[Recommendations for Sequencing Targets](#) (pdf format)

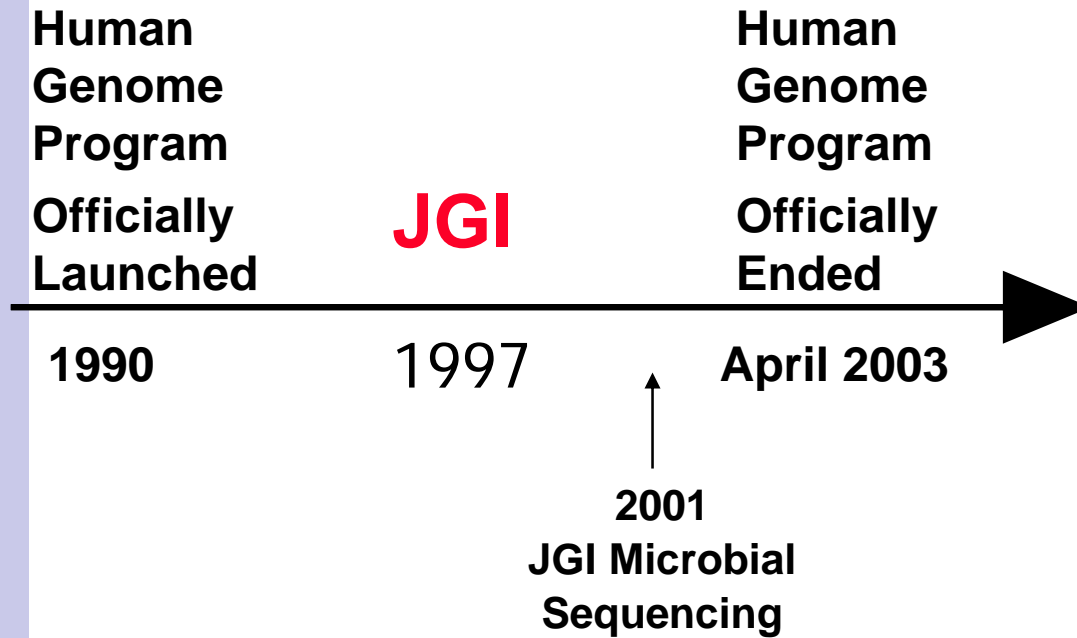

A 1994 spinoff from the Human Genome Project, the Microbial Genome Program's goal has been to completely sequence the genomes of microbes, primarily prokaryotes. However, unlike the human genome, which took years to complete, many microbial genomes can be completely sequenced in weeks or months and, with recent advances in sequencing technologies, even days. Only a few years ago, most scientists could not have imagined having access to the complete genetic sequence of more than a few microbes. As of April 2003, DOE has sequenced the genomes of about 100 microbes, most of them by the Joint Genome Institute. These, in addition to many viruses and higher organisms such as yeast and the roundworm, are available in public databases and are being actively used by academic, medical, and industrial scientists to make comparisons not possible previously. The completed genome of one microbe, *Methanococcus jannaschii*, confirmed the existence of a third major branch of life on earth, the Archaea.

In newly sequenced microbial genomes, about 40% of the predicted open reading frames (potential genes) typically do not have matches in existing databases; this means that even though investigators have high confidence in the existence of these potential genes, their function and biological value are unknown. This exciting finding suggests that a large reservoir of interesting proteins and much fascinating biology remain to be discovered. One of the hardest biological problems, and one in which bioinformatics is beginning to have an impact, is to predict protein structure from primary amino acid sequence. Ultimately, scientists expect to understand the functions of unknown proteins, starting with their gene sequences.

The possible uses of this information are staggering. Microbes, incredibly, make up around 60% of the earth's biomass. They have survived on the planet for over 3.8 billion years and have been found in every conceivable environment, surviving extremes of heat, cold, radiation, pressure, salt, and acid—often where no other forms of life can exist. This rich diversity means that microbes long ago "solved" many problems for which scientists have been actively seeking answers.

Through the study and understanding of a diverse group of microbes, solutions are nearer for DOE mission challenges in environmental cleanup, medicine, agriculture, industrial processes, and energy production and use, to name a few. For example, *M. jannaschii*'s ability to produce methane may have implications for new forms of fuel generation, and *Deinococcus radiodurans* has potential for cleanup of toxic mixed-waste sites containing radionuclides, in addition to heavy metals and organic solvents, because it can survive extremely high levels of radiation and repair its own radiation-damaged DNA. Understanding the genome sequence of *E. anthracis*, which causes anthrax, will promote faster detection methods and new treatments.

JGI Timeline

Burkholderia cepacia

Cytophaga hutchinsonii

Desulfitobacterium halfniense

Enterococcus faecium

Ferroplasma acidarmanus

Magnetospirillum magnetotacticum

Nitrosomonas europaea

Prochlorococcus marinus

Pseudomonas fluorescens

Rhodobacter sphaeroides

Rhodospseudomonas palustris

Sphingomonas aromaticivorans

Thermomonospora fusca

Trichodesmium erythraeum

Xylella fastidiosa

Nostoc punctiforme

Marine synechococcus

Magnetococcus MC-1

Lactic acid bacteria

Lactobacillus gasseri (Klaenhammer)
Lactobacillus casei (Broadbent/Steele)
Lactobacillus delbrueckii (Steele)
Lactococcus cremoris (Weimer)
Brevibacterium linens (Weimer)
Pediococcus pentosaceus (Broadbent)
Oenococcus oeni (Mills)
Leuconostoc mesneteroides (Breidt)
Streptococcus thermophilus (Hutkins)

Bifidobacterium longum (O'Sullivan)

Complex polysaccharide degradation

Clostridium thermocellum (Wu)
Microbulbifer degradans (Weiner)
(complements white rot fungus sequence)

Phototrophic bacteria

Rhodospirillum rubrum (Roberts)
(complements *Rhodopseudomonas palustris*
and *Rhodobacter spheroides*)

Anaerobic methane oxidizing consortium “ball of bugs” (DeLong, Monterey Bay)
one (or two?!) reverse methanogenic archaea in core plus sulfur reducing bacterium on surface

Toxic waste degradation and microbial ecology

Desulfuromonas acetoxidans (Lovely)
Desulfovibrio desulfuricans
Geobacter metallicreducens (Loveley, Ciufu)
Dechloromonas aromatica
Ralstonia eutropha (Valenzuela)
Azotobacter vinelandi
Trichodesmium erythraeum

Microbes in extreme environments

Psychrobacter (Thomashow)
Exiguobacterium (Thomashow)
Methanococcoides burtonii (Sowers, Cavicchioli)

Infectious diseases of plants and animals

Erlichia chaffeensis (Yu)
Erlichia canis (Yu)
Streptococcus suis (Gottschalk)
Haemophilus somnus (Inzana)
Pseudomonas syringae (Lindow)
Agrobacterium tumefaciens

FY 2002
30 projects

2003

Single Microbes

- Rubrobacter xylanophilus
- Prochlorococcus isolate NATL2A
- Kineococcus radiotolerans sp nov
- Methylobacillus flagellatus, strain KT
- Synechococcus elongates PCC7 942
- Moorella thermoacetica ATCC39073
- Anabaena variabilis ATCC 29413
- Burkholderia complex (genomovar V)
- Crocosphaera watsonii WH8501

Fungus

- Trichoderma reesei - 87.55Mb of Sequence Present
- (Strain RUT-C30, ATCC56765)

Marine Algae

- Emiliana huxleyi strain 1516

Stramenopiles

- Phytophthora ramorum UCD Pr4 – 2.46Mb sequence
- Phytophthora sojae P6497 – 319.72Mb sequence

Microbial Consortia

- Acid mine drainage from site in Iron Mountain
- Chlorochromatium aggregatum

59
projects

8 species of *Chlorobia*

Chlorobium limicola, DSMZ 245(T)
Chlorobium phaeobacteroides, MN1
Prosthecochloris spp.
Prosthecochloris aestuarii, SK413/DSMZ 271(t)
Chlorobium vibrioforme f. *thiosulfatophilum*, DSMZ 265(T)
Chlorobium phaeobacteroides, DSMZ 266(T)
Pelodictyon phaeoclathratiforme, BU-1 (DSMZ 5477(T))
Pelodictyon luteolum, DSMZ 273(T)

Model Syntrophic Consortium:

Syntrophobacter fumaroxidans, MPOB
Syntrophomonas wolfei, Göttingen (DSM 2245B)
Methanospirillum hungatei, JF1

Facultative Metal-reducing Gamma proteobacteria

Shewanella putrefaciens, CN-32
Shewanella sp., PV-4
Shewanella amazonesis
Shewanella baltica, OS1155
Shewanella frigidimarina, NCMB400
Shewanella denitrificans, OS 217
Shewanella putrefaciens, 200

five bacteria involved in nitrification

Nirosomonas eutropha C71
Nitrosospira multiformis Surinam
Nitrosomonas oceani
Nitrobacter winogradskyi, Nb-255
Nitrobacter hamburgensis

Single microbes

Syntrophobacter fumaroxidans
Synthophus acidotrophicus
Arthrobacter aurescens, TC1
Thermoanaerobacter ethanolicus, X514
Frankia sp., EAN1pec
Frankia sp., Cc13
Anaeromyxobacter dehalogenans, 2CP-C
Nocardioides sp., JS614
Deinococcus geothermalis, DSM11300
Chromohalobacter salexigens, DSM3043
Clostridium beijerincki, NCIMB 8052
Acidobacterium sp., Ellin6076
Clostridium phytofermentans
Arthrobacter sp., FB24
Thiomicrospira crunogena
Thiomicrospira denitrificans
Sphingopyxis alaskensis, RB2256
Alkaliphillus metalliredigenes
Jannaschiana sp.CCS1
Roseobacter sp., TM1040
Paracoccus denitrificans, 1222
Thiobacillus denitrificans, ATCC 23644
b-proteobacterium sp., JS666

Eukaryotes

Glomus intraradices
Laccaria bicolor
Pichia stipitis, CBS 6054
Pichia mRNA for cDNA libraries

Communities:

200 BACs from anaerobic bioreactor granules
acid mine drainage community
Picoplankton BACS from HOTS site
Boiling thermal pool

Community Sequencing Program Sequencing Plans for 2005

In February 2004, the JGI launched the Community Sequencing Program (CSP).

24 proposals accepted
10 microbial projects

February 25, 2005 – Deadline for receipt of applications for year 2006

Sequencing projects will be chosen based on scientific merit, judged through independent peer review. Criteria for participation in this program, the review process, and interactions between JGI and participants are outlined on the web site:

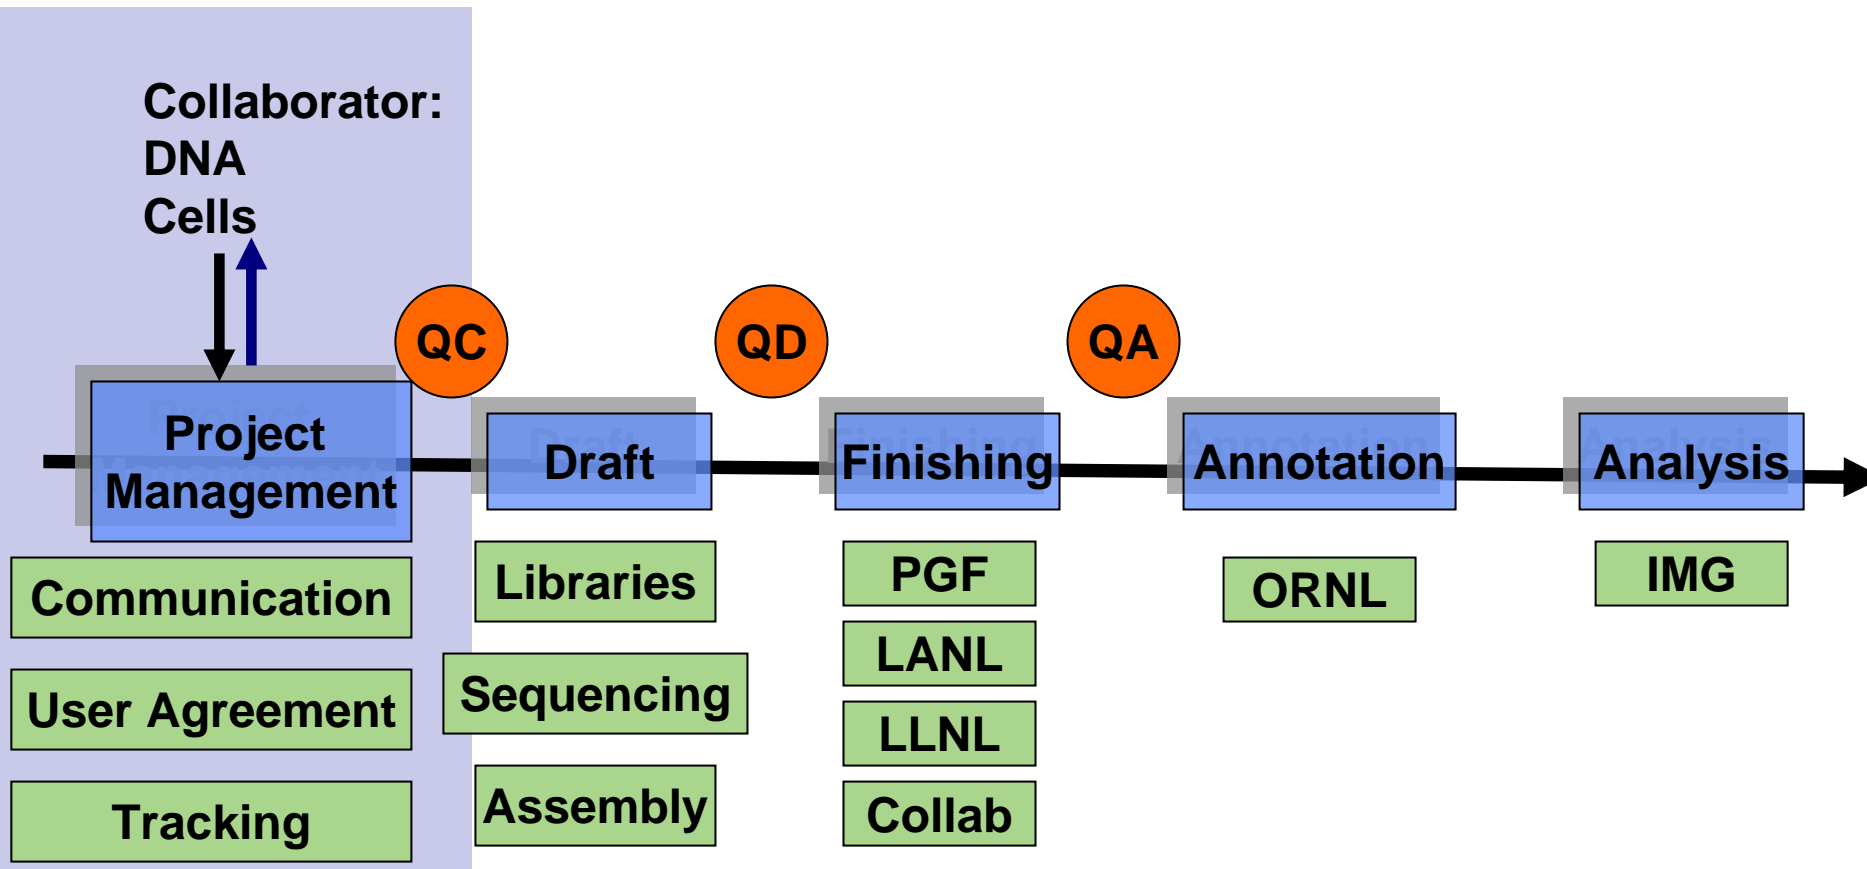

<http://www.jgi.doe.gov/CSP/>

Organism	Proposer	Affiliation	Sequence Allocated (MB)	Status
Microbes				
O. algarvensis symbionts	Dubilier	Max Planck Institute of Marine Microbiology	100	In production
Crenarchaeota	DeLong	MIT	400	
Marinobacter aquaeolei	Edwards	Woods Hole Oceanographic Institution	176	In production
Staph. Aureus VISA strains	Tomasz	Rockefeller University	50	
Prochlorococcus	Chisholm	MIT	540	
Rhodocyclus-like polyphosphate accum.	Hugenholtz	JGI	150	
Rhodobacter	Kaplan	University of Texas, Houston	90	
Contaminated groundwater	Zhou	ORNL	80	
Lactobacillus reuteri (two strains)	Tannock	University of Otago, Dunedin, NZ	48	
Bacillus cereus (two strains)	Sorokin	INRA, France	80	
Basal Organisms				

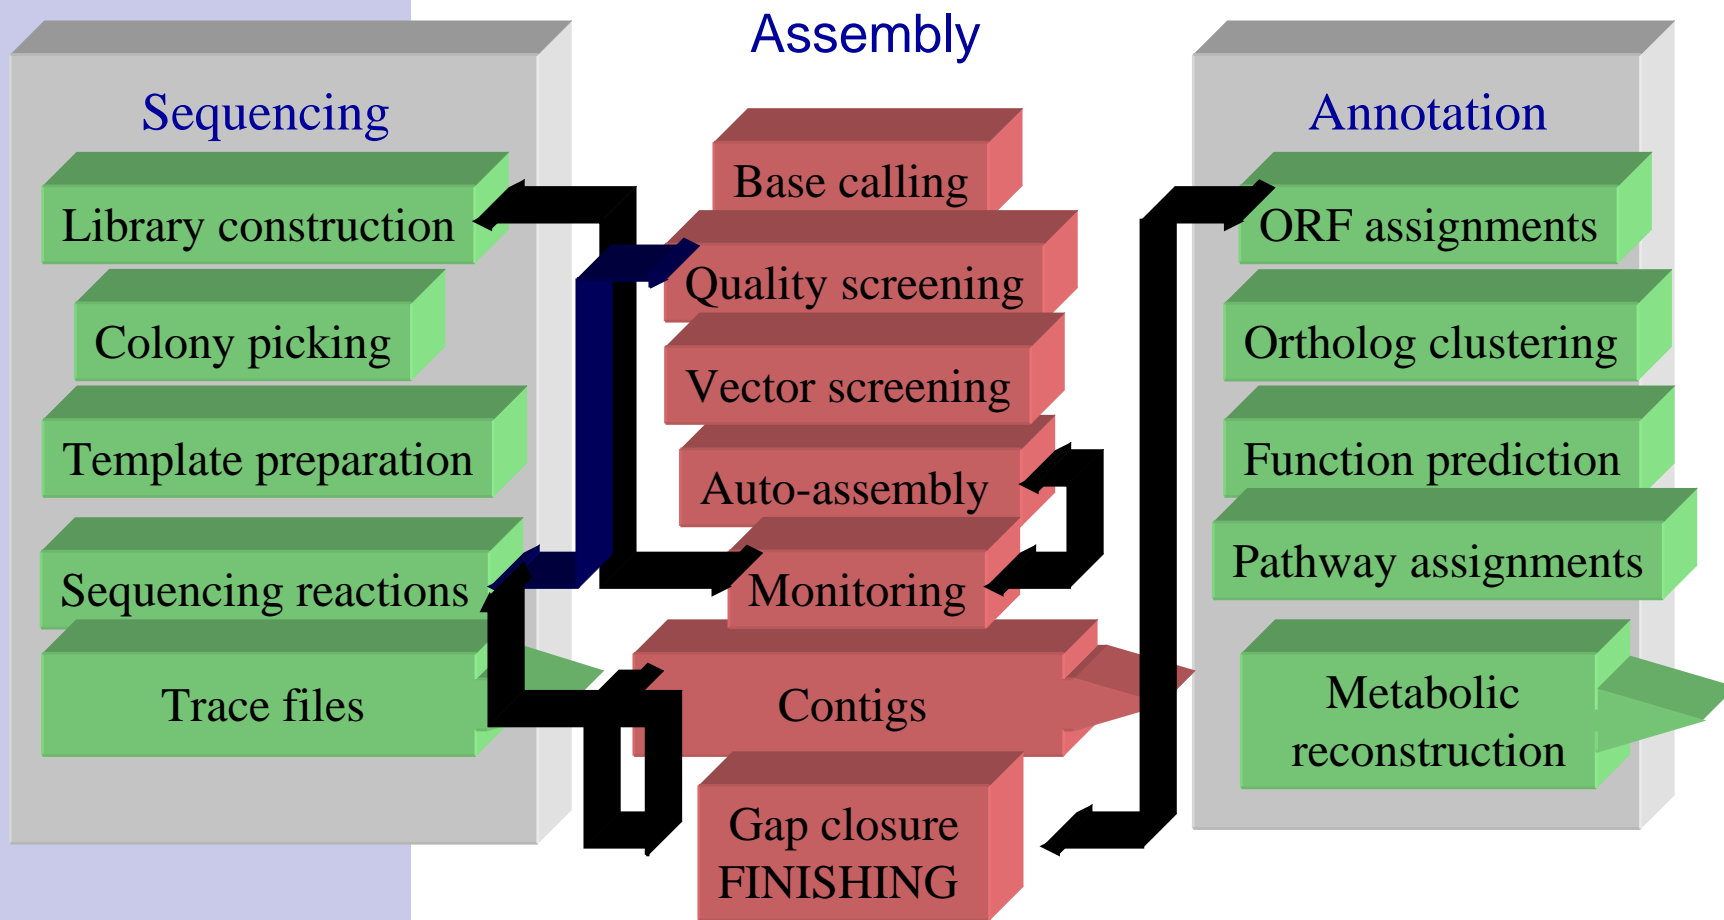

DOE Microbial Program
DOE GTL Program (GTL)
Community Sequencing Program (CSP)
JGI Internal Program

Goal: *to provide the scientific community access to high throughput sequencing and to operate as a Genomic Infrastructure for American Science*

Program Structure

A typical genome sequencing project

Guidelines for Collaborators supplying Microbial DNA to the JGI for sequencing.

DNA sent to the JGI for library construction:

A. Required information for samples:

Name, email, and address of the PI of the Collaborating Laboratory.

Name, email, and address of the person who isolated the DNA.

Name, email and phone number of the person who packs and ships the material.

Itemized contents of the shipment.

Bacterial strain being shipped and culture conditions.

NCBI name and ATCC number of strain (if applicable).

Estimated genome size, and how this was determined. The preferred method is Pulsed Field Gel Electrophoresis.

Please include as much information as is known about the genome, including G+C content, and any available sequence information such as 16s, known repeat sequences, or any sample sequences or contigs available.

Also, please include the names and accession numbers of any sequenced microbial strains that share significant homology with the strain being sequenced at the JGI.

B. Web site information:

In addition, the JGI requests the following information which will be used to describe on going sequencing projects at the JGI.

Photograph-preferably EM with scale and credit.

Basic facts including why it is important and motivation behind sequencing.

Names, email, and addresses of collaborators to be listed on web site.

Any links or other resources about the microbe that can be listed on our site.

Library Construction:

Multiple size insert libraries for each organism and sequence them to a specific depth.

4x Sequence of 2-4kbs – Small Insert

4x Sequence of 8-10kbs – Medium Insert

15x Clone coverage of Fosmid Ends

Sheared Genomic DNA

2.3 kb
2.0 kb

GeneMachines Hydrashear

10 Plate QC

Project: 3634501

Organism: Roseobacter sp. TM1040

Lineage: [cellular organisms](#); [Bacteria](#); [Proteobacteria](#); [Alphaproteobacteria](#); [Rhodobacterales](#); [Rhodobacteraceae](#); [Roseobacter](#)

Vector: pUC, pMCL200

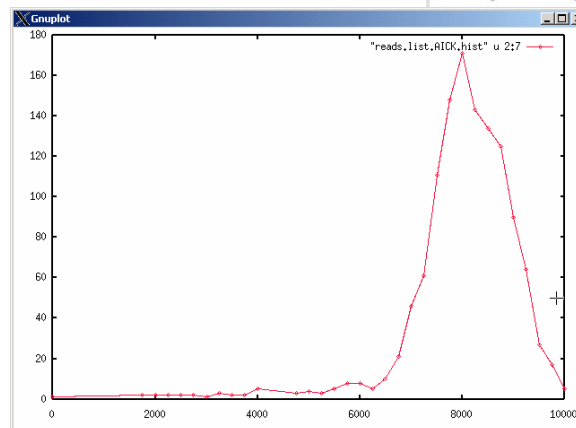

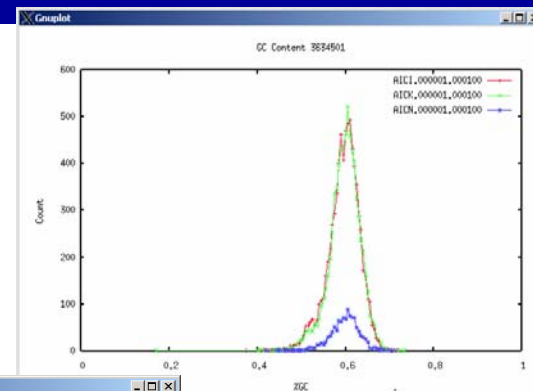

Shearing Operator: CC

Date: Jan 12, 2004

Library: AICI, AICK

Insert Size: 3kb,8kb

- Contamination Check
 - Known JGI contaminants
 - Vector
 - GC content
 - Correct microbe
- Library QC
 - Read distribution
 - Insert size distribution
 - Compare to ideal assembly

Assembled: 3941181 (trimmed)

Phrap: 3489815

Current Depth Estimate : 4.180703 +/- 0.856594

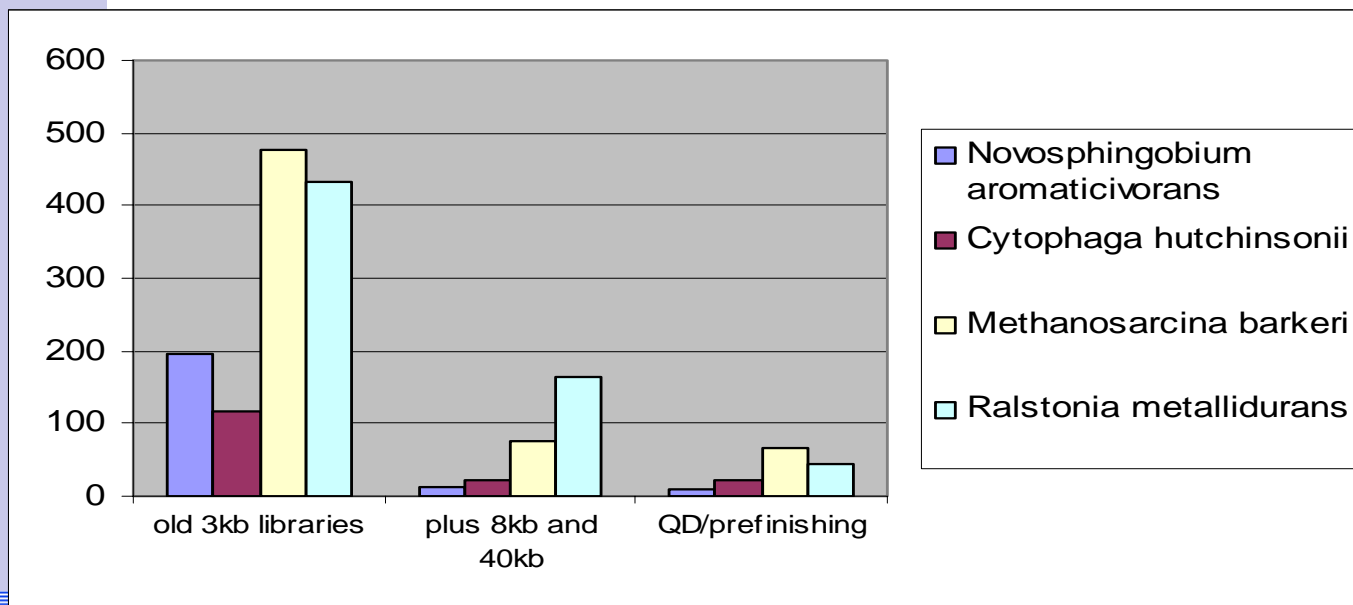

About half the reads are in 105 contigs containing at least 37 reads each
N 50 analytical

N50 (analytic): About half the reads will be in 130 contigs containing at least 38 reads each (3.9 MB)

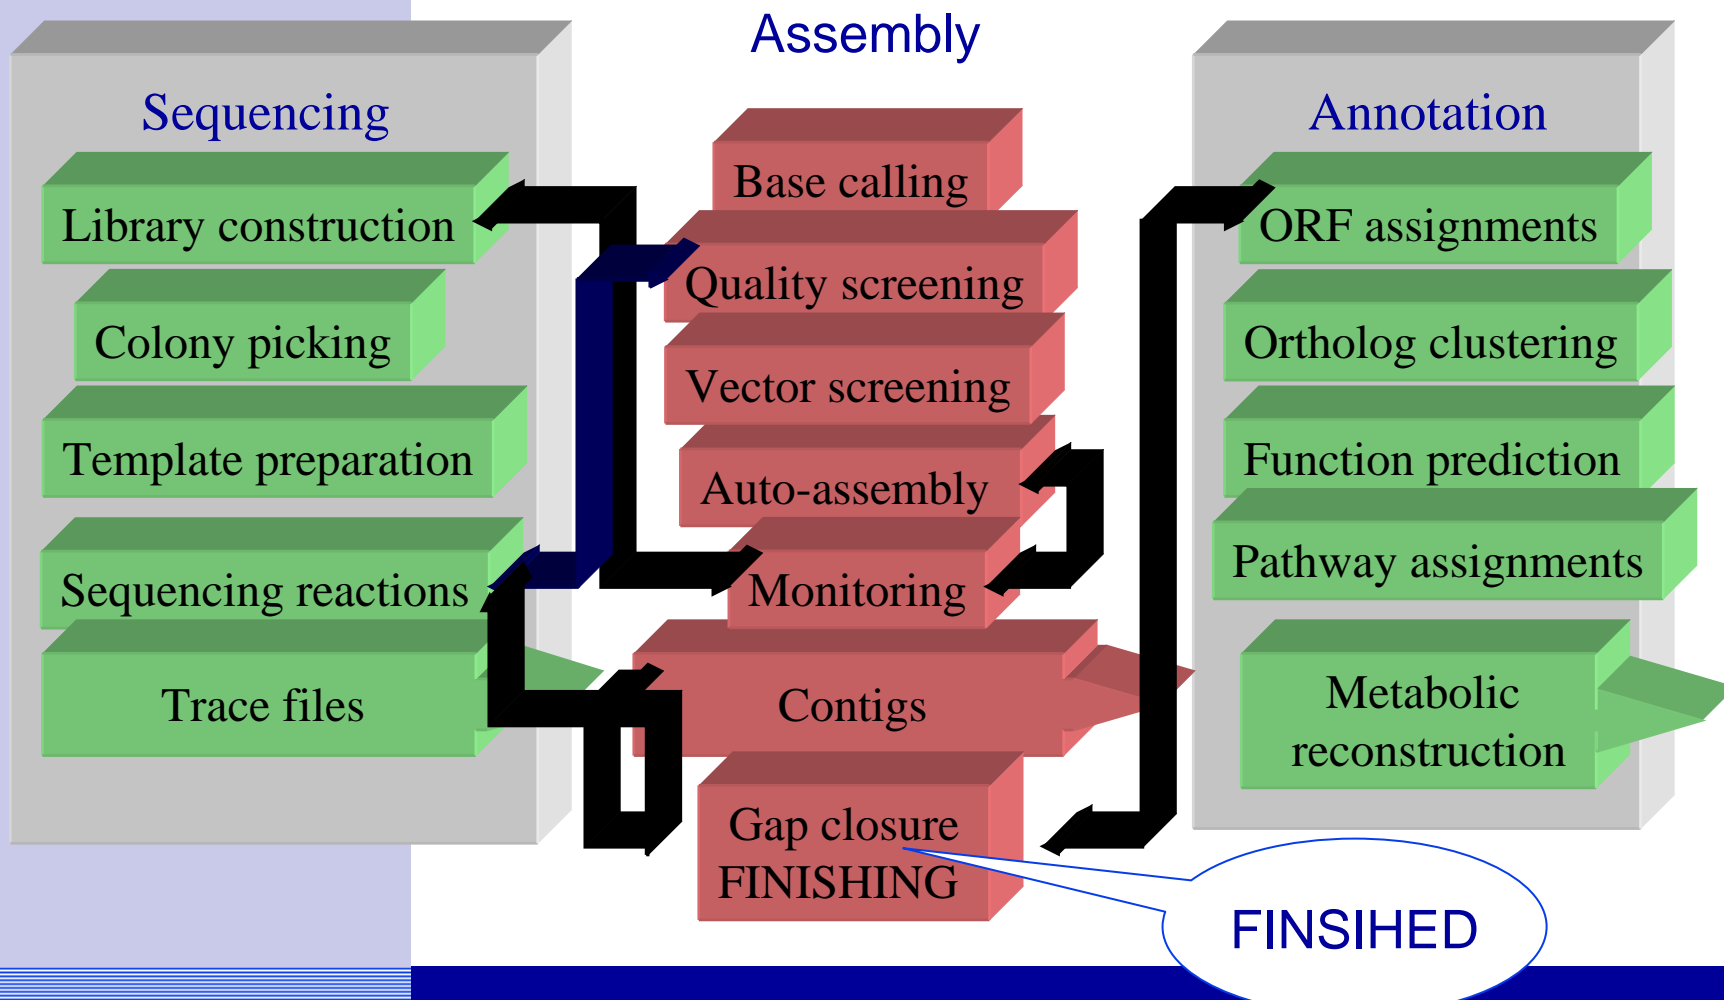

N50 (analytic): About half the reads will be in 756 contigs containing at least 7 reads each (9.0 MB)

Effects of Improvements on Genome Quality

	old 3kb libraries		plus 8kb and 40kb		QD/prefinishing	
	Major Contigs	Genome size (MB)	Major Contigs	Genome size (MB)	Major Contigs	Genome size (MB)
<i>Novosphingobium aromaticivorans</i>	197	4.17	13	4.21	9	4.215
<i>Cytophaga hutchinsonii</i>	118	4.36	23	4.41	22	4.41
<i>Methanosarcina barkeri</i>	478	3.88	77	4.83	67	4.84
<i>Ralstonia metallidurans</i>	432	NA	165	6.83	45	6.83

A typical genome sequencing project

Guideline and finishing checklist for all JGI microbes:

- All low quality areas (<Q30) should be reviewed and re sequenced.
- Final error rate should be < 0.2 per 10 Kb.
- No single clone coverage, i.e. minimum of 2X depth everywhere.
- Manually inspect and quantify single stranded regions.
- Check all high quality discrepancies.
- Final sequence should have a base at every position (no strings of xxxx anywhere).
- Verify all repeats (paired ends and PCR if necessary).
- Make sure to check ends of final contigs (chromosomes, plasmids)
- Using Assembly Viewer and phrapViewer tools check correctness of final assembly. Confirm questionable areas with PCR.

Draft Assembly

All libraries sequenced to completion, data assembled and verified

Draft assembly and annotation available to the collaborator

Project transfers to Microbial Finishing Groups for complete finishing

Annotation

Provide genome and tools to community

[Disclaimer](#)

The **Integrated Microbial Genomes (IMG)** system provides a framework for comparative analysis of the genomes sequenced by the Joint Genome Institute. Its goal is to facilitate the visualization and exploration of genomes from a functional and evolutionary perspective. There are two main approaches to using the system: genes and genomes. Genes can be found by keyword or BLAST query via the Gene Search and then analyzed in the context of their chromosomal, metabolic, and phylogenetic neighborhoods. Genomes of multiple organisms can be selected with the Organism Browser. You can then compare them through the Phylogenetic Profiler in order to identify common or unique properties. The first release of IMG includes 19 JGI genomes together with most publicly available complete microbial genomes.

Note: cookies should be enabled in your browser. A fast internet connection also helps.

**Total genomes in IMG v1.0 - 296: 195 bacterial, 20 archaea, 9 eukaryote
101 bacterial genomes are from JGI**

➤ **Sequenced at JGI (PGF) - 101**

➤ **Finishing by JGI partners and collaborators - 31**

➤ **Annotated automatically at ORNL**

ORF calling: Glimmer, Critica, Generation (multi evidence)
+ COG, Pfam, EC, SwissProt, KEGG, InterPro, NCBI NR

➤ **Public Repositories**

JGI microbes eventually go into RefSeq, EBI-GR, CMR, etc.

➤ **Released via JGI individual portals**

Supports individual genome data search (BLAST), download, annotation viewer (ORNL).

-----------------------------------	--------------------------------------

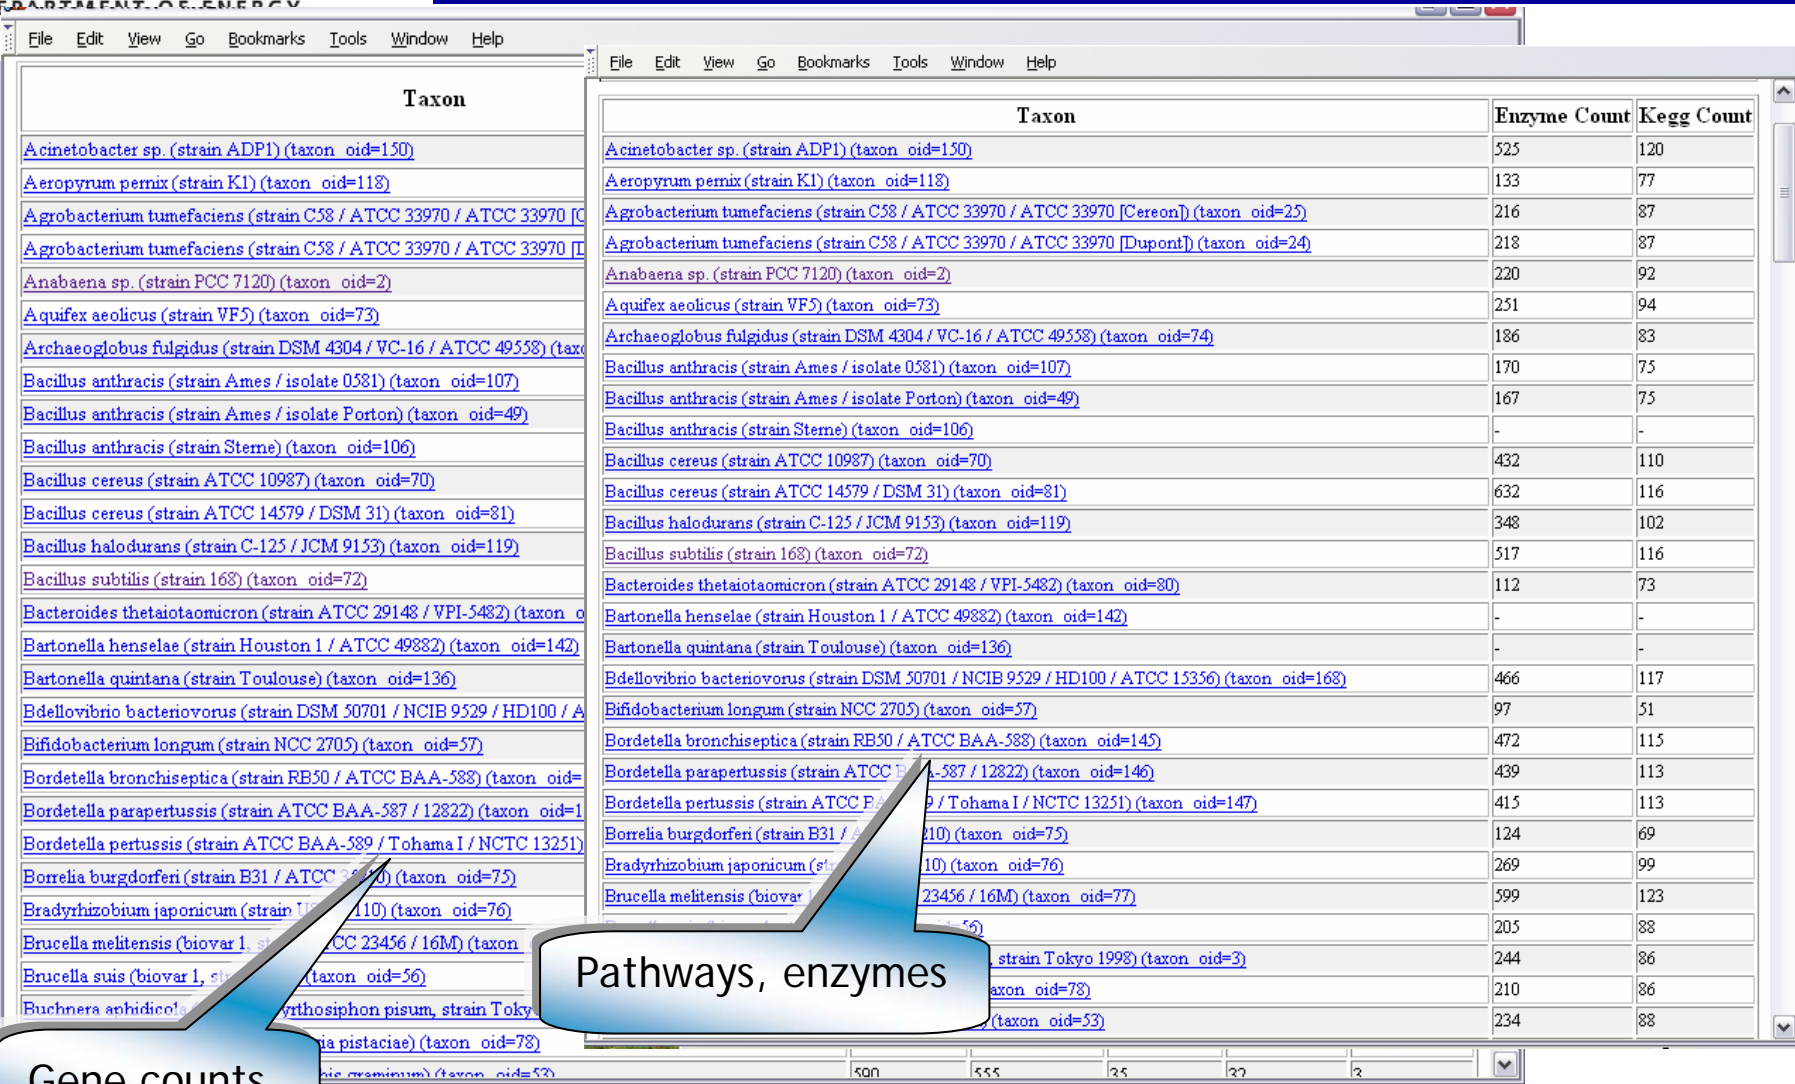

BLASTp

Find matches in selected organisms (all IMG organisms if none are selected).
Protein vs. protein, paste amino acid sequence here:

E-value:	1e-5 <input type="button" value="v"/>
Database:	All IMG Genes - One large Database <input type="button" value="v"/>

<input type="button" value="Go"/>	<input type="button" value="Reset"/>
-----------------------------------	--------------------------------------

hint: – BLAST may be slow for large protein queries.
– The optimum E-value will depend on the size of the BLAST database you select. (For a larger database, use a larger E-value cutoff.)

Taxon	Enzyme Count	Kegg Count
Acinetobacter sp. (strain ADP1) (taxon_oid=150)	525	120
Aeropyrum pernix (strain K1) (taxon_oid=118)	133	77
Agrobacterium tumefaciens (strain C58 / ATCC 33970 / ATCC 33970 [Cereon]) (taxon_oid=25)	216	87
Agrobacterium tumefaciens (strain C58 / ATCC 33970 / ATCC 33970 [Dupont]) (taxon_oid=24)	218	87
Anabaena sp. (strain PCC 7120) (taxon_oid=2)	220	92
Aquifex aeolicus (strain VF5) (taxon_oid=73)	251	94
Archaeoglobus fulgidus (strain DSM 4304 / VC-16 / ATCC 49558) (taxon_oid=74)	186	83
Bacillus anthracis (strain Ames / isolate 0581) (taxon_oid=107)	170	75
Bacillus anthracis (strain Ames / isolate Porton) (taxon_oid=49)	167	75
Bacillus anthracis (strain Sterne) (taxon_oid=106)	-	-
Bacillus cereus (strain ATCC 10987) (taxon_oid=70)	432	110
Bacillus cereus (strain ATCC 14579 / DSM 31) (taxon_oid=81)	632	116
Bacillus halodurans (strain C-125 / JCM 9153) (taxon_oid=119)	348	102
Bacillus subtilis (strain 168) (taxon_oid=72)	517	116
Bacteroides thetaiotaomicron (strain ATCC 29148 / VPI-5482) (taxon_oid=80)	112	73
Bartonella henselae (strain Houston 1 / ATCC 49882) (taxon_oid=142)	-	-
Bartonella quintana (strain Toulouse) (taxon_oid=136)	-	-
Bdellovibrio bacteriovorus (strain DSM 50701 / NCIB 9529 / HD100 / ATCC 15356) (taxon_oid=168)	466	117
Bifidobacterium longum (strain NCC 2705) (taxon_oid=57)	97	51
Bordetella bronchiseptica (strain RB50 / ATCC BAA-588) (taxon_oid=145)	472	115
Bordetella parapertussis (strain ATCC BAA-587 / 12822) (taxon_oid=146)	439	113
Bordetella pertussis (strain ATCC BAA-589 / Tohama I / NCTC 13251) (taxon_oid=147)	415	113
Borrelia burgdorferi (strain B31 / ATCC 49619) (taxon_oid=75)	124	69
Bradyrhizobium japonicum (strain 110) (taxon_oid=76)	269	99
Brucella melitensis (biovar 1, strain 23456 / 16M) (taxon_oid=77)	599	123
Brucella melitensis (biovar 1, strain Tokyo 1998) (taxon_oid=3)	205	88
Brucella suis (biovar 1, strain 23456) (taxon_oid=56)	244	86
Buchnera aphidicola (strain 110) (taxon_oid=76)	210	86
Cylindrocapsa japonica (strain Tokyo 1998) (taxon_oid=3)	234	88

Pathways, enzymes

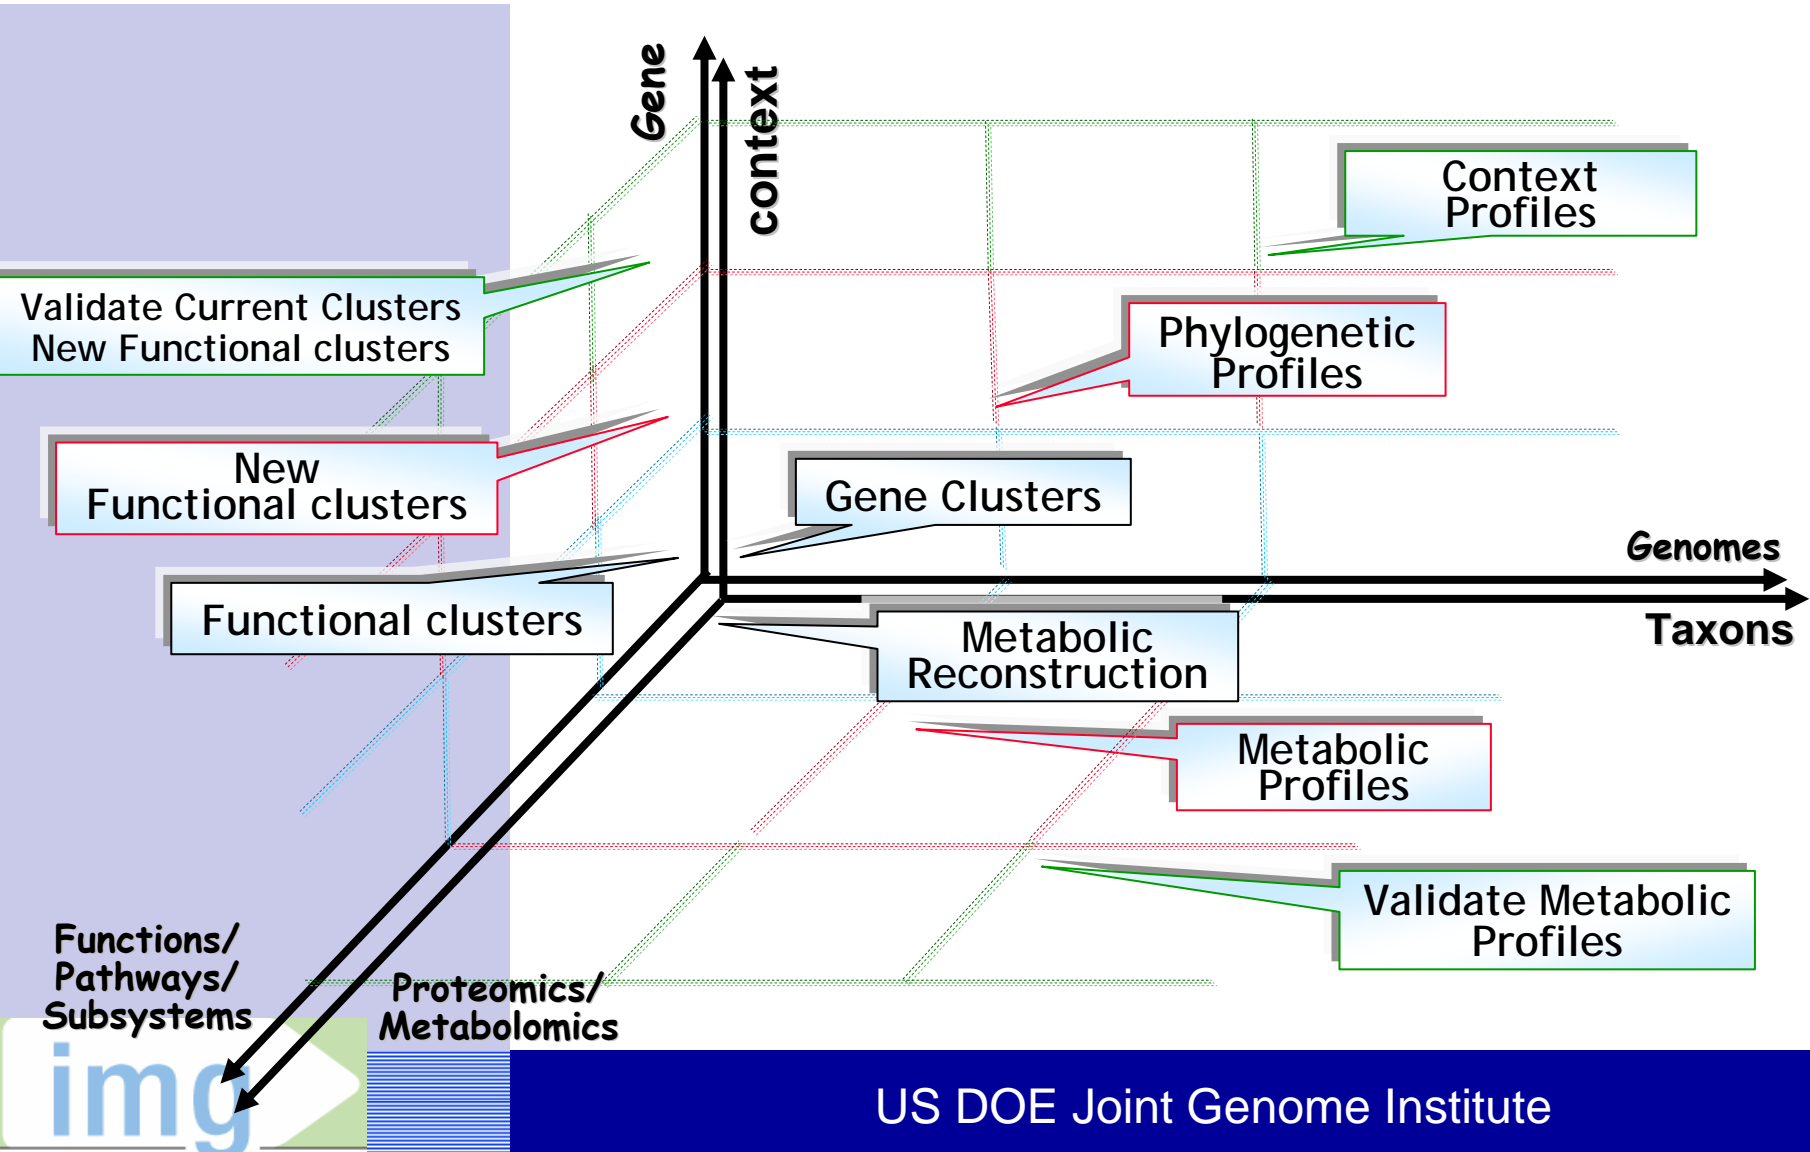

Gene counts

You cannot
analyze one
genome in
isolation

- Provide a data management system that will:
 - support the **analysis of all genomes**
 - support **community annotation** of genomic sequences
 - support **modeling cellular networks**
 - become a platform for understanding genomes
- Provide a data management system that enables scientists to **explore microbial community genomic data** in the context of relevant environmental, geographical, geochemical and phylogenetic data
