PROGRAM - PROJECT - JOB				
TITLE Time Projection Chamber (TPC) Solenoid Fault Location, Magnetic Studies				

INTRODUCTION

On September 30, 1980, Phillip Eberhard requested the assistance of Magnetic Measurements Engineering in locating faults in the Time Projection Chamber (TPC) solenoid with the aid of sensitive, magnetic-field detecting probes. This note reports on magnetic field maps that aided in localizing solenoid shorts and discontinuities. In addition, ten washers used in mounting the LN₂ transfer tube were found to be highly magnetic.

TPC SOLENOID AND FAULT DESCRIPTIONS

Figure 1A is a schematic representation of the TPC solenoid. The solenoid consists of three concentric coils. The inner coil is ultrapure aluminum (UPA) and the outer two coils are superconducting (SC) coils connected electrically in series (point C).

Suspected faults were: 1) a low resistance short to ground from the UPA coil, 2) a low resistance short between the inner SC coil and the UPA coil, and 3) a high resistance area in the inner SC coil.

SELECTION OF MEASUREMENTS SYSTEM

The preliminary test plan was to energize (at low current values) various combinations of the three coils and to measure resultant magnetic fields with a hand held probe. We found this procedure time consuming, and mechanical instabilities introduced significant scatter in the data.

LAWRENCE BERKELEY LABORATORY - UNIVERSITY OF CALIFORNIA ENGINEERING NOTE		CODE MME Book No. 631	SERIAL MT-293 TPC-LBL-81-3	PAGE 2 OF 54

Magnetic Measurements Engineering (MME) recently implemented a "Data Logger" system, utilizing a Tektronix 4051 mini-computer as the controller. This system monitors, records and plots magnetic-field measurements in real time. Very slight program changes allowed the MME Data Logger to be used for the TPC Fault Search Program. A simple mechanical aid was devised to position and to locate the Hall probe.

INSTRUMENTATION

Figure 1B is a schematic diagram of the instrumentation used and Table 1 lists the specific equipment. Figure 2 describes the frame of reference and the means of positioning the Hall probe.

RESULTS

Table 2 is an index of the data runs made. This report tabulates only the data saved on tape files. These tape files are available for further data analysis and plotting.

Shorted turns between adjacent windings of the UPA coil are evident in Figures 4A and 4B in the vicinity of $x = 9$ cm. Variations of UPA coil winding density are noticeable in Figures 4A, 4C and 4D at x-positions of 150, 170 and 318 cm.

A short to ground from the UPA coil in the vicinity of $x = 8$ cm is evident in the data plots of Figures 7 and 8.

The data of Figure 14 indicates a short to ground from the SC coil in the vicinity of $x = 10$ cm.

DISCUSSION

Short term fluctuations/drift (\pm tens of milligausses) were observed during the measurements. Replacing the Gaussmeter (on October 6, 1980 at 18:00 hours) did not significantly reduce the fluctuations/drift. Because the observed variations were slow compared to the time required for collecting data and because these drifts did not interfere with the information we were gathering, it was decided to continue with data acquisition rather than study and attempt to correct the drift problem.

In hindsight, the most probable cause of the drifts is the zero temperature stability of the Hall probe devices which is specified at under ± 90 mG/ $^{\circ}$ C.

As the probe was held and positioned by hand, probe temperature variations through finger contact could easily have been several degrees Celsius.

In each data run, there are noticeable drifts between adjacent data pairs every 30 or so data pairs. This drift is the result of time lapses which occurred while the computer display was being refreshed. In some cases, data runs were repeated to ensure that this drift was not a real phenomena.

The data scatter seen in Figure 10 was the result of an inexperienced Hall probe positioner with hot variable fingers.

RECOMMENDATIONS (MIG)

If further studies of this type would be useful, I would suggest that we use our LSI-11/CAMAC/GPIB Data Acquisition System to automatically position the Hall probe by means of a stepping motor. I also would recommend that a temperature regulated Hall probe be used if very low magnetic fields are to be mapped in the future.

ACKNOWLEDGEMENTS

G. Gibson and R. Smits were extremely helpful in setting up the equipment.
 Most of the very tedious and accurate Hall probe positioning was accomplished by
 G. Gibson.
