Response to Webster's Letter to the Editor

TO THE EDITOR:

We thank Dr. Webster for pointing out some inaccuracies as well as making suggestions for useful additions to our review of definitions of and measurement instruments for assessing wisdom.¹ We apologize for the errors noted. Accordingly, we are inserting the following addendum to the online version of our article:

We want to make a few corrections to our article. The Self-Assessed Wisdom Scale (SAWS)^{2,3} was developed in Canada, and involved samples representing several cultures including large numbers of Chinese Canadian participants. The SAWS included the domains of humor and openness to new

experience, which were two of the nine components that we found to be common to several definitions of wisdom. Finally, the SAWS has been shown to not be associated with social desirability.
