Dear Editor,

In the battle between CRISPR-Cas prokaryotic immune systems and the elements that they target, a diverse array of “anti-CRISPR” proteins have evolved. These proteins appear to have arisen independently multiple times in evolution and function through diverse mechanisms to inhibit CRISPR-Cas immunity. For comprehensive reviews on anti-CRISPRs, we direct readers to recent publications.1,2

Due to the increasing interest in anti-CRISPRs, many new families of these proteins have been discovered in the past year or so. There are now 36 distinct families of anti-CRISPRs described in the literature that block seven subtypes of CRISPR-Cas systems.3-12 In 2015, a naming system for anti-CRISPR genes and proteins was introduced.6,13 To date, this system has been followed in all subsequent publications describing newly discovered anti-CRISPRs. However, as the rate of anti-CRISPR discovery will likely accelerate in the coming years, we feel that it would be advantageous to establish a database for the registration and tracking of anti-CRISPR names.

The primary goal of this database will be to prevent redundant names being used in publications, thus avoiding confusion in the literature. Anti-CRISPR proteins are named according to the subtype they inhibit and the order in which they were discovered – for example, AcrIF1 was the first anti-CRISPR protein identified to inhibit the type I-F system. The database (a Google document) can be found here:

https://tinyurl.com/anti-CRISPR

We propose that this document be updated when researchers have had a manuscript accepted for publication (or posted as a pre-print) in which new anti-CRISPRs are described. We suggest that the authors upload relevant data to the spreadsheet, including the name, CRISPR-Cas subtype inhibited, reference, and amino-acid sequence of the anti-CRISPR (Fig. 1). This spreadsheet may also be utilized by those
preparing a manuscript for submission to ensure that they use anti-CRISPR names that are still available.

<table>

Figure 1: A screenshot from the database, depicting the organization of anti-CRISPR entries.

To avoid the listing of many orthologues, we propose that the database only contain one entry per Acr, which will be considered the “type” Acr for that sequence family. In a case where a paper has investigated proteins that are homologous to an Acr protein, authors should utilize a subscript (e.g. AcrIF6\textsubscript{Pae}) to denote the species in which the anti-CRISPR is found. When multiple proteins from one species are investigated, we suggest a format of AcrIF6\textsubscript{Pae-1}, AcrIF6\textsubscript{Pae-2}, etc. The established conventions for naming anti-CRISPR proteins and genes will be described as part of the database. We view this as an open repository for the field, and as a complementary resource to a previously described anti-CRISPR database.\textsuperscript{14}

Two of us (J.B.-D. and A.R.D) were inspired to establish this database by the success of the CRISPR-Cas classification scheme in bringing order to the naming of Cas proteins.\textsuperscript{15,16} This work has been tremendously valuable for advancing the CRISPR-Cas field. We hope that our contribution to the anti-CRISPR field as presented here will provide a similar long-term benefit.
