according to the motion of the participant.

The rest of the space is dark.

From mm. 69 (the speech), the colors of the American flag will be increasingly present in all of the background but with interferences.

The sounds will turn more reverberant as she goes into the "dreamer section" (mm. 75 to 88). After that, back to the initial sound.

The sound of a press conference is softly audible.

Visuals show news programs again, flashes from photographers, interferences, etc.

The participant can interact with them again in a similar way to the beginning.

At m. 93, the light and visuals cover everything and Hillary's voice seems to be drowned, as if disappearing. Suddenly, everything stops and vanishes.

Just the music continues as in the score from mm. 94 to 113 (*Dies Irae*).

Hillary's anger has a visual response in the color of the background (red, or similar).

Haptic responses follow her rushes of fury.

(Optional: possible short visual references to things she is saying.)

WHIPLASH

5. The Cellphone

Progressively into dark.

Right on the whiplash, an obnoxious voicemail message from the elected president.

The participant has the option to replay the message. This option should be clearly visual. Replay/trash. It will replay until trashed. Then, continue.

6. The Message

Skip. Go directly to 7.

7. You Haven't Been Able to Connect

Many of Hillary's faces are progressively visible around the participant. They sing to him/her, like a choir. The sound is fully spatialized, spherical around the participant, like the visuals.

The participant may interact with each face, displacing them in space. However, their position will be replaced by another face, as if appearing from behind.

WHIPLASH

8. Enough

After the yell in m. 134, the sound of an old train blended with a heartbeat will begin to emerge. It will be present throughout until **10. What Happened?** It will continuously move around in slow circles at a considerable distance from the participant and Hillary.

She appears sitting on a bench, looking at a pendant. In the background, this image of her is inflated to larger than life size. The pendant is in her hands.

Lighting should be warm and soft on her.

9. Mother

Hillary sings, again in the center of the space.

The visuals may reflect parts of what the lyrics imply in images emerging from the background.

The participant can move around freely. He/she could also sit next to her on the bench.

The sound of the train and heartbeat fade in and out subtly. From m. 194 everything is quiet. Silence, and then the sound of interference again.

From her earpiece, a voice can be heard but is impossible to understand.

If the participant is very close or approaches it in time, he/she will hear what it says.

10. What Happened?

WHIPLASH

The sound of the conference room emerges. Voices throwing questions, flashes, etc.

If multiple participants allowed, here they appear again, as at the beginning, expecting news from the candidate.

Visuals of flashes, the questions, news, votes being counted, etc.

She stands up and walks toward a stand, with all of these visuals surrounding her.

She sings from m. 207 (*Dies Irae* Reprise).

The participant can move around, but there should be resistance to the motion so that he/she gravitates toward being placed in front of Hillary. If the participant does nothing, his/her positioning will move toward this position.

WHIPLASH

11. Outro

Dark background.

John Podesta's speech should begin to emerge, along with interferences and images like those from the beginning.

The participant can interact with them again, as at the beginning.

The credits of the show will also scroll up. The participant can interact with them (up/down).

END of "Hillary"

This VR version of *Hillary* gives the opportunity for the participant to feel the immersive part of the piece from a deeper level than the concert hall electro-acoustic original. The interactive element with music is less important due the timing established by the narrative. Likewise, a multi-participant experience was

not intended originally, since part of the concept of the VR version is to try to place the participant in Hillary's shoes. However, a possibility to extend it to multiple participants has been considered. In that case, each participant becomes part of a crowd waiting for Hillary to speak, and there they should be able to briefly interact with each other.

MEETING

This project was inspired by the homonymous sculpture by Elaine Krown Klein, an artist who, with her husband Leo, created the Elaine Krown Klein Fine Arts Scholarship[1] as an aid for UCLA students in the fields of performing and visual arts.

Fig. II.1 *Meeting*, sculpture by Elaine Krown Klein

The decision regarding the instrumentation of the piece was made by considering the other two award recipients from the UCLA Herb Alpert School of Music in 2017: Matthew Lombard, a saxophone player, and Maxim Kuzin, a conductor. Composing a concertino for alto saxophone and ensemble based on

---

[1] The Elaine Krown Klein Fine Arts Scholarship was founded in 1987. Since then (and until the time of writing in December 2019) it has awarded over $700,000 to 220 students.

the concept of the sculpture, entitled *Meeting,* seemed very appropriate.

Furthermore, Ms. Klein's passion for cubist art inspired the idea of creating

subsequent versions of the piece: one purely electronic and possibly one for VR.

The idea behind this was to explore how a composition, while preserving its

identity, could be reinterpreted in different media.

The acoustic instrumental version was premiered on May 14, 2018, and its

subsequent spatialized electronic version, *Meeting 2.0*, was presented on May 15,

2019. In this version I used the recording of the complete solo part as material for

an electronic piece that would follow the structure of the original but derive all its

sounds from the treatment of this recorded solo. Although it sounds like the

original from time to time, processing, digital manipulation, and spatialization were

used to generate all of the background and additional sounds.

The description of what I intend to be *Meeting 3.0* is included after the

score of *Meeting*.

Tomàs Peire Serrate

Meeting

Concertino for Alto Saxophone and Ensemble

2018

Meeting is dedicated to Elaine Krown Klein.

It was premiered on May 14th of 2018,
at the UCLA Schoenberg Hall,
by Matthew Lombard, Alto Saxophone solo,
and Maxim Kuzin conducting
an ensemble of the UCLA herb Alpert School of Music
formed by
Irwin Hui, Darren Lou, Ryan Chou, Stephen Ryder,
Will Grace, Troy Kutch, Chris Routh, Xenia Deviatkina-Loh,
Jennifer Cho, Viola You, Jeffrey Ho and Armando Wood.

Instrumentation

Flute
Oboe
Clarinet in B♭
Bassoon

Horn in F
Trumpet in B♭
Trombone

2 Violins
Viola
Violoncello
Double Bass

Alto Saxophone

Program Notes:

In the Spring of 2017, I had the pleasure of meeting Elaine Krown Klein at the recipients' ceremony of her award. I was impressed by her kindness, generosity, and especially by the love with which she spoke of towards the many scholars that she has been unconditionally supporting for more than 30 years. In her own words: her family. This beautiul idea motivated myself as well as my colleagues and friends Maxim Kuzin and Matthew Lombard, also recipients of the scholarship in that year, to collaborate on a new project, creating, performing and conducting an original work.

In addition to being a philanthropist, Elaine is also an artist, and during a visit to her place she showed me one of her creations: a big bronze sculpture entitled *Meeting* that conveys the idea of people's reunion and gathering. It was a perfect spark to trigger the inspiration for writing this piece.

Meeting 3.0

The experience is intended for multiple participants.

Participants, share the same space and can move around freely, in any direction. Each participant has a symbolic representation of their position, like a quasi-transparent amorphous group of particles in motion with a halo. It is visible to all the participants. They can interact with the sound and music in specified places.

The rehearsal letters (squared) are used to refer to sections or musical materials in the score. The music in *Meeting 3.0* is derived from musical motives of the solo part in the original *Meeting.* The electronic version, *Meeting 2.0,* inspires the electronic sounds, textures, and overall structure in Meeting 3.0. They will not have any visual effect *per se*. A recording of meeting 2.0 can be found with the documentation of this dissertation.

Meeting 3.0 has an approximate duration of 8 minutes.

"Meeting 3.0" Begins

Dark. The background space is dark throughout. The participants' halo has a soft white light on it.

Section 1 – Intro – *Expect*

The sound of an alto saxophone begins to emerge, spatialized, each long note coming from a different place in a wide space. Notes are sustained for few seconds while the sound is moving around.

Progressively, the sounds (single notes and short motives) begin to generate visuals, like trails of particles (one for each note) moving in the space. They have different tonalities of the same color (darker for lower pitch, clearer for higher pitch).

The sound is a constant hybridation in progress between acoustic saxophone (all of the family, all registers) and a digitalized version of the the saxophone sound. The digital component is not hidden; on the contrary it is part of the sound. It evolves through time, like being part of its sound envelope.

The perception of the sound is based upon each participant's position in space.

Section 2 – (approx. at 1') – *Play*

Once the music has been presented (at $\boxed{A}$), it creates an echoing space. Each note, or motive, seems to generate ramifications taking different directions in the space. The music has an overall static texture, with many active elements in it, motives repeating, answering each other, moving around, etc.

While the music continues to generate the sense of an constantly growing space, participants can interact here with musical motives by "capturing" one or two at a time. Once "captured", the sound can be manipulated in real time (while it is still playing) by:

1. Modifying pitch by microtonal transposition, inversion, and spatial rotation (pitches closer, and farther away).

2. Modulating the sound as additive synthesis, changing parameters that will be visually available when the sound is "captured".

3. Stretching the duration of the sounds within a reasonable ratio.

4. Propelling the sound motive towards a particular direction, and therefore "freeing" it.

After two minutes in this section, all motives, gestures, and notes begin a process of compression and consolidation toward a single note in the high register, as at G .

The participants will feel a resistance while playing with the music at this point, until they are allowed to move toward the consolidation area.

The consolidation area should feel as if it is in the center of the space, almost like a concentrated mass of sound. It should be visible, with a mutating color and constantly reshaping.

Section 3 (approx. at 4') – *Hold*

A long high pitch lasts for a few seconds, increases in volume, and unexpectedly fades away in all directions, like in an explosion, although not necessarily loud. After a few more seconds of the sound vanishing, it seems to come back in a granulated form, like a stream of micro particles of sound (very short notes). It comes back from afar and toward the participants. It feels as if it is travelling at great speed because of the extreme granulation of the sound.

Each participant becomes a pole of attraction to the sound from all directions, no matter where they go.

There is a haptic response to this stream of sound, like a tingle. It should be as global as possible around each participant's body, and completely uniform if the participant does nothing.

If he/she moves (for example extending a hand as if trying to stop the particles):

1. There will be a haptic response, an increase in the pressure as a reaction.

2. The motion of the participant will microtonally detune the pitch of the particles of sound when reaching the contact (up or down depending on the gesture).

3. If the participant's movement is abrupt, the particles will produce an additional sound of distortion due to the impact.

The effect of this interaction is audible but only at a very close range, most likely only heard by each participant, unless they are really close to each other.

There is a visual realization of the particles moving fast toward each participant.

Section 3 (approx. at 5') – *Run*

A saxophone begins to play a very fast solo (a mix of G and H elements).

It moves all over the place and seems to attract and absorb the particles. The solo repeats while extending a few notes in each phrase after every repetition. When the sound gets closer to the participant, or vice versa, it reveals more of the notes in-between the original solo, such as faster rhythmic levels in between the notes perceived from afar.

There is a visual representation of the solo, similar to that of the motives in section 1, but larger, thicker, and richer in coloration.

The sound leaves a subtle trail of "digitalized" sound.

174

Participants can interact with the solo by touching it as it approaches them. This contact will generate soft and brief alterations in the notes by:

1. Filtering frequencies

2. Increasing the volume of the digitalized trail

3. Dividing momentarily the sound into two or three distinct tones (although they will be very close to each other).

Section 4 (approx. at 7') – *Away*

Once the space is cleared, the solo disintegrates and breaks into a few different contrasting motives at different registers. The music is progressively gets sparer, with more space for silence in between the motives and notes.

The participants can "chase' some of these motives in the space. They will distance themselves from the theoretical center, but this does not matter. Gradually, sounds will reappear in different positions, making it harder to follow them, and ultimately losing the participant and disappearing.

Motives will be recognizable in color and shape, but will lose definition throughout the last minute of the piece.

Dark.

END of "Meeting 3.0"

Meeting 3.0 tries to propose an interactive experience based on the musical motives of *Meeting,* and the immersion and digitalized sound world of *Meeting 2.0*. The aim is to treat the musical elements almost like physical objects in a shared space with the participants. Immersion in this case, comes from the

complete spatialization of the musical material. Interestingly, the elements' spatial

location, motion and acoustic treatment (for example the different types of reverb

that could be applied to each of them individually) are what end up defining the

space, rather than hypothetical dimensions.

The solo and the derived musical motives, which were in the original

acoustic version, is based and evolves, from repetition towards expansion; a sort

of feedback process where the material is defined, extended, and consolidated.

This gives the opportunity to generate a section in the piece, and a space, where

the participants can interact for a while with the musical material, modify it and

even share it (send it towards, in the description) with other participants.
