**Does Gokana REALLY Have Syllables? A Postscript to Hyman (2011)**

Larry M. Hyman

*University of California, Berkeley*

[submitted to *Phonology*]

In a recent article in *Phonology* (Hyman 2011), I provided evidence that Gokana, a Cross-River language of Nigeria, cares very little, if at all, about organizing its consonants and vowels into syllables. The only potential argument in favor of the syllable that was presented concerned the structure of the the prosodic stem, which consists of a root and at most one derivational and one inflectional suffix. While the prosodic stem can have up to four moras and any of the shapes in (1), the shapes in (2) are unattested:

(1) CV, CVC, CVV, CVCV, CVVCV, CVVCVV, CVVVV

(2) \*CVVVCV, \*CVCVVV

The possible syllable-based explanation that was offered was that the prosodic stem consists of a single trochee with up to two bimoraic syllables, as in (3).

(3)  $\begin{array}{cccccccccccc} \sigma & \sigma & \sigma & \sigma & \sigma & \sigma & \sigma & \sigma & \sigma & \sigma & \sigma & \sigma \\ \wedge & \wedge & \wedge & \wedge & \wedge & \wedge & \wedge & \wedge & \wedge & \wedge & \wedge & \wedge \\ CV & CVV & CVC & CV.CV & CVV.CV & CV.CVV & CVV.V & CVV.CVV & CVV.VV & & & \end{array}$

By this account the shapes in (2) are ruled out by the common constraint that a syllable can be restricted to at most two moras. If the syllabic structures in (3) were not recognized, one would have to stipulate that quadrimoraic \*CVVVCV and \*CVCVVV are disallowed, while CVVCVV and CVVVV are well-formed. This was (and remains) the only evidence that Gokana phonology unambiguously refers to the syllable. Or does it?<sup>1</sup>

The question is how else one might “explain” why \*CVVVCV and \*CVCVVV are unattested as possible prosodic stem shapes.<sup>2</sup> Since Hyman (2011) has appeared, I have realized that there is another possible account for the absence of these forms. Recall

<sup>1</sup> The argument apparently convinced Kiparsky (2013), who writes, “Words and stems are always syllabified... even in Gokana and Japanese (Hyman 2010 [2011])” (slide 37). Note that although some scholars hypothesize the (CV) syllable as part of universal grammar with implications for language acquisition, my goal here was to seek unambiguous evidence that Gokana refers to syllables, not “just” moras.

<sup>2</sup> One reviewer suggests that the absence of a third C might constitute another argument, since CVCVCV would require three syllables. However, this would not explain why CVCVC is also unattested. See Hyman (2011: 73) for further discussion.

that the prosodic stem consists of an obligatory root and at most one derivational and one inflectional suffix. The class of such suffixes is however quite limited in the language. In (4) I repeat the structure of the prosodic stem from Hyman (2011: 70):<sup>3</sup>

(4)	<i>ROOT</i>	+	<i>(derivational suffix)</i>	+	<i>(inflectional suffix)</i>
	-È, -DE		‘causative’		-ii ‘2pl. subject’
	-a		‘anti-causative’		-ÈÈ ‘logophoric’
	-mà		‘instrumental’		
	-Da, -i		(frozen, lexical)		

As seen, derivational suffixes can have the shape –V or –CV, while inflectional suffixes have the shape –VV. Since simple roots have the shapes CV, CVV or CVC, there are six possible input shapes of root + derivational suffix + inflectional suffix.<sup>4</sup> However, as seen in (5), none of these six combinations can produce \*CVVVCV or \*CVCVVV:

(5)	a.	CV	+	V	+	VV	→	CV-V-V	:	tá-è-è	‘finish tr. (log.)’
		CV	+	CV	+	VV	→	CV-CV-V	:	bɛ-rè-è	‘lean tr. (log.)’
	b.	CVV	+	V	+	VV	→	CVV-V-V	:	kèè-è-è	‘wake tr. (log.)’
		CVV	+	CV	+	VV	→	CVV-CV-V	:	pî-nè-è	‘make silent (log.)’
	c.	CVC	+	V	+	VV	→	CVC-V-V	:	bɔr-è-è	‘soften’ (log.)
		CVC	+	CV	+	VV	→	CV-CV-V	:	di-mà-è	‘hit with (log.)’ < /dib/

In the above examples the logophoric suffix /-ÈÈ/ undergoes a rule that shortens a long vowel which occurs after another vowel, i.e. VV → V / V \_\_ (Hyman 2011: 65).<sup>5</sup> The last example also shows consonant cluster simplification before the instrumental suffix –*ma*. In addition to simplex roots, there are complex roots of the shape CVCV or CVVCV, whose final V or CV is often identifiable as a frozen derivational suffix. When one of the derivational suffixes in (4) is added, it replaces the final V and sometimes the second root consonant (since a prosodic stem cannot have a third C). As a result,

<sup>3</sup> /D/ stands for an alveolar consonant which is realized [r] or [n], depending on whether it occurs after a [+nasal] root. /E/ stands for a front non-high vowel which is realized [e] or [ɛ], depending on vowel harmony, and [ɛ̃] after a [+nasal] root.

<sup>4</sup> One reviewer suggests that these root shapes provide more evidence for the syllable, since we can now say that a root = a single syllable with an obligatory onset and one or two moras. Note that the final C of CVC may be followed by a V, hence presumably syllabified as CV.CV. An alternative is that the root consists of a branching mora and a possible second non-branching mora.

<sup>5</sup> The length of the 2pl. subject and logophoric suffixes is seen in two environments: (i) when immediately following a CVC root, e.g. *dib-èè* ‘hit (log.)’; (ii) when immediately following a CVV root, in which case a –DVV allomorph is observed, e.g. *dáà-rèè* ‘sleep (log.)’. However, the vowel shortening rule instead applies when the root is CV: *tú-è* ‘take (log.)’.

the string into the maximal CVV.(C)VV trochaic foot.<sup>8</sup> Given this, it seems that the second hypothesis has to be taken seriously: There is no CVVVCV or CVCVVV because no input can produce such an output. If correct, the syllabic trochee analysis may still be descriptively compatible with the data, but not necessarily explanatory of why the facts are the way they are. Gokana can thus still be considered a language which may not refer to the syllable at all.

---

<sup>8</sup> Compare the Ibibio analysis of Akinlabi & Urua (2003), cited in Hyman (2011: 69-70), whereby the negative suffix /-ke/ undergoes major phonological changes only when it can be fitted into the required heavy-light trochee of the negative construction.
