A healthy 46-year-old female presented to the emergency department (ED) with the complaint of a foreign body sensation in her throat. Patient stated that she was eating a hamburger and chips for lunch when she acutely felt “a piece of a potato chip” lodge in her throat. Although she complained of difficulty swallowing, she was able to tolerate oral intake. She denied any shortness of breath or chest pain. On exam, the patient’s vital signs were stable and she was well-appearing, in no distress. Soft tissue neck radiograph revealed a needle-shaped metallic foreign body. This raised a very concerning question of how the needle got there and whether it had been intentionally placed in the food by the patient or another party intending harm.

A bedside fiberoptic laryngoscopy performed by the on-call ENT surgeon showed an embedded 3.3 cm metallic foreign body in the back of her neck, occurred six months prior to her presentation to the ED. She did not recall whether one of the needles had broken, but after the procedure she continued to have pain in the neck. For six months until the ED diagnosis, she blamed the car accident for her chronic neck pain.

In general, acupuncture is considered safe. The most common reactions are bleeding, needle pain and skin infections, and vagally mediated systemic symptoms, such as nausea, vomiting and syncope. In the literature, a few case
reports have described more serious complications associated with this practice of medicine, such as pneumothorax, cardiac tamponade and spinal cord injury. Although these are significant adverse problems, it should be noted that these complications are rare. For example, pneumothorax occurred only twice in almost 250,000 treatments.

This case describes another rare, potentially hazardous complication associated with acupuncture, in which a broken part of the acupuncture needle was inadvertently left in the patient’s skin and migrated through into her hypopharynx. If the needle had not been identified, it could have led to further complications, such as esophageal laceration, esophageal perforation, vascular injuries, mediastinitis or pulmonary aspiration. This case represents a rare complication with acupuncture therapy.
