Table 3.

Remicade (infliximab) [3, 4, 14]

Initial Visit:

History and Physical

- History of CHF?
- History of malignancy or serious infections (hepatitis, TB, HIV, other)?
- History or family history of multiple sclerosis?
- History of other neurological disease including seizure disorders?
- History of COPD and smoking?
- Total body skin exam for skin cancer
- Check for HSM, cervical/axillary/inguinal lymphadenopathy
- History of diabetes?
- Have you lived in Southwest (risk of coccidiomycosis) or Southeast – Ohio and Mississippi River Valleys (risk of histoplasmosis or blastomycosis)?
- Travel to area endemic for TB?
- Live vaccine within past month – you or household member?
- Medications: Anakinra; cyclosporine; abatacept; natalizumab; other anti-TNF agents; rituximab; methotrexate; corticosteroids; cyclophosphamide (increased risk of solid malignancies in Wegener’s granulomatosis); warfarin (levels can be decreased by anti-TNF agents)
- Wegener’s granulomatosis? (increased risk of malignancy with Remicade)
- Major surgery in next month?
- Active infection? Hold dose for infection or sepsis
- For Enbrel - History of alcoholism? (increased mortality in alcoholic hepatitis)

Labs

- CBC, CMP
- TB test (for PPD, consider >5mm as positive)
- Hepatitis B screen: Hepatitis B sAg, Hepatitis B sAb, Hepatitis B cAb
- Influenza vaccine (if flu season)
- Baseline ANA (optional)
- HIV (optional) – especially with erythrodermic psoriasis
- Cardiovascular risk panel: CRP, homocysteine, HbA1C, lipid profile (if screening for psoriasis) (optional)
- Pneumovax (optional)

Administration Considerations

- Pre-medicate with acetaminophen and antihistamines
Have acetaminophen, antihistamines, corticosteroids, and/or epinephrine available for immediate use

Counseling/Other

- Infusion reaction – ANAPHYLAXIS (e.g., angioedema; bronchospasm; hypotension), serum sickness-like reaction (polyarthralgias, myalgia, fever, rash, headache, sore throat, dysphagia, hand and facial edema), seizure
- Risk of anaphylaxis if previously had Remicade more than 6 months prior
- Can worsen existing malignancies
- Malignancy:
  - Non-Hodgkin's lymphoma and Hodgkin's disease; breast, colorectal, melanoma, acute and chronic leukemia
  - Lymphoma and other malignancies in children and adolescents
  - Non-melanoma skin cancer with prior phototherapy
  - If h/o COPD and smoking, risk of lung or head and neck malignancy
  - Hepatosplenic T-cell lymphoma - all in Crohn's or ulcerative colitis, mostly adolescent or young adult males AND azathioprine or 6-mercaptopurine at or prior to diagnosis (although rheumatologists frequently use this combination)
- Risk of reactivation of latent TB
  - Risk is higher with TNF-blocking monoclonal antibodies than with Enbrel
- Serious, sometimes fatal, infection (especially with methotrexate or corticosteroids): bacterial (including sepsis), mycobacterial, invasive fungal, viral, and opportunistic infections, such as tuberculosis (including reactivation), histoplasmosis, coccidioidomycosis, candidiasis, aspergillosis, blastomycosis, pneumocystosis, listeriosis
- Exacerbation or new onset of demyelinating disease, e.g., multiple sclerosis, seizure disorder
  - Rare cases of optic neuritis, seizure, CNS manifestations of systemic vasculitis, peripheral demyelinating disorders such as Guillain-Barre syndrome; Caution with pre-existing demyelinating or seizure disorders
- Can worsen moderate to severe heart failure or cause new-onset heart failure
- May lower incidence of coronary artery disease (a benefit)
- Loss of efficacy can occur with time, which is sometimes prevented with coadministration of low-dose methotrexate.¹⁴
- Works fast (PASI 50 at week 2)¹⁴ (a benefit)
- Lupus-like syndrome
- Reactivation of hepatitis B
- Hepatotoxicity - acute liver failure, jaundice, hepatitis, cholestasis, autoimmune hepatitis
- Incidence of elevated liver enzymes and liver complications is somewhat higher with Remicade than with other TNF-alpha inhibitors.⁴
Cytopenias: pancytopenia, aplastic anemia, leucopenia, thrombocytopenia
Avoid live vaccines – self and household members
Pediatric Patients: Up to date on vaccines before starting?
Formation of anti-Remicade antibodies after drug-free intervals of >16 weeks, lower incidence in those taking methotrexate concomitantly, associated with decreased efficacy
If you have diabetes, there is higher chance for infection.
For Enbrel - If you have diabetes, there is a risk for hypoglycemia and a higher chance for infection when serum glucose is poorly controlled
For Simponi and Remicade - New-onset or worsening psoriasis
For Cimzia - Erroneously elevated aPPT tests
For Cimzia - Intestinal obstruction (with Crohn's patients)

Follow-up Visit:

History and Physical

Every six months: Total body skin exam for skin cancer
Every six months: Check for HSM, cervical/axillary/inguinal lymphadenopathy
Any new infection – hold dose for active infection or sepsis
When was last dose (< 6 months?) – risk for anaphylaxis if > 6 months?
Is there sustained clinical efficacy in the treatment interval? Skin? Joints?
Any signs of heart failure
Major surgery in next month?
Other interval history

Labs

Every visit for first 4 infusions, then approximately every three months: CBC, CMP
Every year: TB test (consider induration of >5mm as positive)
Influenza vaccine annually (in flu season)
Pre-medicate with acetaminophen and antihistamines
In HBV carriers, check liver panel for laboratory signs of hepatitis B reactivation
ANA and anti-ds-DNA (if lupus-like symptoms)

Other

Any live vaccines in past month?
Any household members getting live vaccine?
