ABSTRACT:

Audience: This modified team-based learning (mTBL) exercise is appropriate for junior or senior emergency medicine learners.

Introduction: The acute red eye is a common chief complaint in the emergency department. It is essential that the emergency physician be knowledgeable about the differential diagnosis for the acute red eye and be able to distinguish between benign and sinister causes of the acute red eye.

Objectives: By the end of this educational session, the learner will: 1) list 10 major causes for an acute red eye; 2) describe historical features that help distinguish between benign and serious causes of the acute red eye; 3) describe physical examination features that help distinguish between benign and serious causes of the acute red eye; and 4) use historical and physical examination features to distinguish between the 10 different causes of the acute red eye.

Method: This is an mTBL session.

Topics: The acute red eye, eye pain, conjunctivitis, scleritis, episcleritis, acute angle closure glaucoma, corneal abrasion, endophthalmitis, anterior uveitis, infectious keratitis, corneal ulcer, corneal foreign body, bacterial keratitis, viral keratitis, herpes keratitis, varicella zoster keratitis, team-based learning.
Linked objectives and methods:
In the individual readiness assessment test, the learners are asked to match each condition with the appropriate definition and picture; this test ensures that they can list each major cause for an acute red eye. Learners then participate in the group readiness assessment test and give answers during the review portion. Learners will be able to describe historical features and physical examination features that help to distinguish between benign and serious diagnoses and then apply this to distinguish between each diagnosis in the group application exercise.

Recommended pre-reading for instructor:
- Consider reading any chapter on the acute red eye in an emergency medicine textbook.

Learner responsible content (LRC):
Any chapter on the acute red eye:
Suggestions:
USER GUIDE

Prepare:
1. Read all instructor pre-reading
2. Post on a learning management system or e-mail the pre-reading (one of the following articles) for your learners, one week in advance.
   - Any chapter on the acute red eye
3. You will need a computer with PowerPoint, projector/screen, and speakers for this session. The session is best run in a classroom with round or square tables.
4. The post-test can be done in any format (paper or online), but we recommend having learners take the post-test as a Kahoot! [https://play.kahoot.it/#/?quizId=5e16583d-ad32-48f6-841c-f4d26f43eb7f]. You may also program the Kahoot! yourself [www.getkahoot.com] (sign up for free account) or use a different audience response system. If the link does not work, log in to Kahoot! and search public kahoots for: The Acute Red Eye, JETem.
5. If using a Kahoot! post-test, each learner will need a device (android, iPhone, tablet, or laptop) to play the Kahoot!

For the in classroom didactic session, you will also need to prepare the following:
1. One copy of team numbers (one number per team)
2. One copy of the iRAT for each learner
3. One copy of the gRAT for each team (4 learners per team), using scratch off stickers (available at www.amazon.com)
4. One copy of the GAE for every two learners.
5. One copy of the gRAT key and GAE key for each instructor (usually one instructor per session).
6. One copy of the post-test for each learner (not necessary if using Kahoot!).

In class implementation:
1. Use the PowerPoint with presenter’s notes to guide you through the presentation. You will start by describing the importance of the acute red eye in the emergency department.
2. Learners then take iRAT. They will need to view the slide with pictures of the 10 different red eyes in order to complete the iRAT. Give your learners 5-10 minutes to complete the iRAT. Learners should not be allowed to use the article or other material during the iRAT.
3. Continue to advance the PowerPoint slides. Once learners have completed the iRAT, break learners up into groups of four. We recommend evenly distributing the number of senior and junior learners in each group. The instructor should assign the groups, rather than having the learners self-select. If faculty members are present, place one faculty member at each table.
4. The session is best implemented in small round or square tables, with four learners at each table.
5. Give each group one copy of the gRAT and a team number. Give the groups 30 minutes to complete the gRAT. This may be done “open book,” but advise learners that they should not reference any articles from the Western Journal of Emergency Medicine (WestJEM). This article can be emailed to learners after the session. They may, however, use textbooks, UpToDate, e-medicine, or other online resources. Walk around the room to ensure learners are on task and do not have any questions.
6. Go over the gRAT answers as a group. Call on one leader (by calling their team number) from each group to provide the condition for each definition given (on the PowerPoint slides). Also, go over the answers to the other gRAT questions (risk factors, treatment, anterior chamber, visual acuity, etc.). Answer any questions and provide teaching pearls; other faculty members may weigh in. Use the PowerPoint slides to guide you through this portion. Make sure you have a copy of the gRAT key. (20 minutes)
7. Now break up the learners into groups of two and have them work on the group application exercise. Give groups 10-15 minutes to complete the GAE. Go over possible answers together. Instruct the learners that you will email them a sample key. Groups may use any resource they wish during this portion (including the WestJEM article).
8. After you have discussed all GAE answers, have each learner complete a post-test: [https://play.kahoot.it/#/?quizId=5e16583d-ad32-48f6-841c-f4d26f43eb7f] or this can be done on paper. (At our residency we have paper “medals” for the Kahoot! winner; these medals go on the residency bulletin board.) If the link does not work, log in to Kahoot! and search public kahoots for: The Acute Red Eye, JETem.
9. After the session, email the gRAT key and the GAE key to your learners.

**Answer choices:**
- Acute angle closure glaucoma
- Anterior uveitis
- Conjunctivitis
- Endophthalmitis
- Subconjunctival hemorrhage
- Anterior scleritis
- Bacterial keratitis
- Corneal abrasion
- Episcleritis
- Viral keratitis

History or exam finding

You are in the wrong didactic session

1. This patient’s redness does not improve with phenylephrine. What is the most likely diagnosis (see Powerpoint slide #1)?
   a. Acute angle closure glaucoma
   b. Bacterial conjunctivitis
   c. Episcleritis
   d. Scleritis

2. What is the most appropriate treatment for this patient who is two days status post cataract surgery (see Powerpoint slide #2)?
   a. Intravitreal vancomycin
   b. Intravenous vancomycin
   c. Topical gatifloxacin
   d. Topical steroids

3. What type of medication would you give this patient (see Powerpoint slide #3)?
   a. Topical antibiotic
   b. Topical beta-blocker
   c. Topical lubricant
   d. Topical sympathomimetic

4. What is the most appropriate treatment for this patient (see Powerpoint slide #4)?
   a. Reassurance
   b. Topical antibiotics
   c. Topical antivirals
   d. Topical steroids

5. Which one of these conditions generally has a clear anterior chamber?
   a. Anterior uveitis
   b. Bacterial keratitis
   c. Endophthalmitis
   d. Episcleritis

6. Which of the following conditions is NOT associated with photophobia?
a. Anterior uveitis
b. Bacterial keratitis
c. Conjunctivitis
d. Corneal abrasion

7. Which of the following is not a common cause of viral keratitis?
   a. Adenovirus
   b. Herpes simplex virus 1
   c. Rhinovirus
   d. Varicella zoster virus

## Condition

### Endophthalmitis

**Picture: C**

Bacterial or fungal infection involving the vitreous and/or aqueous humor. Eye surgery is a risk factor.  

- Eye surgery (cataract surgery has 0.1% risk)  
- Penetrating ocular trauma  
- Corneal infection  
- Intraocular injections  
- (Fungal) hospitalization with central venous access, total parenteral nutrition, or broad spectrum antibiotics.  

- Microorganisms: Coagulase-negative staphylococcus, viridans streptococci (post-procedure), Bacillus cereus (post-traumatic), Staphylococcus, Streptococcus, Candida (endogenous), Klebsiella pneumoniae (East Asia, associated with liver abscess).  

|-----------|------------|-------------------------------|--------------------|-------|--------------|---------------------------------------------|-----------------------------|--------------------------------------------------------|-------------------------------------------------------------|---------------------|
| Endophthalmitis | Bacterial or fungal infection involving the vitreous and/or aqueous humor. Eye surgery is a risk factor. | -Eye surgery (cataract surgery has 0.1% risk)  
- Penetrating ocular trauma  
- Corneal infection  
- Intraocular injections  
- (Fungal) hospitalization with central venous access, total parenteral nutrition, or broad spectrum antibiotics.  

- Microorganisms: Coagulase-negative staphylococcus, viridans streptococci (post-procedure), Bacillus cereus (post-traumatic), Staphylococcus, Streptococcus, Candida (endogenous), Klebsiella pneumoniae (East Asia, associated with liver abscess).  | Pain and decreased vision. | Pain: Yes. | Photophobia: Yes. | Proparacaine: No improvement. | Phenylylephrine: May have some improvement. | Diffuse. | Treatment:  
- If vision “hand motion” or better, then intravitreal injection of antibiotics.  
- If vision “light perception” or worse, then surgery.  

Referral: Emergent. | AC: Commonly associated with hypopyon.  
Visual acuity: Decreased.  
Pupils: Severe cases may have afferent pupillary defect.  
Fluorescein: May diagnose the inciting penetrating injury or corneal abrasion. | Usually occurs 2-7 days post-operatively or 12-24 hours after trauma. |

### Anterior uveitis

**Picture: J**

Inflammation of the iris, choroid, and/or ciliary body causing redness and pain.  

- Idiopathic systemic diseases (spondyloarthropathies), infectious (syphilis, tuberculosis, Lyme disease, toxoplasmosis, herpes viruses, cytomegalovirus), drug-induced (rifabutin, cidofovir, sulfas, moxifloxacin).  

|-----------|------------|-------------------------------|--------------------|-------|--------------|---------------------------------------------|-----------------------------|--------------------------------------------------------|-------------------------------------------------------------|---------------------|
| Anterior uveitis | Inflammation of the iris, choroid, and/or ciliary body causing redness and pain. | - Idiopathic systemic diseases (spondyloarthropathies), infectious (syphilis, tuberculosis, Lyme disease, toxoplasmosis, herpes viruses, cytomegalovirus), drug-induced (rifabutin, cidofovir, sulfas, moxifloxacin).  | Pain, redness, photophobia, consensual photophobia, tearing, decreased vision. | Pain: Yes. | Photophobia: Yes. | Proparacaine: No improvement. | Phenylylephrine: No improvement in redness. | Diffuse, pronounced at the limbus (ciliary flush). | Treatment:  
- Topical steroids, dilating drops (to prevent scarring of iris to lens); do not start steroids without ophthalmology consultation.  

Referral: Urgent (within 24 hours). | AC: Cells and flare.  
Pupil: Constricted or irregular pupil.  
VA: Normal or decreased.  
Fluorescein: +/- (dendrites if HSV underlying cause). | - If a specific diagnosis is suspected can start workup and treat underlying condition. |

<tr>
<td>Episcleritis</td>
<td>Inflammation of the episclera, which is the vascularized tissue between conjunctiva and sclera.</td>
<td>-70% female&lt;sup&gt;9&lt;/sup&gt; -Fifth decade of life&lt;sup&gt;9&lt;/sup&gt; -One-third related to systemic autoimmune conditions.&lt;sup&gt;9&lt;/sup&gt;</td>
<td>Ocular redness without irritation or slight tenderness.</td>
<td>Pain: Usually mild irritation, but chronic or nodular can have pain.&lt;sup&gt;9&lt;/sup&gt; Photophobia: No. Proparacaine: May have improvement of irritation. Phenylephrine: Resolution of episcleral redness after 10-15 minutes.</td>
<td>Most commonly focal in interpalpebral zone, can be diffuse.</td>
<td>Treatment: -Topical lubricants&lt;sup&gt;18&lt;/sup&gt; -Oral non-steroidal anti-inflammatory drugs -Return precautions for symptoms of scleritis. Referral: Primary care follow up.</td>
<td>AC: Clear. Pupils: Normal. VA: Normal. Fluorescein: No uptake.</td>
<td>Most are idiopathic. Inflamed vessels can be moved with cotton tipped applicator.</td>
</tr>
<tr>
<td>Conjunctivitis</td>
<td>Infectious or non-infectious inflammation of the bulbar and palpebral conjunctiva.</td>
<td>-Exposure to adenovirus or enterovirus, Staphylococcus aureus, Streptococcus pneumoniae, Haemophilus influenzae, Neisseria gonorrhea, Chlamydia trachomatis, Diphtheria, or history of allergy.</td>
<td>Tearing, discharge, or associate viral symptoms.</td>
<td>Pain: May have a mild burning sensation. Photophobia: No. Proparacaine: Improvement in irritation. Phenylephrine: Can have mild improvement of redness.</td>
<td>Usually diffuse.</td>
<td>Treatment: Artificial tears 4-8x per day, consider topical antibiotics. Referral: Primary care follow up as needed.</td>
<td>AC: Clear. Pupils: Normal. VA: Normal. Fluorescein: No uptake.</td>
<td>Patients should not have photophobia (should raise suspicion for a more serious condition). Patients commonly have discharge. Viral conjunctivitis is highly contagious 1-2 weeks from onset. Recommend contact precautions and sterilization of patient encounter room after visit.</td>
</tr>

The Acute Red Eye: Group Application Exercise Key (GAE Key)

INSTRUCTOR MATERIALS

The Acute Red Eye: Post-test Key

1. This patient’s redness does not improve with phenylephrine. What is the most likely diagnosis (see Powerpoint slide #1)?
   a. Acute angle closure glaucoma
   b. Bacterial conjunctivitis
   c. Episcleritis
   d. Scleritis

   The patient’s redness is most consistent with episcleritis vs scleritis. The redness of episcleritis should improve with phenylephrine, while the redness of scleritis does not.

2. What is the most appropriate treatment for this patient who is two days status post cataract surgery (see Powerpoint slide #2)?
   a. Intravitreal vancomycin
   b. Intravenous vancomycin
   c. Topical gatifloxacin
   d. Topical steroids

   Given the recent surgery and the patient’s presentation, he most likely has endophthalmitis, the treatment of which is intravitreal antibiotics. IV antibiotics are sometimes, but not always, indicated. Vitrectomy is the treatment in more severe cases of endophthalmitis.

3. What type of medication would you give this patient (see Powerpoint slide #3)?
   a. Topical antibiotic
   b. Topical beta-blocker
   c. Topical lubricant
   d. Topical sympathomimetic

   The patient has acute angle closure glaucoma. Treatment options include: topical parasympathomimetics, beta-blockers, alpha-agonists, and systemic carbonic anhydrase inhibitors.

4. What is the most appropriate treatment for this patient (see Powerpoint slide #4)?
   a. Reassurance
   b. Topical antibiotics
   c. Topical antivirals
   d. Topical steroids

The patient has a subconjunctival hemorrhage and no further treatment is indicated.

5. Which one of these conditions generally has a clear anterior chamber?
   a. Anterior uveitis
   b. Bacterial keratitis
   c. Endophthalmitis
   d. Episcleritis

Anterior uveitis, bacterial keratitis, and endophthalmitis commonly have cells and flare in the anterior chamber.

6. Which of the following conditions is NOT associated with photophobia?
   a. Anterior uveitis
   b. Bacterial keratitis
   c. Conjunctivitis
   d. Corneal abrasion

Photophobia should raise suspicion for a more serious condition. Conjunctivitis does not typically cause photophobia.

7. Which of the following is not a common cause of viral keratitis?
   a. Adenovirus
   b. Herpes simplex virus 1
   c. Rhinovirus
   d. Varicella zoster virus

Rhinovirus is not a common cause of viral keratitis.
