A 85-year-old man with sudden onset of dyspnea and chest pain with an history of immobilization due to right tibia plateau fracture after traffic accident 2 months ago was admitted to our emergency department. He was hypotensive (70/50 mmHg), tachycardic (166 beats/minute), tachypneic (26/minute) on admission. A 12-lead electrocardiogram showed atrial fibrillation with rapid ventricular response, arterial blood gas analysis revealed a hypoxic and hypocarbic profile together with an increased alveolar arterial oxygen. His physical examination was unremarkable except cold extremities, delayed capillary refilling time and bilateral decreased breath sounds with rhoncus, abdominal respiration and increased in diameter of right calf 3 cm more than left. Focused cardiac ultrasonography (FOCUS) performed by the emergency physician (EP) using a Mindray M7® model ultrasound machine with a 3.6 mHz microconvex transducer (M7, Mindray Bio-medical Electronics CO., Shenzhen, China) revealed enlarged right ventricle (RV), hypokinetic lateral wall and hyperkinetic apex of RV (McConnell’s sign)1 and also a large, mobile serpentine thrombus in the right atrium. The thrombus also extended into the inferior vena cava and protruded into the RV through the tricuspid valve during diastole (Video). Computerized tomography angiography of the thorax revealed filling defects in both main pulmonary arteries (Figure). The patient received alteplase treatment with a dose of 100 mg over 2 hours in the intensive care unit. The patient was discharged from the intensive care unit with oral anticoagulation after three days with symptomatic relief.

Pulmonary emboli (PE) is one of the crucial considerations in the differential diagnosis of acute dyspnea and hypotension. Multiple prospective studies reveal a low sensitivity (41-70%) of FOCUS for specifically identifying PE.2,3 As experience with emergency ultrasound grows, EPs will be expected to fully understand and exploit the power of FOCUS to meet the evolving standards of care in emergency medicine.

Video. Focused cardiac sonography shows dilated right ventricle and also a mobile thrombus in the right atrium.
