FOREWORD

This bulletin includes records of the pounds of fish landed in the different areas of the State and their value to the fishermen. It is prepared to meet the numerous requests for such data received throughout the year from members of the fishing industry, harbor commissions, scientists, and persons in other related fields for use in their studies and reports.

This is the sixteenth in the series of fish bulletins dealing with fish catch. The first, published in 1929, contained records of the State's commercial fish catch for 1926 and 1927. Data for subsequent years have been published annually or biennially. Due to the growth of and interest in the marine sport catch and the live bait fishery, additional tables on sport and live bait catches were included with the 1950 figures and these have appeared in succeeding bulletins. In 1947 all available records of commercial catch for the years 1916–1947 were summarized. Although this bulletin carries the title "Marine Fish Catch," small poundages of fresh water commercial landings are also included.

Through the continued cooperation of the Wildlife Protection Branch the accuracy and completeness of the records is insured.

October, 1955

1. JACK MACKEREL AND SARDINE YIELD PER AREA FROM CALI-FORNIA WATERS, 1946–47 THROUGH 1954–55

By CHARLES R. CLOTHIER and EDWARD C. GREENHOOD Marine Fisheries Branch

California Department of Fish and Game

The charts and figures accompanying this article show the fishing grounds for both the sardine, Sardinops caerulea, and the jack mackerel, Trachurus symmetricus. Each species and its area of catch is discussed separately. To designate the locality where fish are caught, the Department of Fish and Game has divided California coastal waters into block areas of 10 minutes of latitude and 10 minutes of longitude. These blocks designate place of catch and facilitate study of fish concentrations. For this study we have used the record of catch by block as given on the fish receipts.

Fish receipts, often referred to as pink tickets, are filled out by the dealer at the time of purchase of fish from the fisherman. These pink tickets list the variety of fish, the pounds landed and the block area of catch, as well as other information. The dealer may, at times, omit the area of catch; however, for jack mackerel and sardines we have two other checks. Sardine checkers employed by the department complete a form known as the sardine checker's ticket. The checker is present during the unloading of sardines and jack mackerel during sardine season. He makes note of the species, total pounds landed, block area of catch, proportion of various kinds of fish in a load when the species are mixed and other information pertaining to the vessel. In addition, a biologist requests block origin information while interviewing the fisherman when taking routine samples of his catch. With these checks, the specific locality remains unknown for only a small portion of the catch.

Figures 4 and 5 show the locality of catch for each species combined into three-season groupings. The block numbers are shown on Figures 4 and 5 and the blocks comprising each general area are indicated with heavy lines. Tables 1 and 2 show catch localities arranged by large general areas (Pinkas, 1951). These tables indicate the seasonal tonnage and the percent of catch taken from each area.

1.1. JACK MACKEREL

In the years before 1947, the small landings of jack mackerel were sold chiefly to the fresh fish markets. A few fish were delivered to the canneries when they were mixed with schools of sardines and Pacific mackerel, but only desultory attempts were made to can these fish because there was little or no market for such a product.

In the years 1946 to 1948, a campaign was conducted by the industry (Roedel, 1949) to develop a market for canned jack mackerel and landings

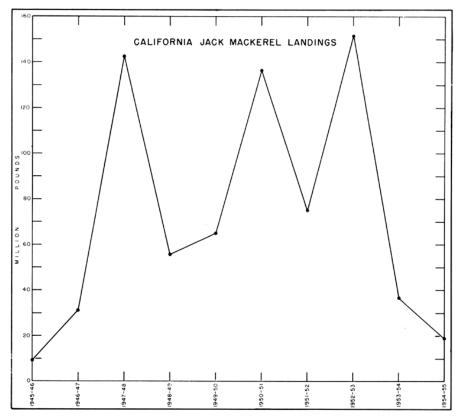

FIGURE 2. California jack mackerel landings by season, 1945-46 through 1954-55. FIGURE 2. California jack mackerel landings by season, 1945-46 through 1954-55

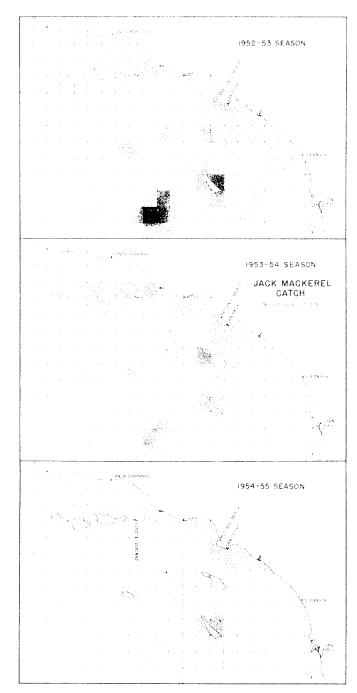

increased rapidly (Fig. 2). This increase was materially influenced by the failure of the sardine and Pacific mackerel fisheries and the resulting need of the processors for a substitute canning fish. The jack mackerel landings reached a peak in 1952–53 as a result of the sardine failure, but showed a sharp decline in 1953–54 due to scarcity of fish on the fishing grounds. This decline continued in 1954–55 because of unfavorable economic conditions.

Jack mackerel are present in the waters off California throughout the entire year, but since the fishery is carried on simultaneously with the sardine and Pacific mackerel fishery, and these species are taken chiefly during the fall and winter months, the jack mackerel landings decline to a minimum in the spring and early summer. As a result, the season for the jack mackerel is here considered the same as that for the Pacific mackerel, May 1st to the following April 30th. For this reason the charts and tables are presented on a seasonal rather than a calendar year basis.

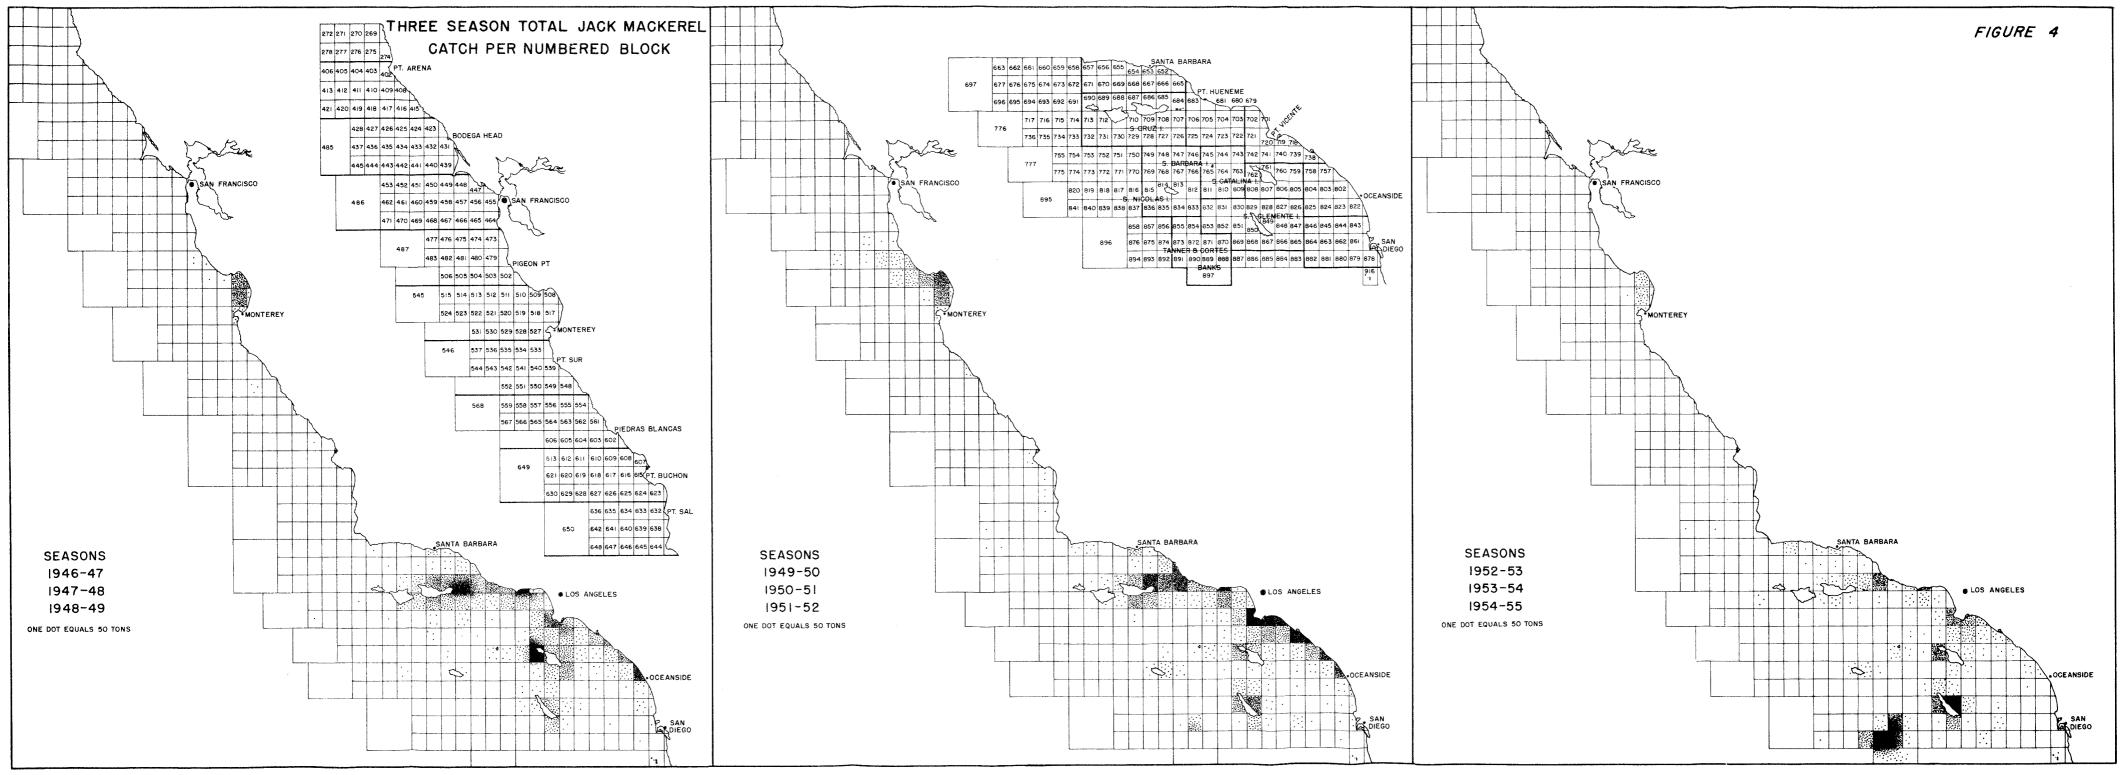

Fig. 4 shows the locality of catches for the past nine years. Preliminary examination of the season by season data showed that the catches fell naturally into three-season groupings except for the last three. In this latter interval the concentration of the fishery on Tanner and Cortez Banks occurred chiefly in 1952–53.

TABLE 1 Jack Mackerel Catch by General Fishing Areas

Pigung, 3, Three-season Southern California jack mackerel catch

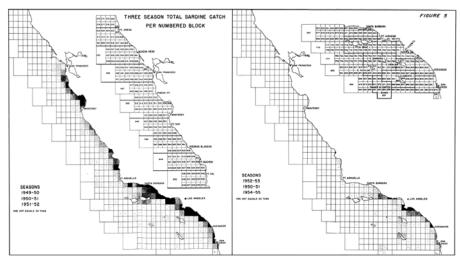

FIGURE 5

During each of the nine seasons, a small fishery was carried on in Monterey Bay but the Southern California fishing ground yielded over 75 percent of the tonnage. From 1946–67 to 1948–49, the catches were centered around Anacapa and Santa Catalina Islands. In the next three seasons, 1949–50 to 1951–52, the fishery tended to concentrate around the Palos Verdes Peninsula between Redondo Beach and San Pedro and. in general, closer to shore. In the last three seasons, 1952–53 to 1954–55, the fishery again tended to be farther offshore with a majority of catches made on Tanner and Cortez Banks, especially in 1952–53 (Fig. 3). In 1953–54 a fair proportion of the catch was still made on the offshore banks but, the grounds around the islands of San Clemente, Santa Catalina, Anacapa and the mainland adjacent to Pt. Hueneme each produced about the same amount of fish as Tanner and Cortez Banks. During the 1954–55 season almost no fish were taken on the offshore banks and the fishery concentrated around San Clemente Island.

A better understanding of the relative tonnages taken from each of the general areas can be obtained from Table 1. Monterey catches have fluctuated from a low of 88 tons in 1952–53 to a high of 13,430 in 1950–51. In Southern California, the five areas, Pt. Hueneme, Pt. Vicente, Oceanside and the islands of Santa Cruz and Santa Catalina supplied the main bulk of the catch up to the 1952–53 season. In that season the offshore banks of Tanner and Cortez supplied two-thirds of the catch with San Clemente a poor second, 16.5 percent. In the 1953–54 season the three areas, Tanner and Cortez Banks, Santa Catalina Island and Pt. Hueneme, each contributed slightly over 19 percent of the catch. In 1954–55, San Clemente Island waters yielded almost half of the catch (41 percent) and Pt. Vicente, 22 percent.

The fisheries for sardines, Pacific mackerel and jack mackerel are closely allied and an analysis of one species is difficult without considering factors affecting the other two. During the sardine season the boats are fishing primarily for sardines, but they may take mackerel also. Consequently, during the sardine season the jack mackerel catches tend to reflect the search for, and catching of, sardines. This was especially true until the nearly total failure of the sardine fishery in 1952–53 and 1953–54. Because there were almost no sardine schools on the Southern California grounds in these two seasons, the fishing localities for jack mackerel more directly reflect the distribution of the mackerel throughout Southern California waters. The two seasons were marked by heavy catches on the offshore banks which suggests that the center of abundance of these fish tends to be well offshore. These fishing grounds are too far from port for the boats to make a round trip every 24 hours and they have been fished only when the yield from the nearer grounds was inadequate.

In 1954–55 sardines were more abundant off Southern California and the major part of the sardine catch was taken along the mainland. The jack mackerel catches, on the other hand, were made farther offshore and centered around San Clemente Island. Because sufficient sardines and jack mackerel were available in the nearer waters to more than supply the cannery needs, the data yield no information about the presence or absence of mackerel on Tanner and Cortez Banks in this season.

1.2. SARDINE

The sardine fishery has long been a part of California's economy and for many years was considered an inexhaustible resource which yielded great income to fishermen, canners and allied industries. Because of the magnitude of this fishery, details of locality of catch have been published in previous years (Clark, 1937a and 1937b; Pinkas, 1951). Catch localities for the last six sardine seasons are shown in the accompanying charts and figures.

The season for processing sardines opens north of Point Arguello on August 1st and closes January 15th. South of this point the season opens October 1st and closes February 1st. Catches made prior to or after the season, for purposes other than processing, are excluded from the catch locality figures but not from the seasonal trend (Fig. 6).

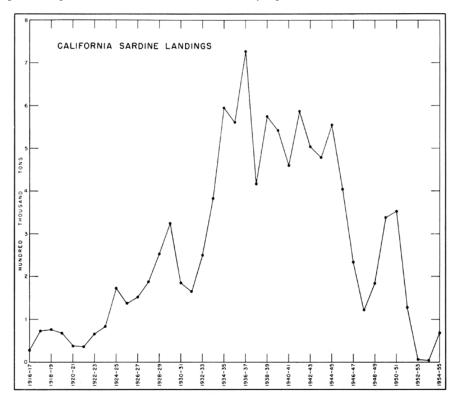

FIGURE 6. California sardine landings by season, 1916-17 through 1954-55. Includes deliveries to reduction ships 1930-38.

FIGURE 6. California sardine landings by season, 1916–17 through 1954–55. Includes deliveries to reduction ships 1930–38

During the three seasons, 1949–50 through 1951–52, the locality of catch did not differ greatly and these three seasons have been combined in Figure 5. In this time interval, north of Point Arguello areas of greatest catch were around Pigeon Point, Monterey Bay and Point Sal. South of Point Arguello the greatest catches were taken off the mainland near Santa Barbara, Hueneme and south to Point Dume, and from Point Vicente to Oceanside. An area of minor concentration occurred north of San Diego and considerable poundages were taken off Santa

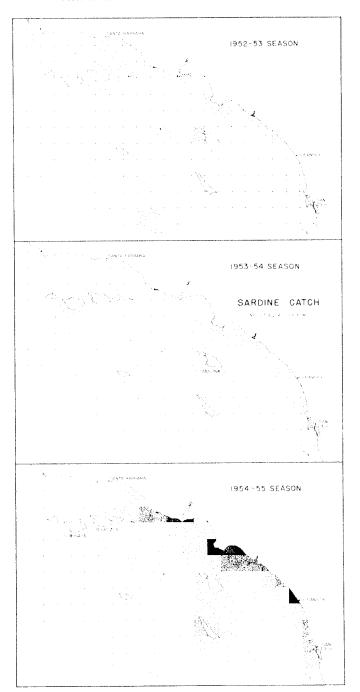

Figure 7. Three-season Southern California sardine catch.

Rosa Island. The remaining catches were scattered from north of San Francisco to the Mexican border, with the biggest portion of the take for these years coming from Southern California waters.

Between 1952–53 and 1954–55, the locality of fishing showed marked changes. There were practically no fish taken north of Point Buchon and the fishery was concentrated south and east of Hueneme. This was quite different from previous periods as some sardines had always been taken off Central California and in some years the latter fishing grounds supplied the major portion of the catch. Not only was the fishery concentrated in Southern California waters in the last three seasons, but, in addition, the landings declined seriously and the total take was less than any one season's catch since the early 1920's. The areas of greatest concentration were Point Vicente and Oceanside with a scattering of catches off Hueneme and Point Dume. Tanner and Cortez Banks yielded some fish and a few vessels caught sardines south of the International boundary.

In order to better understand the changes occurring in the last three seasons, catch localities for each season are shown in Figure 7. The most outstanding features are the small tonnages (less than 8,000) landed in 1952–53 and 1953–54 and the catches on Tanner and Cortez Banks in 1952–53. In this season these offshore banks yielded 23 percent of the landings. This was closely associated with the jack mackerel fishery during this time interval and the tonnage of sardines taken on these banks was insignificant in comparison with the jack mackerel landings. This offshore fishery does not indicate a great abundance of sardines well offshore and presumably the boats would not have fished the area had not jack mackerel been available and accepted by the canners. of the remainder of the 1952–53 catch, approximately 18 percent came from the Santa Cruz Island area and an equal percentage was taken off Point Vicente. The waters around Santa Catalina Island yielded slightly over 10 percent (See Table 2).

The very small landings in 1953–54 came chiefly from coastal waters with 41 percent off Point Vicente, 25 percent off Oceanside and 16 percent off Hueneme.

TABLE 2 Sardine Catch by General Fishing Areas

Landings increased in 1954–55 to over 63,000 tons and it is estimated by many that the catch could have been twice as great had it not been for unfavorable economic conditions. The bulk of the catch was taken off the mainland with 48 percent from the waters off Point Vicente. Hueneme and Oceanside areas yielded 17 and 14 percent respectively. It is the consensus of the research agencies investigating the sardine that the increased landings during this season were due to a northward movement of sardines from central Baja California, Mexico. (Progress Report, California Cooperative Oceanic Fisheries Investigations, July 1, 1953–March 31, 1955, in press.)

The abrupt decline in sardines caught off Monterey and Central California is more clearly indicated by Table 2. Based on percentages in this table, the southern areas take on a false aura of importance. If the total seasonal catch is considered in conjunction with percentage figures, a clearer picture is obtained. The remnant sardine fishery in 1955 was off Southern California and no new fishing grounds were developed in this area except for sporadic catches off Tanner and Cortez Banks.

Octopus Paroctopus apollyon

Oyster

Eastern Crassostrea virginica
Native Ostrea lurida
Pacific Crassostrea gigas
Snail, sea Various species
Squid Loligo opalescens

3. EXPLANATION OF TABLES

Tables published in this bulletin supply the complete available records of all fish, mollusks and crustaceans landed in California by commercial fishing vessels or shipped into California for processing. Fishing boats registering and delivering their catch in California may have their home ports in California, Oregon, Washington or Alaska; no distinction or separation is made in the catch records.

The term "shipment" as used in the tables indicates that the fish were brought into California by common carrier and that they were not caught by our registered fishing fleet. Shipment figures are complete for fish that are processed. Statistics on shipments of fish destined for sale, either fresh or frozen, or for transshipment are not included because our records are incomplete.

On our source documents (fish receipts) the condition or extent of cleaning is not always shown, and for the various species of fish, this cannot be ascertained. We, therefore, use the weight as given by the dealer with the exception of catfish for 1953. This species is usually delivered cleaned, and as the cleaning loss is 50 percent, the total poundage on the fish receipt is doubled.

Mollusks and crustaceans are often purchased by number or container size rather than by weight. It is desirable to show all catch figures in round weight. Hence appropriate average conversion factors have been developed as follows:

Crab, market 2 lbs. each
Abalone, red 50 lbs. per doz.
Abalone, pink 35 lbs. per doz.
Abalone, southern green 35 lbs. per doz.

Clams, Mexican Pismo 8 lbs. round weight per 1 lb. cleaned weight

Clams, Washington 7 lbs. per dozen.

Oyster, eastern 30 lbs. per hundred

Oyster, Pacific 50 lbs. per hundred or 8 lbs. per gallon, cleaned

Clams shipped from Japan are published in these tables as cleaned weights since no conversion factor is available. The value of the species of fish is based on the value to the fishermen at the time of delivery. When the price per pound is not indicated on the fish receipt, an average price is calculated for each region and applied to the unpriced fish. The regions and counties contained therein are shown in Figure 1.

Occasionally small poundages of fish are sold in counties away from the coastal regions. In these instances credit is given to the nearest port and region. Halibut delivered in the San Francisco region is not always separated by species. Hence the total landed in that region is published as 90 percent Pacific halibut and 10 percent California halibut.

Due to changes in Fish and Game laws, it was necessary to modify the tables within this report. In the latter part of September, 1953, it became illegal to sell catfish other than those imported or raised domestically. As a result catfish appear in the 1953 tables but not in 1954. Rock bass caught in California waters were removed from sale in 1953 and all poundages of these fish in the latter part of 1953 and in 1954 came from south of the border. Sale of surf perch caught south of Point Arguello was also prohibited in 1953. In 1954, California sargo, half-moon, opaleye and blacksmith, formerly combined with and shown as perch, are shown as distinct species. Since these fish are not members of the surf perch family (Embiotocidae), their sale is legal. In the past these species were frequently called perch. Now, through the cooperation of the fish dealers, they are distinguished as separate species.

The trend in total landings is shown in Table 3 and Figure 8 for the years 1916–1954. The pounds and value for 1953 and 1954 are compared in Tables 4 and 5 and Figures 9 and 10. The number of licensed fishermen and boats registered yearly are given in Tables 6 through 10. The term "yearly" is used as it distinguishes license year April 1 through March 31 from calendar year as used in the remaining tables.

Detailed poundages by species and regions for 1953 are included in Tables 11–20, and for 1954 in Tables 29–38. Similarly, value figures for 1953 are given in Tables 21–28 and for 1954 in Tables 39–46. The catch of the most important fish taken by party boat sportfishermen is given by numbers in Table 47 for the years 1947–1954. The live bait catch for 1950 through 1954 is included in Table 48.
