INDEX TO
NUCLEAR CHEMISTRY DIVISION ANNUAL REPORT, 1968

Lawrence Radiation Laboratory

Berkeley, California

March 1969

The attached pages are a permuted index of the key words and numbers contained in the titles of the papers in the Nuclear Chemistry Division Annual Report, 1968 (UCRL-18667); author's surnames are also indexed.

The index was prepared by an IBM-1401 computer by means of the KWPT program (Key Words Plus Title). The program takes the title and author of each paper, rejects the "forbidden" (insignificant) words, and indexes those remaining--the key words, authors' surnames, and numbers. As you can see in the attached lists, the indexed terms are alphabetized, then displayed in the left column; the middle column shows the complete title and author listings, and the right column the page numbers. A given title is indexed once for each significant word and surname; thus a title that contains three key words and was written by two authors is indexed five times. Following the word index is the number index, in which numbers are treated as key words.

To make this permuted index as useful as possible, the titles were edited to be suitable for handling by the computer.

We in the Technical Information Division invite your comments concerning this permuted index. We would particularly like to know ways in which the index fails to meet your needs, or if some of the words (which ones?) now treated as significant could be added to the forbidden word list (not indexed) without a loss in the index's usefulness. We also would like to know if you have used the number part of the index. Please address your comments to Gloria Smith or Charlotte Mauk.

This work was done under auspices of the U. S. Atomic Energy Commission.
