Cover: Beach on Kayangel atoll, north of the main Belau archipelago, and partulid land snails endemic to the Belau. Most partulids live in trees and are endemic to a single island or archipelago. In this issue, Osborne, Lomolino, and Rundell show that relationships between habitat use and degree of endemism in Pacific Island land snails conform to the taxon cycle and that, while widespread land snails primarily disperse between archipelago by aerial means, single-archipelago endemic species may disperse between nearby islands within an archipelago via rafting on vegetation.
