Abstract

The ambiphilic β-phosphinoethylboranes Ph₂PCH₂CH₂BR₂ (BR₂ = BCy₂ (**1a**), BBN (**1b**)), which feature a ethano spacer CH₂CH₂ between the Lewis acidic boryl and Lewis basic phosphino groups, were synthesized in nearly quantitative yields via the hydroboration of vinyldiphenylphosphine. Compounds **1a** and **1b** were fully characterized by elemental analysis, and by NMR and IR spectroscopy. X-ray crystallographic studies of compound **1b** revealed infinite helical chains of the molecules connected

through P···B donor-acceptor interactions. The ability of these ambiphilic ligands to concurrently act as donors and acceptors was highlighted by their reactions with (dmpe)NiMe₂. Zwitterionic complexes (dmpe)NiMe(Ph₂PCH₂CH₂BCy₂Me) (**2a**) and (dmpe)NiMe(Ph₂PCH₂CH₂[BBN]Me) (**2b**) were generated via the abstraction of one of the methyl groups, forming a borate, and intramolecular coordination of the phosphine moiety to the resulting cationic metal center. Compound 2b was characterized by X-ray crystallography. Furthermore, B(C₆F₅)₃ abstracts the methyl group of a coordinated borate ligand generate free, 3-coordinate to a borane center in $[(dmpe)NiMe(1a)]^{+}[MeB(C_{6}F_{5})_{3}]^{-}(3).$

β-phosphinoethylborane, nickel, boron, ambiphilic, abstraction

Introduction

The elucidation of the mechanisms by which many enzymes operate has revealed nature's use of multifunctional catalysis as a strategy for the optimization of chemical conversions. The exploitation of the synergistic interaction of two or more reactive centers can lead to cooperative catalytic effects on a variety of chemical processes. In homogeneous catalysis, use of ambiphilic ligands of the type LA-spacer-LB, with both Lewis acidic (LA) and Lewis basic (LB) functionalities, offers the interesting possibility of activating both the metal center and the substrate molecule in a cooperative fashion. For example, the use of such ambiphilic ligands was reported by Labinger and Miller in 1982 to facilitate the formation of CO insertion products. Although relatively scarce, there have been subsequent reports on the use of ambiphilic ligands in catalysis. The bifunctional ligand Me₂PCH₂AlMe₂, first synthesized by Karsch et al., was employed as a cocatalyst in the nickel(II)-catalyzed dehydrogenative

oligomerization of PhSiH₃,^{5a} and has recently been studied as a ligand in rhodium complexes.^{5b} Phosphino/boryl compounds, featuring a variety of different spacer groups, have also been reported as bifunctional ligands in transition-metal chemistry.⁶⁻⁸

Ambiphilic ligands can interact with metal complexes in a variety of ways. After coordination of the phosphino group to the metal center, the Lewis acidic group can interact with an anionic ligand in the metal's coordination sphere, abstract an anionic ligand from the metal, or interact directly with the metal center. Indeed, a number of such interactions have been observed, and this supports the notion that ambiphilic ligands can have a profound effect on the chemistry at the metal center. We now report an efficient synthetic method for the preparation of β -phosphinoethylboranes, and their use as ambiphilic ligands that interact with both the metal center and a second ligand (a methyl group) in the metal's coordination sphere.

Results and Discussion

In 1997 Schmidbaur and coworkers reported the synthesis and structural characterization of cyclo-[(9-borabicyclo[3.3.1]nonanyl)butano(diphenyl)phosphine] Ph₂P(CH₂)₄BC₈H₁₄ and cyclo-[(9-borabicyclo[3.3.1]nonanyl)butano(diphenyl)phosphine] borabicyclo[3.3.1]nonanyl)**propano**(diphenyl)phosphine] Ph₂P(CH₂)₃BC₈H₁₄, **A** and **B** respectively (Chart 1).11,12 The possibility that these phosphino/boryl compounds possess relatively strong P-B interactions might be expected to greatly reduce their ability to interact with organometallic species. Therefore, the synthesis of related compounds possessing shorter spacer groups was undertaken. Although compounds A and B were both prepared by the rapid and quantitative hydroboration of allyldiphenylphosphine (Ph₂PCH₂CH=CH₂) and butenyldiphenylphosphine (Ph₂PCH₂CH=CH₂) (9-BBN), attempts to with 9-borabicyclononane prepare the ethano-bridged cyclo-[(9borabicyclo[3.3.1]nonanyl)**ethano**(diphenyl)phosphine] derivative Ph₂P(CH₂)₂BC₈H₁₄ (C, Chart 1) by reaction of 9-BBN with diphenylvinylphosphine (Ph₂PCH=CH₂) did not produce the desired product. Instead, the reaction gave mixtures of products thought to contain P-B bonded compounds generated through a boraphosphetane intermediate (with loss of ethylene).¹¹

Chart 1

A simple modification of the published hydroboration conditions, ¹¹ involving aromatic solvents instead of THF, allowed the preparation of β-phosphinoethylboranes with an ethano spacer group separating the Lewis acidic boryl and the Lewis basic phosphino groups. Two equivalents of diphenylvinylphosphine were allowed to react with freshly recrystallized, dimeric dicyclohexylborane $[Cy_2B(\mu-H)]_2$ and 9-BBN, respectively, to produce compounds **1a** and **1b** (eq 1). The [(dicyclohexyl)boryl]ethyl(diphenyl)phosphine (1a) formed in a fast and quantitative reaction (isolated yield: 89%) within less than 1 h at ambient temperature. However, slightly elevated temperatures were required for synthesis of (9-borabicyclo[3.3.1]nonanyl)ethyl(diphenyl)phosphine (1b) (56% isolated yield). Both reactions proceed in nearly quantitative fashion based on NMR-scale reactions; however, the high solubility of the compounds led to lower isolated yields. Phosphine-borane adducts, which are possible intermediates in the reaction, were not observed in reactions using the highly reactive [Cy₂B(μ -H)]₂. However, when using 9-BBN, a broad signal in the ³¹P{¹H} NMR spectrum at 5.4 ppm, observable in a NMR-scale reaction at ambient temperature after 15 min, most likely corresponds to the intermediate [Ph₂(H₂C=CH)P](BBN). The formation of this adduct is consistent with the elevated temperatures required for the reaction to proceed. Note that the related compound $Mes_2PCH_2CH_2B(C_6F_5)_2$ (Mes = 2,4,6- $Me_3C_6H_2$) was recently reported.¹³

1a: $BR_2 = BCy_2$
1b: $BR_2 = [BBN]$

Compounds 1a and 1b were isolated and purified as white solids via crystallization from saturated hexane (1a) or toluene solutions (1b) at -30 °C. They were fully characterized by means of elemental analysis, NMR¹⁴ and IR spectroscopy. Singlets in the ³¹P{¹H} NMR spectra at -8.5 (**1a**) and -11.5 ppm (1b), and broad signals in the borane region of the ¹¹B{¹H} NMR spectra at 83.0 (1a) and 86.4 ppm (1b) are indicative of three-coordinate phosphorus and boron centers with no P-B donoracceptor interactions in solution. However, low-temperature NMR experiments, performed in toluene d_8 at -80 °C, resulted in a distinct broadening of both signals, suggesting the possibility of some interaction between the phosphorous and boron centers. Recrystallization of compound 1b from a toluene/THF mixture (4:1) at -30 °C yielded colorless single crystals suitable for an X-ray crystallographic study. Compound 1b crystallizes in the tetragonal space group I4(1)/a. The molecular structure of 1b does indeed reveal the presence of P-B interactions in the solid-state. However, unlike the C_3 and C_4 bridged phosphinoboranes **A** and **B**, which possess cyclic structures, compound **1b** forms a polymeric framework of infinite helical chains of 1b connected through P···B donor-acceptor interactions. The asymmetric unit is illustrated in Figure 1, and a short section of one of the helices is shown in Figure 2.

Figure 1. Molecular structure of compound **1b** with atomic numbering (ORTEP; 50% probability ellipsoids; hydrogen atoms are omitted for clarity). Selected bond lengths (Å) and angles (deg): P1···B1', 2.056(2); P1-C1, 1.834(2); C1-C2, 1.530(2); C2-B1, 1.640(3); P1-C11, 1.827(2); P1-C17, 1.836(2); B1-C3, 1.634(3); B1-C7, 1.630(3); C1-P1-B1', 120.0(1); C1-P1-C11, 106.7(1); C1-P1-C17, 99.5(1); C11-P1-C17, 106.1(1); P1-C1-C2, 116.5(1); C1-C2-B1, 118.5(2); C2-B1-P1', 103.6(2); C2-B1-C3, 110.2(2); C2-B1-C7, 117.0(2); C3-B1-C7, 105.0(2).

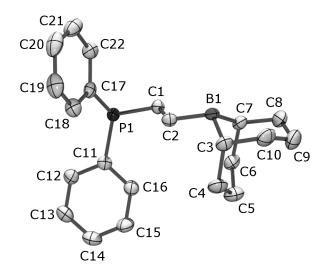

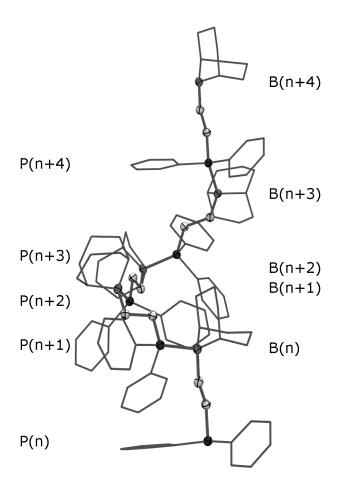

Figure 2. Molecular structure of compound 1b. Short section of one of the P···B connected helices.

Much of the metrical data for compound **1b** is in agreement with that of the corresponding C_3 -(**B**) and C_4 -bridged cyclic derivatives (**A**). The P–C1 and C2–B distances of 1.834(2) and 1.640(3) Å, respectively, show only minor differences compared to values for the previously reported analogues (**A**: 1.824(1), 1.643(2) Å; **B**: 1.828(2), 1.628(4) Å)¹¹ or structurally related phosphine-borane adducts (*e.g.*, [BH₂–CH₂–PPh₂]₂: 1.800(2), 1.645(3) Å¹⁵). The P–B bond length of 2.056(2) Å lies between the corresponding values for **B** (2.029(2) Å) and **A** (2.072(3) Å). The helical arrangement of the infinite phosphine-borane adduct chain results in a quasi- C_4 -symmetry for the $\{PC_2B\}_x$ core, with a P_n ···· P_{n+4} distance of 1.7 nm.

To probe the ambiphilic character of the β -phosphinoethylboranes 1, reactions of these compounds with an organometallic complex were investigated. The nickel dimethyl compound (dmpe)NiMe₂ (dmpe = bis(dimethylphosphino)ethane) was treated with both 1a and 1b in equimolar quantities at ambient temperature. This led to formation of the zwitterionic nickel-methyl complexes 2a and 2b, respectively (eq 2). The ambiphilic nature of the β -phosphinoethylboranes is manifested in their behavior as phosphine donors, and as Lewis acids, in the abstraction of a methyl group from the nickel

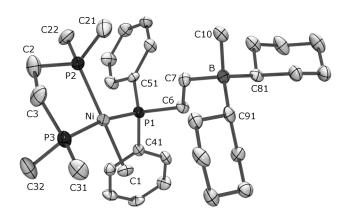

center.

The identities of complexes **2a** and **2b** were established by elemental analysis, and by NMR and IR spectroscopy. The ³¹P{¹H} NMR spectra of both compounds display three doublets of doublets due to the presence of three inequivalent phosphorus atoms coordinated to the nickel center. Another characteristic feature of both compounds is that they display signals for two distinct methyl groups in their ¹H and ¹³C{¹H} NMR spectra. ¹⁴ Specifically, the hydrogen atoms of the abstracted methyl groups, now bound to B, appear as broad resonances at 0.10 (**2a**) and -0.42 ppm (**2b**), due to the quadrupole moment of the boron center. The ¹H NMR shifts for the remaining Ni-CH₃ groups appear as singlets at 0.23 (**2a**) and -0.05 ppm (**2b**), and are shifted upfield with respect to those for the starting complex (dmpe)NiMe₂ (-0.31 ppm). ¹⁶ In addition, sharp signals in the ¹¹B{¹H} spectra, at -14.9 (**2a**) and -16.3 ppm (**2b**), support the proposed alkyl abstraction and the formation of borate groups.

Further confirmation of the assignments of compounds 2a and 2b as zwitterionic compounds was obtained from structural studies. Crystallization of complex 2a from a toluene/THF mixture (1:2)

at -30 °C gave yellow single crystals suitable for an X-ray diffraction structure determination. The solid state structure of complex **2a** and the atom numbering scheme are given in Figure 3. Complex **2a** crystallizes in the triclinic space group $P\bar{1}$ with two molecules in the formula unit. The nickel atom exhibits a distorted square planar geometry (sum of angles about Ni: 360.6°).

Figure 3. Molecular structure of **2a** with atomic numbering (ORTEP; 50% probability ellipsoids; hydrogen atoms are omitted for clarity). Selected bond lengths (Å) and angles (deg): Ni–P1, 2.195(2); Ni–P2, 2.199(1); Ni–P3, 2.17(2); Ni–C1, 1.970(4); P1–C6, 1.827(5); C6–C7, 1.550(6); C7–B, 1.662(7); B–C10, 1.659(7); B–C81, 1.662(7); B–C91, 1.684(7); P1–Ni–P2, 102.32(5); P2–Ni–P3, 86.72(5); P3–Ni–C1, 85.8(2); C1–Ni–P1, 85.7(2); Ni–P1–C6, 107.2(2); P1–C6–C7, 110.8(3); C6–C7–B, 118.9(4); C7–B–C10, 105.2(4).

The ability of the β -phosphinoethylborane ligands to react further with nickel zwitterions 2a and 2b was explored. Addition of a second equivalent of compound 1 to 2a,b did not result in a second methyl group transfer reaction, or displacement of the coordinated phosphine. The signals for both the Ni-CH₃ and B-CH₃ groups remained clearly visible in the NMR spectra of the reactions. Interestingly, addition of the highly Lewis acidic compound $B(C_6F_5)_3$ to 2a resulted in a methyl group transfer from the cyclohexyl borate moiety to the $B(C_6F_5)_3$ molecule (eq 3). The newly formed complex (3) was identified in an NMR scale reaction as the only product after 10 min at ambient temperature. The

¹¹B{¹H} NMR spectra contained two distinct signals at 82.1 (broad) and –14.4 ppm (sharp) which were assigned to the three-coordinate -BCy₂ group (without any type of B···Me interaction) and the four-

coordinate, anionic borate counter-anion $[MeB(C_6F_5)_3]^-$, respectively.

Experimental Section

General Considerations. All operations were performed with rigorous exclusion of air and water, using standard Schlenk and drybox techniques (Vacuum Atmospheres NEXUS; <1 ppm O₂, <1 ppm H₂O). Dry, oxygen-free solvents were employed throughout. Removal of thiophenes from benzene and toluene was accomplished by washing each with H₂SO₄ and saturated NaHCO₃ followed by drying over MgSO₄. Olefin impurities were removed from pentane by treatment with concentrated H₂SO₄, 0.5 N KMnO₄ in 3 M H₂SO₄, saturated NaHCO₃, and then the drying agent MgSO₄. All solvents were distilled from sodium benzophenone ketyl and stored under nitrogen. Benzene-*d*₆ (Cambridge Isotope Laboratories Inc.) was purified by vacuum distillation from Na/K alloy. Dichloromethane-*d*₂ (Cambridge Isotope Laboratories Inc.) was purified by vacuum distillation from CaH₂. All other chemicals were obtained from Aldrich and used without further purification.

All NMR spectra were recorded at room temperature in benzene- d_6 or dichloromethane- d_2 unless otherwise noted, using a Bruker AM-400 spectrometer (FT, 400.1 MHz 1 H; 128.4 MHz 11 B; 100.6 MHz 13 C; 162.0 MHz 31 P), a Bruker AMX-400 spectrometer (FT, 400.1 MHz 1 H; 376.5 MHz 19 F) or a Bruker DRX-500 spectrometer (FT, 500.1 MHz 1 H, 160.5 MHz 11 B; 125.8 MHz 13 C; 202.5 MHz 31 P). Spectra were referenced to the residual nondeuterated solvent for 1 H and 13 C or to external standard samples

(BF₃·OEt₂ for ¹¹B, 85% H₃PO₄ for ³¹P, C₆F₆ for ¹⁹F). Infrared spectra were recorded as Nujol mulls using a Mattson FT-IR spectrometer at a resolution of 4 cm⁻¹. Elemental analyses (CHN) were performed by the microanalytical laboratory at the University of California, Berkeley.

Ph,PCH,CH,BCv, (1a). At ambient temperature a solution of 2.506 g of vinyldiphenylphosphine (11.81 mmol) in 5 mL of toluene was added to a suspension of 2.103 g of dicyclohexylborane (11.81 mmol) in 10 mL of toluene with stirring. A colorless solution formed within one minute. After stirring for 2 h at ambient temperature the solvent was removed in vacuo. The sticky crude product was redissolved in 15 mL of hexanes and crystallized during ca. 14 h at -30 °C to give 1a as a colorless solid (3.922 g, 10.05 mmol, 85%). A second crop of crystals (195 mg, 0.50 mmol, 4.2%) was obtained from the concentrated mother liquid. IR (Nujol, KBr): 1946 w, 1880 w, 1806 w, 1587 w, 1304 s, 1262 m, 1227 m, 1142 m, 1094 m, 1027 m, 976 m, 957 m, 890 w, 841 w, 737 s, 696 s, 505 w cm⁻¹. ¹H NMR (benzene- d_6): δ 7.52 (t, ³ J_{HH} = 7.6 Hz, 4 H, o-Ph), 7.13–7.03 (m, 6 H, m-/p-Ph), 2.12 (m, 2 H, PCH₂), 1.70 (m, 6 H, β -/ δ -Cy), 1.50 (m, 4 H, γ -Cy), 1.45–1.36 (m, 4 H, α -Cy, PCH₂CH₂B), 1.33– 1.15 (m, 6 H, β -/ δ -Cy), 1.07 (m, 4 H, γ -Cy). ¹³C{¹H} NMR (benzene- d_6): δ 140.0 (d, ¹ J_{CP} = 16.1 Hz, *ipso-Ph*), 133.3 (d, ${}^{2}J_{CP}$ = 18.1 Hz, o-Ph), 128.7 (d, ${}^{3}J_{CP}$ = 6.2 Hz, m-Ph), 128.7 (p-Ph), 36.1 (vbr, α -Cy), 27.8 (β-Cy), 27.4 (γ-Cy), 27.3 (δ-Cy), 22.1 (d, ${}^{1}J_{CP} = 14.1 \text{ Hz}$, PCH₂), 20.1 (vbr, Cy₂BCH₂). ${}^{11}B\{{}^{1}H\}$ NMR (benzene- d_6): δ 83.0 ppm. ³¹P{¹H} NMR (benzene- d_6): δ -8.5 ppm. Anal. Calcd. for C₂₆H₃₆BP (390.35 g mol⁻¹): C, 80.00; H, 9.30. Found: C, 80.29; H, 8.91.

Ph₂PCH₂CH₂[BBN] (**1b**). Following the procedure presented above, vinyldiphenylphosphine (1.139 g, 5.37 mmol) and recrystallized 9-BBN (655 mg, 5.37 mmol) were combined with stirring. The mixture was heated to 60 °C and for 3 h at this temperature. Then, the solvent was removed in vacuo. The crude product was washed with hexanes (3 x 5 mL) and dried under vacuum to give **1b** as a white powder in 55.5% yield (996 mg, 2.98 mmol). IR (Nujol, KBr): 1961 w, 1901 w, 1821 w, 1774 w, 1586 w, 1482 s, 1434 s, 1306 w, 1264 m, 1200 w, 1188 m, 1106 s, 1071 m, 1028 m, 999 w, 949 w, 896 m, 837 w, 771 w, 747 s, 699 s, 634 w, 562 w, 523 m, 502 m cm⁻¹. ¹H NMR (benzene-*d*₆): δ 7.50 (m, 4 H,

o-Ph), 7.10 (4 H, *m*-Ph), 7.05 (m, 2 H, *p*-Ph), 2.24 (m, 2 H, PCH₂), 1.84–1.77 (m, 6 H, β-/γ-BBN), 1.70 (m, 2 H, α-BBN), 1.69–1.62 (m, 4 H, β-BBN), 1.55 (m, 2H, CH₂B), 1.18 ppm (m, 2 H, γ-BBN). 13 C{ 1 H} NMR (benzene- d_6): δ 139.9 (d, $^{1}J_{CP}$ = 15.1 Hz, *ipso*-Ph), 133.2 (d, $^{2}J_{CP}$ = 17.6 Hz, *o*-Ph), 128.7 (d, $^{3}J_{CP}$ = 6.3 Hz, *m*-Ph), 128.6 (*p*-Ph), 33.5 (β-BBN), 31.4 (vbr, α-BBN), 23.6 (γ-BBN), 23.5 (vbr, CH₂B), 22.9 ppm (d, $^{1}J_{CP}$ = 11.3 Hz, PCH₂). 11 B{ 1 H} NMR (benzene- d_6): δ 86.4 ppm. 31 P{ 1 H} NMR (benzene- d_6): δ -11.5 ppm. Anal. Calcd. for C₂₂H₂₈BP (334.24 g mol⁻¹): C, 79.06; H, 8.44. Found: C, 79.28; H, 8.56.

(dmpe)NiMe(Ph₂PCH₂CH₂BCy₂Me) (2a). In a drybox, (dmpe)NiMe₂¹⁶ (126.2 mg, 0.53) mmol) was dissolved in 8 mL of a toluene/THF mixture (1:1). A solution of 206.2 mg of Ph₂PCH₂CH₂BCy₂ (0.53 mmol) in 4 ml of toluene was slowly added with stirring at ambient temperature. The mixture was stirred at ambient temperature for 3 h. Then, the solvents were removed in vacuo, the residue was washed with toluene (1 x 3 mL) and hexanes (3 x 3 mL), and dried under vacuum to give 264.7 mg (0.42 mmol, 79 %) of analytically pure 5a as a light yellow powder. Crystallization from toluene/THF mixtures (1:2) at -30°C gave single crystals suitable for an X-ray structure determination. IR (nujol, KBr): 1586 w, 1463 s, 1328 w, 1301 m, 1285 m, 1260 m, 1240 s, 1227 m, 1197 m, 1175 m, 1161 m, 1147 w, 1118 m, 1100 s, 1070 m, 1022 m, 987 m, 876 m, 852 w, 829 m, 797 m, 737 s, 698 s, 655 m, 522 m, 512 m cm⁻¹. ¹H NMR (400.1 MHz, dichloromethane- d_2): δ 7.59 $(m, 4 H, o-Ph), 7.36 (m, 6 H, m-Ph, p-Ph), 2.43 (m, 2 H, PCH₂CH₂B), 1.75–1.40 (br m, 18 H, Cy^{<math>\beta$}, Cy^{$\gamma$}, Cy^{δ} , PCH₂CH₂B, PMe₂), 1.25–0.80 (br m, 18 H, Cy^{α} , Cy^{β} , Cy^{γ} , Cy^{δ} , PMe₂), 0.60 (br, 2 H, PCH₂CH₂P), 0.11 (br, 2 H, PCH₂CH₂P), -0.07 (s, 3 H, NiMe), -0.75 ppm (br s, 3 H, BMe). ¹H NMR (400.1 MHz, benzene- d_6): δ 7.58 (m, 4 H, o-Ph), 7.01 (m, 4 H, m-Ph), 6.95 (m, 2 H, p-Ph), 2.90 (m, 2 H, PC H_2 CH₂B-), 2.50–2.15 (m, 10 H, Cy^{β} , Cy^{γ} , Cy^{δ}), 1.90–1.65 (m, 10 H, Cy^{β} , Cy^{γ} , Cy^{δ}), 1.08 (m, 2 H, PCH_2CH_2B), $0.99 \text{ (m, 2 H, Cy}^{\alpha}), 0.91 \text{ (m, 10 H, PC}_{2}CH_{2}P, PMe_{2}), 0.56 \text{ (m, 6 H, PMe}_{2}), 0.23 \text{ (s, 3 H, NiMe)}, 0.10$ (br s, 3 H, BMe). ${}^{13}\text{C}\{{}^{1}\text{H}\}$ NMR (100.6 MHz, dichloromethane- d_2): δ 137.0 (br, *ipso*-Ph), 132.9 (d, ${}^{2}J_{CP}$ = 8.8 Hz, o-Ph), 130.1 (p-Ph), 128.9 (d, ${}^{3}J_{CP}$ = 5.9 Hz, m-Ph), 36.8 (m, PCH₂CH₂P), 32.8 (Cy^{β}), 32.7

Anal. Calcd for $C_{34}H_{58}BNiP_3$ (629.25 g mol $^{-1}$): C, 64.90; H, 9.29. Found: C, 64.94; H, 9.52.

(dmpe)NiMe(Ph₂PCH₂CH₂[BBN]Me) (2b). In a drybox, (dmpe)NiMe₂ (130.8 mg, 0.55 mmol) was dissolved in 15 mL of a toluene/THF mixture (3:1) and the resulting solution was stirred at ambient temperature. Solid Ph₂PCH₂CH₂BBN (183.0 mg, 0.55 mmol) was slowly added and the brownish mixture was stirred for 3 h. The yellow precipitate was separated, washed with toluene (1 x 3 mL) and hexanes (4 x 3 mL), and dried under vacuum to give 129.6 mg (0.23 mmol, 41 %) of analytically pure 5b as a yellow powder. IR (Nujol, KBr): 1428 m, 1280 w, 1259 m, 1176 w, 1144 w, 1101 w, 1060 w, 1010 w, 941 s, 901 m, 841 w, 817 w, 796 w, 741 m, 655 w, 521 m, 487 m cm⁻¹. ¹H NMR (400.1 MHz, dichloromethane- d_2): δ 7.60 (m, 4 H, o-Ph), 7.36 (m, 6 H, m-Ph, p-Ph), 2.4 (m, 2 H, PCH₂CH₂B), 2.07–1.85 (br m, 4 H, BBN^{β}), 1.85–1.60 (br m, 6 H, BBN^{γ}, BBN^{α}, PCH₂CH₂B), 1.52 (d, ${}^{2}J_{HP}$ = 9.2 Hz, 6 H, PMe₂), 1.47 (m, 6 H, BBN ${}^{\beta}$, BBN ${}^{\gamma}$), 0.93 (d, ${}^{2}J_{HP}$ = 8.0 Hz, 6 H, PMe₂), 0.77 (br, 2 H, PCH₂CH₂P), 0.17 (br, 2 H, PCH₂CH₂P), -0.05 (br d, 3 H, NiMe), -0.42 ppm (br, 3 H, MeBBN). ¹³C{¹H} NMR (100.6 MHz, dichloromethane- d_2): δ 137.1 (d, ${}^{1}J_{CP}$ = 34.2 Hz, ipso-Ph), 132.9 (d, ${}^{2}J_{CP}$ = 9.1 Hz, o-Ph), 130.1 (p-Ph), 128.9 (d, ${}^{3}J_{CP}$ = 8.0 Hz, m-Ph), 34.0 (BBN ${}^{\beta}$), 33.8 (BBN ${}^{\beta}$), 29.5 (m, PCH₂CH₂P), 28.8 (br m, PCH₂CH₂B), 28.0 (m, PCH₂CH₂P), 27.8 (BBN ${}^{\gamma}$), 27.4 (BBN ${}^{\gamma}$), 26.7 (vbr, BBN ${}^{\alpha}$), 23.2 (d, ${}^{1}J_{CP}$ = 18.1

Hz, PCH₂CH₂B), 12.3 (d, ${}^{1}J_{CP} = 21.1 \text{ Hz}$, PMe₂), 11.9 (d, ${}^{1}J_{CP} = 28.2 \text{ Hz}$, PMe₂), 9.8 (br m, MeBBN), 1.0 ppm (br m, NiMe). ${}^{11}B\{{}^{1}H\}$ NMR (128.4 MHz, dichloromethane- d_2): δ –17.3 ppm. ${}^{11}B\{{}^{1}H\}$ NMR (128.4 MHz, benzene- d_6): δ –16.3 ppm. ${}^{31}P\{{}^{1}H\}$ NMR (162.0 MHz, dichloromethane- d_2): δ 40.4 (br d, ${}^{2}J_{PP} = 244 \text{ Hz}$, trans- P^{dmpe}), 30.3 (br d, ${}^{2}J_{PP} = 244 \text{ Hz}$, PPh₂), 28.8 ppm (br, cis- P^{dmpe}). ${}^{31}P\{{}^{1}H\}$ NMR (162.0 MHz, benzene- d_6): δ 38.5 (dd, ${}^{2}J_{PP} = 256 \text{ Hz}$, ${}^{2}J_{PP} = 16.2 \text{ Hz}$, trans- P^{dmpe}), 31.3 (br d, ${}^{2}J_{PP} = 256 \text{ Hz}$, PPh₂), 27.8 ppm (dd, ${}^{2}J_{PP} = 34.0 \text{ Hz}$, ${}^{2}J_{PP} = 16.2 \text{ Hz}$, cis- P^{dmpe}). Anal. Calcd for C₃₀H₅₀BNiP₃ (573.14 g mol⁻¹): C, 62.87; H, 8.79. Found: C, 63.02; H, 8.90.

NMR-scale reaction of (dmpe)NiMe(Ph₂PCH₂CH₂BCy₂Me) with B(C₆F₅)₃. (3). In a drybox, a solution of 12.6 mg of **5a** (20 μmol) in 0.5 mL of benzene- d_6 was added to 10.2 mg of B(C₆F₅)₃ (20 μmol). A few drops of THF were added to completely dissolve the brownish mixture, which was then transferred into a 5-mm Wilmad NMR tube equipped with a J. Young Teflon valve seal. Proton, boron, fluorine, and phosphorus NMR spectroscopy confirmed the clean formation of one new product. ¹H NMR (benzene- d_6): δ 7.31 (m, 4 H, o-Ph), 7.10 (m, 6 H, m-Ph, p-Ph), 2.28 (m, 2 H, PC H_2 CH₂B), 1.74 (m, 4 H, Cy), 1.50–0.90 (br m, 10 H, Cy, PC H_2 CH₂B, PC H_2 CH₂P), 0.83 (d, $^2J_{HP}$ = 9.6 Hz, 6 H, PMe₂), 0.34 (d, $^2J_{HP}$ = 8.4 Hz, 6 H, PMe₂), -0.04 (m, 3 H, NiMe). ¹¹B{¹H} NMR (benzene- d_6): δ 82.1 (vbr, BCy₂), -14.4 ppm (MeB(C₆F₅)₃). ¹⁹F{¹H} NMR (376.5 MHz, benzene- d_6): δ -130.8 (d), -163.4 (t), -165.8 ppm (t). ³¹P{¹H} NMR (benzene- d_6): δ 41.0 (dd, $^2J_{PP}$ = 257.5 Hz, $^2J_{PP}$ = 17.8 Hz, *trans*-P^{dmpe}), 29.3 (dd, $^2J_{PP}$ = 257.5 Hz, $^2J_{PP}$ = 30.8 Hz, PPh₂), 27.7 ppm (dd, $^2J_{PP}$ = 29.3 Hz, $^2J_{PP}$ = 17.8 Hz, *cis*-P^{dmpe}).

Synopsis TOC

The β -phosphinoethylboranes $Ph_2PCH_2CH_2BR_2$ ($BR_2 = BCy_2$, BBN) were synthesized. The ability of these compounds to act as ambiphilic ligands was demonstrated by their reactions with (dmpe)NiMe₂.
