HOW TO READ THE PET 600 BACKPLANE DIAGRAMS

The following documents show how the PET 600 Tomograph is laid out and wired. All the drawings are done as seen from the back of the rack.

Cables connected to bin 1 through 15 are referred to by their bin number (B#) followed by their pin strip number (P#) and then by the lowest pin number in a connector (when there is more than one connector to a strip) - see diagram "BIN 1-15 CONNECTOR LAYOUT".

Since bin 16 has no labels on the back, the pin strips are referred to by the cards the strips are connected to - see "BIN 16 CONNECTOR LAYOUT". If there is more than one connector to a strip, the connectors are numbered from 1 up to 4 starting from left to right. The connector number is shown in the lower left corner of the connector. The information denoted by an arrow (->) inside the connector tells you where that connector is connected to at the other end.

The four databus in the system are P1, A, B, and C. P1 is the decoder databus. It carries instructions from the decoder driver in bin 16 to the decoders in bin 1 through 15. A, B, and C carry data from the coincidence cards in bin 1 through 15 to the concentrator card in bin 16. All databus starts from bin 16 and split into two directions; one goes to the top half of the rack and the other goes to the bottom half of the rack (see fig. 1). The databus are terminated in the databus terminator panel located on the opposite side of the rack.

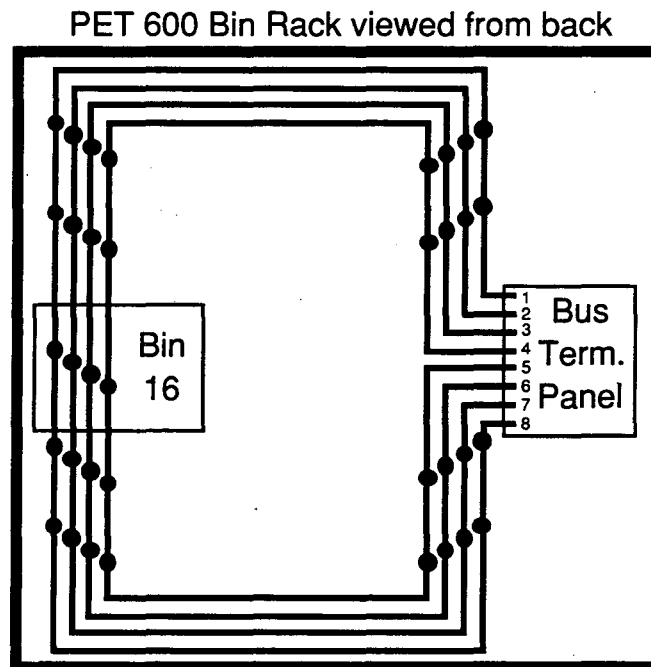

Fig. 1 (Databus Diagram)
Databus P1, A, B, and C originate from bin 16 and loop to the top and bottom through bin 1 to 15 then terminate at the Databus Terminator Panel.

HOW THE BINS INTERACT WITH EACH OTHER

In bin 1 to 15, there are a total of 12 pin strips with 13 connectors, some connectors are on the same strip. The connectors are described by their strip number (P#) and also by their lowest pin number when there is more than one connector to a strip.

P1 is connected to the decoder board which receives commands via the databus from the decoder driver in bin 16. This is how the individual decoders are controlled.

P2 and P6 are connected to the front end cards. P2 and P6 are the left right veto lines which prevent the adjacent crystals from recording the same event. The crystals within a group are internally wired for the left right veto. We use P2 and P6 connectors to connect the last crystal in a group to the first crystal in the next group.

P7 is connected to the address card. There are three connectors on this strip, P7(1), P7(18), and P7(35). Pin strip P7 has four rows of pins (the rest have only two) and the connectors are placed on the central two rows (labeled B and C) leaving the outer two rows (labeled A and D) without connections. The crystals in this group are placed in coincidence with the crystals from six other groups. Three of the six coincidence circuits are located in the local bin - the remaining three are located in three remote bins. We use strip P7 cables to carry the local crystal addresses to remote coincidence cards to form the coincidences that are not processed locally.

P10, P11, P12 are the coincidence ports that receive the remote crystal addresses. There are two connectors for each strip making a total of six connectors, P10(3), P10(41), P11(3), P11(41), P12(3), and P12(41). P10(41), P11(41), and P12(41) are individually connected to the remote address cards in coincidence with the local address card. P10(3), P11(3), and P12(3) are connected to databus A, B, and C; this connector-databus order alternates from bin to bin. P10(3), P11(3), and P12(3) send out coincidence addresses to the concentrator card in bin 16 to be processed.

P13 takes in instructions from Unloader A, B, C in bin 16. These instructions tell the bin when it is time to use the databus and when to send data to the concentrator.

DECODER(2):B3P1 & B10P1
DECODER(3):CONTROL PANEL (PG2)
CONCENTRATOR(1):CAMAC, SLOT 6 (HISTOGRAM SELECTOR)
CONCENTRATOR(2):B3P10(3) & B10P11(3)
CONCENTRATOR(3):B3P12(3) & B10P10(3)
CONCENTRATOR(4):B3P11(3) & B10P12(3)
UNLOADER A(1):ALL P13
UNLOADER A(2):ALL P13
UNLOADER B(1):ALL P13
UNLOADER B(2):ALL P13
UNLOADER C(1):ALL P13
UNLOADER C(2):ALL P13

<- Bin 16
(Bin 16 is not well labeled so the connectors are named after the boards they are attached to - see diagram "BIN 16 CONNECTOR LAYOUT". When there are more than one connector to one board, the connectors are numbered from 1 up to 4 starting from left to right. Due to lack of writing space in the chart, bin 16's board connectors are abbreviated as follow:
Decoder: D(1), D(2)
Concentrator: C(1),...,C(4)
Unloader: U(A), U(B), U(C)

'TAKE IT' RECEIVED. GOES HIGH AND STAYS HIGH UNTIL ALL COINCIDENCE CARDS SERVICED AS NEEDED.
FROM SHEET 1 A

LATCHES DATA SPECIFYING COINCIDENCE CARDS HAVING AVAILABLE DATA REQUIRING A 'SEND IT' COMMAND.
TO SHEET 1 B

FF2 IS CLOCKED AT THE END OF AN UNLOAD SEQUENCE SETTING FF1 Q HIGH ENABLING THE RESPONSE TO FOLLOWING 'TAKE IT' OR IF MULTIPLE COIN. CARDS REQUIRE PROCESSING THE RISING EDGE OF FF1 Q RESTARTS THE UNLOADING PROCESS.

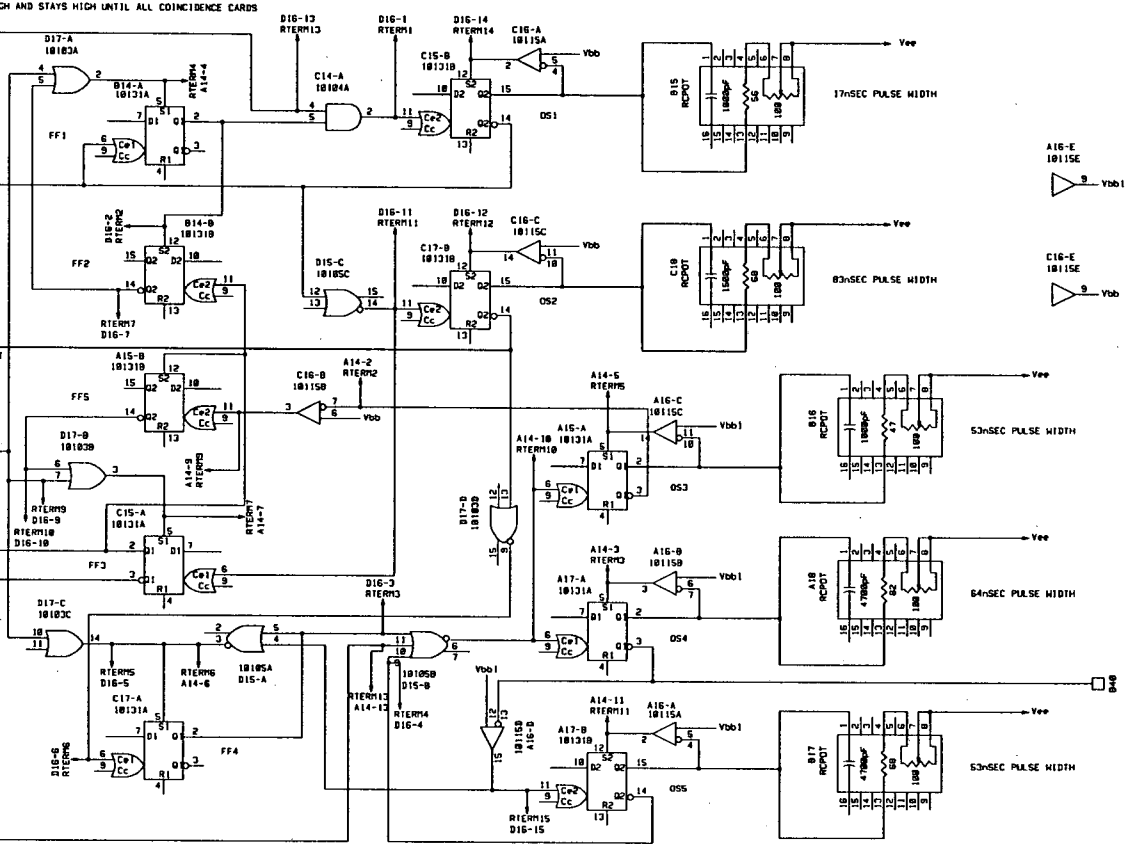

TO SHEET 2 C
CLOCKS ROTATING BOARD SELECT

GLOBAL CLEAR

TO DECODERS HIGH DISABLES LOW ALLOWS OUTPUTS TO FOLLOW INPUTS. EFFECTIVELY THIS IS 'SEND IT', PULSE WIDTH = 5 OS1 + OS2 > 100SECS. E

TO PRIORITY ENCODERS LOW ALLOWS OUTPUTS TO CHANGE HIGH LATCHES OUTPUTS.

TR FROM CONCENTRATOR

A16-E 10115E

C16-E 10115E

53mSEC PULSE WIDTH

64mSEC PULSE WIDTH

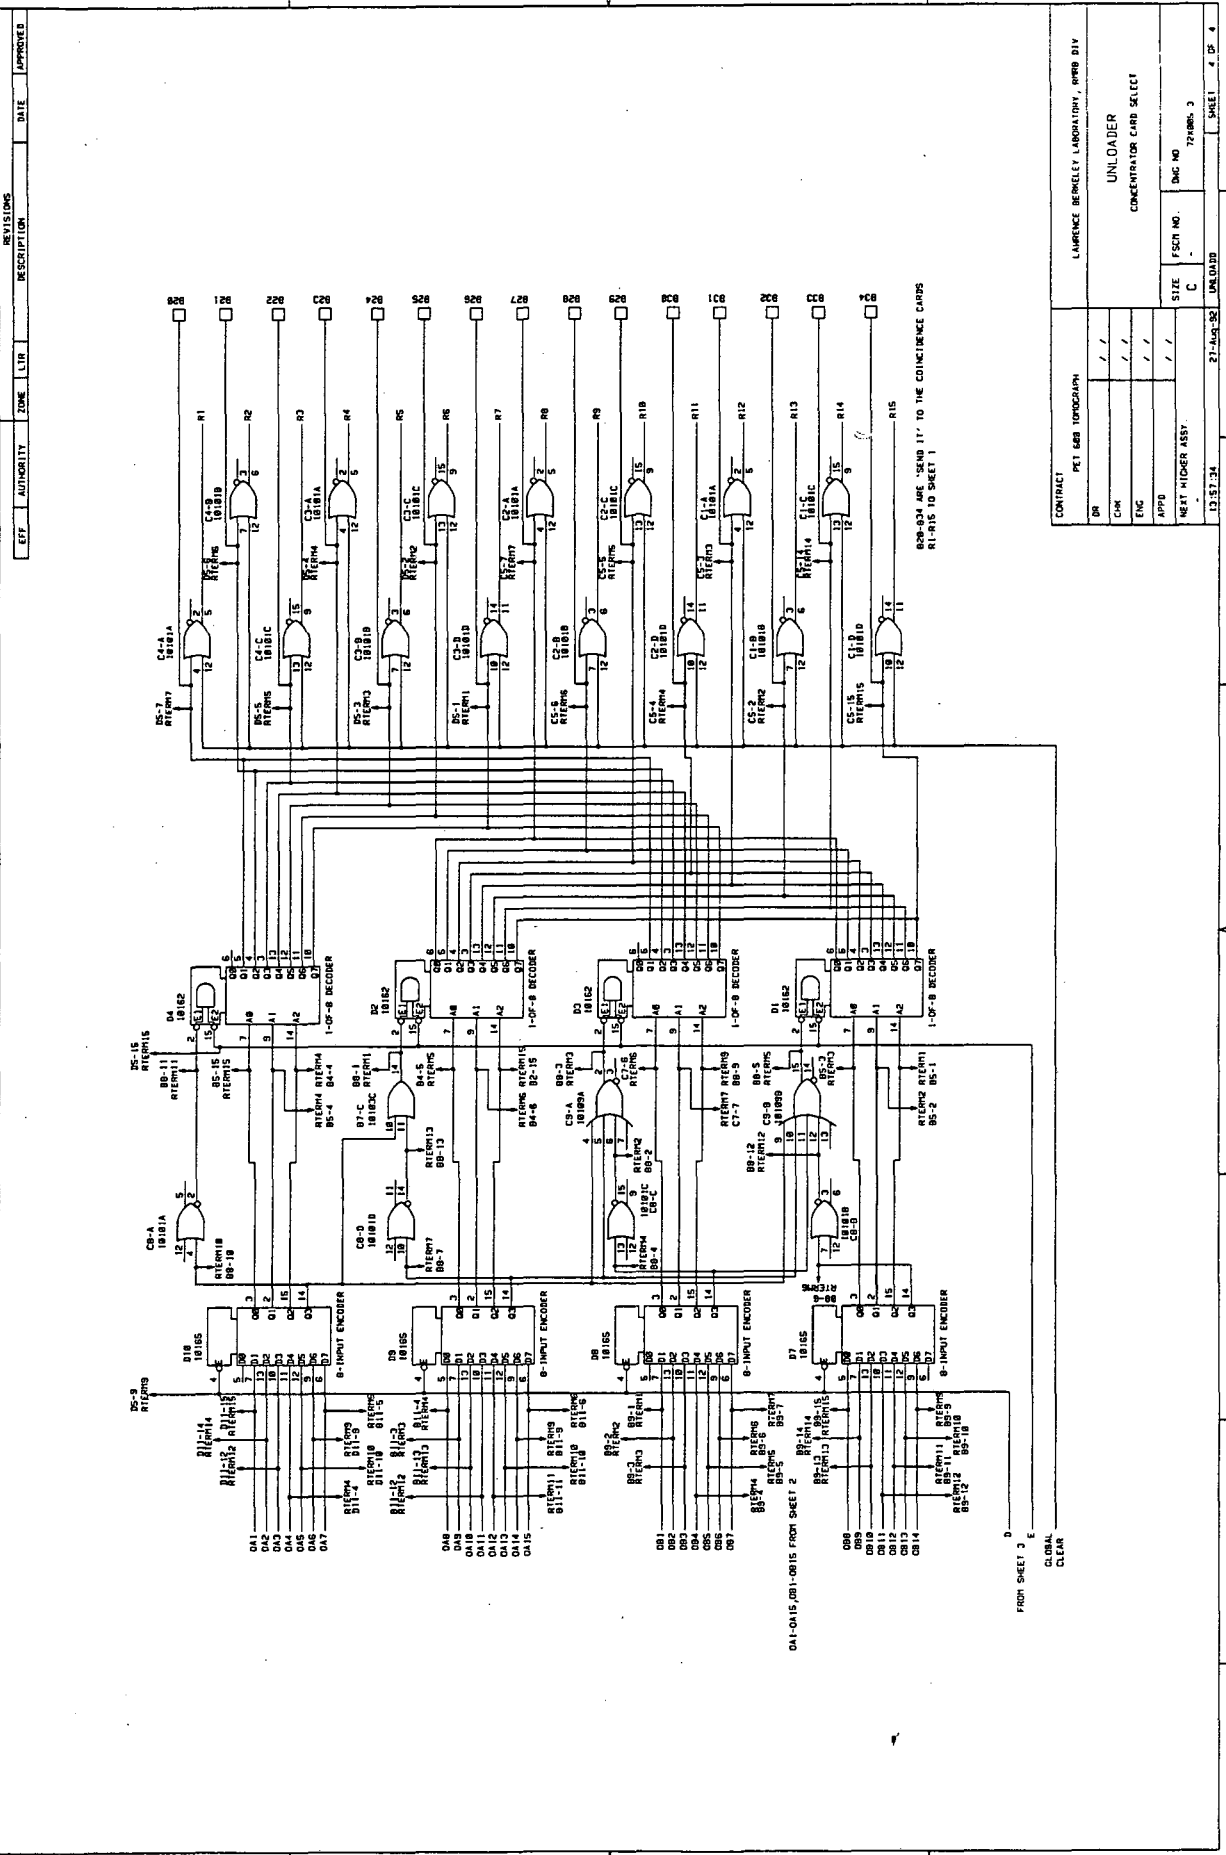

53mSEC PULSE WIDTH

OS4 PREVENTS THE GENERATION OF A LDCLK BEFORE PROPER COINCIDENCE CARD SELECTION IN RESPONSE TO THE CHANGE OF STATE OF THE CONCENTRATOR'S FIFO'S INPUT READY LINE AS LOAD CLOCK IS APPLIED. IF BOARD SELECTION IS COMPLETE AND FIFO INPUTS ARE READY THE TRAILING EDGE OF OS4 WILL GENERATE A LDCLK.
IF THE PREVIOUS LDCLK HAS FILLED THE CONCENTRATOR FIFO'S INPUT READY WILL REMAIN HIGH FOR AN UNDEFINED LENGTH OF TIME. BOARD SELECTION WILL CONTINUE. OS4 WILL TIME OUT THUS ENABLING THE GENERATION OF A LDCLK WHICH WILL OCCUR WHEN INPUT READY GOES LOW AS FIFO'S ARE UNLCKED.

LDCLK TO CONCENTRATOR
