Search for Heavy Resonances Decaying into a Photon and a Hadronically Decaying Higgs Boson in pp Collisions at $\sqrt{s} = 13$ TeV with the ATLAS Detector

ATLAS Collaboration

This Letter presents a search for the production of new heavy resonances decaying into a Higgs boson and a photon using proton-proton collision data at $\sqrt{s} = 13$ TeV collected by the ATLAS detector at the LHC. The data correspond to an integrated luminosity of 139 fb^{-1} . The analysis is performed by reconstructing hadronically decaying Higgs boson ($H \rightarrow b\bar{b}$) candidates as single large-radius jets. A novel algorithm using information about the jet constituents in the center-of-mass frame of the jet is implemented to identify the two b -quarks in the single jet. No significant excess of events is observed above the expected background. Upper limits are set on the production cross-section times branching fraction for narrow spin-1 resonances decaying into a Higgs boson and a photon in the resonance mass range from 0.7 to 4 TeV, cross-sections times branching fractions are excluded between 11.6 fb and 0.11 fb at a 95% confidence level.

Many extensions to the standard model, such as technicolor [1], little Higgs [2], or a more complex Higgs sector [3], predict new massive bosons. Some of these bosons may decay into a Higgs boson and a photon at the one-loop level [4]. Searches for such particles have been carried out by both the ATLAS [5] and CMS [6] Collaborations at the Large Hadron Collider (LHC).

This Letter reports on a generic search for a narrow, neutral, spin-1 boson (Z') that decays into a photon and a Higgs boson. The Higgs boson subsequently decays hadronically as $H \rightarrow b\bar{b}$, where the hadronic products from both b quarks are reconstructed as a single large-radius jet. The analysis uses data from $\sqrt{s} = 13$ TeV proton–proton (pp) collisions that were recorded by the ATLAS detector from 2015 to 2018 with a single-photon trigger [7], corresponding to an integrated luminosity of 139 fb^{-1} . The single-photon trigger uses loose photon identification requirements based on calorimetric shower-shape variables [8] and imposes a transverse momentum threshold of 140 GeV. It is fully efficient for events passing the offline analysis selection. The search identifies the two b quarks in the single jet by using a novel methodology based on information about the jet constituents calculated in the center-of-mass frame of the jet. This technique significantly improves the search sensitivity compared to the previous ATLAS [5] and CMS [6] analyses, in addition to the gains from the larger data sample.

The ATLAS detector [9, 10] is a general-purpose particle detector with a cylindrical geometry¹. It consists of an inner detector surrounded by a superconducting solenoid that produces a 2 T magnetic field, electromagnetic and hadronic calorimeters, and a muon spectrometer with a toroidal magnetic field. The inner detector provides precision tracking of charged particles with pseudorapidity $|\eta| < 2.5$. The calorimeter system covers the pseudorapidity range $|\eta| < 4.9$. It comprises sampling calorimeters with either liquid argon or scintillator tiles as the active medium. A two-level trigger system accepts events from the 40 MHz bunch crossings at a rate of 1 kHz for off-line analysis.

Monte Carlo (MC) simulated events are used to optimize the event selection and to help validate the analysis. The signal samples, with decays of $Z' \rightarrow H\gamma$ at the one-loop level [4], were generated for eight different mass points in a range from 700 to 4000 GeV via quark-antiquark annihilation, $q\bar{q} \rightarrow Z' \rightarrow H\gamma$, using the MADGRAPH leading-order (LO) v2.6.2 generator [11] interfaced to PYTHIA 8.235 [12] with the NNPDF23LO parton distribution functions (PDFs) [13] for both generators and the A14 set of tuned parameters [14] for the underlying event. The total decay widths of the Z' resonances were set to 4.2 MeV, which is much smaller than the experimental mass resolution, which varies from around 35 GeV at the 700 GeV signal mass point to 150 GeV at the 4000 GeV signal mass point. The dominant SM background arises from events with prompt photons produced in association with jets (γ +jets). Less dominant SM backgrounds include a prompt photon produced in association with a W/Z boson ($W/Z+\gamma$) or a top–anti-top quark pair ($t\bar{t}+\gamma$). The MC sample of γ +jets events was simulated using the SHERPA 2.2.2 generator [15] with up to two additional parton emissions at next-to-leading-order (NLO) accuracy and up to four additional partons at LO accuracy using Comix [16] and OpenLoops [17]. The events were then merged with the SHERPA parton shower [18] using the ME+PS@NLO prescription [19]. Samples are generated using the NNPDF3.0nnlo PDF set [20], along with the dedicated set of tuned parton-shower parameters developed by the SHERPA authors. The $W/Z+\gamma$ events were modeled with SHERPA 2.1.1 at LO with the CT10 PDFs [21] for both generators and the underlying event. The $t\bar{t}+\gamma$ events were simulated using MADGRAPH5_aMC@NLO v2.2.3 at LO with the CTEQ6L1 PDFs [22], then interfaced

¹ ATLAS uses a right-handed coordinate system with its origin at the nominal interaction point in the center of the detector and the z -axis along the beam pipe. The x -axis points to the center of the LHC ring, and the y -axis points upward. Cylindrical coordinates (r, ϕ) are used in the transverse plane, ϕ being the azimuthal angle around the z -axis. The pseudorapidity is defined in terms of the polar angle θ as $\eta = -\ln(\theta/2)$. The distance between two objects in η - ϕ space is $\Delta R = \sqrt{(\Delta\eta)^2 + (\Delta\phi)^2}$. Transverse momentum is defined by $p_T = p \sin \theta$.

to PYTHIA 8.186 with the A14 parameter tune and the NNPDF23LO PDFs. In the signal samples and $t\bar{t}+\gamma$ background sample, EVTGEN [23] was used to model charm and b -hadron decays. The effect of multiple pp interactions in the same and neighboring bunch crossings (pileup) is included by overlaying minimum-bias events simulated with PYTHIA 8.186 on each event of interest in all samples. The generated samples were processed through a GEANT4-based detector simulation [24, 25] and the same ATLAS reconstruction software as the data.

An event is selected if it contains a $H \rightarrow b\bar{b}$ candidate and at least one isolated photon that satisfies the “tight” identification criteria [26, 27]. A selected photon must have transverse momentum (p_T) greater than 200 GeV and be within the calorimeter barrel region $|\eta| < 1.37$. Each $H \rightarrow b\bar{b}$ candidate is reconstructed as a single jet using the anti- k_t algorithm [28, 29] with a large radius parameter ($R = 1.0$), hereafter referred to as a large- R jet (J). The large- R jets are formed from topological energy clusters (topoclusters) [30] in the calorimeter and are trimmed [31] to mitigate the effects of pileup and soft radiation. The large- R jet constituents are reclustered into subjets using the k_t algorithm [32] with $R = 0.2$, and the subjets that carry less than 5% of the p_T of the original large- R jet are removed. To overcome the limited angular resolution of the calorimeter, the mass of a large- R jet (m_J) is computed using a combination of calorimeter and tracking information [33]. Large- R jets are required to have $p_T > 200$ GeV, $|\eta| < 2.0$, $50 \text{ GeV} < m_J < 200 \text{ GeV}$, and an angular separation of $\Delta R > 1.0$ from photon candidates. For the baseline event selection, at least one large- R jet and one photon are required to pass the selection described above.

The photon and large- R jet with the highest p_T in an event are combined to form a resonance candidate. The invariant mass of the resonance candidate ($m_{J\gamma}$) is used to distinguish signal from background. In addition, the large- R jet mass must be consistent with the Higgs boson mass ($m_H = 125.80$ GeV), $m_H - \Delta_{m,D} < m_J < m_H + \Delta_{m,U}$. The parameters $\Delta_{m,D}$ and $\Delta_{m,U}$ are determined by maximizing the search sensitivity $\epsilon/(\sqrt{B} + 3/2)$ [34], where ϵ is the resonance signal selection efficiency and B is the number of background events, as estimated from MC samples, within the resonance mass window, $|m_{J\gamma} - \bar{m}_{Z'}| < 2\sigma_{m_{Z'}}$. Here $\bar{m}_{Z'}$ and $\sigma_{m_{Z'}}$ are the peak position and the core resolution of the reconstructed $m_{J\gamma}$ distribution of the $Z' \rightarrow H\gamma$ signal MC events, respectively. The above procedure is performed separately for each $m_{Z'}$ hypothesis. The optimized parameters $\Delta_{m,D}$ and $\Delta_{m,U}$ are then parameterized by fourth-order polynomial functions of the large- R jet p_T . The optimized mass window of the large- R jets varies from around [100, 130] GeV at $p_T = 0.5$ TeV to [90, 160] GeV at $p_T = 2$ TeV.

To further reduce the background, a novel algorithm [35–37] is applied to the large- R jet to identify the two b quarks that originated from the Higgs boson. It uses the kinematics of the jet constituents in the center-of-mass (c.m.) frame of the large- R jet (jet rest frame), where the final products of a two-body $H \rightarrow b\bar{b}$ decay can be easily separated into a back-to-back topology. In this approach, the topoclusters of the large- R jet and the tracks associated with the jet are boosted to the large- R jet’s rest frame. In the jet rest frame, the topoclusters of the large- R jet are reclustered using the EEKT jet algorithm [38] to form exactly two c.m. subjets, assumed to originate from the Higgs boson decay. A track is considered to be associated with a c.m. subjet if the opening angle $\Delta\theta$ between the track and the c.m. subjet, calculated in the jet rest frame, satisfies the requirement that $2 \times (1 - \cos \Delta\theta) < 0.8$. The c.m. subjets and their associated tracks are then boosted back to the laboratory frame and the standard ATLAS b -tagging algorithm based on a multivariate technique, MV2c10 [39, 40], is applied to each c.m. subjet to identify those containing a b hadron (called c.m. b subjets). For this analysis, the working point of the MV2c10 tagger output is chosen to have an overall efficiency of 77%. This was determined using simulated Randall-Sundrum graviton [41] ($G \rightarrow HH, H \rightarrow b\bar{b}$) events, in which the p_T distribution of the large- R jets that contain a Higgs boson is reweighted to match the inclusive jet p_T distribution observed in data [42]. Compared to the previous method used to identify $H \rightarrow b\bar{b}$ reconstructed as large- R jets, MC studies [42] show that b -tagging based

on c.m. subjects can reject more background than the b tagging based on the other subject algorithm at a given signal identification efficiency: by 20%–50% for large- R jets with $p_T \leq 1.5$ TeV and up to a factor of 10 or more for large- R jets with $p_T > 1.5$ TeV. Among several tagging techniques [42] developed to improve the identification of $H \rightarrow b\bar{b}$ with $p_T > 1$ TeV, the c.m. algorithm typically rejects 20% more background at a given signal efficiency.

Studies using MC simulated events show that the correlation between the b -tagging efficiencies of two c.m. b subjects is negligible, and thus the b -tagging efficiency of each c.m. b subject in a large- R jet can be calibrated using boosted hadronic top-quark decays $t \rightarrow Wb$ from $t\bar{t} \rightarrow WbW\bar{b}$ events where one W boson decays hadronically and the other decays leptonically. The hadronic products of the boosted $t \rightarrow Wb$ decay are reconstructed as a single large- R jet, in which exactly two c.m. subjects are reconstructed in the jet rest frame: one corresponding to the b quark, and the other corresponding to the W boson. MC studies show that the b -tagging performance is almost identical for c.m. b subjects in the boosted hadronic top-quark decay events and $H \rightarrow b\bar{b}$ events. A standard combinatorial likelihood approach [43] is applied to extract the c.m. b -subject tagging efficiency in order to calculate an MC-to-data scale factor, defined as the ratio of the c.m. b -subject tagging efficiencies measured in data and simulated $t\bar{t}$ events [44]. The scale factor is found to be consistent with unity within its uncertainty and has no significant dependence on the kinematics of the c.m. subject and the large- R jet. The uncertainty of the scale factor is about 5%, dominated by the systematic uncertainties such as the dependence of the calibration scale factor on the choice of the $t\bar{t}$ MC generators, and the dependence of the MV2c10 [39, 40] b -tagging scale factors on the jet flavor.

The selected resonance candidates are retained for further analysis if one or both of the c.m. subjects in the large- R jet pass the b -tagging requirement, and are assigned to the single- or double- b -tagged category, respectively. Afterwards, optimizations of the selection requirements on the photon p_T (p_T^γ) and the large- R jet p_T (p_T^J) are carried out in sequence in order to further improve the search sensitivity. The optimizations are performed separately for the selected events in the single- and double- b -tagged categories with the same procedure as used for the large- R jet mass-window optimization described above. It yields $p_T^\gamma > p_T^0 + a \times m_{J\gamma}$ and $p_T^J > 0.8 \times (p_T^0 + a \times m_{J\gamma})$, where $p_T^0 = 12.0$ (121.8) GeV and $a = 0.35$ (0.22) for the selected events with $m_{J\gamma} \leq 2000$ (1500) GeV in the single- b -tagged (double- b -tagged) category. For events with $m_{J\gamma} > 2000$ (1500) GeV, the selection requirements on the photon and the large- R jet p_T are the same as those for events with $m_{J\gamma} = 2000$ (1500) GeV. Depending on the resonance mass, the final signal efficiency in the single- and double- b -tagged categories varies between 10% and 20%.

The final discrimination between signal and background is achieved by a simultaneous fit to the $m_{J\gamma}$ distributions of the selected data events in the single- and double- b -tagged categories. The signal probability density function (SPDF) is modeled as a sum of a Crystal Ball function [45] and a small Gaussian component that describes the tails produced by poorly reconstructed resonance candidates. The SPDF parameters extracted from MC simulated events are interpolated as polynomial functions of the resonance mass up to the third order. Afterwards, the parameters of the SPDF at a given resonance mass are fixed to the values determined using the parameterization. The background probability density function (BPDF) is modeled as $B(m_{J\gamma}) = (1 - x)^{p_1} x^{p_2 + p_3 \log(x)}$ [46], where $x = m_{J\gamma}/\sqrt{s}$, $\sqrt{s} = 13$ TeV is the center-of-mass energy, and the three dimensionless shape parameters p_1 , p_2 , and p_3 are allowed to float in the fit. The choice of the BPDF is motivated and validated by using control data samples containing events that satisfy all the signal selection criteria in either the single- or double- b -tagged category, except for the b -tagging and large- R jet mass requirements. The selected large- R jet candidates in the control data samples are required to have masses lying in sidebands, whose width varies from 10 GeV to 30 GeV, separated from the Higgs boson signal band by 5 GeV, and to have both of the c.m. subjects failing the b -tagging requirement at the 85%-efficiency working point. MC simulated events show that the background $m_{J\gamma}$ distributions in

the single- and double- b -tagged categories are well described by the events in the corresponding control sample.

The effect of systematic uncertainties from various sources was studied. The uncertainty of the integrated luminosity is 1.7% [47, 48]. Uncertainties resulting from detector effects only affect the calculation of the signal selection efficiencies since the background is estimated from the data. Those uncertainties include effects from the energy and mass scales (2%–6.5%) of the large- R jets [49], the large- R jet energy resolution ($< 0.2\%$) and mass resolution (18%–30%), the trigger efficiencies ($< 0.1\%$), the photon energy scale and resolution ($< 2\%$) [27], the photon reconstruction, identification and isolation efficiencies ($< 0.1\%$) [8], the b -tagging efficiency of the c.m. subjet (3%–15%), and the pileup modeling ($< 0.5\%$) [50]. In principle, the detector modeling may also affect the SPDF. However, such effects are found to be negligible. The signal efficiency and acceptance are also affected by theoretical uncertainties, such as the PDF choice and initial- and final-state radiation modeling. These are also found to be small ($< 5\%$ from the PDF, $< 1\%$ from parton showering and $< 1\%$ from renormalization-factorization scale). The above systematic uncertainties degrade the final limits by 10% at 700 GeV, increasing to around 20% at 2.5 TeV and back to 10% at 4 TeV. Another kind of uncertainty, referred to as the spurious signal, arises from a potential bias in the estimated number of signal events due to the choice of background parameterization. It was estimated by fitting the signal-plus-background model to control data sample $m_{J\gamma}$ distributions with a control region to signal region background-shape correction factor derived from simulation. The absolute number of fitted signal events at a given $m_{Z'}$ hypothesis value is taken as the number of spurious-signal events, which varies from a few events in the low mass region to less than 0.1 events in the high mass region, and is parameterized as an exponential function of $m_{Z'}$. The signal from a hypothetical Z' resonance is extracted as $\sigma \times \mathcal{B}$, defined as its production cross-section times the decay branching fraction $\mathcal{B}(Z' \rightarrow H\gamma)$, by performing an unbinned extended maximum-likelihood fit to the $m_{J\gamma}$ distributions of the selected events in the double- and single- b -tagged categories. The predicted SM value of the $H \rightarrow b\bar{b}$ decay branching ratio, 0.582 ± 0.007 [51], is used to calculate the upper limit on $\sigma \times \mathcal{B}$ from $\sigma \times \mathcal{B}(Z' \rightarrow H\gamma) \times \mathcal{B}(H \rightarrow b\bar{b})$. The fitting range for the double- b -tagged category is from 0.6 TeV to 4.2 TeV, while for the single- b -tagged category it is from 1.4 TeV to 4.2 TeV because of poor sensitivity in the low mass region. Systematic uncertainties are taken into account as nuisance parameters with Gaussian sampling distributions [5]. The lowest local (global) p value is 0.005 (0.412) at 775 GeV, corresponding to a local (global) significance of 2.6σ (0.22σ). No significant signal-like excess is observed and the data are found to be described very well by a background-only fit, as shown in Figs. 1(a) and 1(b). Hypothetical signal distributions for $m_{Z'} = 2$ TeV and $m_{Z'} = 3$ TeV with arbitrary normalizations are also plotted in Figs 1(a) and 1(b) for illustration purposes. Combined upper limits on the signal $\sigma \times \mathcal{B}$ at the 95% confidence level are derived using a modified frequentist method [52, 53], with toy MC experiment, taking into account both the statistical and systematic uncertainties. The result as a function of the resonance mass is shown in Fig 1(c). The better sensitivity and larger integrated luminosity (139 fb^{-1}) of this search lowers the expected upper limits of this search as compared to that of the previous ATLAS search (36.1 fb^{-1}) [5]. The ratio of the current expected upper limits to that of the previous result is about 1/3 (1/15) for resonances with masses below 1.2 TeV (above 2.5 TeV). A similar comparison with that of the previous CMS search (35.9 fb^{-1}) [6], where a multivariable approach based on a boosted decision tree was used to identify $H \rightarrow b\bar{b}$ decays, finds a ratio that varies between 2/5 and 1/3 for masses below 2.5 TeV.

In conclusion, this Letter reports on a search for the production of new heavy resonances decaying into a Higgs boson and a photon, using 139 fb^{-1} of $\sqrt{s} = 13$ TeV pp collision data collected by the ATLAS detector at the LHC. The analysis is performed by reconstructing the hadronic decay of the Higgs boson as a single large-radius jet, targeting the $H \rightarrow b\bar{b}$ mode. A novel algorithm using information about the jet constituents in the center-of-mass frame of the jet is implemented to identify the two b quarks in

Figure 1: (a), (b) Distribution of the reconstructed $m_{J\gamma}$ in the single- and double- b -tagged categories, with the background-only fits shown by the solid lines. The corresponding chi-square probabilities of the fits are 46% and 23%, after rebinning requiring at least five events in each bin. Hypothetical signal distributions for $m_{Z'} = 2$ TeV and $m_{Z'} = 3$ TeV with arbitrary normalizations are plotted for illustration purposes. The bottom panel gives the significance (deviation / statistical uncertainty) for each bin, calculated using the recommendation of Ref. [54]. The impact on the background fit from the statistical uncertainties of BPDF parameters is shown as a light band around the solid line. This effect is incorporated into the significance calculation. (c) Observed and expected 95% confidence-level limits on $\sigma \times \mathcal{B}$ as a function of $m_{Z'}$.

the jet and enhances the sensitivity of the search. No significant excess of events is observed above the expected background. Upper limits are set on the production cross-section times branching fraction for resonance decays into a Higgs boson and a photon in the resonance mass range from 0.7 to 4 TeV, which is significantly wider than in the previous ATLAS and CMS searches.

We thank CERN for the very successful operation of the LHC, as well as the support staff from our institutions without whom ATLAS could not be operated efficiently.

- ¹⁰⁷Department of Physics and Astronomy, Michigan State University, East Lansing MI; United States of America.
- ¹⁰⁸B.I. Stepanov Institute of Physics, National Academy of Sciences of Belarus, Minsk; Belarus.
- ¹⁰⁹Research Institute for Nuclear Problems of Byelorussian State University, Minsk; Belarus.
- ¹¹⁰Group of Particle Physics, University of Montreal, Montreal QC; Canada.
- ¹¹¹P.N. Lebedev Physical Institute of the Russian Academy of Sciences, Moscow; Russia.
- ¹¹²National Research Nuclear University MEPhI, Moscow; Russia.
- ¹¹³D.V. Skobeltsyn Institute of Nuclear Physics, M.V. Lomonosov Moscow State University, Moscow; Russia.
- ¹¹⁴Fakultät für Physik, Ludwig-Maximilians-Universität München, München; Germany.
- ¹¹⁵Max-Planck-Institut für Physik (Werner-Heisenberg-Institut), München; Germany.
- ¹¹⁶Nagasaki Institute of Applied Science, Nagasaki; Japan.
- ¹¹⁷Graduate School of Science and Kobayashi-Maskawa Institute, Nagoya University, Nagoya; Japan.
- ¹¹⁸Department of Physics and Astronomy, University of New Mexico, Albuquerque NM; United States of America.
- ¹¹⁹Institute for Mathematics, Astrophysics and Particle Physics, Radboud University Nijmegen/Nikhef, Nijmegen; Netherlands.
- ¹²⁰Nikhef National Institute for Subatomic Physics and University of Amsterdam, Amsterdam; Netherlands.
- ¹²¹Department of Physics, Northern Illinois University, DeKalb IL; United States of America.
- ¹²²^(a) Budker Institute of Nuclear Physics and NSU, SB RAS, Novosibirsk; ^(b) Novosibirsk State University Novosibirsk; Russia.
- ¹²³Institute for High Energy Physics of the National Research Centre Kurchatov Institute, Protvino; Russia.
- ¹²⁴Institute for Theoretical and Experimental Physics named by A.I. Alikhanov of National Research Centre "Kurchatov Institute", Moscow; Russia.
- ¹²⁵Department of Physics, New York University, New York NY; United States of America.
- ¹²⁶Ochanomizu University, Otsuka, Bunkyo-ku, Tokyo; Japan.
- ¹²⁷Ohio State University, Columbus OH; United States of America.
- ¹²⁸Homer L. Dodge Department of Physics and Astronomy, University of Oklahoma, Norman OK; United States of America.
- ¹²⁹Department of Physics, Oklahoma State University, Stillwater OK; United States of America.
- ¹³⁰Palacký University, RCPTM, Joint Laboratory of Optics, Olomouc; Czech Republic.
- ¹³¹Institute for Fundamental Science, University of Oregon, Eugene, OR; United States of America.
- ¹³²Graduate School of Science, Osaka University, Osaka; Japan.
- ¹³³Department of Physics, University of Oslo, Oslo; Norway.
- ¹³⁴Department of Physics, Oxford University, Oxford; United Kingdom.
- ¹³⁵LPNHE, Sorbonne Université, Université de Paris, CNRS/IN2P3, Paris; France.
- ¹³⁶Department of Physics, University of Pennsylvania, Philadelphia PA; United States of America.
- ¹³⁷Konstantinov Nuclear Physics Institute of National Research Centre "Kurchatov Institute", PNPI, St. Petersburg; Russia.

- ¹³⁸Department of Physics and Astronomy, University of Pittsburgh, Pittsburgh PA; United States of America.
- ¹³⁹(^a)Laboratório de Instrumentação e Física Experimental de Partículas - LIP, Lisboa; (^b)Departamento de Física, Faculdade de Ciências, Universidade de Lisboa, Lisboa; (^c)Departamento de Física, Universidade de Coimbra, Coimbra; (^d)Centro de Física Nuclear da Universidade de Lisboa, Lisboa; (^e)Departamento de Física, Universidade do Minho, Braga; (^f)Departamento de Física Teórica y del Cosmos, Universidad de Granada, Granada (Spain); (^g)Dep Física and CEFITEC of Faculdade de Ciências e Tecnologia, Universidade Nova de Lisboa, Caparica; (^h)Instituto Superior Técnico, Universidade de Lisboa, Lisboa; Portugal.
- ¹⁴⁰Institute of Physics of the Czech Academy of Sciences, Prague; Czech Republic.
- ¹⁴¹Czech Technical University in Prague, Prague; Czech Republic.
- ¹⁴²Charles University, Faculty of Mathematics and Physics, Prague; Czech Republic.
- ¹⁴³Particle Physics Department, Rutherford Appleton Laboratory, Didcot; United Kingdom.
- ¹⁴⁴IRFU, CEA, Université Paris-Saclay, Gif-sur-Yvette; France.
- ¹⁴⁵Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz CA; United States of America.
- ¹⁴⁶(^a)Departamento de Física, Pontificia Universidad Católica de Chile, Santiago; (^b)Universidad Andres Bello, Department of Physics, Santiago; (^c)Instituto de Alta Investigación, Universidad de Tarapacá; (^d)Departamento de Física, Universidad Técnica Federico Santa María, Valparaíso; Chile.
- ¹⁴⁷Universidade Federal de São João del Rei (UFSJ), São João del Rei; Brazil.
- ¹⁴⁸Department of Physics, University of Washington, Seattle WA; United States of America.
- ¹⁴⁹Department of Physics and Astronomy, University of Sheffield, Sheffield; United Kingdom.
- ¹⁵⁰Department of Physics, Shinshu University, Nagano; Japan.
- ¹⁵¹Department Physik, Universität Siegen, Siegen; Germany.
- ¹⁵²Department of Physics, Simon Fraser University, Burnaby BC; Canada.
- ¹⁵³SLAC National Accelerator Laboratory, Stanford CA; United States of America.
- ¹⁵⁴Physics Department, Royal Institute of Technology, Stockholm; Sweden.
- ¹⁵⁵Departments of Physics and Astronomy, Stony Brook University, Stony Brook NY; United States of America.
- ¹⁵⁶Department of Physics and Astronomy, University of Sussex, Brighton; United Kingdom.
- ¹⁵⁷School of Physics, University of Sydney, Sydney; Australia.
- ¹⁵⁸Institute of Physics, Academia Sinica, Taipei; Taiwan.
- ¹⁵⁹(^a)E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi; (^b)High Energy Physics Institute, Tbilisi State University, Tbilisi; Georgia.
- ¹⁶⁰Department of Physics, Technion, Israel Institute of Technology, Haifa; Israel.
- ¹⁶¹Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv; Israel.
- ¹⁶²Department of Physics, Aristotle University of Thessaloniki, Thessaloniki; Greece.
- ¹⁶³International Center for Elementary Particle Physics and Department of Physics, University of Tokyo, Tokyo; Japan.
- ¹⁶⁴Graduate School of Science and Technology, Tokyo Metropolitan University, Tokyo; Japan.
- ¹⁶⁵Department of Physics, Tokyo Institute of Technology, Tokyo; Japan.
- ¹⁶⁶Tomsk State University, Tomsk; Russia.
- ¹⁶⁷Department of Physics, University of Toronto, Toronto ON; Canada.
- ¹⁶⁸(^a)TRIUMF, Vancouver BC; (^b)Department of Physics and Astronomy, York University, Toronto ON; Canada.
- ¹⁶⁹Division of Physics and Tomonaga Center for the History of the Universe, Faculty of Pure and Applied Sciences, University of Tsukuba, Tsukuba; Japan.

- ¹⁷⁰Department of Physics and Astronomy, Tufts University, Medford MA; United States of America.
- ¹⁷¹Department of Physics and Astronomy, University of California Irvine, Irvine CA; United States of America.
- ¹⁷²Department of Physics and Astronomy, University of Uppsala, Uppsala; Sweden.
- ¹⁷³Department of Physics, University of Illinois, Urbana IL; United States of America.
- ¹⁷⁴Instituto de Física Corpuscular (IFIC), Centro Mixto Universidad de Valencia - CSIC, Valencia; Spain.
- ¹⁷⁵Department of Physics, University of British Columbia, Vancouver BC; Canada.
- ¹⁷⁶Department of Physics and Astronomy, University of Victoria, Victoria BC; Canada.
- ¹⁷⁷Fakultät für Physik und Astronomie, Julius-Maximilians-Universität Würzburg, Würzburg; Germany.
- ¹⁷⁸Department of Physics, University of Warwick, Coventry; United Kingdom.
- ¹⁷⁹Waseda University, Tokyo; Japan.
- ¹⁸⁰Department of Particle Physics and Astrophysics, Weizmann Institute of Science, Rehovot; Israel.
- ¹⁸¹Department of Physics, University of Wisconsin, Madison WI; United States of America.
- ¹⁸²Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal; Germany.
- ¹⁸³Department of Physics, Yale University, New Haven CT; United States of America.
- ^a Also at Borough of Manhattan Community College, City University of New York, New York NY; United States of America.
- ^b Also at Centro Studi e Ricerche Enrico Fermi; Italy.
- ^c Also at CERN, Geneva; Switzerland.
- ^d Also at CPPM, Aix-Marseille Université, CNRS/IN2P3, Marseille; France.
- ^e Also at Département de Physique Nucléaire et Corpusculaire, Université de Genève, Genève; Switzerland.
- ^f Also at Departament de Física de la Universitat Autònoma de Barcelona, Barcelona; Spain.
- ^g Also at Department of Financial and Management Engineering, University of the Aegean, Chios; Greece.
- ^h Also at Department of Physics and Astronomy, Michigan State University, East Lansing MI; United States of America.
- ⁱ Also at Department of Physics and Astronomy, University of Louisville, Louisville, KY; United States of America.
- ^j Also at Department of Physics, Ben Gurion University of the Negev, Beer Sheva; Israel.
- ^k Also at Department of Physics, California State University, East Bay; United States of America.
- ^l Also at Department of Physics, California State University, Fresno; United States of America.
- ^m Also at Department of Physics, California State University, Sacramento; United States of America.
- ⁿ Also at Department of Physics, King's College London, London; United Kingdom.
- ^o Also at Department of Physics, St. Petersburg State Polytechnical University, St. Petersburg; Russia.
- ^p Also at Department of Physics, University of Fribourg, Fribourg; Switzerland.
- ^q Also at Dipartimento di Matematica, Informatica e Fisica, Università di Udine, Udine; Italy.
- ^r Also at Faculty of Physics, M.V. Lomonosov Moscow State University, Moscow; Russia.
- ^s Also at Giresun University, Faculty of Engineering, Giresun; Turkey.
- ^t Also at Graduate School of Science, Osaka University, Osaka; Japan.
- ^u Also at Hellenic Open University, Patras; Greece.
- ^v Also at IJCLab, Université Paris-Saclay, CNRS/IN2P3, 91405, Orsay; France.
- ^w Also at Institutio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona; Spain.
- ^x Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg; Germany.
- ^y Also at Institute for Mathematics, Astrophysics and Particle Physics, Radboud University Nijmegen/Nikhef, Nijmegen; Netherlands.
- ^z Also at Institute for Nuclear Research and Nuclear Energy (INRNE) of the Bulgarian Academy of

Sciences, Sofia; Bulgaria.

aa Also at Institute for Particle and Nuclear Physics, Wigner Research Centre for Physics, Budapest; Hungary.

ab Also at Institute of Particle Physics (IPP); Canada.

ac Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku; Azerbaijan.

ad Also at Instituto de Fisica Teorica, IFT-UAM/CSIC, Madrid; Spain.

ae Also at Joint Institute for Nuclear Research, Dubna; Russia.

af Also at Louisiana Tech University, Ruston LA; United States of America.

ag Also at Moscow Institute of Physics and Technology State University, Dolgoprudny; Russia.

ah Also at National Research Nuclear University MEPhI, Moscow; Russia.

ai Also at Physics Department, An-Najah National University, Nablus; Palestine.

aj Also at Physikalisches Institut, Albert-Ludwigs-Universität Freiburg, Freiburg; Germany.

ak Also at The City College of New York, New York NY; United States of America.

al Also at TRIUMF, Vancouver BC; Canada.

am Also at Universita di Napoli Parthenope, Napoli; Italy.

an Also at University of Chinese Academy of Sciences (UCAS), Beijing; China.
