INTRODUCTION

This is a list and index of unclassified UCRL Reports published by the Lawrence Radiation Laboratory, University of California at Berkeley, California in 1960. It does not include (1) Reports published by the Laboratory at Livermore, California, (2) Reports prepared for intra-Laboratory distribution only, or (3) Security classified reports.

Translations made or ordered made by Lawrence Radiation Laboratory Berkeley, are included and are indicated by the abbreviation "Trans" in the report number.

Reports included in this volume are those which were cited in the 1960 issues of "Unclassified Reports Title List" (UCRL-12000, Vol. 2). Since there is a slight lag between the date when a report is published and the date when its title appears in UCRL-12000, a few reports published in late 1959 appear in this index and similarly a few published in late 1960 do not appear. Frequently the date of the report (the one shown on the report) is considerably earlier than the date of publication (distribution).

This index is divided into two sections. The first section consists of the complete report citation arranged under broad subject divisions (see Table of Contents) and subarranged within the divisions by report number. Slight changes have been made in some titles to verbalize symbols or to suit limited punctuation facility of the computer used to prepare this index. Please note in some cases when a title is poor or meaningless for a subject approach (Keyword-In-Context), it has been necessary to add words or phrases

to best describe the subject content of the report. These words or phrases are enclosed in parentheses and added to the line below the original title. The information given in parenthesis is not to be confused in a citation with the report title. The second section of this list is a subject-author and report number index to the citations appearing in the first section. This index is prepared on the IBM 1401 by the arrangement of authors and words within the report title in alphabetical order. These words and names are shifted alphabetically to a central position on the page. In addition to the entry title word or author's name each line of the index contains the remainder of the entry up to a total of sixty characters and spaces. About 350 recurring non-significant words that may appear in report titles are not included as index entries.

Section I of this list can be used for scanning purposes, and Section II for the location of specific information by author, subject, or report number.

In Section I all citations are assigned a consecutive serial number. The same serial number is assigned to each index entry for a given report. The first three digits of the serial number are the identifying figures for a particular report. For example 099 60, ... 099 is the reference number for the 99th report in Section I; the last two digits, 60, refer to the 1960 volume of this index series.

In order to accomodate computer limitations, some titles have been edited to verbalize certain symbols and characters to substitute for certain marks of punctuation, to avoid confusing alpha-numeric notations, or to expand titles made up of words insufficiently descriptive of the subjects treated.

This volume is the first one of a new series. If it meets needs as expected and is well received, we intend to publish a 1961 volume soon and then perhaps one for 1959. Suggestions for improvements are welcome and should be addressed to the Information Division, Lawrence Radiation Laboratory, Berkeley.

SECTION II

INDEX

This section is an alphabetical and numerical arrangement of the title words, authors' names and report numbers from report entries that appear in Section I. Each title is rearranged by a computer program so that authors' names and words within a report title appear alphabetically in a central position on each page. The entry word is displayed in the context in which it appears in the title. Authors' names are interfiled with title words.

To locate specific topics of interest, the reader need only look for words that would be appropriate to his topic and note their meaning within the title. When interest is confirmed, the serial identification at the left hand side of entry is noted and the citation is located in Section I where the full report information is given. The subject-author index is not intended for page by page scanning.

Note that looking in several places is usually required, e. g. proton, antiproton, meson, K meson, AU and gold. Those interested in quantitative information such as 2 Bev experiments should look under Bev. No effort has been made for single entry of synonyms. The user should try all the various possible significant entry words describing or related to his subject interest. Note that some prefix words such as nonideal and postirradiation appear in the index.

Minor irregularities in the alpha-numeric order of the index entries such as the seemingly random author entries for the several Messrs. Smith are due to the order rules followed by the computer.

The UCRL-Report number index follows the subject-author index.
