- Tstop9:** stop pair production with equal probability of the stop decaying via  $\tilde{t} \rightarrow c\tilde{\chi}_1^0$  or via the four-body decay  $\tilde{t} \rightarrow bff'\tilde{\chi}_1^0$  where  $f$  represents a lepton or a quark.
- Tstop10:** stop pair production with  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0 \rightarrow (f\bar{f}') + \tilde{\chi}_1^0$  with a virtual  $W$ -boson.
- Tstop11:** stop pair production with  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm$  decaying through an intermediate slepton to  $l\nu\tilde{\chi}_1^0$ .
- Tstop12:** stop pair production with  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  and  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ .
- Tstop13:** stop pair production with  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  where the  $\tilde{\chi}_1^0$  can decay with equal probability to  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$  or to  $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$ .
- Tstop14:** stop pair production with wino-like couplings to electroweakinos, that is:  $\tilde{t} \rightarrow t\tilde{\chi}_{1,2}^0$  with BR 33%,  $\tilde{g} \rightarrow b\tilde{\chi}_1^\pm$  with BR 67%.
- Tstop15:** stop pair production with higgsino-like couplings to electroweakinos, that is:  $\tilde{t} \rightarrow t\tilde{\chi}_{1,2}^0$  with BR 50%,  $\tilde{g} \rightarrow b\tilde{\chi}_1^\pm$  with BR 50%.
- Tstop16:** stop pair production with  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ , followed either by  $\tilde{\chi}_1^\pm \rightarrow \nu_\tau\tilde{\tau}_1$  and  $\tilde{\tau}_1 \rightarrow \tau\tilde{\chi}_1^0$ , or by  $\tilde{\chi}_1^\pm \rightarrow \tau\tilde{\nu}_\tau$  and  $\tilde{\nu}_\tau \rightarrow \nu\tilde{\chi}_1^0$ , each with BR 50%.
- Tstop1RPV:** stop pair production with  $\tilde{t} \rightarrow \tilde{b}\tilde{s}$  via RPV coupling  $\lambda''_{323}$ .
- Tstop2RPV:** stop pair production with  $\tilde{t} \rightarrow b\tilde{t}$ , via RPV coupling  $\lambda''_{333}$ .
- Tstop3RPV:** stop pair production with  $\tilde{t} \rightarrow q\mu$ , via RPV coupling  $\lambda''_{23k}$ .
- Tstop4RPV:** stop pair production with  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ ,  $\tilde{\chi}_1^\pm \rightarrow bbs$  via RPV coupling  $\lambda''_{323}$ .
- Tstop5RPV:** stop pair production with  $\tilde{t} \rightarrow t\tilde{\chi}_{1,2}^0$ ,  $\tilde{\chi}_{1,2}^0 \rightarrow tbs$  via RPV coupling  $\lambda''_{323}$ .
- Tsbot1:** sbottom pair production with  $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ .
- Tsbot2:** sbottom pair production with  $\tilde{b} \rightarrow t\tilde{\chi}_1^-, \tilde{\chi}_1^- \rightarrow W^-\tilde{\chi}_1^0$ .
- Tsbot3:** sbottom pair production with  $\tilde{b} \rightarrow b\tilde{\chi}_2^0$ , where one of the  $\tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0 \rightarrow f\bar{f}\tilde{\chi}_1^0$  and the other  $\tilde{\chi}_2^0 \rightarrow \tilde{\ell}\ell^+ \rightarrow \ell^+\ell^-\tilde{\chi}_1^0$ .
- Tsbot4:** sbottom pair production with  $\tilde{b} \rightarrow b\tilde{\chi}_2^0$ , with  $\tilde{\chi}_2^0 \rightarrow H\tilde{\chi}_1^0$ .
- Tchi1chi1A:** electroweak pair and associated production of nearly mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_1^0$ , where  $\tilde{\chi}_1^\pm$  decays to  $\tilde{\chi}_1^0$  plus soft radiation, and where one of the  $\tilde{\chi}_1^0$  decays to  $\gamma + \tilde{G}$  while the other one decays to  $Z/H + \tilde{G}$  (with equal probability).
- Tchi1chi1B:** electroweak pair production of charginos  $\tilde{\chi}_1^\pm$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate slepton or sneutrino to  $l\nu\tilde{\chi}_1^0$  and where the slepton or sneutrino mass is 5%, 25%, 50%, 75% and 95% of the  $\tilde{\chi}_1^\pm$  mass.
- Tchi1chi1C:** electroweak pair production of charginos  $\tilde{\chi}_1^\pm$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate slepton or sneutrino to  $l\nu\tilde{\chi}_1^0$  and where  $m_{\tilde{l},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$ .
- Tchi1chi1D:** electroweak associated pair production of charginos  $\tilde{\chi}_1^\pm$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate scalar tau lepton or sneutrino to  $\tau\nu\tilde{\chi}_1^0$  and where  $m_{\tilde{\tau}}, m_{\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$ .
- Tchi1chi1F:** electroweak pair and associated production of nearly mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_1^0$  (i.e.  $\tilde{\chi}_1^\pm\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_1^\pm\tilde{\chi}_1^0$  production) where the  $\tilde{\chi}_1^\pm$  decays exclusively to  $\tilde{\chi}_1^0$  plus soft radiation and the  $\tilde{\chi}_1^0$  decays to  $\gamma/Z + \tilde{G}$ .
- Tchi1chi1G:** electroweak pair production of charginos  $\tilde{\chi}_1^\pm$ , which are nearly mass-degenerate with neutralinos  $\tilde{\chi}_1^0$ . The  $\tilde{\chi}_1^\pm$  decays either to  $W^\pm + \tilde{G}$ , or to  $\tilde{\chi}_1^0$  plus soft radiation. The  $\tilde{\chi}_1^0$  decays exclusively to  $\gamma + \tilde{G}$ .
- Tchi1chi1H:** electroweak pair production of charginos  $\tilde{\chi}_1^\pm$ , with  $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{\chi}_1^0$  and  $W^\pm \rightarrow \ell^\pm + \nu$ .
- Tchi1chi1I:** electroweak pair production of charginos  $\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$  and  $W^\pm \rightarrow q\bar{q}'$ .
- Tchi1n1A:** electroweak associated production of mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_1^0$ , where  $\tilde{\chi}_1^\pm$  decays exclusively to  $W^\pm + \tilde{G}$  and  $\tilde{\chi}_1^0$  decays exclusively to  $\gamma + \tilde{G}$ .
- Tchi1n2A:** electroweak associated production of mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate slepton or sneutrino to  $l\nu\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate slepton or sneutrino to  $l^+\ell^-\tilde{\chi}_1^0$  or  $\nu\bar{\nu}\tilde{\chi}_1^0$ .
- Tchi1n2B:** electroweak associated production of mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate slepton or sneutrino to  $l\nu\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate slepton or sneutrino to  $l^+\ell^-\tilde{\chi}_1^0$  or  $\nu\bar{\nu}\tilde{\chi}_1^0$  and where the slepton or sneutrino mass is 5%, 25%, 50%, 75% and 95% of the  $\tilde{\chi}_1^\pm$  mass.

- Tchi1n2C:** electroweak associated production of mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate slepton or sneutrino to  $l\nu\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate slepton or sneutrino to  $l^+l^-\tilde{\chi}_1^0$  or  $\nu\bar{\nu}\tilde{\chi}_1^0$  and where  $m_{\tilde{l},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$ .
- Tchi1n2D:** electroweak associated production of mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate scalar tau lepton or sneutrino to  $\tau\nu\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate scalar tau lepton or sneutrino to  $\tau^+\tau^-\tilde{\chi}_1^0$  or  $\nu\bar{\nu}\tilde{\chi}_1^0$  and where  $m_{\tilde{\tau},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$ .
- Tchi1n2E:** electroweak associated production of mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{\chi}_1^0$  and  $\tilde{\chi}_2^0 \rightarrow H + \tilde{\chi}_1^0$ .
- Tchi1n2F:** electroweak associated production of mass-degenerate wino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate  $W^{**}$  to  $l\nu\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate  $Z^*$  to  $l^+l^-\tilde{\chi}_1^0$  or  $\nu\bar{\nu}\tilde{\chi}_1^0$ .
- Tchi1n2Fa:** electroweak associated production of mass-degenerate wino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate  $W^{**}$  to  $q\bar{q}\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate  $Z^*$  to  $l^+l^-\tilde{\chi}_1^0$  or  $\nu\bar{\nu}\tilde{\chi}_1^0$ .
- Tchi1n2Fb:** electroweak associated production of mass-degenerate wino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate  $W^{(*)}$  to  $q\bar{q}\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate  $Z^{(*)}$  to  $q\bar{q}\tilde{\chi}_1^0$ .
- Tchi1n2Fc:** electroweak associated production of mass-degenerate wino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate  $W^{(*)}$  to  $q\bar{q}\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate  $H^{(*)}$  to  $q\bar{q}\tilde{\chi}_1^0$ .
- Tchi1n2G:** electroweak associated production of Higgsino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , and electroweak associated production of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^0$ , where  $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})/2$  and where  $\tilde{\chi}_1^\pm$  decays through an intermediate  $W^{**}$  to  $q\bar{q}\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate  $Z^*$  to  $l^+l^-\tilde{\chi}_1^0$ .
- Tchi1n2Ga:** electroweak associated production of Higgsino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , and electroweak associated production of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^0$ , where  $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})/2$  and where  $\tilde{\chi}_1^\pm$  decays through an intermediate  $W^{**}$  to  $l\nu\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate  $Z^*$  to  $l^+l^-\tilde{\chi}_1^0$ .
- Tchi1n2H:** electroweak associated production of mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  decays through an intermediate slepton or sneutrino to  $l\nu\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate scalar tau lepton or sneutrino to  $\tau^+\tau^-\tilde{\chi}_1^0$  or  $\nu\bar{\nu}\tilde{\chi}_1^0$ .
- Tchi1n2I:** electroweak associated production of mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  decays to  $W^\pm + \tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays 50% of the time to  $Z + \tilde{\chi}_1^0$  and 50% of the time to  $H + \tilde{\chi}_1^0$ .
- Tchi1n12\_GGM:** in the framework of General Gauge Mediation (GGM): electroweak pair and associated production of nearly mass-degenerate charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_1^0, \tilde{\chi}_2^0$  (i.e.  $\tilde{\chi}_1^\pm\tilde{\chi}_1^0, \tilde{\chi}_1^\pm\tilde{\chi}_2^0$  production) where the  $\tilde{\chi}_1^\pm$  decays exclusively to  $W^\pm + \tilde{G}$ , the  $\tilde{\chi}_2^0$  decays to  $Z/H + \tilde{G}$  and the  $\tilde{\chi}_1^0$  decays to  $\gamma/Z + \tilde{G}$ . The branching ratios depend on the composition of the gauge eigenstates of the neutralinos in the GGM scenario.
- TwinoLSPBL:** Electroweak pair production of wino-like  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_1^0$  (i.e.  $\tilde{\chi}_1^\pm\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_1^0\tilde{\chi}_1^0$ ). The  $\tilde{\chi}_1^\pm$  can decay via bi-linear RPV into  $Zl, Hl$  or  $W\nu$ ; the  $\tilde{\chi}_1^0$  can decay into  $Z\nu, H\nu$  or  $Wl$ .
- Tn1n1A:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_1^0$  and  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0$  decay to  $\tilde{\chi}_1^0$  plus soft radiation and where both of the  $\tilde{\chi}_1^0$  decay to  $H + \tilde{G}$ .
- Tn1n1B:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_1^0$  and  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0$  decay to  $\tilde{\chi}_1^0$  plus soft radiation and where the  $\tilde{\chi}_1^0$  decays 50% of the time to  $H + \tilde{G}$  and 50 % of the time to  $Z + \tilde{G}$ .
- Tn1n1C:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_1^0$  and  $\tilde{\chi}_2^0$ , where  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0$  decay to  $\tilde{\chi}_1^0$  plus soft radiation and where both of the  $\tilde{\chi}_1^0$  decay to  $Z + \tilde{G}$ .

- Tn1n1D:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_1^0, \tilde{\chi}_2^0$ .
- Tn1n1E:** electroweak pair and associated production of nearly mass-degenerate wino-like charginos  $\tilde{\chi}_1^\pm$  and neutralinos  $\tilde{\chi}_1^0$ .
- Tn1n2A:** electroweak associated production of nearly mass-degenerate neutralinos  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$ , where the  $\tilde{\chi}_2^0$  always decays to  $\gamma + \tilde{G}$  and  $\tilde{\chi}_3^0$  50% of the time to  $H + \tilde{G}$  and 50 % of the time to  $Z + \tilde{G}$ .
- Tn2n3A:** electroweak associated production of mass-degenerate neutralinos  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$ , where  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$  decay through intermediate sleptons to  $l^+l^-\tilde{\chi}_1^0$  and where the slepton mass is 5%, 25%, 50%, 75% and 95% of the  $\tilde{\chi}_2^0$  mass.
- Tn2n3B:** electroweak associated production of mass-degenerate neutralinos  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$ , where  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$  decay through intermediate sleptons to  $l^+l^-\tilde{\chi}_1^0$  and where  $m_{\tilde{l}} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_3^0})/2$ .

- TWinoBinoA:** electroweak pair production of mass-degenerate wino-like doublet  $(\tilde{\chi}_2^0, \tilde{\chi}_1^\pm)$  (including all pair-production mechanisms) decaying into a bino singlet ( $\tilde{\chi}_1^0$ ). Decays happen via Standard Model bosons, assumed to decay via hadrons.
- TWinoHinoA:** electroweak pair production of mass-degenerate wino-like doublet  $(\tilde{\chi}_3^0, \tilde{\chi}_2^\pm)$  (including all possible pair-production mechanisms) decaying into a quasi-mass-degenerate Higgsino triplet  $(\tilde{\chi}_1^0, \tilde{\chi}_2^0, \tilde{\chi}_1^\pm)$ . Decays happen via Standard Model bosons, assumed to decay via hadrons.
- THinoBinoA:** electroweak pair production of quasi-mass-degenerate higgsino-like triplet  $(\tilde{\chi}_2^0, \tilde{\chi}_3^0, \tilde{\chi}_1^\pm)$  (including all possible pair-production mechanisms) decaying into a bino singlet ( $\tilde{\chi}_1^0$ ). Decays happen via Standard Model bosons, assumed to decay via hadrons.
- THinoWinoA:** electroweak pair production of quasi-mass-degenerate higgsino-like triplet  $(\tilde{\chi}_2^0, \tilde{\chi}_3^0, \tilde{\chi}_1^\pm)$  (including all possible pair-production mechanisms) decaying into a mass-degenerate wino doublet  $(\tilde{\chi}_1^0, \tilde{\chi}_1^\pm)$ . Decays happen via Standard Model bosons, assumed to decay via hadrons.

### $\tilde{\chi}_1^0$ (Lightest Neutralino) mass limit

$\tilde{\chi}_1^0$  is often assumed to be the lightest supersymmetric particle (LSP). See also the  $\tilde{\chi}_2^0, \tilde{\chi}_3^0, \tilde{\chi}_4^0$  section below.

We have divided the  $\tilde{\chi}_1^0$  listings below into five sections:

- 1) Accelerator limits for stable  $\tilde{\chi}_1^0$ ,
- 2) Bounds on  $\tilde{\chi}_1^0$  from dark matter searches,
- 3)  $\tilde{\chi}_1^0 - p$  elastic cross section (spin-dependent, spin-independent interactions),
- 4) Other bounds on  $\tilde{\chi}_1^0$  from astrophysics and cosmology, and
- 5) Unstable  $\tilde{\chi}_1^0$  (Lightest Neutralino) mass limit.

### Accelerator limits for stable $\tilde{\chi}_1^0$

Unless otherwise stated, results in this section assume spectra, production rates, decay modes, and branching ratios as evaluated in the MSSM, with gaugino and sfermion mass unification at the GUT scale. These papers generally study production of  $\tilde{\chi}_i^0\tilde{\chi}_j^0$  ( $i \geq 1, j \geq 2$ ),  $\tilde{\chi}_1^+\tilde{\chi}_1^-$ , and (in the case of hadronic collisions)  $\tilde{\chi}_1^+\tilde{\chi}_2^0$  pairs. The mass limits on  $\tilde{\chi}_1^0$  are either direct, or follow indirectly from the constraints set by the non-observation of  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0$  states on the gaugino and higgsino MSSM parameters  $M_2$  and  $\mu$ . In some cases, information is used from the nonobservation of slepton decays.

Obsolete limits obtained from  $e^+e^-$  collisions up to  $\sqrt{s}=184$  GeV have been removed from this compilation and can be found in the 2000 Edition (The European Physical Journal **C15** 1 (2000)) of this Review.  
 $\Delta m = m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$

<sup>1</sup> LEES 23c search in  $398 \text{ fb}^{-1}$  of  $e^+e^-$  annihilations at 10.58 GeV for SUSY in events with a tagged  $B$  meson and one and only one charged track that must be consistent with the hypothesis of being a proton. The results are interpreted in an RPV SUSY model, where a neutralino is produced in the decay of a  $B$  meson into a neutralino and a proton with the RPV coupling  $\lambda'_{113}$ . A branching fraction upper limit is determined for the  $\lambda'_{113}$  coupling, divided by the relevant squark mass squared as a function of the neutralino mass, see their figure 6. They also search for a new dark sector antibaryon that could be produced in decays of  $B$  mesons.

<sup>2</sup> AAD 22e searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for supersymmetry by measuring the yield asymmetry between events containing  $e^- \mu^+$  and those containing  $e^+ \mu^-$ . This was found in agreement with the standard model prediction of 1. Limits are set on the RPV production of  $t \tilde{\mu}_L$  events with  $\tilde{\mu}_L \rightarrow \mu \tilde{\chi}_1^0$  for various values of  $\lambda'_{231}$ , see their figures 6 and 7.

<sup>3</sup> TUMASYAN 22s searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for evidence of electroweakino pair production in events with three or four leptons, with up to two hadronically decaying  $\tau$  leptons, or two same-sign light leptons ( $e$  or  $\mu$ ). No significant excess above the Standard Model expectations is observed. Limits are set on the mass of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  in the models Tchi1n2B (in flavory-democratic and tau-enriched or -dominated scenarios), Tchi1n2E, Tchi1n2F, see their Figures 16–20, and on the mass of the higgsino-triplet  $\tilde{\chi}_2^0$ ,  $\tilde{\chi}_1^\pm$ , and  $\tilde{\chi}_1^0$  in the models Tn1n1A, Tn1n1B, and Tn1n1C, see their Figure 21.

<sup>4</sup> TUMASYAN 22v searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for evidence of electroweakino pair production with decay to two Higgs bosons  $H$ , with  $H \rightarrow b\bar{b}$ , resulting either in 4 resolved  $b$ -jets or two large-radius jets, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  in the models Tn1n1A, see their Figures 11 and 12, or in a model where higgsino-like nearly mass degenerate  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$  are pair produced and each decay to  $H$  and a bino-like  $\tilde{\chi}_1^0$ , see their Figure 13. Limits are also set on the gluino mass in the model Tglu11, see their Figure 14.

<sup>5</sup> AAD 21Ax searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for pair production of electroweakinos decaying to the LSP via the emission of Standard Model bosons (Higgs,  $W$ ,  $Z$ ) decaying into hadrons. The final state in all cases characterised by the presence of  $\cancel{E}_T$ , jets, and large-R jets tagged according to the boson of interest. Different assumptions (Higgsino, Wino, Bino) are made for the pair produced electroweakinos and for the LSP multiplet. No significant excess above the Standard Model predictions is observed. Limits are set on the electroweakino masses as a function of the model parameters (in particular  $m_{\tilde{\chi}_3^0}$ ). See Fig. 16.

<sup>6</sup> AAD 21BF searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for pair production of gluinos, stops, electroweakinos decaying RPV either directly or indirectly via the LSP. The final state in all cases is one or two leptons, many jets (up to fifteen) and  $b$ -jets. Different models with different branching fractions of the gluino or stop follow from the assumptions on the nature of the electroweakinos. No significant excess above the Standard Model predictions is observed. Limits are set on the  $gluino$ ,  $\tilde{t}_1$ , electroweakino masses as a function of the  $\tilde{\chi}_1^0$  mass in several scenarios of gluino, stop and electroweakino pair production.

<sup>7</sup> DREINER 09 show that in the general MSSM with non-universal gaugino masses there exists no model-independent laboratory bound on the mass of the lightest neutralino. An essentially massless  $\tilde{\chi}_1^0$  is allowed by the experimental and observational data, imposing some constraints on other MSSM parameters, including  $M_2$ ,  $\mu$  and the slepton and squark masses.

<sup>8</sup> ABBIENDI 04H search for charginos and neutralinos in events with acoplanar leptons+jets and multi-jet final states in the 192–209 GeV data, combined with the results on leptonic final states from ABBIENDI 04. The results hold for a scan over the parameter space covering the region  $0 < M_2 < 5000$  GeV,  $-1000 < \mu < 1000$  GeV and  $\tan\beta$  from 1 to 40. This limit supersedes ABBIENDI 00H.

<sup>9</sup> HEISTER 04 data collected up to 209 GeV. Updates earlier analysis of selectrons from HEISTER 02e, includes a new analysis of charginos and neutralinos decaying into stau and uses results on charginos with initial state radiation from HEISTER 02j. The limit is based on the direct search for charginos and neutralinos, the constraints from the slepton search and the Higgs mass limits from HEISTER 02 using a top mass of 175 GeV, interpreted in a framework with universal gaugino and sfermion masses. Assuming the mixing in the stau sector to be negligible, the limit improves to 43.1 GeV. Under the assumption of MSUGRA with unification of the Higgs and sfermion masses, the limit improves to 50 GeV, and reaches 53 GeV for  $A_0 = 0$ . These limits include and update the results of BARATE 01.

<sup>10</sup> ABDALLAH 03M uses data from  $\sqrt{s} = 192$ –208 GeV. A limit on the mass of  $\tilde{\chi}_1^0$  is derived from direct searches for neutralinos combined with the chargino search. Neutralinos are searched in the production of  $\tilde{\chi}_1^0 \tilde{\chi}_2^0$ ,  $\tilde{\chi}_1^0 \tilde{\chi}_3^0$ , as well as  $\tilde{\chi}_2^0 \tilde{\chi}_3^0$  and  $\tilde{\chi}_2^0 \tilde{\chi}_4^0$  giving rise to cascade decays, and  $\tilde{\chi}_1^0 \tilde{\chi}_2^0$  and  $\tilde{\chi}_1^0 \tilde{\chi}_3^0$ , followed by the decay  $\tilde{\chi}_2^0 \rightarrow \tilde{\tau} \tau$ . The results hold for the parameter space defined by values of  $M_2 < 1$  TeV,  $|\mu| \leq 2$  TeV with the  $\tilde{\chi}_1^0$  as LSP. The limit is obtained for  $\tan\beta = 1$  and large  $m_0$ , where  $\tilde{\chi}_2^0 \tilde{\chi}_4^0$  and chargino pair production are important. If the constraint from Higgs searches is also imposed, the limit improves to 49.0 GeV in the  $m_h^{\text{max}}$  scenario with  $m_t = 174.3$  GeV. These limits update the results of ABREU 00j.

<sup>11</sup> ABDALLAH 03M uses data from  $\sqrt{s} = 192$ –208 GeV. An indirect limit on the mass of  $\tilde{\chi}_1^0$  is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays and  $\tilde{\tau} \tau$  final states), for charginos (for all  $\Delta m_+$ ) and for sleptons, stop and sbottom. The results hold for the full parameter space defined by values of  $M_2 < 1$  TeV,  $|\mu| \leq 2$  TeV with the  $\tilde{\chi}_1^0$  as LSP. Constraints from the Higgs search in the  $m_h^{\text{max}}$  scenario assuming  $m_t = 174.3$  GeV are included. The limit is obtained for  $\tan\beta \geq 5$  when stau mixing leads to mass degeneracy between  $\tilde{\tau}_1$  and  $\tilde{\chi}_1^0$  and the limit is based on  $\tilde{\chi}_2^0$  production followed by its decay to  $\tilde{\tau}_1 \tau$ . In the pathological scenario where  $m_0$  and  $|\mu|$  are large, so that the  $\tilde{\chi}_2^0$  production cross section is negligible, and where there is mixing in the stau sector but not in stop nor sbottom, the limit is based on charginos with soft decay products and an ISR photon. The limit then degrades to 39 GeV. See Figs. 40–42 for the dependence of the limit on  $\tan\beta$  and  $m_{\tilde{\nu}}$ . These limits update the results of ABREU 00w.

<sup>12</sup> ACCIARRI 00D data collected at  $\sqrt{s} = 189$  GeV. The results hold over the full parameter space defined by  $0.7 \leq \tan\beta \leq 60$ ,  $0 \leq M_2 \leq 2$  TeV,  $m_0 \leq 500$  GeV,  $|\mu| \leq 2$  TeV. The minimum mass limit is reached for  $\tan\beta = 1$  and large  $m_0$ . The results of slepton searches from ACCIARRI 99w are used to help set constraints in the region of small  $m_0$ . The limit improves to 48 GeV for  $m_0 \gtrsim 200$  GeV and  $\tan\beta \gtrsim 10$ . See their Figs. 6–8 for the  $\tan\beta$  and  $m_0$  dependence of the limits. Updates ACCIARRI 98f.

<sup>13</sup> AAD 14k sets limits on the  $\chi$ -nucleon spin-dependent and spin-independent cross sections out to  $m_\chi = 10$  TeV.

<sup>14</sup> CALIBBI 13 use the fact that if the relic abundance of  $\tilde{\chi}_1^0$  does not overclose the universe, scalar lepton and Higgsino masses must be relatively small. Using 8 TeV ATLAS constraints on the scalar tau mass and on invisible Higgs decays, they estimate a lower bound for the  $\tilde{\chi}_1^0$  mass.

### Bounds on $\tilde{\chi}_1^0$ from dark matter searches

These papers generally exclude regions in the  $M_2 - \mu$  parameter plane assuming that  $\tilde{\chi}_1^0$  is the dominant form of dark matter in the galactic halo. These limits are based on the lack of detection in laboratory experiments, telescopes, or by the absence of a signal in underground neutrino detectors. The latter signal is expected if  $\tilde{\chi}_1^0$  accumulates in the Sun or the Earth and annihilates into high-energy  $\nu$ 's.

- 1 ABE 23b sets limits on the dark matter annihilation cross section from line-like features in TeV gamma-rays in the direction of the Galactic center using the MAGIC stereoscopic telescope.
- 2 FOSTER 23 sets limits on the dark matter annihilation cross section from monochromatic gamma-rays in the inner Milky Way using 14 years of data from Fermi-LAT.
- 3 GUO 23A sets limits on the dark matter annihilation cross section from 10 years of IceCube muon-track data from 18 dwarf spheroidal galaxies.
- 4 ABBASI 22b presents 7 years of data from a search of neutrinos from dark matter annihilations in the sun using the DeepCore sub-array of IceCube. Annihilation cross section limits applies to dark matter masses between 5–100 GeV.
- 5 ABDALLA 22 uses gamma-ray observations in the Galactic center to constrain the dark matter annihilation cross section for annihilations into  $WW$  and  $\tau\tau$  for dark matter masses between 200 GeV to 70 TeV. This updates ABDALLAH 18.
- 6 ABDALLAH 21 places constraints on the dark matter annihilation cross section for annihilations into gamma-rays from the dwarf irregular galaxy WLM for masses between 0.15 to 10 TeV.
- 7 ABAZAJIAN 20 sets constraints on the dark matter annihilation from gamma-ray searches from Fermi LAT observations of the Galactic center.
- 8 ABDALLAH 20 places constraints on the dark matter annihilation cross section for annihilations into gamma-rays from Milky Way dwarf galaxy satellites for masses between 0.2 to 40 TeV.
- 9 ABE 20G is based on SuperKamiokande data taken from 1996 to 2016 searching for neutrinos produced from dark matter annihilations in the galactic center or halo. They place constraints on the dark matter-nucleon scattering cross section for dark matter masses between 1 GeV and 10 TeV.
- 10 ALBERT 20 sets limits on the annihilation cross section of dark matter with mass between 1 and 100 TeV from gamma-ray observations of the local dwarf spheroidal galaxies.
- 11 ALBERT 20a set limits on the dark matter annihilation cross section from neutrinos observations in the Galactic center using 11 years of ANTARES data.
- 12 ALBERT 20c set limits on the dark matter annihilation cross section from neutrinos observations in the Galactic center combining Antares and IceCube data.
- 13 ALVAREZ 20 set limits on the dark matter annihilation from gamma-ray searches from Fermi LAT observations in the directions of dwarf spheroidal galaxies.
- 14 HOOFF 20 set limits on the dark matter annihilation from gamma-ray searches from Fermi LAT observations in the directions of dwarf spheroidal galaxies.
- 15 DI-MAURO 19 sets limits on the dark matter annihilation from gamma-ray searches in M31 and M33 galaxies using Fermi LAT data.
- 16 JOHNSON 19 sets limits on p-wave dark matter annihilations in the galactic center using Fermi data.
- 17 LI 19d sets limits on dark matter annihilation cross sections searching for line-like signals in the all-sky Fermi data.
- 18 AHNEN 18 uses observations of the dwarf satellite galaxy Ursa Major II to obtain upper limits on annihilation cross sections for dark matter in various channels for masses between 0.1–100 TeV.
- 19 ALBERT 18b sets limits on the annihilation cross section of dark matter with mass between 1 and 100 TeV from gamma-ray observations of the Andromeda galaxy.
- 20 ALBERT 18c sets limits on the spin-dependent coupling of dark matter to protons from dark matter annihilation in the Sun.
- 21 AARTSEN 17 is based on data collected during 327 days of detector livetime with IceCube. They looked for interactions of  $\nu$ 's resulting from neutralino annihilations in the Earth over a background of atmospheric neutrinos and set 90% CL limits on the spin independent neutralino-proton cross section for neutralino masses in the range 10–10000 GeV.
- 22 AARTSEN 17A is based on data collected during 532 days of livetime with the IceCube 86-string detector including the DeepCore sub-array. They looked for interactions of  $\nu$ 's from neutralino annihilations in the Sun over a background of atmospheric neutrinos and set 90% CL limits on the spin dependent neutralino-proton cross section for neutralino masses in the range 10–10000 GeV. This updates AARTSEN 16c.
- 23 AARTSEN 17c is based on 1005 days of running with the IceCube detector. They set a limit on the annihilation cross section for dark matter with masses between 10–1000 GeV annihilating in the Galactic center assuming an NFW profile. The limit is of  $1.2 \times 10^{23} \text{ cm}^3 \text{ s}^{-1}$  in the  $\tau^+\tau^-$  channel. Supercedes AARTSEN 15e.
- 24 ARCHAMBAULT 17 performs a joint statistical analysis of four dwarf galaxies with VERITAS looking for gamma-ray emission from neutralino annihilation. They set limits on the neutralino annihilation cross section.
- 25 ADRIAN-MARTINEZ 16 is based on data from the ANTARES neutrino telescope. They looked for interactions of  $\nu$ 's from neutralino annihilations in the Sun over a background of atmospheric neutrinos and set 90% CL limits on the muon neutrino flux. They also obtain limits on the spin dependent and spin independent neutralino-proton cross section for neutralino masses in the range 50 to 5,000 GeV. This updates ADRIAN-MARTINEZ 13.
- 26 AHNEN 16 combines 158 hours of Segue 1 observations with MAGIC with 6 year observations of 15 dwarf satellite galaxies by Fermi-LAT to set limits on annihilation cross sections for dark matter masses between 10 GeV and 100 TeV.
- 27 AVRORIN 16 is based on 2.76 years with Lake Baikal neutrino telescope. They derive 90% upper limits on the annihilation cross section from dark matter annihilations in the Galactic center.
- 28 CIRELLI 16 and LEITE 16 derive bounds on the annihilation cross section from radio observations.
- 29 ACKERMANN 15 is based on 5.8 years of data with Fermi-LAT and search for monochromatic gamma-rays in the energy range of 0.2–500 GeV from dark matter annihilations. This updates ACKERMANN 13A.

- 30 ACKERMANN 15A is based on 50 months of data with Fermi-LAT and search for dark matter annihilation signals in the isotropic gamma-ray background as well as galactic subhalos in the energy range of a few GeV to a few tens of TeV.
- 31 ACKERMANN 15B is based on 6 years of data with Fermi-LAT observations of Milky Way dwarf spheroidal galaxies. Set limits on the annihilation cross section from  $m_\chi = 2 \text{ GeV}$  to 10 TeV. This updates ACKERMANN 14.
- 32 BUCKLEY 15 is based on 5 years of Fermi-LAT data searching for dark matter annihilation signals from Large Magellanic Cloud.
- 33 CHOI 15 is based on 3903 days of SuperKamiokande data searching for neutrinos produced from dark matter annihilations in the sun. They place constraints on the dark matter-nucleon scattering cross section for dark matter masses between 4–200 GeV.
- 34 ALEKSIC 14 is based on almost 160 hours of observations of Segue 1 satellite dwarf galaxy using the MAGIC telescopes between 2011 and 2013. Sets limits on the annihilation cross section out to  $m_\chi = 10 \text{ TeV}$ .
- 35 AVRORIN 14 is based on almost 2.76 years with Lake Baikal neutrino telescope. They derive 90% upper limits on the fluxes of muons and muon neutrinos from dark matter annihilations in the Sun.
- 36 AARTSEN 13c is based on data collected during 339.8 effective days with the IceCube 59-string detector. They looked for interactions of  $\nu_\mu$ 's from neutralino annihilations in nearby galaxies and galaxy clusters. They obtain limits on the neutralino annihilation cross section for neutralino masses in the range 30–100,000 GeV.
- 37 BERGSTROM 13, JIN 13, and KOPP 13 derive limits on the mass and annihilation cross section using AMS-02 data. JIN 13 also sets a limit on the lifetime of the dark matter particle.
- 38 BOLIEV 13 is based on data collected during 24.12 years of live time with the Bakson Underground Scintillator Telescope. They looked for interactions of  $\nu_\mu$ 's from neutralino annihilations in the Sun over a background of atmospheric neutrinos and set 90% CL limits on the muon flux. They also obtain limits on the spin dependent and spin independent neutralino-proton cross section for neutralino masses in the range 10–1000 GeV.
- 39 ACKERMANN 10 place upper limits on the annihilation cross section with  $b\bar{b}$  or  $\mu^+\mu^-$  final states.
- 40 ACHTERBERG 06 is based on data collected during 421.9 effective days with the AMANDA detector. They looked for interactions of  $\nu_\mu$ 's from the centre of the Earth over a background of atmospheric neutrinos and set 90% CL limits on the muon flux. Their limit is compared with the muon flux expected from neutralino annihilations into  $W^+W^-$  and  $b\bar{b}$  at the centre of the Earth for MSSM parameters compatible with the relic dark matter density, see their Fig. 7.
- 41 ACKERMANN 06 is based on data collected during 143.7 days with the AMANDA-II detector. They looked for interactions of  $\nu_\mu$ 's from the Sun over a background of atmospheric neutrinos and set 90% CL limits on the muon flux. Their limit is compared with the muon flux expected from neutralino annihilations into  $W^+W^-$  in the Sun for SUSY model parameters compatible with the relic dark matter density, see their Fig. 3.
- 42 DEBOER 06 interpret an excess of diffuse Galactic gamma rays observed with the EGRET satellite as originating from  $\pi^0$  decays from the annihilation of neutralinos into quark jets. They analyze the corresponding parameter space in a supergravity inspired MSSM model with radiative electroweak symmetry breaking, see their Fig. 3 for the preferred region in the  $(m_0, m_{1/2})$  plane of a scenario with large  $\tan\beta$ .
- 43 AMBROSIO 99 and DESAI 04 set new neutrino flux limits which can be used to limit the parameter space in supersymmetric models based on neutralino annihilation in the Sun and the Earth.
- 44 LOSECCO 95 reanalyzed the IMB data and places lower limit on  $m_{\tilde{\chi}_1^0}$  of 18 GeV if the LSP is a photino and 10 GeV if the LSP is a higgsino based on LSP annihilation in the sun producing high-energy neutrinos and the limits on neutrino fluxes from the IMB detector.
- 45 MORI 93 excludes some region in  $M_2-\mu$  parameter space depending on  $\tan\beta$  and lightest scalar Higgs mass for neutralino dark matter  $m_{\tilde{\chi}_1^0} > m_W$ , using limits on ongoing muons produced by energetic neutrinos from neutralino annihilation in the Sun and the Earth.
- 46 BOTTINO 92 excludes some region  $M_2-\mu$  parameter space assuming that the lightest neutralino is the dark matter, using ongoing muons at Kamiokande, direct searches by Ge detectors, and by LEP experiments. The analysis includes top radiative corrections on Higgs parameters and employs two different hypotheses for nucleon-Higgs coupling. Effects of rescaling in the local neutralino density according to the neutralino relic abundance are taken into account.
- 47 BOTTINO 91 excluded a region in  $M_2-\mu$  plane using ongoing muon data from Kamioka experiment, assuming that the dark matter surrounding us is composed of neutralinos and that the Higgs boson is not too heavy.
- 48 GELMINI 91 exclude a region in  $M_2-\mu$  plane using dark matter searches.
- 49 KAMIONKOWSKI 91 excludes a region in the  $M_2-\mu$  plane using IMB limit on ongoing muons originated by energetic neutrinos from neutralino annihilation in the sun, assuming that the dark matter is composed of neutralinos and that  $m_{H_1^0} \lesssim 50 \text{ GeV}$ . See Fig. 8 in the paper.
- 50 MORI 91B exclude a part of the region in the  $M_2-\mu$  plane with  $m_{\tilde{\chi}_1^0} \lesssim 80 \text{ GeV}$  using a limit on ongoing muons originated by energetic neutrinos from neutralino annihilation in the earth, assuming that the dark matter surrounding us is composed of neutralinos and that  $m_{H_1^0} \lesssim 80 \text{ GeV}$ .
- 51 OLIVE 88 result assumes that photinos make up the dark matter in the galactic halo. Limit is based on annihilations in the sun and is due to an absence of high energy neutrinos detected in underground experiments. The limit is model dependent.

### $\tilde{\chi}_1^0-p$ elastic cross section

Experimental results on the  $\tilde{\chi}_1^0-p$  elastic cross section are evaluated at  $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$ . The experimental results on the cross section are often mass dependent. Therefore, the mass and cross section results are also given where the limit is strongest, when appropriate. Results are quoted separately for spin-dependent interactions (based on an effective 4-Fermi Lagrangian of the form  $\overline{\chi}\gamma^\mu\gamma^5\chi\overline{q}\gamma_\mu\gamma^5q$ ) and spin-independent interactions ( $\overline{\chi}\chi\overline{q}q$ ). For calculational details see GRIEST 88b, ELLIS 88b, BARBIERI 89c, DREES 93b, ARNOWITT 96, BERGSTROM 96, and BAER 97 in addition to the theory papers listed in the Tables. For a description of the theoretical assumptions and experimental techniques underlying most

- The strongest upper limit is 4.2 × 10<sup>-5</sup> pb at 32 GeV. The limit for scattering on neutrons is 4 × 10<sup>-6</sup> pb at 100 GeV and is 1.5 × 10<sup>-6</sup> pb at 30 GeV.
- The strongest upper limit is 1.4 × 10<sup>-4</sup> pb at 28 GeV. The limit for scattering on neutrons is 1.1 × 10<sup>-5</sup> pb at 100 GeV and is 4.3 × 10<sup>-6</sup> pb at 28 GeV.
- The strongest limit is < 1.7 × 10<sup>-4</sup> pb at m<sub>χ</sub> = 40 GeV. This updates FU 17 and XIA 19A.
- The strongest limit is < 3.2 × 10<sup>-5</sup> pb at m<sub>χ</sub> = 25 GeV. This updates AMOLE 17.
- The strongest limit is < 2 × 10<sup>-4</sup> pb at m<sub>χ</sub> = 30 GeV. For scatterings on neutrons, the strongest limit is < 6.3 × 10<sup>-6</sup> pb at m<sub>χ</sub> = 30 GeV.
- The strongest limit is 5 × 10<sup>-4</sup> pb at m<sub>χ</sub> = 35 GeV. The limit for scattering on neutrons is 3 × 10<sup>-5</sup> pb at 100 GeV and is 1.6 × 10<sup>-5</sup> pb at 35 GeV. This updates AKERIB 16A.
- Directional recoil detector. This updates DAW 12.
- This result updates ARCHAMBAULT 12. The strongest limit is 0.013 pb at m<sub>χ</sub> = 20 GeV.
- The strongest limit is 5 × 10<sup>-4</sup> pb at m<sub>χ</sub> = 80 GeV.
- The strongest limit is 5.2 × 10<sup>-3</sup> pb at 50 GeV. The limit for scattering on neutrons is 2.8 × 10<sup>-4</sup> pb at 100 GeV and the strongest limit is 2.0 × 10<sup>-4</sup> pb at 50 GeV. This updates APRILE 13.
- The strongest limit is 0.0043 pb and occurs at m<sub>χ</sub> = 35 GeV. FELIZARDO 14 also presents limits for the scattering on neutrons. At m<sub>χ</sub> = 100 GeV, the upper limit is 0.13 pb and the strongest limit is 0.066 pb at m<sub>χ</sub> = 35 GeV.
- This result updates LEBEDENKO 09A. The strongest limit is 8 × 10<sup>-3</sup> pb at m<sub>χ</sub> = 50 GeV. Limit applies to the neutralino neutron elastic cross section.
- The strongest limit is 6 × 10<sup>-3</sup> pb at m<sub>χ</sub> = 60 GeV.
- The strongest limit is 5.7 × 10<sup>-3</sup> pb at m<sub>χ</sub> = 35 GeV.
- This result updates LEE 07A. The strongest limit is at m<sub>χ</sub> = 80 GeV.
- Predictions for the spin-dependent elastic cross section based on a frequentist approach to electroweak observables in the framework of N = 1 supergravity models with radiative breaking of the electroweak gauge symmetry.
- The strongest limit is 0.6 pb and occurs at m<sub>χ</sub> = 30 GeV. The limit for scattering on neutrons is 0.01 pb at m<sub>χ</sub> = 100 GeV, and the strongest limit is 0.0045 pb at m<sub>χ</sub> = 30 GeV.
- Limit applies to neutron elastic cross section.
- The strongest upper limit is 0.25 pb and occurs at m<sub>χ</sub> ≈ 40 GeV.
- The strongest upper limit is 4 pb and occurs at m<sub>χ</sub> ≈ 60 GeV. The limit on the neutron spin-dependent elastic cross section is 0.07 pb. This latter limit is improved in AHMED 09, where a limit of 0.02 pb is obtained at m<sub>χ</sub> = 100 GeV. The strongest limit in AHMED 09 is 0.018 pb and occurs at m<sub>χ</sub> = 60 GeV.
- The strongest upper limit is 1.2 pb and occurs at m<sub>χ</sub> ≈ 40 GeV. The limit on the neutron spin-dependent cross section is 35 pb.
- The strongest upper limit is 0.35 pb and occurs at m<sub>χ</sub> ≈ 60 GeV.
- The strongest upper limit is 1.2 pb and occurs m<sub>χ</sub> ≈ 30 GeV.

- ELLIS 04 calculates the χp elastic scattering cross section in the framework of N=1 supergravity models with radiative breaking of the electroweak gauge symmetry, but without universal scalar masses. In the case of universal squark and slepton masses, but non-universal Higgs masses, the limit becomes 2 × 10<sup>-4</sup>, see ELLIS 03c.
- The strongest upper limit is 0.75 pb and occurs at m<sub>χ</sub> ≈ 70 GeV.
- The strongest upper limit is 30 pb and occurs at m<sub>χ</sub> ≈ 20 GeV.
- The strongest upper limit is 8 pb and occurs at m<sub>χ</sub> ≈ 30 GeV.
- ELLIS 01c calculates the χ-p elastic scattering cross section in the framework of N=1 supergravity models with radiative breaking of the electroweak gauge symmetry. In models with nonuniversal Higgs masses, the upper limit to the cross section is 6 × 10<sup>-4</sup>.
- The strongest upper limit is 3 pb and occurs at m<sub>χ</sub> ≈ 60 GeV. The limits are for inelastic scattering X<sup>0</sup> + 129Xe → X<sup>0</sup> + 129Xe\* (39.58 keV).
- The strongest upper limit is 4.4 pb and occurs at m<sub>χ</sub> ≈ 60 GeV.
- The strongest upper limit is about 35 pb and occurs at m<sub>χ</sub> ≈ 15 GeV.

- The strongest upper limit is 9.2 × 10<sup>-12</sup> pb at 36 GeV.
- The strongest upper limit is 2.6 × 10<sup>-11</sup> pb at 28 GeV.
- Commissioning Run for PandaX-4T. The strongest limit is 3.8 × 10<sup>-11</sup> pb at m<sub>χ</sub> = 40 GeV.
- WANG 20g strongest limit is 2.2 × 10<sup>-10</sup> pb at 30 GeV using 132 ton-day full exposure of PandaX-II. This updates CUI 17A, though the results here provide weaker constraints.
- The strongest upper limit is 2.2 × 10<sup>-8</sup> pb at 60 GeV.
- This updates AMAUDRUZ 18.

# Searches Particle Listings

## Supersymmetric Particle Searches

- <sup>7</sup> This updates AMOLE 16.
- <sup>8</sup> The strongest limit is  $2.05 \times 10^{-6}$  at  $m = 60$  GeV.
- <sup>9</sup> The strongest limit is  $1.09 \times 10^{-8}$  pb at  $m_\chi = 126$  GeV. This updates AGNES 15.
- <sup>10</sup> The strongest limit is  $1.0 \times 10^{-8}$  pb at  $m_\chi = 46$  GeV. This updates AGNESE 15B.
- <sup>11</sup> Based on 278.8 days of data collection. The strongest limit is  $4.1 \times 10^{-11}$  pb at  $m_\chi = 30$  GeV. This updates APRILE 17G.
- <sup>12</sup> AKERIB 17. The strongest limit is  $1.1 \times 10^{-10}$  pb at 50 GeV. This updates AKERIB 16.
- <sup>13</sup> The strongest limit is  $1.1 \times 10^{-9}$  pb at 50 GeV. This updates APRILE 12.
- <sup>14</sup> The strongest upper limit is  $7.6 \times 10^{-10}$  at  $m_\chi = 33$  GeV.
- <sup>15</sup> Predictions for the spin-independent elastic cross section based on a frequentist approach to electroweak observables in the framework of  $N = 1$  supergravity models with radiative breaking of the electroweak gauge symmetry using the 20 fb<sup>-1</sup> LHC data and the 5 fb<sup>-1</sup> 7 TeV LHC data and the LUX data.
- <sup>16</sup> The strongest limit is  $3.6 \times 10^{-6}$  pb and occurs at  $m_\chi = 35$  GeV. Felizardo 2014 updates Felizardo 2012.
- <sup>17</sup> Predictions for the spin-independent elastic cross section based on a Bayesian approach to electroweak observables in the framework of  $N = 1$  supergravity models with radiative breaking of the electroweak gauge symmetry using the 20 fb<sup>-1</sup> LHC data and LUX.
- <sup>18</sup> AGNESE 13 presents 90% CL limits on the elastic cross section for masses in the range 7–100 GeV using the Si based detector. The strongest upper limit is  $1.8 \times 10^{-6}$  pb at  $m_\chi = 50$  GeV. This limit is improved to  $7 \times 10^{-7}$  pb in AGNESE 13A.
- <sup>19</sup> This result updates LEBEDENKO 09. The strongest limit is  $3.9 \times 10^{-8}$  pb at  $m_\chi = 52$  GeV.
- <sup>20</sup> ANGLÖHER 12 presents results of 730 kg days from the CRESST-II dark matter detector. They find two maxima in the likelihood function corresponding to best fit WIMP masses of 25.3 and 11.6 GeV with elastic cross sections of  $1.6 \times 10^{-6}$  and  $3.7 \times 10^{-5}$  pb respectively, see their Table 4. The statistical significance is more than  $4\sigma$ . ANGLÖHER 12 updates ANGLÖHER 09.
- <sup>21</sup> Predictions for the spin-independent elastic cross section based on a frequentist approach to electroweak observables in the framework of  $N = 1$  supergravity models with radiative breaking of the electroweak gauge symmetry using the 5 fb<sup>-1</sup> LHC data and XENON100.
- <sup>22</sup> The strongest limit is  $1.4 \times 10^{-7}$  at  $m_\chi = 60$  GeV.
- <sup>23</sup> This result updates LEE 07A. The strongest limit is  $2.1 \times 10^{-7}$  at  $m_\chi = 70$  GeV.
- <sup>24</sup> AHMED 11A gives combined results from CDMS and EDELWEISS. The strongest limit is at  $m_\chi = 90$  GeV.
- <sup>25</sup> ARMENGAUD 11 updates result of ARMENGAUD 10. Strongest limit at  $m_\chi = 85$  GeV.
- <sup>26</sup> The strongest upper limit is  $5.1 \times 10^{-8}$  pb and occurs at  $m_\chi \simeq 30$  GeV. The values quoted here are based on the analysis performed in ANGLE 08 with the update from SORENSEN 09.
- <sup>27</sup> The strongest upper limit is  $6.6 \times 10^{-7}$  pb and occurs at  $m_\chi \simeq 65$  GeV.
- <sup>28</sup> AKERIB 06A updates the results of AKERIB 05. The strongest upper limit is  $1.6 \times 10^{-7}$  pb and occurs at  $m_\chi \simeq 60$  GeV.
- <sup>29</sup> The strongest upper limit is also close to  $1.0 \times 10^{-6}$  pb and occurs at  $m_\chi \simeq 70$  GeV. BENOIT 06 claim that the discrimination power of ZEPLIN-I measurement (ALNER 05A) is not reliable enough to obtain a limit better than  $1 \times 10^{-3}$  pb. However, SMITH 06 do not agree with the criticisms of BENOIT 06.
- <sup>30</sup> AKERIB 04 is incompatible with BERNABEI 00 most likely value, under the assumption of standard WIMP-halo interactions. The strongest upper limit is  $4 \times 10^{-7}$  pb and occurs at  $m_\chi \simeq 60$  GeV.
- <sup>31</sup> Predictions for the spin-independent elastic cross section in the framework of  $N = 1$  supergravity models with radiative breaking of the electroweak gauge symmetry.
- <sup>32</sup> KIM 02 and ELLIS 04 calculate the  $\chi p$  elastic scattering cross section in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry, but without universal scalar masses.
- <sup>33</sup> In the case of universal squark and slepton masses, but non-universal Higgs masses, the limit becomes  $2 \times 10^{-6}$  ( $2 \times 10^{-11}$  when constraint from the BNL  $g-2$  experiment are included), see ELLIS 03E. ELLIS 05 display the sensitivity of the elastic scattering cross section to the  $\pi$ -Nucleon  $\Sigma$  term.
- <sup>34</sup> PIERCE 04A calculates the  $\chi p$  elastic scattering cross section in the framework of models with very heavy scalar masses. See Fig. 2 of the paper.
- <sup>35</sup> The strongest upper limit is  $1.8 \times 10^{-5}$  pb and occurs at  $m_\chi \simeq 80$  GeV.
- <sup>36</sup> Under the assumption of standard WIMP-halo interactions, Akerib 03 is incompatible with BERNABEI 00 most likely value at the 99.98% CL. See Fig. 4.
- <sup>37</sup> BAER 03A calculates the  $\chi p$  elastic scattering cross section in several models including the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry.
- <sup>38</sup> The strongest upper limit is  $7 \times 10^{-6}$  pb and occurs at  $m_\chi \simeq 30$  GeV.
- <sup>39</sup> ABRAMS 02 is incompatible with the DAMA most likely value at the 99.9% CL. The strongest upper limit is  $3 \times 10^{-6}$  pb and occurs at  $m_\chi \simeq 30$  GeV.
- <sup>40</sup> The strongest upper limit is  $2 \times 10^{-5}$  pb and occurs at  $m_\chi \simeq 40$  GeV.
- <sup>41</sup> The strongest upper limit is  $7 \times 10^{-6}$  pb and occurs at  $m_\chi \simeq 46$  GeV.
- <sup>42</sup> The strongest upper limit is  $1.8 \times 10^{-5}$  pb and occurs at  $m_\chi \simeq 32$  GeV
- <sup>43</sup> BOTTINO 01 calculates the  $\chi p$  elastic scattering cross section in the framework of the following supersymmetric models:  $N=1$  supergravity with the radiative breaking of the electroweak gauge symmetry,  $N=1$  supergravity with nonuniversal scalar masses and an effective MSSM model at the electroweak scale.
- <sup>44</sup> Calculates the  $\chi p$  elastic scattering cross section in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry.
- <sup>45</sup> ELLIS 01c calculates the  $\chi p$  elastic scattering cross section in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry. ELLIS 02b find a range  $2 \times 10^{-8}$ – $1.5 \times 10^{-7}$  at  $\tan\beta=50$ . In models with nonuniversal Higgs masses, the upper limit to the cross section is  $4 \times 10^{-7}$ .
- <sup>46</sup> ACCOMANDO 00 calculate the  $\chi p$  elastic scattering cross section in the framework of minimal  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry. The limit is relaxed by at least an order of magnitude when models with nonuniversal scalar masses are considered. A subset of the authors in ARNOWITT 02 updated the limit to  $< 9 \times 10^{-8}$  ( $\tan\beta < 55$ ).
- <sup>47</sup> BERNABEI 00 search for annual modulation of the WIMP signal. The data favor the hypothesis of annual modulation at  $4\sigma$  and are consistent, for a particular model framework quoted there, with  $m_{\chi_0} = 44 \pm 12_9$  GeV and a spin-independent  $X^0$ -proton cross section of  $(5.4 \pm 1.0) \times 10^{-6}$  pb. See also BERNABEI 01 and BERNABEI 00c.
- <sup>48</sup> FENG 00 calculate the  $\chi p$  elastic scattering cross section in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry with a particular emphasis on focus point models. At  $\tan\beta=50$ , the range is  $8 \times 10^{-8}$ – $4 \times 10^{-7}$ .

### Other bounds on $\tilde{\chi}_1^0$ from astrophysics and cosmology

Most of these papers generally exclude regions in the  $M_2 - \mu$  parameter plane by requiring that the  $\tilde{\chi}_1^0$  contribution to the overall cosmological density is less than some maximal value to avoid overclosure of the Universe. Those not based on the cosmological density are indicated. Many of these papers also include LEP and/or other bounds.

- 1 ELLIS 00 updates ELLIS 98. Uses LEP  $e^+e^-$  data at  $\sqrt{s}=202$  and 204 GeV to improve bound on neutralino mass to 51 GeV when scalar mass universality is assumed and 46 GeV when Higgs mass universality is relaxed. Limits on  $\tan\beta$  improve to  $> 2.7$  ( $\mu > 0$ ),  $> 2.2$  ( $\mu < 0$ ) when scalar mass universality is assumed and  $> 1.9$  (both signs of  $\mu$ ) when Higgs mass universality is relaxed.
- 2 ATHRON 17b places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using all Run I and the 13 fb $^{-1}$  13 TeV Run II LHC searches and other experimental data.
- 3 BECHTLE 16 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using all Run I LHC searches.
- 4 BAGNASCHI 15 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using all Run I LHC searches.
- 5 Implications of the LHC result on the Higgs mass and on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry.
- 6 BUCHMUELLER 14A places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches using the 20 fb $^{-1}$  8 TeV and the 5 fb $^{-1}$  7 TeV LHC and the LUX data.
- 7 ROSZKOWSKI 14 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using Bayesian statistics and indirect experimental searches using the 20 fb $^{-1}$  LHC and the LUX data.
- 8 CABRERA 13 and STREGE 13 place constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry with and without non-universal Higgs masses using the 5.8 fb $^{-1}$ ,  $\sqrt{s}=7$  TeV ATLAS supersymmetry searches and XENON100 results.
- 9 ELLIS 13b place constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry with and without Higgs mass universality. Models with universality below the GUT scale are also considered.
- 10 BALAZS 12 and STREGE 12 place constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using the 1 fb $^{-1}$  LHC supersymmetry searches, the 5 fb $^{-1}$  Higgs mass constraints, both with  $\sqrt{s}=7$  TeV, and XENON100 results.
- 11 BECHTLE 12 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches, using the 5 fb $^{-1}$  LHC and XENON100 data.
- 12 BESKIDT 12 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches, the 5 fb $^{-1}$  LHC and the XENON100 data.
- 13 BELANGER 04 and BOTTINO 12 (see also BOTTINO 03, BOTTINO 03A and BOTTINO 04) do not assume gaugino or scalar mass unification.
- 14 FENG 12b places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry and large sfermion masses using the 1 fb $^{-1}$  LHC supersymmetry searches, the 5 fb $^{-1}$  LHC Higgs mass constraints both with  $\sqrt{s}=7$  TeV, and XENON100 results.
- 15 BUCHMUELLER 11 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches and including supersymmetry breaking relations between A and B parameters.
- 16 Places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry but non-Universal Higgs masses.
- 17 ELLIS 10 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry with universality above the GUT scale.
- 18 BUCHMUELLER 09 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches.
- 19 DREINER 09 show that in the general MSSM with non-universal gaugino masses there exists no model-independent laboratory bound on the mass of the lightest neutralino. An essentially massless  $\tilde{\chi}_1^0$  is allowed by the experimental and observational data, imposing some constraints on other MSSM parameters, including  $M_2$ ,  $\mu$  and the slepton and squark masses.
- 20 BUCHMUELLER 08 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches.
- 21 CALIBBI 07 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry with universality above the GUT scale including the effects of right-handed neutrinos.
- 22 ELLIS 07 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry with universality below the GUT scale.
- 23 ALLANACH 06 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry.
- 24 DE-AUSTRI 06 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry.
- 25 BALTZ 04 places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry.
- 26 Limit assumes a pseudo scalar mass  $< 200$  GeV. For larger pseudo scalar masses,  $m_{\tilde{\chi}} > 18(29)$  GeV for  $\tan\beta=50(10)$ . Bounds from WMAP,  $(g-2)_\mu$ ,  $b \rightarrow s\gamma$ , LEP.
- 27 ELLIS 04b places constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry including supersymmetry breaking relations between A and B parameters. See also ELLIS 03d.
- 28 PIERCE 04a places constraints on the SUSY parameter space in the framework of models with very heavy scalar masses.

- 29 BAER 03, CHATTOPADHYAY 03, ELLIS 03c and LAHANAS 03 place constraints on the SUSY parameter space in the framework of  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry based on WMAP results for the cold dark matter density.
- 30 BOEHM 00b and ELLIS 03 place constraints on the SUSY parameter space in the framework of minimal  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry. Includes the effect of  $\chi$ - $t$  co-annihilations.
- 31 LAHANAS 02 places constraints on the SUSY parameter space in the framework of minimal  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry. Focuses on the role of pseudo-scalar Higgs exchange.
- 32 BARGER 01c use the cosmic relic density inferred from recent CMB measurements to constrain the parameter space in the framework of minimal  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry.
- 33 ELLIS 01b places constraints on the SUSY parameter space in the framework of minimal  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry. Focuses on models with large  $\tan\beta$ .
- 34 FENG 00 explores cosmologically allowed regions of MSSM parameter space with multi-TeV masses.
- 35 ELLIS 98b assumes a universal scalar mass and radiative supersymmetry breaking with universal gaugino masses. The upper limit to the LSP mass is increased due to the inclusion of  $\chi - \tilde{\tau}_R$  coannihilations.
- 36 EDSJO 97 included all coannihilation processes between neutralinos and charginos for any neutralino mass and composition.
- 37 Notes the location of the neutralino Z resonance and h resonance annihilation corridors in minimal supergravity models with radiative electroweak breaking.
- 38 Mass of the bino (=LSP) is limited to  $m_{\tilde{B}} \lesssim 350$  GeV for  $m_t = 174$  GeV.
- 39 DREES 93, KELLEY 93 compute the cosmic relic density of the LSP in the framework of minimal  $N=1$  supergravity models with radiative breaking of the electroweak gauge symmetry.
- 40 FALK 93 relax the upper limit to the LSP mass by considering sfermion mixing in the MSSM.
- 41 MIZUTA 93 include coannihilations to compute the relic density of Higgsino dark matter.
- 42 LOPEZ 92 calculate the relic LSP density in a minimal SUSY GUT model.
- 43 MCDONALD 92 calculate the relic LSP density in the MSSM including exact tree-level annihilation cross sections for all two-body final states.
- 44 GRIEST 91 improve relic density calculations to account for coannihilations, pole effects, and threshold effects.
- 45 NOJIRI 91 uses minimal supergravity mass relations between squarks and sleptons to narrow cosmologically allowed parameter space.
- 46 Mass of the bino (=LSP) is limited to  $m_{\tilde{B}} \lesssim 350$  GeV for  $m_t \leq 200$  GeV. Mass of the higgsino (=LSP) is limited to  $m_{\tilde{H}} \lesssim 1$  TeV for  $m_t \leq 200$  GeV.
- 47 ROSZKOWSKI 91 calculates LSP relic density in mixed gaugino/higgsino region.
- 48 Mass of the bino (=LSP) is limited to  $m_{\tilde{B}} \lesssim 550$  GeV. Mass of the higgsino (=LSP) is limited to  $m_{\tilde{H}} \lesssim 3.2$  TeV.
- 49 KRAUSS 83 finds  $m_{\tilde{\gamma}}$  not 30 eV to 2.5 GeV. KRAUSS 83 takes into account the gravitino decay. Find that limits depend strongly on reheated temperature. For example a new allowed region  $m_{\tilde{\gamma}} = 4\text{--}20$  MeV exists if  $m_{\text{gravitino}} < 40$  TeV. See figure 2.

### Unstable $\tilde{\chi}_1^0$ (Lightest Neutralino) mass limit

Unless otherwise stated, results in this section assume spectra and production rates as evaluated in the MSSM. Unless otherwise stated, the goldstino or gravitino mass  $m_{\tilde{G}}$  is assumed to be negligible relative to all other masses. In the following,  $\tilde{G}$  is assumed to be undetected and to give rise to a missing energy ( $\cancel{E}$ ) signature.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

<sup>1</sup> AAD 23AE searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with  $2\ell$  with same flavour and opposite sign, plus jets and  $\cancel{E}_T$ , defining signal region with the dilepton invariant mass both on- and off-shell with respect to the  $Z$  boson. No significant excess above the Standard Model predictions is observed. Limits are set on models of strong and electroweak production. In this case, limits are placed on production of mass-degenerate, higgsino triplet NLSF with  $\tilde{\chi}_1^0 \rightarrow Z\tilde{G}$  in a GGM-like scenario, see figure 15.

<sup>2</sup> AAD 23AM searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing electron/photon pairs with invariant mass compatible with  $h/Z$  and originating from a common displaced vertex. No significant excess above the Standard Model predictions is observed. Limits are set on a model where members of a nearly degenerate higgsino triplet are pair-produced, yielding long-lived  $\tilde{\chi}_1^0$  followed by  $\tilde{\chi}_1^0 \rightarrow h/Z\tilde{G}$ . Limits are set on  $m_{\tilde{\chi}_1^0}$  as a function of its lifetime and of the  $B(\tilde{\chi}_1^0 \rightarrow h\tilde{G})$  assuming  $B(\tilde{\chi}_1^0 \rightarrow h\tilde{G}) + B(\tilde{\chi}_1^0 \rightarrow Z\tilde{G}) = 1$ , see Figure 10.

<sup>3</sup> AAD 23CP searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with  $2\ell$  with same charge or  $3\ell$  plus at least one jet and  $\cancel{E}_T$ , defining signal region based on 'transverse mass' of the dilepton system,  $\cancel{E}_T$  significance and effective mass. No significant excess above the Standard Model predictions is observed. Limits are set on the mass of a mass-degenerate higgsino triplet decaying into a lepton (neutral or charged) and a  $W$  via a bilinear RPV coupling, see figure 14.

<sup>4</sup> TUMASYAN 23AO searched in  $138 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of neutralino-chargino production in events with nearly trackless and out-of-time jets that are used to identify decays of long-lived particles. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the long-lived  $\tilde{\chi}_1^0$  in the model Tn1n1B, see their figures 8-10.

<sup>5</sup> AAD 21V searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tchi1n12-GGM, and RPV models similar to Tchi1n2L, Tglu1A (with  $q = u, d, s, c, b$ , with equal branching fractions), and  $\tilde{\ell}_L/\tilde{\nu} \rightarrow \ell/\nu\tilde{\chi}_1^0$  (mass-degenerate  $\tilde{\ell}_L$  and  $\tilde{\nu}$  of all 3 generations), all with  $\tilde{\chi}_1^0 \rightarrow \ell^\pm\tilde{\tau}\nu$  via  $\lambda_{12k}$  or  $\lambda_{133}$  (where  $i, k = 1, 2$ ), see their Figure 11.

<sup>6</sup> AAIJ 21V searched in  $5.38 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for long-lived particles (LLP) decaying to  $e^\pm\mu^\mp\nu$ . The LLP can be a  $\tilde{\chi}_1^0$  in RPV SUSY, or a right-handed neutrino, and can be produced in pairs, in the decay of the Higgs boson, or from charged

current processes. No significant excess above the Standard Model expectations is observed. Limits are set on the cross section times branching ratio for all three production mechanisms, see their Figures 6-8.

<sup>7</sup> SIRUNYAN 21AF searched in  $140 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with two displaced vertices from long-lived particles decaying into multijet or dijet final states. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu2RPV with  $\lambda'_{323}$  coupling, on the  $\tilde{\chi}_1^0$  mass in an RPV model with  $\tilde{\chi}_1^0$  pair production and the RPV decay  $\tilde{\chi}_1^0 \rightarrow tbs$  with  $\lambda'_{323}$  coupling and on the  $\tilde{\tau}$  mass in an RPV model with top squark pair production and the RPV decay  $\tilde{\tau} \rightarrow \tilde{d}_i\tilde{d}_j$  with  $\lambda'_{3ij}$  coupling, see their Figure 7.

<sup>8</sup> SIRUNYAN 21M searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with two opposite-sign same-flavour leptons (electrons, muons) and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  mass in Tchi1n2Fa, see their Figure 11, on the  $\tilde{\chi}_1^0$  mass in Tn1n1C and Tn1n1B for  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$ , see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsbot3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.

<sup>9</sup> AAD 20AN searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two photons and missing transverse momentum. Events are further categorised in terms of lepton or jet multiplicity. No significant excess over the expected background is observed. Limits at 95% C.L. are set on the Higgsino mass in the Tn1n1A simplified model, see their Figure 11.

<sup>10</sup> SIRUNYAN 19CA searched in  $77.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing delayed photons in both single and diphoton plus  $\cancel{E}_T$  final states. No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. exclusion limits in the context of GMSB, using the SPS8 benchmark model. For neutralino proper decay lengths of 0.1, 1, 10, and 100 m, masses up to about 320, 525, 360, and 215 GeV are excluded, respectively. See their Fig. 5. The searches involve the simplified models Tglu1D, Tglu4A,B,C, Tsqk4,4A,4B.

<sup>11</sup> SIRUNYAN 19CI searched in  $77.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsbot4 simplified model, see Figure 3, and on the wino mass in the Tchi1n2E simplified model, see their Figure 4. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 5.

<sup>12</sup> SIRUNYAN 19K searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with a photon, an electron or muon, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tchi1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.

<sup>13</sup> AABOUD 18CK searched for events with at least 3  $b$ -jets and large missing transverse energy in two datasets of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  of  $36.1 \text{ fb}^{-1}$  and  $24.3 \text{ fb}^{-1}$  depending on the trigger requirements. The analyses aimed to reconstruct two Higgs bosons decaying to pairs of  $b$ -quarks. No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the Tn1n1A simplified model, see their Figure 15(a). Constraints are also presented as a function of the BR of Higgsino decaying into an higgs boson and a gravitino, see their Figure 15(b).

<sup>14</sup> AABOUD 18Z searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing four or more charged leptons (electrons, muons and tau) to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, neutralino and gluino mass in a simplified model of NLSF pair production with R-parity violating decays of the LSP via  $\lambda_{12k}$  or  $\lambda_{133}$  to charged leptons, see their Figures 7, 8.

<sup>15</sup> SIRUNYAN 18AO searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and neutralinos in events with either two or more leptons (electrons or muons) of the same electric charge, or with three or more leptons, which can include up to two hadronically decaying tau leptons. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2A, Tchi1n2H, Tchi1n2D, Tchi1n2E and Tchi1n2F simplified models, see their Figures 14, 15, 16, 17 and 18. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 19.

<sup>16</sup> SIRUNYAN 18AP searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and neutralinos by combining a number of previous and new searches. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2E, Tchi1n2F and Tchi1n2I simplified models, see their Figures 7, 8, 9 and 10. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 11, 12, 13 and 14.

<sup>17</sup> SIRUNYAN 18AR searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tchi1n2F simplified models, see their Figure 8, and on the higgsino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tsbot3 simplified model, see their Figure 10.

<sup>18</sup> SIRUNYAN 18O searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two Higgs bosons, decaying to pairs of  $b$ -quarks, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the Tn1n1A simplified model, see their Figure 9.

<sup>19</sup> SIRUNYAN 18X searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and  $\cancel{E}_T$ . The razor variables ( $M_R$  and  $R^2$ ) are used to categorise the events. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsbot4 simplified model and on the wino mass in the Tchi1n2E simplified model, see their Figure 5. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 6.

<sup>20</sup> KHACHATRYAN 14L searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for evidence of direct pair production of neutralinos with Higgs or  $Z$ -bosons in the decay chain, leading to  $HH, HZ$  and  $ZZ$  final states with missing transverse energy. The decays of 16-20

- a Higgs boson to a  $b$ -quark pair, to a photon pair, and to final states with leptons are considered in conjunction with hadronic and leptonic decay modes of the  $Z$  and  $W$  bosons. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of GMSB simplified models where the decays  $\tilde{\chi}_1^0 \rightarrow H\bar{G}$  or  $\tilde{\chi}_1^0 \rightarrow Z\bar{G}$  take place either 100% or 50% of the time, see Figs. 16–20.
- 21 AAD 20b searched in  $32.8 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing an oppositely charge lepton pair ( $e\bar{e}, \mu\bar{\mu}$  or  $e\bar{\mu}$ ) coming from long-lived neutralinos decaying through the  $R$ -parity-violating decay  $\tilde{\chi}_1^0 \rightarrow \ell\ell\nu$  with  $\lambda_{121} \neq 0$  or  $\lambda_{122} \neq 0$ . No excess over the expected background is observed. Limits are derived for decay lengths of the neutralino between 1 mm and 10 m in a scenario where a squark-antisquark pair is produced, with the squark decaying to a quark and a  $\tilde{\chi}_1^0$ , with either  $\tilde{\chi}_1^0 \rightarrow e\bar{e}\nu/e\bar{\mu}\nu$  ( $\lambda_{121} \neq 0$ ) or  $\tilde{\chi}_1^0 \rightarrow e\bar{\mu}\nu/\mu\bar{\mu}\nu$  ( $\lambda_{122} \neq 0$ ), see their Figures 4 and 5.
- 22 AABOU 19c searched in  $32.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of neutralinos decaying into a  $Z$ -boson and a gravitino, in events characterized by the presence of dimuon vertices with displacements from the  $pp$  interaction point in the range of 1400 cm. Neutralinos are assumed to be produced in the decay chain of gluinos as in Tglu1A models. No significant excess is observed in the number of vertices relative to the predicted background. In GGM with a gluino mass of 1100 GeV, neutralino masses in the range 300–1000 GeV are excluded for certain values of  $c\tau$ , see their Figure 7.
- 23 AAIJ 17z searched in  $1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  and in  $2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing a displaced vertex with one associated high transverse momentum  $\mu$ . No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. upper limits on the cross section times branching fractions of pair-produced neutralinos decaying non-promptly into a muon and two quarks. Long-lived particles in a mass range 23–198 GeV are considered, see their Fig. 5 and Fig. 6.
- 24 KHACHATRYAN 16bx searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing 3 or more leptons coming from the electroweak production of wino- or higgsino-like neutralinos, assuming non-zero  $R$ -parity-violating leptonic couplings  $\lambda_{122}$ ,  $\lambda_{123}$ , and  $\lambda_{233}$  or semileptonic couplings  $\lambda'_{131}$ ,  $\lambda'_{233}$ ,  $\lambda'_{331}$ , and  $\lambda'_{333}$ . No excess over the expected background is observed and limits are derived on the neutralino mass, see Figs. 24 and 25.
- 25 AAD 14Bh searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing non-pointing photons in a diphoton plus missing transverse energy final state. No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. exclusion limits in the context of gauge-mediated supersymmetric breaking models, with the lightest neutralino being the next-to-lightest supersymmetric particle and decaying with a lifetime in the range from 0.25 ns to about 100 ns into a photon and a gravitino. For limits on the NLSF lifetime versus  $\Lambda$  plane, for the SPS8 model, see their Fig. 7.
- 26 AAD 13Ap searched in  $4.8 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing non-pointing photons in a diphoton plus missing transverse energy final state. No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. exclusion limits in the context of gauge-mediated supersymmetric breaking models, with the lightest neutralino being the next-to-lightest supersymmetric particle and decaying with a lifetime in excess of 0.25 ns into a photon and a gravitino. For limits in the NLSF lifetime versus  $\Lambda$  plane, for the SPS8 model, see their Fig. 8.
- 27 AAD 13Q searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing a high- $p_T$  isolated photon, at least one jet identified as originating from a bottom quark, and high missing transverse momentum. Such signatures may originate from supersymmetric models with gauge-mediated supersymmetry breaking in events in which one of a pair of higgsino-like neutralinos decays into a photon and a gravitino while the other decays into a Higgs boson and a gravitino. No significant excess above the expected background was found and limits were set on the neutralino mass in a generalized GMSB model (GGM) with a higgsino-like neutralino NLSF, see their Fig. 4. Intermediate neutralino masses between 220 and 380 GeV are excluded at 95% C.L., regardless of the squark and gluino masses, purely on the basis of the expected weak production.
- 28 AAD 13R looked in  $4.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing new, heavy particles that decay at a significant distance from their production point into a final state containing a high-momentum muon and charged hadrons. No excess over the expected background is observed and limits are placed on the production cross-section of neutralinos via squarks for various  $m_{\tilde{q}}, m_{\tilde{\chi}_1^0}$  in an  $R$ -parity violating scenario with  $\lambda'_{211} \neq 0$ , as a function of the neutralino lifetime, see their Fig. 6.
- 29 AALTONEN 13i searched in  $6.3 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for events containing  $\cancel{E}_T$  and a delayed photon that arrives late in the detector relative to the time expected from prompt production. No evidence of delayed photon production is observed.
- 30 CHATRCHYAN 13AH searched in  $4.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing  $\cancel{E}_T$  and a delayed photon that arrives late in the detector relative to the time expected from prompt production. No significant excess above the expected background was found and limits were set on the pair production of  $\tilde{\chi}_1^0$  depending on the neutralino proper decay length, see Fig. 8. Supersedes CHATRCHYAN 12Bk.
- 31 AAD 12CP searched in  $4.8 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with two photons and large  $\cancel{E}_T$  due to  $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$  decays in a GMSB framework. No significant excess above the expected background was found and limits were set on the neutralino mass in a generalized GMSB model (GGM) with a bino-like neutralino NLSF, see Figs. 6 and 7. The other sparticle masses were decoupled,  $\tan\beta = 2$  and  $c\tau_{NLSF} < 0.1 \text{ mm}$ . Also, in the framework of the SPS8 model, limits are presented in Fig. 8.
- 32 AAD 12CT searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing four or more leptons (electrons or muons) and either moderate values of missing transverse momentum or large effective mass. No significant excess is found in the data. Limits are presented in a simplified model of  $R$ -parity violating supersymmetry in which charginos are pair-produced and then decay into a  $W$ -boson and a  $\tilde{\chi}_1^0$ , which in turn decays through an RPV coupling into two charged leptons ( $e^\pm e^\mp$  or  $\mu^\pm \mu^\mp$ ) and a neutrino. In this model, limits are set on the neutralino mass as a function of the chargino mass, see Fig. 3a. Limits are also set in an  $R$ -parity violating mSUGRA model, see Fig. 3b.
- 33 AAD 12R looked in  $33 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing new, heavy particles that decay at a significant distance from their production point into a final state containing a high-momentum muon and charged hadrons. No excess over the expected background is observed and limits are placed on the production cross-section of neutralinos via squarks for various  $(m_{\tilde{q}}, m_{\tilde{\chi}_1^0})$  in an  $R$ -parity violating scenario with  $\lambda'_{211} \neq 0$ , as a function of the neutralino lifetime, see their Fig. 8. Superseded by AAD 13R.
- 34 ABZOV 12AD looked in  $6.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for events with a photon, a  $Z$ -boson, and large  $\cancel{E}_T$  in the final state. This topology corresponds to a GMSB model where pairs of neutralino NLSFs are either pair produced promptly or from decays of other supersymmetric particles and then decay to either  $Z\bar{G}$  or  $\gamma\bar{G}$ . No significant excess over the SM expectation is observed and a limit at 95% C.L. on the cross section is derived as a function of the effective SUSY breaking scale  $\Lambda$ , see Fig. 3. Assuming  $N_{mes} = 2$ ,  $M_{mes} = 3 \Lambda$ ,  $\tan\beta = 3$ ,  $\mu = 0.75 M_1$ , and  $C_{grav} = 1$ , the model is excluded at 95% C.L. for values of  $\Lambda < 87 \text{ TeV}$ .
- 35 CHATRCHYAN 12Bk searched in  $2.23 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with two photons and large  $\cancel{E}_T$  due to  $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$  decays in a GMSB framework. No significant excess above the expected background was found and limits were set on the pair production of  $\tilde{\chi}_1^0$  depending on the neutralino lifetime, see Fig. 6.
- 36 CHATRCHYAN 11B looked in  $35 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with an isolated lepton ( $e$  or  $\mu$ ), a photon and  $\cancel{E}_T$  which may arise in a generalized gauge mediated model from the decay of Wino-like NLSFs. No evidence for an excess over the expected background is observed. Limits are derived in the plane of squark/gluino mass versus Wino mass (see Fig. 4). Mass degeneracy of the produced squarks and gluinos is assumed.
- 37 AALTONEN 10 searched in  $2.6 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for diphoton events with large  $\cancel{E}_T$ . They may originate from the production of  $\tilde{\chi}^\pm$  in pairs or associated to a  $\tilde{\chi}_1^0$ , decaying into  $\tilde{\chi}_1^0$  which itself decays in GMSB to  $\gamma\bar{G}$ . There is no excess of events beyond expectation. An upper limit on the cross section is calculated in the GMSB model as a function of the  $\tilde{\chi}_1^0$  mass and lifetime, see their Fig. 2. A limit is derived on the  $\tilde{\chi}_1^0$  mass of 149 GeV for  $\tau_{\tilde{\chi}_1^0} \ll 1 \text{ ns}$ , which improves the results of previous searches.
- 38 ABZOV 10P looked in  $6.3 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for events with at least two isolated  $\gamma$ s and large  $\cancel{E}_T$ . These could be the signature of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  production, decaying to  $\tilde{\chi}_1^0$  and finally  $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$  in a GMSB framework. No significant excess over the SM expectation is observed, and a limit at 95% C.L. on the cross section is derived for  $N_{mes} = 1$ ,  $\tan\beta = 15$  and  $\mu > 0$ , see their Fig. 2. This allows them to set a limit on the effective SUSY breaking scale  $\Lambda > 124 \text{ TeV}$ , from which the excluded  $\tilde{\chi}_1^0$  mass range is obtained.
- 39 ABZOV 08f looked in  $1.1 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for diphoton events with large  $\cancel{E}_T$ . They may originate from the production of  $\tilde{\chi}^\pm$  in pairs or associated to a  $\tilde{\chi}_1^0$ , decaying to a  $\tilde{\chi}_1^0$  which itself decays promptly in GMSB to  $\gamma\bar{G}$ . No significant excess was found compared to the background expectation. A limit is derived on the masses of SUSY particles in the GMSB framework for  $M = 2\Lambda$ ,  $N = 1$ ,  $\tan\beta = 15$  and  $\mu > 0$ , see Figure 2. It also excludes  $\Lambda < 91.5 \text{ TeV}$ . Supersedes the results of ABZOV 05A. Superseded by ABZOV 10P.
- 40 ABULENCIA 07H searched in  $346 \text{ pb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for events with at least three leptons ( $e$  or  $\mu$ ) from the decay of  $\tilde{\chi}_1^0$  via  $L\bar{L}E$  couplings. The results are consistent with the hypothesis of no signal. Upper limits on the cross-section are extracted and a limit is derived in the framework of mSUGRA on the masses of  $\tilde{\chi}_1^0$  and  $\tilde{\chi}_1^\pm$ , see e.g. their Fig. 3 and Tab. II.
- 41 ABBIENDI 06b use  $600 \text{ pb}^{-1}$  of data from  $\sqrt{s} = 189\text{--}209 \text{ GeV}$ . They look for events with diphotons +  $\cancel{E}$  final states originating from prompt decays of pair-produced neutralinos in a GMSB scenario with  $\tilde{\chi}_1^0$  NLSF. Limits on the cross-section are computed as a function of  $m(\tilde{\chi}_1^0)$ , see their Fig. 14. The limit on the  $\tilde{\chi}_1^0$  mass is for a pure Bino state assuming a prompt decay, with lifetimes up to  $10^{-9} \text{ s}$ . Supersedes the results of ABBIENDI 04N.
- 42 ABDALLAH 05B use data from  $\sqrt{s} = 180\text{--}209 \text{ GeV}$ . They look for events with single photons +  $\cancel{E}$  final states. Limits are computed in the plane  $(m(\tilde{G}), m(\tilde{\chi}_1^0))$ , shown in their Fig. 9b for a pure Bino state in the GMSB framework and in Fig. 9c for a no-scale supergravity model. Supersedes the results of ABREU 00Z.
- 43 ABDALLAH 05B use data from  $\sqrt{s} = 130\text{--}209 \text{ GeV}$ . They look for events with diphotons +  $\cancel{E}$  final states and single photons not pointing to the vertex, expected in GMSB when the  $\tilde{\chi}_1^0$  is the NLSF. Limits are computed in the plane  $(m(\tilde{G}), m(\tilde{\chi}_1^0))$ , see their Fig. 10. The lower limit is derived on the  $\tilde{\chi}_1^0$  mass for a pure Bino state assuming a prompt decay and  $m_{\tilde{e}_R} = m_{\tilde{e}_L} = 2 m_{\tilde{\chi}_1^0}$ . It improves to 100 GeV for  $m_{\tilde{e}_R} = m_{\tilde{e}_L} = 1.1 m_{\tilde{\chi}_1^0}$  and the limit in the plane  $(m(\tilde{\chi}_1^0), m(\tilde{e}_R))$  is shown in Fig. 10b. For long-lived neutralinos, cross-section limits are displayed in their Fig. 11. Supersedes the results of ABREU 00Z.

### $\tilde{\chi}_2^0, \tilde{\chi}_3^0, \tilde{\chi}_4^0$ (Neutralinos) mass limits

Neutralinos are unknown mixtures of photinos,  $z$ -inos, and neutral higgsinos (the supersymmetric partners of photons and of  $Z$  and Higgs bosons). The limits here apply only to  $\tilde{\chi}_2^0, \tilde{\chi}_3^0$ , and  $\tilde{\chi}_4^0$ .  $\tilde{\chi}_1^0$  is the lightest supersymmetric particle (LSP); see  $\tilde{\chi}_1^0$  Mass Limits. It is not possible to quote rigorous mass limits because they are extremely model dependent; i.e. they depend on branching ratios of various  $\tilde{\chi}^0$  decay modes, on the masses of decay products ( $\tilde{e}, \tilde{\nu}, \tilde{q}, \tilde{g}$ ), and on the  $\tilde{e}$  mass exchanged in  $e^+e^- \rightarrow \tilde{\chi}_1^0\tilde{\chi}_1^0$ . Limits arise either from direct searches, or from the MSSM constraints set on the gaugino and higgsino mass parameters  $M_2$  and  $\mu$  through searches for lighter charginos and neutralinos. Often limits are given as contour plots in the  $m_{\tilde{\chi}_0} - m_{\tilde{e}}$  plane vs other parameters. When specific assumptions are made, e.g. the neutralino is a pure photino ( $\tilde{\gamma}$ ), pure  $z$ -ino ( $\tilde{Z}$ ), or pure neutral higgsino ( $\tilde{H}^0$ ), the neutralinos will be labelled as such.

Limits obtained from  $e^+e^-$  collisions at energies up to 136 GeV, as well as other limits from different techniques, are now superseded and have not been included in this compilation. They can be found in the 1998 Edition (The European Physical Journal **C3** 1 (1998)) of this Review. Some later papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

<sup>1</sup> AAD 23AE searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with 2  $\ell$  with same flavour and opposite sign, plus jets and  $\cancel{E}_T$ , defining signal region with the dilepton invariant mass both on- and off-shell with respect to the  $Z$  boson. No significant excess above the Standard Model predictions is observed. Limits are set on models of strong and electroweak production. For electroweak production, limits are placed on production of mass-degenerate, wino-like  $\tilde{\chi}_2^0 \tilde{\chi}_1^0$  with  $\tilde{\chi}_2^0 \rightarrow Z \tilde{\chi}_1^0$  and  $\tilde{\chi}_1^0 \rightarrow W \tilde{\chi}_1^0$ , see figure 15.

<sup>2</sup> AAD 23CI searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions for events containing 1  $\ell$  ( $e$  or  $\mu$ ), jets, and  $\cancel{E}_T$ . Final states consistent with the production of a diboson system plus  $\cancel{E}_T$  were identified also by making use of large-R jet tagging techniques. No excess on top of the Standard Model background was observed. Limits were set on the production of  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm$  (assuming wino cross sections) decaying to  $WZ \tilde{\chi}_1^0 \tilde{\chi}_1^0$  or  $WW \tilde{\chi}_1^0 \tilde{\chi}_1^0$ . See their figure 9.

<sup>3</sup> AAD 23CI searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions for events containing 1  $\ell$  ( $e$  or  $\mu$ ), jets, and  $\cancel{E}_T$ . Final states consistent with the production of a boson + Higgs system plus  $\cancel{E}_T$  were identified via a BDT. No excess on top of the Standard Model background was observed. Limits were set on the production of degenerate  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  (assuming wino cross sections) decaying into  $Wh \tilde{\chi}_1^0 \tilde{\chi}_1^0$ . See their figure 10.

<sup>4</sup> AAD 23CP searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with 2  $\ell$  with same charge plus at least one jet and  $\cancel{E}_T$ , defining signal region based on 'stransverse mass' of the dilepton system,  $\cancel{E}_T$  significance and effective mass. No significant excess above the Standard Model predictions is observed. Limits are set on the mass of mass-degenerate  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0$  for the wino-like production of  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  followed by the decay into either  $WZ \tilde{\chi}_1^0 \tilde{\chi}_1^0$  or  $Wh \tilde{\chi}_1^0 \tilde{\chi}_1^0$ , see figure 13.

<sup>5</sup> AAD 23CR searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for RPV SUSY in final states with multiple leptons and  $b$ -tagged jets. No significant excess above the Standard Model expectations is observed. Limits are set on the production of electroweakinos (wino or higgsino) that decay via RPV coupling  $\lambda'_{133}$  to a charged lepton or a neutrino, a  $b$  quark, and an additional  $t$  or  $b$  quark, see their figure 16. A second model addresses direct  $\tilde{\mu}_{L,R}$  production and decay to a muon and a bino-like neutralino, which decays in the same way as in the first model, see their figure 17.

<sup>6</sup> HAYRAPETYAN 23E searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of gluino, top squark and electroweakino pair production in events with at least one photon, multiple jets, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set in models for strong production, Tglu4D, Tglu4E, Tglu4F and Tstop13, see their figure 9. They also interpret the results in the models for electroweak production, shown in their figure 10. Tchi1n1A assumes wino-like  $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$  production, while Tchi1chi1A assumes higgsino-like cross sections and includes  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm, \tilde{\chi}_1^0 \tilde{\chi}_2^0$  and  $\tilde{\chi}_{1,2}^0 \tilde{\chi}_1^\pm$  production. For  $\tilde{\chi}_1^0 \tilde{\chi}_2^0$  alone no mass point can be excluded in the model Tchi1chi1A, but in another model for  $\tilde{\chi}_1^0 \tilde{\chi}_2^0$  production, Tn1n2A.

<sup>7</sup> TUMASYAN 23B searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of electroweakino pair production with decays including hadronically decaying bosons,  $WW, WZ, WH$ , or  $ZH$ , identified with a DNN classifying large-area (AK8) jets. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the nearly mass degenerate wino-like  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  in the models Tchi1chi1I, Tchi1n2Fb, and Tchi1n2Fc, see their figure 4. They also consider a model that contains both  $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$  and  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm$  production, see their figure 5 (upper). Results are also interpreted in the model THinoBinoA with nearly mass-degenerate higgsino-like  $\tilde{\chi}_3^0, \tilde{\chi}_2^0, \tilde{\chi}_1^\pm$ , and a lighter bino-like  $\tilde{\chi}_1^0$ , see their figure 5 (lower).

<sup>8</sup> TUMASYAN 22Q searched in up to  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of electroweakino and top squark pair production with a small mass difference between the produced supersymmetric particles and the lightest neutralino in events with two or three low-momentum leptons and missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  in the model Tchi1n2F, see their Figure 8. Limits are also set in a higgsino simplified model with both  $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0 \tilde{\chi}_1^0$  production, where  $\tilde{\chi}_2^0 \rightarrow Z \tilde{\chi}_1^0$  and  $m_{\tilde{\chi}_1^\pm} = 1/2(m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})$ . A model inspired by the pMSSM is used for further interpretations in the case of a higgsino LSP, see their Figure 9. Limits are also set on the mass of the top squark in the models Tstop2 and Tstop3, see their Figure 10.

<sup>9</sup> TUMASYAN 22s searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of electroweakino pair production in events with three or four leptons, with up to two hadronically decaying  $\tau$  leptons, or two same-sign light leptons ( $e$  or  $\mu$ ). No significant excess above the Standard Model expectations is observed. Limits are set on the mass of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  in the models Tchi1n2B (in flavour-democratic and tau-enriched or -dominated scenarios), Tchi1n2E, Tchi1n2F, see their Figures 16–20, and on the mass of the higgsino-triplet  $\tilde{\chi}_2^0, \tilde{\chi}_1^\pm$ , and  $\tilde{\chi}_1^0$  in the models Tn1n1A, Tn1n1B, and Tn1n1C, see their Figure 21.

<sup>10</sup> TUMASYAN 22v searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of electroweakino pair production with decay to two Higgs bosons  $H$ , with  $H \rightarrow b\bar{b}$ , resulting either in 4 resolved  $b$ -jets or two large-radius jets, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  in the models Tn1n1A, see their Figures 11 and 12, or in a model where higgsino-like nearly mass degenerate  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$  are pair produced and each decay to  $H$  and a bino-like  $\tilde{\chi}_1^0$ , see their Figure 13. Limits are also set on the gluino mass in the model Tglu1I, see their Figure 14.

<sup>11</sup> AAD 21BG searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for pair production  $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$  in final states with three leptons, with and without assuming the presence of a  $Z \rightarrow \ell\ell$  decay. No significant excess above the Standard Model predictions is observed. Limits are set on the  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  mass in Tchi1n2E, Tchi1n2F and Tchi1n2Ga. See their Fig. 16.

<sup>12</sup> AAD 21Y searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tchi1n12-GGM, and RPV models similar to Tchi1n2I, Tglu1A (with  $q = u, d, s, c, b$ , with equal branching fractions), and  $\tilde{\ell}_L/\tilde{\nu} \rightarrow \ell/\nu \tilde{\chi}_1^0$  (mass-degenerate  $\tilde{\ell}_L$  and  $\tilde{\nu}$  of all 3 generations), all with  $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$  via  $\lambda_{12k}$  or  $\lambda_{133}$  (where  $i, k \in 1, 2$ ), see their Figure 11.

<sup>13</sup> SIRUNYAN 21M searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  mass in Tchi1n2Fa, see their Figure 11, on the  $\tilde{\chi}_1^0$  mass in Tn1n1C and Tn1n1B for  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$ , see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsb03, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.

<sup>14</sup> TUMASYAN 21c searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with one lepton, a Higgs boson decaying to a pair of bottom quarks, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Lower limits are set on the masses of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  in the simplified model Tchi1n2E, see their Figure 6.

<sup>15</sup> AAD 20AN searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two photons and missing transverse momentum. Events are further categorised in terms of lepton or jet multiplicity. No significant excess over the expected background is observed. Limits at 95% C.L. are set on the Higgsino mass in the Tn1n1A simplified model, see their Figure 11.

<sup>16</sup> AAD 20I reported on ATLAS searches for electroweak production in models with compressed mass spectra as Tchi1n2Ga. A dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Events with  $\cancel{E}_T$ , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Constraints at 95% C.L. are placed in Higgsino models on the mass of the  $\tilde{\chi}_2^0$  (the  $\tilde{\chi}_1^\pm$  mass is halfway between the  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^0$  masses) at 193 GeV for a mass splitting between  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^0$  of 9.3 GeV and extend down to a mass splitting of 2.4 GeV at the LEP chargino mass limit. See their Fig. 14(a).

<sup>17</sup> AAD 20I reported on ATLAS searches for electroweak production in models with compressed mass spectra as Tchi1n2Fa. A dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Events with  $\cancel{E}_T$ , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Constraints at 95% C.L. are placed in Wino-Bino models on the mass of the  $\tilde{\chi}_2^0$  (degenerate with  $\tilde{\chi}_1^\pm$ ) at 240 GeV for a mass splitting between  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^0$  of 7 GeV and extend down to a mass splitting of 1.5 GeV at the LEP chargino mass limit of 92.4 GeV. See their Fig. 14(b,c).

<sup>18</sup> AAD 20K reported on a search for electroweak production in models with mass splittings near the electroweak scale as Tchi1n2F and exploiting three-lepton final state events with an emulated recursive jigsaw reconstruction method. The analysis uses a dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$ . Exclusion limits at 95% C.L. are derived on next-to-lightest neutralinos and charginos with masses up to 345 GeV for a massless lightest neutralino, see their Fig. 7.

<sup>19</sup> AAD 20R searched for electroweak production in the model Tchi1n2E, selecting events with a pair of  $b$ -tagged jets consistent with those from a Higgs boson decay, either an electron or a muon from the  $W$  boson decay and  $\cancel{E}_T$ . The analysis uses a dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$ . Exclusion limits at 95% C.L. are derived on next-to-lightest neutralinos and charginos with masses up to 740 GeV for a massless lightest neutralino, assuming pure wino cross-sections. See their Fig. 6.

# Searches Particle Listings

## Supersymmetric Particle Searches

- <sup>20</sup> SIRUNYAN 20AU searched in  $77.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing one soft, hadronically decaying tau lepton, one energetic jet from initial-state radiation, and large  $E_{T\cancel{}}$ . No excess over the expected background is observed. Limits are derived on the wino mass in the Tchi1n2D simplified model, see their Figure 2.
- <sup>21</sup> AABOUD 19AU searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and next-to-lightest neutralinos decaying into lightest neutralinos and a  $W$  and a Higgs boson, respectively. Fully hadronic, semileptonic, diphoton, and multilepton (electrons, muons) final states with missing transverse momentum are considered in this search. Observations are consistent with the Standard Model expectations, and 95% confidence-level limits of up to 680 GeV on the chargino/next-to-lightest neutralino masses are set (Tchi1n2E model). See their Figure 14 for an overlay of exclusion contours from all searches.
- <sup>22</sup> SIRUNYAN 19BU searched for pair production of gauginos via vector boson fusion assuming the gaugino spectrum is compressed, in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$ . The final states explored included zero leptons plus two jets, one lepton plus two jets, and one hadronic tau plus two jets. A similar bound is obtained in the light slepton limit.
- <sup>23</sup> AABOUD 18AY searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and neutralinos as in Tchi1n2D models, in events characterised by the presence of at least two hadronically decaying tau leptons and large missing transverse energy. No significant deviation from the expected SM background is observed. Assuming decays via intermediate  $\tilde{\tau}_1$  and  $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}$ , the observed limits rule out  $\tilde{\chi}_2^0$  masses up to 760 GeV for a massless  $\tilde{\chi}_1^0$ . See their Fig. 7 (right). Interpretations are also provided in Fig 8 (bottom) for different assumptions on the ratio between  $m_{\tilde{\tau}}$  and  $m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0}$ .
- <sup>24</sup> AABOUD 18BT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the next-to-lightest neutralino mass up to 1100 GeV for massless  $\tilde{\chi}_1^0$  in the Tchi1n2C simplified model exploiting the  $3\ell$  signature, see their Figure 8(c).
- <sup>25</sup> AABOUD 18BT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the next-to-lightest neutralino mass up to 580 GeV for massless  $\tilde{\chi}_1^0$  in the Tchi1n2F simplified model exploiting the  $2\ell+2$  jets and  $3\ell$  signatures, see their Figure 8(d).
- <sup>26</sup> AABOUD 18CK searched for events with at least 3  $b$ -jets and large missing transverse energy in two datasets of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  of  $36.1 \text{ fb}^{-1}$  and  $24.3 \text{ fb}^{-1}$  depending on the trigger requirements. The analyses aimed to reconstruct two Higgs bosons decaying to pairs of  $b$ -quarks. No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the T1n1n1A simplified model, see their Figure 15(a). Constraints are also presented as a function of the BR of Higgsino decaying into a higgs boson and a gravitino, see their Figure 15(b).
- <sup>27</sup> AABOUD 18CO searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of mass-degenerate charginos and next-to-lightest neutralinos in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. The search channels are based on recursive jigsaw reconstruction. Limits are set on the next-to-lightest neutralinos mass up to 600 GeV for massless neutralinos in the Tchi1n2F simplified model exploiting the statistical combination of  $2\ell+2$  jets and  $3\ell$  channels. Next-to-lightest neutralinos masses below 220 GeV are not excluded due to an excess of events above the SM prediction in the dedicated regions. See their Figure 13(d).
- <sup>28</sup> AABOUD 18R searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2G higgsino models, and  $\tilde{\chi}_2^0$  masses are excluded up to 145 GeV for  $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$ . The exclusion limits extend down to mass splittings of 2.5 GeV, see their Fig. 10 (top). Results are also interpreted in terms of exclusion bounds on the production cross-sections for the NUHM2 scenario as a function of the universal gaugino mass  $m_{1/2}$  and  $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$ , see their Fig. 12.
- <sup>29</sup> AABOUD 18R searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2F wino models, and  $\tilde{\chi}_2^0$  masses are excluded up to 175 GeV for  $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$ . The exclusion limits extend down to mass splittings of 2 GeV, see their Fig. 10 (bottom). Results are also interpreted in terms of exclusion bounds on the production cross-sections for the NUHM2 scenario as a function of the universal gaugino mass  $m_{1/2}$  and  $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$ , see their Fig. 12.
- <sup>30</sup> AABOUD 18U searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results of the diphoton channel are interpreted in terms of lower limits on the masses of gauginos Tchi1n1A models, which reach as high as 1.3 TeV. Gaugino masses below 1060 GeV are excluded for any NLSP mass, see their Fig. 10.
- <sup>31</sup> SIRUNYAN 18AJ searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two low-momentum, oppositely charged leptons (electrons or muons) and  $E_{T\cancel{}}$ . No excess over the expected background is observed. Limits are derived on the wino mass in the Tchi1n2F simplified model, see their Figure 5. Limits are also set on the stop mass in the Tstop10 simplified model, see their Figure 6. Finally, limits are set on the Higgsino mass in the Tchi1n2G simplified model, see Figure 8 and in the pMSSM, see Figure 7.
- <sup>32</sup> SIRUNYAN 18DP searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and neutralinos or of chargino pairs in events with a tau lepton pair and significant missing transverse momentum. Both hadronic and leptonic decay modes are considered for the tau lepton. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tchi1ch1D and Tchi1n2 simplified models, see their Figures 14 and 15. Also, excluded stau pair production cross sections are shown in Figures 11, 12, and 13.
- <sup>33</sup> SIRUNYAN 17AW searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with a charged lepton (electron or muon), two jets identified as originating from a  $b$ -quark, and large  $E_{T\cancel{}}$ . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the chargino and the next-to-lightest neutralino in the Tchi1n2E simplified model, see their Figure 6.
- <sup>34</sup> AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons,  $E_{T\cancel{}}$ , with or without hadronic jets, in  $20 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on mass-degenerate  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$  masses in the Tn2n3A and Tn2n3B simplified models. See their Fig. 15.
- <sup>35</sup> AAD 15BA searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of charginos and neutralinos decaying to a final state containing a  $W$  boson and a 125 GeV Higgs boson, plus missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with the decays  $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0$  and  $\tilde{\chi}_2^0 \rightarrow H \tilde{\chi}_1^0$  having 100% branching fraction, see Fig. 8. A combination of the multiple final states for the Higgs decay yields the best limits (Fig. 8d).
- <sup>36</sup> AAD 14H searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of charginos and neutralinos decaying to a final state with three leptons and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via either all three generations of leptons, staus only, gauge bosons, or Higgs bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 8.
- <sup>37</sup> AAD 14X searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the neutralino mass in an R-parity conserving simplified model where the decay  $\tilde{\chi}_{2,3}^0 \rightarrow \ell^\pm \ell^\mp \tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Fig. 10.
- <sup>38</sup> AAD 13 searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for charginos and neutralinos decaying to a final state with three leptons ( $e$  and  $\mu$ ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 and 3, and in simplified models, see Fig. 4. For the simplified models with intermediate slepton decays, degenerate  $\tilde{\chi}_2^\pm$  and  $\tilde{\chi}_2^0$  masses up to 500 GeV are excluded at 95% C.L. for very large mass differences with the  $\tilde{\chi}_1^0$ . Supersedes AAD 12As.
- <sup>39</sup> CHATRCHYAN 12BJ searched in  $4.98 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for direct electroweak production of charginos and neutralinos in events with at least two leptons, jets and missing transverse momentum. No significant excesses over the expected SM backgrounds are observed and 95% C.L. limits on the production cross section of  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  pair production were set in a number of simplified models, see Figs. 7 to 12. Most limits are for exactly 3 jets.
- <sup>40</sup> ABREU 00w combines data collected at  $\sqrt{s}=189 \text{ GeV}$  with results from lower energies. The mass limit is obtained by constraining the MSSM parameter space with gaugino and stfermion mass universality at the GUT scale, using the results of negative direct searches for neutralinos (including cascade decays and  $\tilde{\tau}\tilde{\tau}$  final states) from ABREU 01, for charginos from ABREU 00j and ABREU 00T (for all  $\Delta m_\pm$ ), and for charged sleptons from ABREU 01b. The results hold for the full parameter space defined by all values of  $M_2$  and  $|\mu| \leq 2 \text{ TeV}$  with the  $\tilde{\chi}_1^0$  as LSP.
- <sup>41</sup> AAD 20AN searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two photons and missing transverse momentum. Events are further categorised in terms of lepton or jet multiplicity. No significant excess over the expected background is observed. Limits at 95% C.L. are derived in Tchi1n2E simplified models. Next-to-lightest neutralinos and charginos with masses up to 310 GeV for a massless lightest neutralino are excluded. See their Fig. 10.
- <sup>42</sup> AAD 14G searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of chargino-neutralino pairs, decaying to a final state with two leptons ( $e$  and  $\mu$ ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via gauge bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 10.
- <sup>43</sup> KHACHATRYAN 14I searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of charginos and neutralinos decaying to a final state with three leptons ( $e$  or  $\mu$ ) and missing transverse momentum, or with a  $Z$ -boson, dijets and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Figs. 12–16.
- <sup>44</sup> AAD 12As searched in  $2.06 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for charginos and neutralinos decaying to a final state with three leptons ( $e$  and  $\mu$ ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 (top), and in simplified models, see Fig. 2 (bottom).
- <sup>45</sup> AAD 12T looked in  $1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for the production of supersymmetric particles decaying into final states with missing transverse momentum and exactly two isolated leptons ( $e$  or  $\mu$ ). Same-sign dilepton events were separately studied. Additionally, in opposite-sign events, a search was made for an excess of same-flavor over different-flavor lepton pairs. No excess over the expected background is observed and limits are placed on the effective production cross section of opposite-sign dilepton events with  $E_{T\cancel{}} > 250 \text{ GeV}$  and on same-sign dilepton events with  $E_{T\cancel{}} > 100 \text{ GeV}$ . The latter limit is interpreted in a simplified electroweak gaugino production model.

### $\tilde{\chi}_1^\pm, \tilde{\chi}_2^\pm$ (Charginos) mass limits

Charginos are unknown mixtures of  $w$ -inos and charged higgsinos (the supersymmetric partners of  $W$  and Higgs bosons). A lower mass limit for the lightest chargino ( $\tilde{\chi}_1^\pm$ ) of approximately 45 GeV, independent of the field composition and of the decay mode, has been obtained by the LEP experiments from the analysis of the  $Z$  width and decays. These results, as well as other now superseded limits from  $e^+e^-$  collisions at energies below 136 GeV, and from hadronic collisions, can be found in the 1998 Edition (The European Physical Journal **C3** 1 (1998)) of this Review.

Unless otherwise stated, results in this section assume spectra, production rates, decay modes and branching ratios as evaluated in the MSSM, with gaugino and sfermion mass unification at the GUT scale. These papers generally study production of  $\tilde{\chi}_1^0 \tilde{\chi}_2^0$ ,  $\tilde{\chi}_1^+ \tilde{\chi}_1^-$  and (in the case of hadronic collisions)  $\tilde{\chi}_1^+ \tilde{\chi}_2^0$  pairs, including the effects of cascade decays. The mass limits on  $\tilde{\chi}_1^\pm$  are either direct, or follow indirectly from the constraints set by the non-observation of  $\tilde{\chi}_2^0$  states on the gaugino and higgsino MSSM parameters  $M_2$  and  $\mu$ . For generic values of the MSSM parameters, limits from high-energy  $e^+e^-$  collisions coincide with the highest value of the mass allowed by phase-space, namely  $m_{\tilde{\chi}_1^\pm} \lesssim \sqrt{s}/2$ . The still unpublished combination of the results of the four LEP collaborations from the 2000 run of LEP2 at  $\sqrt{s}$  up to  $\approx 209$  GeV yields a lower mass limit of 103.5 GeV valid for general MSSM models. The limits become however weaker in certain regions of the MSSM parameter space where the detection efficiencies or production cross sections are suppressed. For example, this may happen when: (i) the mass differences  $\Delta m_{\pm} = m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}$  or  $\Delta m_{\nu} = m_{\tilde{\chi}_1^\pm} - m_{\tilde{\nu}}$  are very small, and the detection efficiency is reduced; (ii) the electron sneutrino mass is small, and the  $\tilde{\chi}_1^\pm$  production rate is suppressed due to a destructive interference between  $s$  and  $t$  channel exchange diagrams. The regions of MSSM parameter space where the following limits are valid are indicated in the comment lines or in the footnotes.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

## Supersymmetric Particle Searches

> 345	95	55	AAD	14H	ATLS	$\tilde{\chi}_1^\pm \tilde{\chi}_2^0 \rightarrow W \tilde{\chi}_1^0 Z \tilde{\chi}_1^0$ , simplified model, $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}$ , $m_{\tilde{\chi}_1^0} = 0$ GeV	4	AAD 23CP searched in 139 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for events with 2 $\ell$ with same charge plus at least one jet and $E_T$ , defining signal region based on 'stransverse mass' of the dilepton system, $E_T$ significance and effective mass. No significant excess above the Standard Model predictions is observed. Limits are set on the mass of mass-degenerate $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ for the wino-like production of $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ followed by the decay into either $WZ \tilde{\chi}_1^0 \tilde{\chi}_1^0$ or $Wh \tilde{\chi}_1^0 \tilde{\chi}_1^0$ , see figure 13.
> 148	95	55	AAD	14H	ATLS	$\tilde{\chi}_1^\pm \tilde{\chi}_2^0 \rightarrow W \tilde{\chi}_1^0 H \tilde{\chi}_1^0$ , simplified model, $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}$ , $m_{\tilde{\chi}_1^0} = 0$ GeV	5	AAD 23CR searched in 139 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for RPV SUSY in final states with multiple leptons and $b$ -tagged jets. No significant excess above the Standard Model expectations is observed. Limits are set on the production of electroweakinos (wino or higgsino) that decay via RPV coupling $\lambda'_{i33}$ to a charged lepton or a neutrino, a $b$ quark, and an additional $t$ or $b$ quark, see their figure 16. A second model addresses direct $\tilde{\mu}_{L,R}$ production and decay to a muon and a bino-like neutralino, which decays in the same way as in the first model, see their figure 17.
> 380	95	55	AAD	14H	ATLS	$\tilde{\chi}_1^\pm \tilde{\chi}_2^0 \rightarrow \tau^\pm \nu \tilde{\chi}_1^0 \tau^\pm \tau^\mp \tilde{\chi}_1^0$ , simplified model, $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}$ , $m_{\tilde{\chi}_1^0} = 0$ GeV	6	AAD 23M searched in 139 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for $\tilde{\chi}_1^\pm$ pair production, followed by $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0 \rightarrow \ell^\pm \nu \tilde{\chi}_1^0$ in events with two leptons. The focus is on models where $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}$ is close to the $W$ mass. No significant excess above the Standard Model predictions is observed. Limits are set on the $\tilde{\chi}_1^\pm$ mass as a function of $m_{\tilde{\chi}_1^0}$ , see Figure 9.
> 750	95	56	AAD	14X	ATLS	RPV, $\geq 4\ell^\pm$ , $\tilde{\chi}_1^\pm \rightarrow W^{(*)\pm} \tilde{\chi}_1^0$ , $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$	7	HAYRAPETYAN 23E searched in 137 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for evidence of gluino, top squark and electroweakino pair production in events with at least one photon, multiple jets, and large $E_T$ . No significant excess above the Standard Model expectations is observed. Limits are set in models for strong production, Tglu4D, Tglu4E, Tglu4F and Tstop13, see their figure 9. They also interpret the results in the models for electroweak production, shown in their figure 10. Tchi1n1A assumes wino-like $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$ production, while Tchi1chi1A assumes higgsino-like cross sections and includes $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm$ , $\tilde{\chi}_1^0 \tilde{\chi}_2^0$ and $\tilde{\chi}_1^0 \tilde{\chi}_1^\pm$ production. For $\tilde{\chi}_1^0 \tilde{\chi}_2^0$ alone no production can be excluded in the model Tchi1chi1A, but in another model for $\tilde{\chi}_1^0 \tilde{\chi}_2^0$ production, Tn1n2A.
> 210	95	57	KHACHATRY...14L	CMS	$\tilde{\chi}_2^0 \rightarrow H \tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0$ simplified models, $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm}$ , $m_{\tilde{\chi}_1^0} = 0$ GeV	8	TUMASYAN 23B searched in 137 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for evidence of electroweakino pair production with decays including hadronically decaying bosons, $WW$ , $WZ$ , $WH$ , or $ZH$ , identified with a DNN classifying large-area (AK8) jets. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the nearly mass degenerate wino-like $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ in the models Tchi1chi1I, Tchi1n2Fb, and Tchi1n2Fc, see their figure 4. They also consider a model that contains both $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm$ production, see their figure 5 (upper). Results are also interpreted in the model THinoBinoA with nearly mass-degenerate higgsino-like $\tilde{\chi}_3^0$ , $\tilde{\chi}_2^0$ , $\tilde{\chi}_1^\pm$ , and a lighter bino-like $\tilde{\chi}_1^0$ , see their figure 5 (lower).	
> 540	95	58	AAD	13	ATLS	$3\ell^\pm + E_T$ , pMSSM, SMS	9	TUMASYAN 22Q searched in up to 137 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for evidence of electroweakino and top squark pair production with a small mass difference between the produced supersymmetric particles and the lightest neutralino in events with two or three low-momentum leptons and missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ in the model Tchi1n2F, see their Figure 8. Limits are also set in a higgsino simplified model with both $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0 \tilde{\chi}_1^0$ production, where $\tilde{\chi}_2^0 \rightarrow Z \tilde{\chi}_1^0$ and $m_{\tilde{\chi}_1^\pm} = 1/2(m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})$ . A model inspired by the pMSSM is used for further interpretations in the case of a higgsino LSP, see their Figure 9. Limits are also set on the mass of the top squark in the models Tstop2 and Tstop3, see their Figure 10.
> 540	95	59	AAD	13B	ATLS	$2\ell^\pm + E_T$ , pMSSM, SMS	10	TUMASYAN 22s searched in 137 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for evidence of electroweakino pair production in events with three or four leptons, with up to two hadronically decaying $\tau$ leptons, or two same-sign light leptons ( $e$ or $\mu$ ). No significant excess above the Standard Model expectations is observed. Limits are set on the mass of $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ in the models Tchi1n2B (in flavor-democratic and tau-enriched or -dominated scenarios), Tchi1n2E, Tchi1n2F, see their Figures 16–20, and on the mass of the higgsino-triplet $\tilde{\chi}_2^0$ , $\tilde{\chi}_1^\pm$ , and $\tilde{\chi}_1^0$ in the models Tn1n1A, Tn1n1B, and Tn1n1C, see their Figure 21.
> 540	95	60	AAD	12Ct	ATLS	$\geq 4\ell^\pm$ , RPV, $m_{\tilde{\chi}_1^0} > 300$ GeV	11	AAD 21Ax searched in 139 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for pair production of electroweakinos decaying to the LSP via the emission of Standard Model bosons (Higgs, $W$ , $Z$ ) decaying into hadrons. The final state in all cases characterised by the presence of $E_T$ , jets, and large- $R$ jets tagged according to the boson of interest. Different assumptions (Higgsino, Wino, Bino) are made for the pair produced electroweakinos and for the LSP multiplet. No significant excess above the Standard Model predictions is observed. Limits are set on the electroweakino masses as a function of the model parameters (in particular $m_{\tilde{\chi}_1^0}$ ). See Figs. 12, 14, 15.
> 94	95	61	CHATRCHYAN 12Bj	CMS	$\geq 2\ell$ , jets + $E_T$ , $pp \rightarrow \tilde{\chi}_1^\pm \tilde{\chi}_2^0$	12	AAD 21Bc searched in 139 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for pair production $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$ in final states with three leptons, with and without assuming the presence of a $Z \rightarrow \ell\ell$ decay. No significant excess above the Standard Model predictions is observed. Limits are set on the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ mass in Tchi1n2E, Tchi1n2F and Tchi1n2Ga. See their Fig. 16.	
• • •						We do not use the following data for averages, fits, limits, etc. • • •		
> 310	95	63	AAD	20AN	ATLS	$2\gamma + E_T$ , Tchi1n2E, $m_{\tilde{\chi}_1^0} = 0$ GeV	13	AAD 21E searched in 139 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for production of wino-like $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$ , followed by the RPV decay of $\tilde{\chi}_1^\pm$ into $Z\ell$ , $H\ell$ or $W\nu$ and of $\tilde{\chi}_1^0$ into $Z\nu$ , $H\nu$ or $W\ell$ , in events with three leptons, looking for $Z\ell$ resonances. No significant excess above the Standard Model predictions is observed. Limits are set on the common $m_{\tilde{\chi}_1^\pm}/m_{\tilde{\chi}_1^0}$ mass in the TwinoLSPRPV simplified model, as a function of the common $\tilde{\chi}_1^\pm/\tilde{\chi}_1^0$ branching fraction to a $Z$ boson. See Figure 9.

1 AAD 23AE searched in 139 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with 2  $\ell$  with same flavour and opposite sign, plus jets and  $E_T$ , defining signal region with the dilepton invariant mass both on- and off-shell with respect to the  $Z$  boson. No significant excess above the Standard Model predictions is observed. Limits are set on models of strong and electroweak production. For electroweak production, limits are placed on production of mass-degenerate, wino-like  $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$  with  $\tilde{\chi}_2^0 \rightarrow Z \tilde{\chi}_1^0$  and  $\tilde{\chi}_1^\pm \rightarrow W \tilde{\chi}_1^0$ , see figure 15.

2 AAD 23Ci searched in 139 fb<sup>-1</sup> of  $pp$  collisions for events containing 1  $\ell$  ( $e$  or  $\mu$ ), jets, and  $E_T$ . Final states consistent with the production of a diboson system plus  $E_T$  were identified also by making use of large- $R$  jet tagging techniques. No excess on top of the Standard Model background was observed. Limits were set on the production of  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm$  (assuming wino cross sections) decaying to  $WZ \tilde{\chi}_1^0 \tilde{\chi}_1^0$  or  $WW \tilde{\chi}_1^0 \tilde{\chi}_1^0$ . See their figure 9.

3 AAD 23Ci searched in 139 fb<sup>-1</sup> of  $pp$  collisions for events containing 1  $\ell$  ( $e$  or  $\mu$ ), jets, and  $E_T$ . Final states consistent with the production of a boson + Higgs system plus  $E_T$  were identified via a BDT. No excess on top of the Standard Model background was observed. Limits were set on the production of degenerate  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  (assuming wino cross sections) decaying into  $Wh \tilde{\chi}_1^0 \tilde{\chi}_1^0$ . See their figure 10.

12 AAD 21Bc searched in 139 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for pair production  $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$  in final states with three leptons, with and without assuming the presence of a  $Z \rightarrow \ell\ell$  decay. No significant excess above the Standard Model predictions is observed. Limits are set on the  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  mass in Tchi1n2E, Tchi1n2F and Tchi1n2Ga. See their Fig. 16.

13 AAD 21E searched in 139 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for production of wino-like  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm$  and  $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$ , followed by the RPV decay of  $\tilde{\chi}_1^\pm$  into  $Z\ell$ ,  $H\ell$  or  $W\nu$  and of  $\tilde{\chi}_1^0$  into  $Z\nu$ ,  $H\nu$  or  $W\ell$ , in events with three leptons, looking for  $Z\ell$  resonances. No significant excess above the Standard Model predictions is observed. Limits are set on the common  $m_{\tilde{\chi}_1^\pm}/m_{\tilde{\chi}_1^0}$  mass in the TwinoLSPRPV simplified model, as a function of the common  $\tilde{\chi}_1^\pm/\tilde{\chi}_1^0$  branching fraction to a  $Z$  boson. See Figure 9.

14 AAD 21v searched in 139 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tchi1n12-GGM, and RPV models similar to Tchi1n2I, Tglu1A (with  $q = u, d, s, c, b$ , with equal branching fractions), and  $\tilde{\ell}_L/\tilde{\nu} \rightarrow \ell/\nu \tilde{\chi}_1^0$  (mass-degenerate  $\tilde{\ell}_L$  and  $\tilde{\nu}$  of all 3 generations), all with  $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$  via  $\lambda_{12k}$  or  $\lambda_{i33}$  (where  $i, k \in \{1, 2\}$ ), see their Figure 11.

# Searches Particle Listings

## Supersymmetric Particle Searches

- 15 SIRUNYAN 21M searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  mass in Tchi1n2Fa, see their Figure 11, on the  $\tilde{\chi}_1^0$  mass in Tn1n1C and Tn1n1B for  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$ , see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsb0t3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.
- 16 TUMASYAN 21c searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with with one lepton, a Higgs boson decaying to a pair of bottom quarks, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Lower limits are set on the masses of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  in the simplified model Tchi1n2E, see their Figure 6.
- 17 AAD 20AN searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two photons and missing transverse momentum. Events are further categorised in terms of lepton or jet multiplicity. No significant excess over the expected background is observed. Limits at 95% C.L. are set on the Higgsino mass in the T1n1n1A simplified model, see their Figure 11.
- 18 AAD 20I reported on ATLAS searches for electroweak production in models with compressed mass spectra as Tchi1n2Fa. A dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Events with  $\cancel{E}_T$ , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Constraints at 95% C.L. are placed on the mass of the  $\tilde{\chi}_1^\pm$  (degenerate with  $\tilde{\chi}_2^0$ ) at 240 GeV for a mass splitting between  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_1^0$  of 7 GeV and extend down to a mass splitting of 1.5 GeV at the LEP chargino mass limit of 92.4 GeV. See their Fig. 14(b,c).
- 19 AAD 20K reported on a search for electroweak production in models with mass splittings near the electroweak scale as Tchi1n2F and exploiting three-lepton final state events with an emulated recursive jigsaw reconstruction method. The analysis uses a dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$ . Exclusion limits at 95% C.L. are derived on next-to-lightest neutralinos and charginos with masses up to 345 GeV for a massless lightest neutralino, see their Fig. 7.
- 20 AAD 20O reported on a search for electroweak production in models with charginos and sleptons decaying into final states with exactly two oppositely charged leptons and missing transverse momentum. A dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Exclusion limits at 95% C.L. are derived on  $m_{\tilde{\chi}_1^\pm}$  decaying according to the Tchi1chi1H simplified model. Chargino masses up to 420 GeV are excluded for a massless lightest neutralino, see their Fig. 7(a).
- 21 AAD 20Q reported on a search for electroweak production in models with charginos and sleptons decaying into final states with exactly two oppositely charged leptons and missing transverse momentum. A dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Exclusion limits at 95% C.L. are derived on  $m_{\tilde{\chi}_1^\pm}$  decaying according to the Tchi1chi1C simplified model. Chargino masses up to 1000 GeV are excluded for a massless lightest neutralino, see their Fig. 7(b).
- 22 AAD 20R searched for electroweak production in the model Tchi1n2E, selecting events with a pair of  $b$ -tagged jets consistent with those from a Higgs boson decay, either an electron or a muon from the  $W$  boson decay and  $\cancel{E}_T$ . The analysis uses a dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$ . Exclusion limits at 95% C.L. are derived on next-to-lightest neutralinos and charginos with masses up to 740 GeV for a massless lightest neutralino, assuming pure wino cross-sections. See their Fig. 6.
- 23 SIRUNYAN 20AU searched in  $77.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing one soft, hadronically decaying tau lepton, one energetic jet from initial-state radiation, and large  $\cancel{E}_T$ . No excess over the expected background is observed. Limits are derived on the wino mass in the Tchi1n2D simplified model, see their Figure 2.
- 24 SIRUNYAN 20B searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one photon and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on chargino masses in a general gauge-mediated SUSY breaking (GGM) scenario Tchi1n12-GGM, see Figure 4. Limits are also set on the NLSP mass in the Tchi1chi1F and Tchi1chi1G simplified models, see their Figure 5. Finally, limits are set on the gluino mass in the Tglu4A simplified model, see Figure 6.
- 25 AABOUD 19AU searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and next-to-lightest neutralinos decaying into lightest neutralinos and a  $W$ , and a Higgs boson, respectively. Fully hadronic, semileptonic, diphoton, and multilepton (electrons, muons) final states with missing transverse momentum are considered in this search. Observations are consistent with the Standard Model expectations, and 95% confidence-level limits of up to 680 GeV on the chargino/next-to-lightest neutralino masses are set (Tchi1n2E model). See their Figure 14 for an overlay of exclusion contours from all searches.
- 26 SIRUNYAN 19BU searched for pair production of gauginos via vector boson fusion assuming the gaugino spectrum is compressed, in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$ . The final states explored included zero leptons plus two jets, one lepton plus two jets, and one hadronic tau plus two jets. A similar bound is obtained in the light slepton limit.
- 27 SIRUNYAN 19CI searched in  $77.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t4 simplified model, see Figure 3, and on the wino mass in the Tchi1n2E simplified model, see their Figure 4. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 5.
- 28 SIRUNYAN 19K searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with a photon, an electron or muon, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tchi1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.
- 29 AABOUD 18AY searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos as in Tchi1chi1D models in events characterised by the presence of at least two hadronically decaying tau leptons and large missing transverse energy. No significant deviation from the expected SM background is observed. In the Tchi1chi1D model, assuming decays via intermediate  $\tilde{\tau}_L$ , the observed limits rule out  $\tilde{\chi}_1^\pm$  masses up to 630 GeV for a massless  $\tilde{\chi}_1^0$ . See their Fig.7 (left). Interpretations are also provided in Fig 8 (top) for different assumptions on the ratio between  $m_{\tilde{\tau}}$  and  $m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0}$ .
- 30 AABOUD 18AY searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and neutralinos as in Tchi1n2D models, in events characterised by the presence of at least two hadronically decaying tau leptons and large missing transverse energy. No significant deviation from the expected SM background is observed. Assuming decays via intermediate  $\tilde{\tau}_L$  and  $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$ , the observed limits rule out  $\tilde{\chi}_1^\pm$  masses up to 760 GeV for a massless  $\tilde{\chi}_1^0$ . See their Fig.7 (right). Interpretations are also provided in Fig 8 (bottom) for different assumptions on the ratio between  $m_{\tilde{\tau}}$  and  $m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0}$ .
- 31 AABOUD 18BT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass up to 750 GeV for massless neutralinos in the Tchi1chi1C simplified model exploiting  $2\ell + 0$  jets signatures, see their Figure 8(a).
- 32 AABOUD 18BT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass up to 1100 GeV for massless neutralinos in the Tchi1n2C simplified model exploiting  $3\ell$  signature, see their Figure 8(c).
- 33 AABOUD 18BT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass up to 580 GeV for massless neutralinos in the Tchi1n2F simplified model exploiting  $2\ell + 2$  jets and  $3\ell$  signatures, see their Figure 8(d).
- 34 AABOUD 18CK searched for events with at least 3  $b$ -jets and large missing transverse energy in two datasets of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  of  $36.1 \text{ fb}^{-1}$  and  $24.3 \text{ fb}^{-1}$  depending on the trigger requirements. The analyses aimed to reconstruct two Higgs bosons decaying to pairs of  $b$ -quarks. No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the T1n1n1A simplified model, see their Figure 15(a). Constraints are also presented as a function of the BR of Higgsino decaying into a higgs boson and a gravitino, see their Figure 15(b).
- 35 AABOUD 18CO searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of mass-degenerate charginos and next-to-lightest neutralinos in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. The search channels are based on recursive jigsaw reconstruction. Limits are set on the chargino mass up to 600 GeV for massless neutralinos in the Tchi1n2F simplified model exploiting the statistical combination of  $2\ell + 2$  jets and  $3\ell$  channels. Chargino masses below 220 GeV are not excluded due to an excess of events above the SM prediction in the dedicated regions. See their Figure 13(d).
- 36 AABOUD 18R searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2G wino models and  $\tilde{\chi}_1^\pm$  masses are excluded up to 175 GeV for  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$ . The exclusion limits extend down to mass splittings of 2 GeV, see their Fig. 10 (bottom).
- 37 AABOUD 18R searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2G higgsino models and  $\tilde{\chi}_1^\pm$  masses are excluded up to 145 GeV for  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$ . The exclusion limits extend down to mass splittings of 2.5 GeV, see their Fig. 10 (top).
- 38 AABOUD 18U searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results of the diphoton channel are interpreted in terms of lower limits on the masses of gauginos Tchi1chi1A models, which reach as high as 1.3 TeV. Gaugino masses below 1060 GeV are excluded for any NLSP mass, see their Fig. 10.
- 39 AABOUD 18Z searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via  $\lambda_{12k}$  or  $\lambda_{j33}$  to charged leptons, see their Figures 7, 8.
- 40 SIRUNYAN 18AA searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one photon and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking (GGM) scenario with bino-like  $\tilde{\chi}_1^0$  and wino-like  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0$ , see Figure 7. Limits are also set on the NLSP mass in the Tchi1n1A and Tchi1chi1A simplified models, see their Figure 8. Finally, limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, see their Figure 9, and on the squark mass in the Tsqk4A and Tsqk4B simplified models, see their Figure 10.
- 41 SIRUNYAN 18AJ searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two low-momentum, oppositely charged leptons (electrons or muons) and  $\cancel{E}_T$ . No excess over the expected background is observed. Limits are derived on the wino mass in the Tchi1n2F simplified model, see their Figure 5. Limits are also set on the stop mass in the Tstop10 simplified model, see their Figure 6. Finally, limits are set on the Higgsino mass in the Tchi1n2G simplified model, see Figure 8 and in the pMSSM, see Figure 7.
- 42 SIRUNYAN 18AO searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and neutralinos in events with either two or more leptons (electrons or muons) of the same electric charge, or with three or more leptons, which can include up to two hadronically decaying tau leptons. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2A, Tchi1n2H, Tchi1n2D, Tchi1n2E and Tchi1n2F simplified models,

- see their Figures 14, 15, 16, 17 and 18. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 19.
- 43 SIRUNYAN 18AP searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and neutralinos by combining a number of previous and new searches. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2E, Tchi1n2F and Tchi1n2I simplified models, see their Figures 7, 8, 9 and 10. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 11, 12, 13 and 14.
- 44 SIRUNYAN 18AR searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tchi1n2F simplified models, see their Figure 8, and on the higgsino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tsb0t3 simplified model, see their Figure 10.
- 45 SIRUNYAN 18DN searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and for pair production of top squarks in events with two leptons (electrons or muons) of the opposite electric charge. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tchi1chi1C and Tchi1chi1E simplified models, see their Figure 8. Limits are also set on the stop mass in the Tstop1 and Tstop2 simplified models, see their Figure 9.
- 46 SIRUNYAN 18DP searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and neutralinos or of chargino pairs in events with a tau lepton pair and significant missing transverse momentum. Both hadronic and leptonic decay modes are considered for the tau lepton. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tchi1chi1D and Tchi1n2 simplified models, see their Figures 14 and 15. Also, excluded stau pair production cross sections are shown in Figures 11, 12, and 13.
- 47 SIRUNYAN 18X searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and  $\cancel{E}_T$ . The razor variables ( $M_R$  and  $R^2$ ) are used to categorise the events. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t4 simplified model and on the wino mass in the Tchi1n2E simplified model, see their Figure 5. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 6.
- 48 KHACHATRYAN 17L searched in about  $19 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two  $\tau$  (at least one decaying hadronically) and  $\cancel{E}_T$ . In the Tchi1chi1C model, assuming decays via intermediate  $\tilde{\tau}$  or  $\nu_\tau$  with equivalent mass, the observed limits rule out  $\tilde{\chi}_1^\pm$  masses up to 420 GeV for a branching  $\tilde{\chi}_1^0$ . See their Fig. 5.
- 49 SIRUNYAN 17AW searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with a charged lepton (electron or muon), two jets identified as originating from a  $b$ -quark, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the chargino and the next-to-lightest neutralino in the Tchi1n2E simplified model, see their Figure 6.
- 50 AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons,  $\cancel{E}_T$ , with or without hadronic jets, in  $20 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the  $\tilde{\chi}_1^\pm$  mass in the Tchi1chi1B and Tchi1chi1C simplified models. See their Fig. 13.
- 51 AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons,  $\cancel{E}_T$ , with or without hadronic jets, in  $20 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on mass-degenerate  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0$  masses in the Tchi1n2B, Tchi1n2C, and Tchi1n2D simplified models. See their Figs. 16, 17, and 18. Interpretations in phenomenological-MSSM, two-parameter Non Universal Higgs Masses (NUHM2), and gauge-mediated symmetry breaking (GMSB) models are also given in their Figs. 20, 21 and 22.
- 52 KHACHATRYAN 16R searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with one or more photons, one electron or muon, and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking model (GGM), for a wino-like neutralino NLSP scenario, see Fig. 5. Limits are also set in the Tglu1D and Tchi1n1A simplified models, see Fig. 6. The Tchi1n1A limit is reduced to 340 GeV for a branching ratio reduced by the weak mixing angle.
- 53 AAD 15BA searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of charginos and neutralinos decaying to a final state containing a  $W$  boson and a 125 GeV Higgs boson, plus missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with the decays  $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0$  and  $\tilde{\chi}_2^0 \rightarrow H \tilde{\chi}_1^0$  having 100% branching fraction, see Fig. 8. A combination of the multiple final states for the Higgs decay yields the best limits (Fig. 8d).
- 54 AAD 15CA searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with one or more photons and  $\cancel{E}_T$ , with or without leptons ( $e, \mu$ ). No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in the general gauge-mediated SUSY breaking model (GGM), for wino-like NLSP, see Fig. 9, 12.
- 55 AAD 14X searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of charginos and neutralinos decaying to a final state with three leptons and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via either all three generations of leptons, staus only, gauge bosons, or Higgs bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 8.
- 56 AAD 14X searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the wino-like chargino mass in an R-parity violating simplified model where the decay  $\tilde{\chi}_1^\pm \rightarrow W^{(*)} \tilde{\chi}_1^0$ , with  $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$ , takes place with a branching ratio of 100%, see Fig. 8.
- 57 KHACHATRYAN 14L searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for evidence of chargino-neutralino  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  pair production with Higgs or  $W$ -bosons in the decay chain, leading to  $HW$  final states with missing transverse energy. The decays of a Higgs boson to a photon pair are considered in conjunction with hadronic and leptonic decay modes of the  $W$  bosons. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of simplified models where the decays  $\tilde{\chi}_2^0 \rightarrow H \tilde{\chi}_1^0$  and  $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0$  take place 100% of the time, see Figs. 22–23.
- 58 AAD 13 searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for charginos and neutralinos decaying to a final state with three leptons ( $e$  and  $\mu$ ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 and 3, and in simplified models, see Fig. 4. For the simplified models with intermediate slepton decays, degenerate  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0$  masses up to 500 GeV are excluded at 95% C.L. for very large mass differences with the  $\tilde{\chi}_1^0$ . Supersedes AAD 12As.
- 59 AAD 13B searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for gauginos decaying to a final state with two leptons ( $e$  and  $\mu$ ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Limits are derived in a simplified model of wino-like chargino pair production, where the chargino always decays to the lightest neutralino via an intermediate on-shell charged slepton, see Fig. 2(b). Chargino masses between 110 and 340 GeV are excluded at 95% C.L. for  $m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$ . Exclusion limits are also derived in the phenomenological MSSM, see Fig. 3.
- 60 AAD 12CT searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing four or more leptons (electrons or muons) and either moderate values of missing transverse momentum or large effective mass. No significant excess is found in the data. Limits are presented in a simplified model of R-parity violating supersymmetry in which charginos are pair-produced and then decay into a  $W$ -boson and a  $\tilde{\chi}_1^0$ , which in turn decays through an RPV coupling into two charged leptons ( $e^\pm e^\mp$  or  $e^\pm \mu^\mp$ ) and a neutrino. In this model, chargino masses up to 540 GeV are excluded at 95% C.L. for  $m_{\tilde{\chi}_1^0}$  above 300 GeV, see Fig. 3a. The limit deteriorates for lighter  $\tilde{\chi}_1^0$ . Limits are also set in an R-parity violating mSUGRA model, see Fig. 3b.
- 61 KHACHATRYAN 12BJ searched in  $4.98 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for direct electroweak production of charginos and neutralinos in events with at least two leptons, jets and missing transverse momentum. No significant excesses over the expected SM backgrounds are observed and 95% C.L. limits on the production cross section of  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  pair production were set in a number of simplified models, see Figs. 7 to 12.
- 62 ABDALLAH 03M uses data from  $\sqrt{s} = 192\text{--}208 \text{ GeV}$  to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass of charginos is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays), for charginos and for sleptons. These limits are valid for values of  $M_2 < 1 \text{ TeV}$ ,  $|\mu| \leq 2 \text{ TeV}$  with the  $\tilde{\chi}_1^0$  as LSP. Constraints from the Higgs search in the  $m_h^{\text{max}}$  scenario assuming  $m_t = 174.3 \text{ GeV}$  are included. The quoted limit applies if there is no mixing in the third family or when  $m_{\tilde{\tau}_1} - m_{\tilde{\chi}_1^0} > 6 \text{ GeV}$ . If mixing is included the limit degrades to 90 GeV. See Fig. 43 for the mass limits as a function of  $\tan\beta$ . These limits update the results of ABREU 00w.
- 63 AAD 20AN searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two photons and missing transverse momentum. Events are further categorised in terms of lepton or jet multiplicity. No significant excess over the expected background is observed. Limits at 95% C.L. are derived in Tchi1n2E simplified models. Next-to-lightest neutralinos and charginos with masses up to 310 GeV for a massless lightest neutralino are excluded. See their Fig. 10.
- 64 KHACHATRYAN 16AA searched in  $7.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with one or more photons, hadronic jets and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in the general gauge-mediated SUSY breaking model (GGM), for a wino-like neutralino NLSP scenario and with the wino mass fixed at 10 GeV above the bino mass, see Fig. 4. Limits are also set in the Tchi1chi1A and Tchi1n1A simplified models, see Fig. 3.
- 65 KHACHATRYAN 16R searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with one or more photons, one electron or muon, and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are also set in the Tglu1F simplified model, see Fig. 6.
- 66 KHACHATRYAN 16Y searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with one or two soft isolated leptons, hadronic jets, and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the  $\tilde{\chi}_1^\pm$  mass (which is degenerate with the  $\tilde{\chi}_2^0$ ) in the Tchi1n2A simplified model, see Fig. 4.
- 67 AAD 14AV searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for the direct production of charginos, neutralinos and staus in events containing at last two hadronically decaying  $\tau$ -leptons, large missing transverse momentum and low jet activity. The quoted limit was derived for direct  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$  production with  $\tilde{\chi}_2^0 \rightarrow \tilde{\tau} \tau \rightarrow \tau \tau \tilde{\chi}_1^0$  and  $\tilde{\chi}_1^\pm \rightarrow \tilde{\tau} \nu(\tilde{\nu}_\tau) \rightarrow \tau \nu \tilde{\chi}_1^0$ ,  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm}$ ,  $m_{\tilde{\tau}} = 0.5 (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})$ ,  $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$ . No excess over the expected SM background is observed. Exclusion limits are set in simplified models of  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$  and  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  pair production, see their Figure 7. Upper limits on the cross section and signal strength for direct di-stau production are derived, see Figures 8 and 9. Also, limits are derived in a pMSSM model where the only light slepton is the  $\tilde{\tau}_R$ , see Figure 10.
- 68 AAD 14AV searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for the direct production of charginos, neutralinos and staus in events containing at last two hadronically decaying  $\tau$ -leptons, large missing transverse momentum and low jet activity. The quoted limit was derived for direct  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$  production with  $\tilde{\chi}_1^\pm \rightarrow \tilde{\tau} \nu(\tilde{\nu}_\tau) \rightarrow \tau \nu \tilde{\chi}_1^0$ ,  $m_{\tilde{\tau}} = 0.5 (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})$ ,  $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$ . No excess over the expected SM background is observed. Exclusion limits are set in simplified models of  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$  and  $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$  pair production, see their Figure 7. Upper limits on the cross section and signal strength for direct di-stau production are derived, see Figures 8 and 9. Also, limits are derived in a pMSSM model where the only light slepton is the  $\tilde{\tau}_R$ , see Figure 10.
- 69 AAD 14G searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of chargino pairs, or chargino-neutralino pairs, decaying to a final state with two leptons ( $e$  and  $\mu$ ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of chargino pair production, with chargino decays to the lightest neutralino via either sleptons or gauge bosons, see Fig. 5; or in simplified models of chargino and next-to-lightest neutralino

# Searches Particle Listings

## Supersymmetric Particle Searches

production, with decays to the lightest neutralino via gauge bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 10.

- 70 AALTONEN 14 searched in  $5.8 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for evidence of chargino and next-to-lightest neutralino associated production in final states consisting of three leptons (electrons, muons or taus) and large missing transverse momentum. The results are consistent with the Standard Model predictions within  $1.85 \sigma$ . Limits on the chargino mass are derived in an mSUGRA model with  $m_0 = 60 \text{ GeV}$ ,  $\tan\beta = 3$ ,  $A_0 = 0$  and  $\mu > 0$ , see their Fig. 2.
- 71 KHACHATRYAN 14i searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of chargino pairs decaying to a final state with opposite-sign lepton pairs ( $e$  or  $\mu$ ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Fig. 18.
- 72 AALTONEN 13Q searched in  $6.0 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for evidence of chargino-neutralino associated production in like-sign dilepton final states. One lepton is identified as the hadronic decay of a tau lepton, while the other is an electron or muon. Good agreement with the Standard Model predictions is observed and limits are set on the chargino-neutralino cross section for simplified gravity- and gauge-mediated models, see their Figs. 2 and 3.
- 73 AAD 12As searched in  $2.06 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for charginos and neutralinos decaying to a final state with three leptons ( $e$  and  $\mu$ ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 (top), and in simplified models, see Fig. 2 (bottom).
- 74 AAD 12T looked in  $1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for the production of supersymmetric particles decaying into final states with missing transverse momentum and exactly two isolated leptons ( $e$  or  $\mu$ ). Opposite-sign and same-sign dilepton events were separately studied. Additionally, in opposite-sign events, a search was made for an excess of same-flavor over different-flavor lepton pairs. No excess over the expected background is observed and limits are placed on the effective production cross section of opposite-sign dilepton events with  $E_{T, \ell} > 250 \text{ GeV}$  and on same-sign dilepton events with  $E_{T, \ell} > 100 \text{ GeV}$ . The latter limit is interpreted in a simplified electroweak gaugino production model as a lower chargino mass limit.
- 75 CHATRCHYAN 11B looked in  $35 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with an isolated lepton ( $e$  or  $\mu$ ), a photon and  $E_{T, \cancel{e}}$  which may arise in a generalized gauge mediated model from the decay of Wino-like NLSPs. No evidence for an excess over the expected background is observed. Limits are derived in the plane of squark/gluino mass versus Wino mass (see Fig. 4). Mass degeneracy of the produced squarks and gluinos is assumed.
- 76 CHATRCHYAN 11v looked in  $35 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with  $\geq 3$  isolated leptons ( $e$ ,  $\mu$  or  $\tau$ ), with or without jets and  $E_{T, \cancel{e}}$ . No evidence for an excess over the expected background is observed. Limits are derived in the CMSSM ( $m_0, m_{1/2}$ ) plane for  $\tan\beta = 3$  (see Fig. 5).

### Long-lived $\tilde{\chi}^\pm$ (Chargino) mass limit

Limits on charginos which leave the detector before decaying.

1 AAD 23G searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for chargino/neutralino pair production (wino-like LSP) in events with high- $p_T$  tracks with large ionisation in the pixel detector. No significant excess above the Standard Model predictions is observed. Limits are set on the chargino mass as a function of its lifetime, see Figure 19.

2 AAD 22U searched for the signature of disappearing track from a long-lived chargino in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$ . Long-lived charginos decay into quasi-degenerate neutralino emitting a low-momentum particle whose identification is not attempted. The signal is identified by requiring short tracklets in the four pixel layers with no continuation in the SCT (strip) detector. The main background from fake tracklets is estimated directly with the data. No significant excess above the background prediction is found. The results are interpreted in an AMSB scenario (wino LSP), on  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}^\pm$  and  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}_1^0$ , assuming  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm) = 100\%$ , see their figure 7. Results are also interpreted in a higgsino-LSP model, with  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}^\mp$ , and  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}_{1,2}^0$ , assuming  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm) = 95.5\%$ ,  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 e^\pm) = 3\%$ ,  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 \mu^\pm) = 1.5\%$ , see their figure 8. Finally, results are interpreted in a simplified model of gluino pair production, with  $pp \rightarrow \tilde{g} \tilde{g}$  and  $B(\tilde{g} \rightarrow q q \tilde{\chi}_1^0) = B(\tilde{g} \rightarrow q q \tilde{\chi}^+) = B(\tilde{g} \rightarrow q q \tilde{\chi}^-) = 1/3$ , see their figure 9.

3 SIRUNYAN 20N searched in  $101 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of long-lived charginos in events containing isolated tracks with missing hits in the outer layer of the silicon tracker and little or no associated calorimetric energy deposits (disappearing tracks). No significant excess above the Standard Model expectations is observed. In an AMSB context and assuming a wino LSP, limits are set on the cross section of direct chargino production through  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}^\mp$  and  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}_1^0$ , assuming  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm) = 100\%$ , as a function of the chargino mass and mean proper lifetime, see Figure 2. In the case of a Higgsino LSP, limits are set on the cross section of direct chargino production through  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}^\mp$  and  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}_{1,2}^0$ , assuming  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm) = 95.5\%$ ,  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 e^\pm) = 3\%$ ,  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 \mu^\pm) = 1.5\%$ , as a function of the chargino mass and mean proper lifetime, see Figure 3.

4 AABOUD 19AT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for metastable  $R$ -hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Results are interpreted in terms of direct electroweak production of long-lived charginos in the context of AMSB scenarios. Chargino masses are excluded at 95% C.L. below 1090 GeV. See their Figure 10 (right).

5 AABOUD 18As searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of long-lived charginos in the context of AMSB or phenomenological MSSM scenarios with wino-like LSP. Events with a disappearing track due to a low-momentum pion accompanied by at least one jet with high transverse momentum from initial-state radiation are considered. No significant excess above the Standard Model expectations is observed. Exclusion limits are set at 95% confidence level on the mass of charginos for different chargino lifetimes. For a pure wino with a lifetime of about 0.2 ns, corresponding to a mass-splitting between the charged and neutral wino of around 160 MeV, chargino masses up to 460 GeV are excluded, see their Fig. 8.

6 SIRUNYAN 18BR searched in  $38.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of long-lived charginos in events containing isolated tracks with missing hits in the outer layer of the silicon tracker and little or no associated calorimetric energy deposits (disappearing tracks). No significant excess above the Standard Model expectations is observed. In an AMSB context, limits are set on the cross section of direct chargino production through  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}^\mp$  and  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}_1^0$ , assuming  $BR(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm) = 100\%$ , as a function of the chargino mass and mean proper lifetime, see Figures 3, 4 and 5.

7 AAD 15AE searched in  $19.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ATLAS muon system. In the absence of an excess of events above the expected backgrounds, limits are set on stable charginos, see Fig. 10.

8 AAD 15BM searched in  $18.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for stable and metastable non-relativistic charged particles through their anomalous specific ionization energy loss in the ATLAS pixel detector. In absence of an excess of events above the expected backgrounds, limits are set on stable charginos (see Table 5) and on metastable charginos decaying to  $\tilde{\chi}_1^0 \pi^\pm$ , see Fig. 11.

9 AAD 13H searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for direct electroweak production of long-lived charginos in the context of AMSB scenarios. The search is based on the signature of a high-momentum isolated track with few associated hits in the outer part of the tracking system, arising from a chargino decay into a neutralino and a low-momentum pion. The  $p_T$  spectrum of the tracks was found to be consistent with the SM expectations. Constraints on the lifetime and the production cross section were obtained, see Fig. 6. In the minimal AMSB framework with  $\tan\beta = 5$ , and  $\mu > 0$ , a chargino having a mass below 103 (85) GeV for a chargino-neutralino mass splitting  $\Delta m_{\tilde{\chi}_1^0}$  of 160 (170) MeV is excluded at the 95% C.L. See Fig. 7 for more precise bounds.

10 AAD 12BJ looked in  $1.02 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for signatures of decaying charginos resulting in isolated tracks with few associated hits in the outer region of the tracking system. The  $p_T$  spectrum of the tracks was found to be consistent with the SM expectations. Constraints on the lifetime and the production cross section were obtained. In the minimal AMSB framework with  $m_{3/2} < 32 \text{ TeV}$ ,  $m_0 < 1.5 \text{ TeV}$ ,  $\tan\beta = 5$ , and  $\mu > 0$ , a chargino having a mass below 92 GeV and a lifetime between 0.5 ns and 2 ns is excluded at the 95% C.L. See their Fig. 8 for more precise bounds.

11 ABAZOV 09M searched in  $1.1 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for events with direct production of a pair of charged massive stable particles identified by their TOF.

See key on page 1171

# Searches Particle Listings Supersymmetric Particle Searches

- The number of the observed events is consistent with the predicted background. The data are used to constrain the production cross section as a function of the  $\tilde{\chi}_1^\pm$  mass, see their Fig. 2. The quoted limit improves to 206 GeV for gaugino-like charginos.
- <sup>12</sup>ABBIENDI 03L used  $e^+e^-$  data at  $\sqrt{s} = 130\text{--}209$  GeV to select events with two high momentum tracks with anomalous  $dE/dx$ . The excluded cross section is compared to the theoretical expectation as a function of the heavy particle mass in their Fig. 3. The bounds are valid for colorless fermions with lifetime longer than  $10^{-6}$  s. Supersedes the results from ACKERSTAFF 98P.
- <sup>13</sup>ABREU 00T searches for the production of heavy stable charged particles, identified by their ionization or Cherenkov radiation, using data from  $\sqrt{s} = 130$  to 189 GeV. These limits include and update the results of ABREU 98P.
- <sup>14</sup>KHACHATRYAN 15AB searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events containing tracks with little or no associated calorimeter energy deposits and with missing hits in the outer layers of the tracking system (disappearing-track signature). Such disappearing tracks can result from the decay of charginos that are nearly mass degenerate with the lightest neutralino. The number of observed events is in agreement with the background expectation. Limits are set on the cross section of electroweak chargino production in terms of the chargino mass and mean proper lifetime, see Fig. 4. In the minimal AMSB model, a chargino mass below 260 GeV is excluded at 95% C.L., see their Fig. 5.
- <sup>15</sup>KHACHATRYAN 15O searched in  $18.8 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for evidence of long-lived charginos in the context of AMSB and pMSSM scenarios. The results are based on a previously published search for heavy stable charged particles at 7 and 8 TeV. In the minimal AMSB framework with  $\tan\beta = 5$  and  $\mu \geq 0$ , constraints on the chargino mass and lifetime were placed, see Fig. 5. Charginos with a mass below 800 (100) GeV are excluded at the 95% C.L. for lifetimes above 100 ns (3 ns). Constraints are also placed on the pMSSM parameter space, see Fig. 3.
- <sup>16</sup>KHACHATRYAN 15W searched in up to  $20.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for evidence of long-lived neutralinos produced through  $\bar{q}q$ -pair production, with  $\bar{q} \rightarrow q\tilde{\chi}^0$  and  $\tilde{\chi}^0 \rightarrow \ell^+\ell^-\nu$  (RPV:  $\lambda_{121}, \lambda_{122} \neq 0$ ). 95% C.L. exclusion limits on cross section times branching ratio are set as a function of mean proper decay length of the neutralino, see Figs. 6 and 9.
- <sup>17</sup>AAD 13BD searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events containing tracks with no associated hits in the outer region of the tracking system resulting from the decay of charginos that are nearly mass degenerate with the lightest neutralino, as is often the case in AMSB scenarios. No significant excess above the background expectation is observed for candidate tracks with large transverse momentum. Constraints on chargino properties are obtained and in the minimal AMSB model, a chargino mass below 270 GeV is excluded at 95% C.L., see their Fig. 7.
- <sup>18</sup>ABAZOV 13B looked in  $6.3 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV for charged massive long-lived particles in events with muon-like particles that have both speed and ionization energy loss inconsistent with muons produced in beam collisions. In the absence of an excess, limits are set at 95% C.L. on gaugino- and higgsino-like charginos, see their Table 20 and Fig. 23.

- <sup>1</sup>AAD 23CB searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for heavy particles decaying into an  $e\mu, e\tau, \mu\tau$  final state. No significant deviation from the expected SM background is observed. Limits are set on the mass of a stau neutrino with R-parity-violating couplings, with decays  $\tilde{\nu}_\tau \rightarrow e\mu, \tilde{\nu}_\tau \rightarrow e\tau, \tilde{\nu}_\tau \rightarrow \mu\tau$ , see figures 4b, 5b, 6b.
- <sup>2</sup>TUMASYAN 23H searched in  $138 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for evidence of resonant  $\tilde{\nu}_\tau$  production in events with two charged leptons,  $e\mu, e\tau, \mu\tau$ . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of  $\tilde{\nu}_\tau$  in an RPV model for resonant sneutrino production, where all RPV couplings vanish, except for those that are connected to the production and decay of the  $\tilde{\nu}_\tau$ , considering a SUSY mass hierarchy with  $\tilde{\nu}_\tau$  as the LSP. The  $\tilde{\nu}_\tau$  is produced resonantly through  $\lambda'_{311}$  coupling, and decays via  $\lambda_{33k}$  coupling to two leptons, see their figure 3 for couplings of 0.1 and 0.01. Exclusion limits are also shown in the plane of  $\tilde{\nu}_\tau$  mass and  $\lambda'$  coupling, for four values of  $\lambda$  couplings, see their figure 6. In addition, limits are set on heavy  $Z'$  gauge bosons with lepton flavor violating decays, see their figure 4, and on nonresonant quantum black hole production in models with extra spatial dimensions, see their figure 5. Model-independent upper limits on the product of the cross section, the branching fraction, acceptance, and efficiency are given as well, see their figure 7.
- <sup>3</sup>AABOUD 18CM searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for heavy particles decaying into an  $e\mu, e\tau, \mu\tau$  final state. No significant deviation from the expected SM background is observed. Limits are set on the mass of a stau neutrino with R-parity-violating couplings. For  $\tilde{\nu}_\tau \rightarrow e\mu$ , masses below 3.4 TeV are excluded at 95% CL, see their Figure 4(b). Upper limits on the RPV couplings  $|\lambda_{312}|$  versus  $|\lambda'_{311}|$  are also performed, see their Figure 8(a-b).
- <sup>4</sup>AABOUD 18CM searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for heavy particles decaying into an  $e\mu, e\tau, \mu\tau$  final state. No significant deviation from the expected SM background is observed. Limits are set on the mass of a stau neutrino with R-parity-violating couplings. For  $\tilde{\nu}_\tau \rightarrow e\tau$ , masses below 2.9 TeV are excluded at 95% CL, see their Figure 5(b). Upper limits on the RPV couplings  $|\lambda_{313}|$  versus  $|\lambda'_{311}|$  are also performed, see their Figure 8(c).
- <sup>5</sup>AABOUD 18CM searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for heavy particles decaying into an  $e\mu, e\tau, \mu\tau$  final state. No significant deviation from the expected SM background is observed. Limits are set on the mass of a stau neutrino with R-parity-violating couplings. For  $\tilde{\nu}_\tau \rightarrow \mu\tau$ , masses below 2.6 TeV are excluded at 95% CL, see their Figure 6(b). Upper limits on the RPV couplings  $|\lambda_{323}|$  versus  $|\lambda'_{311}|$  are also performed, see their Figure 8(d).
- <sup>6</sup>AABOUD 18Z searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1nA/Tn1nB/Tn1nC, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via  $\lambda_{12k}$  or  $\lambda_{333}$  to charged leptons, see their Figures 7, 8.
- <sup>7</sup>SIRUNYAN 18AT searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for heavy resonances decaying into  $e\mu$  final states. No significant excess above the Standard Model expectation is observed and 95% C.L. exclusions are placed on the cross section times branching ratio for the R-parity-violating production and decay of a supersymmetric tau sneutrino, see their Fig. 3.

### $\tilde{\nu}$ (Sneutrino) mass limit

The limits may depend on the number,  $M(\tilde{\nu})$ , of sneutrinos assumed to be degenerate in mass. Only  $\tilde{\nu}_L$  (not  $\tilde{\nu}_R$ ) is assumed to exist. It is possible that  $\tilde{\nu}$  could be the lightest supersymmetric particle (LSP).

We report here, but do not include in the Listings, the limits obtained from the fit of the final results obtained by the LEP Collaborations on the invisible width of the Z boson ( $\Delta\Gamma_{\text{inv}} < 2.0$  MeV, LEP-SLC 06):  $m_{\tilde{\nu}} > 43.7$  GeV ( $M(\tilde{\nu})=1$ ) and  $m_{\tilde{\nu}} > 44.7$  GeV ( $M(\tilde{\nu})=3$ ).

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

# Searches Particle Listings

## Supersymmetric Particle Searches

- <sup>8</sup> AABOUD 16P searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with different flavour dilepton pairs ( $e\mu, e\tau, \mu\tau$ ) from the production of  $\tilde{\nu}_\tau$  via an RPV  $\lambda'_{311}$  coupling and followed by a decay via  $\lambda_{312} = \lambda_{321} = 0.07$  for  $e + \mu$ , via  $\lambda_{313} = \lambda_{331} = 0.07$  for  $e + \tau$  and via  $\lambda_{323} = \lambda_{332} = 0.07$  for  $\mu + \tau$ . No evidence for a dilepton resonance over the SM expectation is observed, and limits are derived on  $m_{\tilde{\nu}_\tau}$  at 95% CL, see their Figs. 2(b), 3(b), 4(b), and Table 3.
- <sup>9</sup> AAD 14x searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the sneutrino mass in an R-parity violating simplified model where the decay  $\tilde{\nu} \rightarrow \nu \tilde{\chi}_1^0$ , with  $\tilde{\chi}_1^0 \rightarrow \ell^\pm \tilde{\tau} \nu$ , takes place with a branching ratio of 100%, see Fig. 9.
- <sup>10</sup> AAD 11z looked in  $1.07 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with one electron and one muon of opposite charge from the production of  $\tilde{\nu}_\tau$  via an RPV  $\lambda'_{311}$  coupling and followed by a decay via  $\lambda_{312}$  into  $e + \mu$ . No evidence for an ( $e, \mu$ ) resonance over the SM expectation is observed, and a limit is derived in the plane of  $\lambda'_{311}$  versus  $m_{\tilde{\nu}_\tau}$  for three values of  $\lambda_{312}$ , see their Fig. 2. Masses  $m_{\tilde{\nu}_\tau} < 1.32$  (1.45) TeV are excluded for  $\lambda'_{311} = 0.10$  and  $\lambda_{312} = 0.05$  ( $\lambda'_{311} = 0.11$  and  $\lambda_{312} = 0.07$ ).
- <sup>11</sup> ABDALLAH 03M uses data from  $\sqrt{s} = 192\text{--}208 \text{ GeV}$  to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays) and for sleptons. These limits are valid for values of  $M_2 < 1 \text{ TeV}$ ,  $|\mu| \leq 1 \text{ TeV}$  with the  $\tilde{\chi}_1^0$  as LSP. The quoted limit is obtained when there is no mixing in the third family. See Fig. 43 for the mass limits as a function of  $\tan\beta$ . These limits update the results of ABREU 00W.
- <sup>12</sup> HEISTER 02N derives a bound on  $m_{\tilde{\nu}_e}$  by exploiting the mass relation between the  $\tilde{\nu}_e$  and  $\tilde{e}$ , based on the assumption of universal GUT scale gaugino and scalar masses  $m_{1/2}$  and  $m_0$  and the search described in the  $\tilde{e}$  section. In the MSUGRA framework with radiative electroweak symmetry breaking, the limit improves to  $m_{\tilde{\nu}_e} > 130 \text{ GeV}$ , assuming a trilinear coupling  $A_0=0$  at the GUT scale. See Figs. 5 and 7 for the dependence of the limits on  $\tan\beta$ .
- <sup>13</sup> DECAMP 92 limit is from  $\Gamma(\text{invisible})/\Gamma(\ell\ell) = 5.91 \pm 0.15$  ( $N_\nu = 2.97 \pm 0.07$ ).
- <sup>14</sup> SIRUNYAN 19A0 searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two same-sign muons and at last two jets, originating from resonant production of second-generation sleptons ( $\tilde{\mu}_L, \tilde{\nu}_\mu$ ) via the R-parity violating coupling  $\lambda'_{211}$  to quarks. No significant excess above the Standard Model expectations is observed. Upper limits on cross sections are derived in the context of two simplified models, see their Figure 4. The cross section limits are translated into limits on  $\lambda'_{211}$  for a modified CMSSM, see their Figure 5.
- <sup>15</sup> KHACHATRYAN 16BE searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for evidence of narrow resonances decaying into  $e\mu$  final states. No significant excess above the Standard Model expectation is observed and 95% C.L. exclusions are placed on the cross section times branching ratio for the production of an R-parity-violating supersymmetric tau sneutrino, applicable to any sneutrino flavour, see their Fig. 2.
- <sup>16</sup> AAD 15o searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for evidence of heavy particles decaying into  $e\mu, e\tau$  or  $\mu\tau$  final states. No significant excess above the Standard Model expectation is observed, and 95% C.L. exclusions are placed on the cross section times branching ratio for the production of an R-parity-violating supersymmetric tau sneutrino, see their Fig. 2. For couplings  $\lambda'_{311} = 0.10$  and  $\lambda_{33k} = 0.05$ , the lower limits on the  $\tilde{\nu}_\tau$  mass are 1610, 1110, 1100 GeV in the  $e\mu, e\tau$ , and  $\mu\tau$  channels, respectively.
- <sup>17</sup> AAD 13A searched in  $4.6 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for evidence of heavy particles decaying into  $e\mu, e\tau$  or  $\mu\tau$  final states. No significant excess above the Standard Model expectation is observed, and 95% C.L. exclusions are placed on the cross section times branching ratio for the production of an R-parity-violating supersymmetric tau sneutrino, see their Fig. 2. For couplings  $\lambda'_{311} = 0.10$  and  $\lambda_{33k} = 0.05$ , the lower limits on the  $\tilde{\nu}_\tau$  mass are 1610, 1110, 1100 GeV in the  $e\mu, e\tau$ , and  $\mu\tau$  channels, respectively.
- <sup>18</sup> AAD 11h looked in  $35 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with one electron and one muon of opposite charge from the production of  $\tilde{\nu}_\tau$  via an RPV  $\lambda'_{311}$  coupling and followed by a decay via  $\lambda_{312}$  into  $e + \mu$ . No evidence for an excess over the SM expectation is observed, and a limit is derived in the plane of  $\lambda'_{311}$  versus  $m_{\tilde{\nu}_\tau}$  for several values of  $\lambda_{312}$ , see their Fig. 2. Superseded by AAD 11z.
- <sup>19</sup> AALTONEN 10Z searched in  $1 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for events from the production  $d\bar{d} \rightarrow \tilde{\nu}_\tau$  with the subsequent decays  $\tilde{\nu}_\tau \rightarrow e\mu, \mu\tau, e\tau$  in the MSSM framework with RPV. Two isolated leptons of different flavor and opposite charges are required, with  $\tau$ s identified by their hadronic decay. No statistically significant excesses are observed over the SM background. Upper limits on  $\lambda'_{311}$  times the branching ratio are listed in their Table III for various  $\tilde{\nu}_\tau$  masses. Limits on the cross section times branching ratio for  $\lambda'_{311} = 0.10$  and  $\lambda_{33k} = 0.05$ , displayed in Fig. 2, are used to set limits on the  $\tilde{\nu}_\tau$  mass of 558 GeV for the  $e\mu$ , 441 GeV for the  $e\tau$  and 442 GeV for the  $e\tau$  channels.
- <sup>20</sup> ABAZOV 10M looked in  $5.3 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for events with exactly one pair of high  $p_T$  isolated  $e\mu$  and a veto against hard jets. No evidence for an excess over the SM expectation is observed, and a limit at 95% C.L. on the cross section times branching ratio is derived, see their Fig. 3. These limits are translated into limits on couplings as a function of  $m_{\tilde{\nu}_\tau}$  as shown on their Fig. 4. As an example, for  $m_{\tilde{\nu}_\tau} = 100 \text{ GeV}$  and  $\lambda_{312} \leq 0.07$ , couplings  $\lambda'_{311} > 7.7 \times 10^{-4}$  are excluded.
- <sup>21</sup> ABDALLAH 04H use data from LEP 1 and  $\sqrt{s} = 192\text{--}208 \text{ GeV}$ . They re-use results or re-analyze the data from ABDALLAH 03M to put limits on the parameter space of anomaly-mediated supersymmetry breaking (AMSB), which is scanned in the region  $1 < m_{3/2} < 50 \text{ TeV}$ ,  $0 < m_0 < 1000 \text{ GeV}$ ,  $1.5 < \tan\beta < 35$ , both signs of  $\mu$ . The constraints are obtained from the searches for mass degenerate chargino and neutralino, for SM-like and invisible Higgs, for leptonically decaying charginos and from the limit on non-SM Z width of 3.2 MeV. The limit is for  $m_t = 174.3 \text{ GeV}$  (see Table 2 for other  $m_t$  values). The limit improves to 114 GeV for  $\mu < 0$ .
- <sup>22</sup> ADRIANI 93M limit from  $\Delta\Gamma(Z)(\text{invisible}) < 16.2 \text{ MeV}$ .
- <sup>23</sup> ALEXANDER 91F limit is for one species of  $\tilde{\nu}$  and is derived from  $\Gamma(\text{invisible, new})/\Gamma(\ell\ell) < 0.38$ .

### Charged sleptons

This section contains limits on charged scalar leptons ( $\tilde{\ell}$ , with  $\ell=e,\mu,\tau$ ). Studies of width and decays of the Z boson (use is made here of  $\Delta\Gamma_{\text{inv}} < 2.0 \text{ MeV}$ , LEP 00) conclusively rule out  $m_{\tilde{\ell}_R} < 40 \text{ GeV}$  (41 GeV for  $\tilde{\ell}_L$ ), independently of decay modes, for each individual slepton. The limits improve to 43 GeV (43.5 GeV for  $\tilde{\ell}_L$ ) assuming all 3 flavors to be degenerate. Limits on higher mass sleptons depend on model assumptions and on the mass splitting  $\Delta m = m_{\tilde{\ell}} - m_{\tilde{\chi}_1^0}$ . The mass and composition of  $\tilde{\chi}_1^0$  may affect the slepton production rate in  $e^+e^-$  collisions through t-channel exchange diagrams. Production rates are also affected by the potentially large mixing angle of the lightest mass eigenstate  $\tilde{\ell}_1 = \tilde{\ell}_R \sin\theta_{\tilde{\ell}} + \tilde{\ell}_L \cos\theta_{\tilde{\ell}}$ . It is generally assumed that only  $\tilde{\tau}$  may have significant mixing. The coupling to the Z vanishes for  $\theta_{\tilde{\ell}}=0.82$ . In the high-energy limit of  $e^+e^-$  collisions the interference between  $\gamma$  and Z exchange leads to a minimal cross section for  $\theta_{\tilde{\ell}}=0.91$ , a value which is sometimes used in the following entries relative to data taken at LEP2. When limits on  $m_{\tilde{\ell}_R}$  are quoted, it is understood that limits on  $m_{\tilde{\ell}_L}$  are usually at least as strong.

Possibly open decays involving gauginos other than  $\tilde{\chi}_1^0$  will affect the detection efficiencies. Unless otherwise stated, the limits presented here result from the study of  $\tilde{\ell}^+\tilde{\ell}^-$  production, with production rates and decay properties derived from the MSSM. Limits made obsolete by the recent analyses of  $e^+e^-$  collisions at high energies can be found in previous Editions of this Review.

For decays with final state gravitinos ( $\tilde{G}$ ),  $m_{\tilde{G}}$  is assumed to be negligible relative to all other masses.

### R-parity conserving $\tilde{e}$ (Selectron) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

••• We do not use the following data for averages, fits, limits, etc. •••

- none 90–325 95 17 AAD 14G ATLS  $\bar{\ell}\bar{\ell} \rightarrow \ell^{\pm}\bar{\chi}_1^0\ell^{\pm}\bar{\chi}_1^0$ , simplified model,  $m_{\tilde{\ell}_L}^2 = m_{\tilde{\ell}_R}^2, m_{\tilde{\chi}_1^0} = 0$  GeV
- 18 KHACHATRYAN...14i CMS  $\bar{\ell} \rightarrow \ell\bar{\chi}_1^0$ , simplified model
- 1 AAD 23M searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for  $\tilde{\ell}^{\pm}$  pair production, followed by  $\tilde{\ell}^{\pm} \rightarrow \ell^{\pm}\bar{\chi}_1^0$  in events with two leptons. The focus is on models where  $m_{\tilde{\ell}^{\pm}} - m_{\tilde{\chi}_1^0}$  is close to the  $W$  mass. No significant excess above the Standard Model predictions is observed. Limits were set on the  $\tilde{\ell}$  mass (assuming  $\tilde{e} - \tilde{\mu}$  and  $L - R$  degeneracy), as a function of  $m_{\tilde{\chi}_1^0}$ , see Figure 6. Limits were also derived for single  $\tilde{e}$  or  $\tilde{\mu}$ , and for  $L$  and  $R$  independently, see Figure 7.
- 2 SIRUNYAN 21M searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with two opposite-sign same-flavour leptons (electrons, muons) and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^{\pm}$  mass in Tchi1n2Fa, see their Figure 11, on the  $\tilde{\chi}_1^0$  mass in Tn1n1C and Tn1n1B for  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^{\pm}} = m_{\tilde{\chi}_1^0}$ , see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsb0t3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.
- 3 AAD 200 reported on a search for electroweak production in models with charginos and sleptons decaying into final states with exactly two oppositely charged leptons and missing transverse momentum. A dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Light-flavour sleptons  $\tilde{e}$  and  $\tilde{\mu}$  are constrained at 95% C.L. to have masses above 700 GeV for massless lightest neutralino, see their Fig. 7(c). Exclusion limits are also set for selectrons and smuons separately, considering either right- or left-handed components, by including only the di-electron and di-muon same-flavour signal regions defined in the search, see their Fig. 8.
- 4 SIRUNYAN 19Aw searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak pair production of selectrons or smuons in events with two leptons (electrons or muons) of the opposite electric charge and same flavour, no jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass assuming left-handed, right-handed or both left- and right-handed (mass degenerate) production, see their Figure 6. Similarly, limits are set on the smuon mass, see their Figure 7. Limits are also set on slepton masses under the assumption that the selectron and smuon are mass degenerate, see their Figure 5.
- 5 AABOUD 18Bt searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass up to 500 GeV for massless  $\tilde{\chi}_1^0$ , assuming degeneracy of  $\tilde{e}, \tilde{\mu}$ , and  $\tilde{\tau}$  and exploiting the  $2\ell$  signature, see their Figure 8(b).
- 6 AABOUD 18r searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in slepton pair production models with a fourfold degeneracy assumed in selectron and smuon masses. The  $\tilde{e}$  masses are excluded up to 190 GeV for  $m_{\tilde{e}} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$ . The exclusion limits extend down to mass splittings of 1 GeV, see their Fig. 11.
- 7 CHATRCHYAN 14R searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in a stau (N)NLSP simplified model (GMSB) where the decay  $\tilde{\ell} \rightarrow \ell^{\pm}\tau^{\pm}\tilde{\tau}^{\pm}\tilde{G}$  takes place with a branching ratio of 100%, see Fig. 8.
- 8 AAD 13b searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for sleptons decaying to a final state with two leptons ( $e$  and  $\mu$ ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Limits are derived in a simplified model of direct left-handed slepton pair production, where left-handed slepton masses between 85 and 195 GeV are excluded at 95% C.L. for  $m_{\tilde{\chi}_1^0} = 20 \text{ GeV}$ . See also Fig. 2(a). Exclusion limits are also derived in the phenomenological MSSM, see Fig. 3.
- 9 ABBIENDI 04 search for  $\tilde{e}_R\tilde{e}_R$  production in acoplanar di-electron final states in the 183–208 GeV data. See Fig. 13 for the dependence of the limits on  $m_{\tilde{\chi}_1^0}$  and for the limit at  $\tan\beta=35$ . This limit supersedes ABBIENDI 00g.
- 10 ACHARD 04 search for  $\tilde{e}_R\tilde{e}_L$  and  $\tilde{e}_R\tilde{e}_R$  production in single- and acoplanar di-electron final states in the 192–209 GeV data. Absolute limits on  $m_{\tilde{e}_R}$  are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses  $m_{1/2}$  and  $m_0$ ,  $1 \leq \tan\beta \leq 60$  and  $-2 \leq \mu \leq 2 \text{ TeV}$ . See Fig. 4 for the dependence of the limits on  $m_{\tilde{\chi}_1^0}$ . This limit supersedes ACCIARRI 99w.
- 11 ABDALLAH 03M looked for acoplanar dielectron +  $\cancel{E}_T$  final states at  $\sqrt{s} = 189\text{--}208 \text{ GeV}$ . The limit assumes  $\mu = -200 \text{ GeV}$  and  $\tan\beta=1.5$  in the calculation of the production cross section and  $B(\tilde{e} \rightarrow e\tilde{\chi}_1^0)=1$ . See Fig. 15 for limits in the  $(m_{\tilde{e}_R}, m_{\tilde{\chi}_1^0})$  plane. These limits include and update the results of ABREU 01.
- 12 ABDALLAH 03M uses data from  $\sqrt{s} = 192\text{--}208 \text{ GeV}$  to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays) and for sleptons. These limits are valid for values of  $M_2 < 1 \text{ TeV}$ ,  $|\mu| \leq 1 \text{ TeV}$  with the  $\tilde{\chi}_1^0$  as LSP. The quoted limit is obtained when there is no mixing in the third family. See Fig. 43 for the mass limits as a function of  $\tan\beta$ . These limits update the results of ABREU 00w.
- 13 HEISTER 02E looked for acoplanar dielectron +  $\cancel{E}_T$  final states from  $e^+e^-$  interactions between 183 and 209 GeV. The mass limit assumes  $\mu < -200 \text{ GeV}$  and  $\tan\beta=2$  for the production cross section and  $B(\tilde{e} \rightarrow e\tilde{\chi}_1^0)=1$ . See their Fig. 4 for the dependence of the limit on  $\Delta m$ . These limits include and update the results of BARATE 01.
- 14 HEISTER 02N search for  $\tilde{e}_R\tilde{e}_L$  and  $\tilde{e}_R\tilde{e}_R$  production in single- and acoplanar di-electron final states in the 183–208 GeV data. Absolute limits on  $m_{\tilde{e}_R}$  are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses  $m_{1/2}$  and  $m_0$ ,  $1 \leq \tan\beta \leq 50$  and  $-10 \leq \mu \leq 10 \text{ TeV}$ . The region of small  $|\mu|$ , where cascade decays are important, is covered by a search for  $\tilde{\chi}_1^0\tilde{\chi}_3^0$  in final states with

leptons and possibly photons. Limits on  $m_{\tilde{e}_L}$  are derived by exploiting the mass relation between the  $\tilde{e}_L$  and  $\tilde{e}_R$ , based on universal  $m_0$  and  $m_{1/2}$ . When the constraint from the mass limit of the lightest Higgs from HEISTER 02 is included, the bounds improve to  $m_{\tilde{e}_R} > 77(75) \text{ GeV}$  and  $m_{\tilde{e}_L} > 115(115) \text{ GeV}$  for a top mass of 175(180) GeV. In the MSUGRA framework with radiative electroweak symmetry breaking, the limits improve further to  $m_{\tilde{e}_R} > 95 \text{ GeV}$  and  $m_{\tilde{e}_L} > 152 \text{ GeV}$ , assuming a trilinear coupling  $A_0=0$  at the GUT scale. See Figs. 4, 5, 7 for the dependence of the limits on  $\tan\beta$ .

- 15 AAD 20i reported on ATLAS searches for slepton pair production in models with compressed mass spectra. A dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Events with  $\cancel{E}_T$ , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Light-flavour sleptons  $\tilde{e}$  and  $\tilde{\mu}$  are constrained at 95% C.L. to have masses above 251 GeV for a mass splitting slepton- $\tilde{\chi}_1^0$  of 10 GeV, with constraints extending down to mass splittings of 550 MeV at the LEP slepton limits (73 GeV), see their Fig. 16(a). If only selectrons are considered, and  $\tilde{e} = \tilde{e}_R$ , masses below 101 GeV are excluded for mass splitting  $\tilde{e}_R, \tilde{\chi}_1^0$  of 7.5 GeV. See their Fig. 16(b).
- 16 AAD 20j reported on ATLAS searches for slepton pair production in models with compressed mass spectra. A dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Events with  $\cancel{E}_T$ , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Light-flavour sleptons  $\tilde{e}$  and  $\tilde{\mu}$  are constrained at 95% C.L. to have masses above 251 GeV for a mass splitting slepton- $\tilde{\chi}_1^0$  of 10 GeV, with constraints extending down to mass splittings of 550 MeV at the LEP slepton limits (73 GeV). See their Fig. 16(a). If only selectron are considered, and  $\tilde{e} = \tilde{e}_L$ , masses below 169 GeV are excluded for mass splitting  $\tilde{e}_L, \tilde{\chi}_1^0$  of 7.1 GeV. See their Fig. 16(b).
- 17 AAD 14G searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of slepton pairs, decaying to a final state with two leptons ( $e$  and  $\mu$ ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of slepton pair production, see Fig. 8. An interpretation in the pMSSM is also given, see Fig. 10.
- 18 KHACHATRYAN 14i searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of slepton pairs decaying to a final state with opposite-sign lepton pairs ( $e$  or  $\mu$ ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Fig. 18.

#### R-parity violating $\tilde{e}$ (Selectron) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 1 AAD 21Y searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tchi1n12-GGM, and RPV models similar to Tchi1n2L, Tglu1A (with  $q = u, d, s, c, b$ , with equal branching fractions), and  $\tilde{e}_L/\tilde{\nu} \rightarrow \ell/\nu\tilde{\chi}_1^0$  (mass-degenerate  $\tilde{L}$  and  $\tilde{\nu}$  of all 3 generations), all with  $\tilde{\chi}_1^0 \rightarrow \ell^{\pm}\ell^{\mp}\nu$  via  $\lambda_{12k}$  or  $\lambda_{i33}$  (where  $i, k \in 1, 2$ ), see their Figure 11.
- 2 AABOUD 18Z searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via  $\lambda_{12k}$  or  $\lambda_{i33}$  to charged leptons, see their Figures 7, 8.
- 3 AAD 14x searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in an R-parity violating simplified model where the decay  $\tilde{\ell} \rightarrow \ell\tilde{\chi}_1^0$ , with  $\tilde{\chi}_1^0 \rightarrow \ell^{\pm}\ell^{\mp}\nu$ , takes place with a branching ratio of 100%, see Fig. 9.
- 4 ABBIENDI 04F use data from  $\sqrt{s} = 189\text{--}209 \text{ GeV}$ . They derive limits on sparticle masses under the assumption of RPV with  $LL\tilde{E}$  or  $LQ\tilde{D}$  couplings. The results are valid for  $\tan\beta = 1.5$ ,  $\mu = -200 \text{ GeV}$ , with, in addition,  $\Delta m > 5 \text{ GeV}$  for indirect decays via  $LQ\tilde{D}$ . The limit quoted applies to direct decays via  $LL\tilde{E}$  or  $LQ\tilde{D}$  couplings. For indirect decays, the limits on the  $\tilde{e}_R$  mass are respectively 99 and 92 GeV for  $LL\tilde{E}$  and  $LQ\tilde{D}$  couplings and  $m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$  and degrade slightly for larger  $\tilde{\chi}_1^0$  mass. Supersedes the results of ABBIENDI 00.
- 5 ABDALLAH 04M use data from  $\sqrt{s} = 192\text{--}208 \text{ GeV}$  to derive limits on sparticle masses under the assumption of RPV with  $LL\tilde{E}$  or  $UD\tilde{D}$  couplings. The results are valid for  $\mu$

# Searches Particle Listings

## Supersymmetric Particle Searches

$= -200$  GeV,  $\tan\beta = 1.5$ ,  $\Delta m > 5$  GeV and assuming a BR of 1 for the given decay. The limit quoted is for indirect  $\overline{UD\overline{D}}$  decays using the neutralino constraint of 39.5 GeV for  $L\overline{L}\overline{E}$  and of 38.0 GeV for  $\overline{UD\overline{D}}$  couplings, also derived in ABDALLAH 04M. For indirect decays via  $L\overline{L}\overline{E}$  the limit improves to 95 GeV if the constraint from the neutralino is used and to 94 GeV if it is not used. For indirect decays via  $\overline{UD\overline{D}}$  couplings it remains unchanged when the neutralino constraint is not used. Supersedes the result of ABREU 00u.

<sup>1</sup> AAD 23CR searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for RPV SUSY in final states with multiple leptons and b-tagged jets. No significant excess above the Standard Model expectations is observed. Limits are set on the production of electroweakinos (wino or higgsino) that decay via RPV coupling  $\chi'_{133}$  to a charged lepton or a neutrino, a b quark, and an additional t or b quark, see their figure 16. A second model addresses direct  $\tilde{\mu}_{L,R}$  production and decay to a muon and a bino-like neutralino, which decays in the same way as in the first model, see their figure 17.

<sup>2</sup> AAD 23M searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for  $\tilde{e}^\pm$  pair production, followed by  $\tilde{e}^\pm \rightarrow \ell^\pm \tilde{\chi}_1^0$  in events with two leptons. The focus is on models where  $m_{\tilde{e}^\pm} - m_{\tilde{\chi}_1^0}$  is close to the W mass. No significant excess above the Standard Model predictions is observed. Limits were set on the  $\tilde{\ell}$  mass (assuming  $\tilde{e} - \tilde{\mu}$  and  $L - R$  degeneracy), as a function of  $m_{\tilde{\chi}_1^0}$ , see Figure 6. Limits were also derived for single  $\tilde{e}$  or  $\tilde{\mu}$ , and for L and R independently, see Figure 7.

<sup>3</sup> SIRUNYAN 21M searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  mass in Tchi1n2Fa, see their Figure 11, on the  $\tilde{\chi}_1^0$  mass in Tn1n1C and Tn1n1B for

$m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$ , see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsb0t3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.

<sup>4</sup> AAD 20i reported on ATLAS searches for slepton pair production in models with compressed mass spectra. A dataset of  $pp$  collisions at  $\sqrt{s} = 13$  TeV corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Events with  $\cancel{E}_T$ , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Light-flavour sleptons  $\tilde{e}$  and  $\tilde{\mu}$  are constrained at 95% C.L. to have masses above 251 GeV for a mass splitting slepton  $-\tilde{\chi}_1^0$  of 10 GeV, with constraints extending down to mass splittings of 550 MeV at the LEP slepton limits (73 GeV). See their Fig. 16(a). If only smuon are considered, and  $\tilde{\mu} = \tilde{\mu}_R$ , masses below 150 GeV are excluded for mass splitting  $\tilde{\mu}_R, \tilde{\chi}_1^0$  of 8.2 GeV. See their Fig. 16(b).

<sup>5</sup> AAD 20i reported on ATLAS searches for slepton pair production in models with compressed mass spectra. A dataset of  $pp$  collisions at  $\sqrt{s} = 13$  TeV corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Events with  $\cancel{E}_T$ , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Light-flavour sleptons  $\tilde{e}$  and  $\tilde{\mu}$  are constrained at 95% C.L. to have masses above 251 GeV for a mass splitting slepton  $-\tilde{\chi}_1^0$  of 10 GeV, with constraints extending down to mass splittings of 550 MeV at the LEP slepton limits (73 GeV). See their Fig. 16(a). If only smuon are considered, and  $\tilde{\mu} = \tilde{\mu}_L$ , masses below 216 GeV are excluded for mass splitting  $\tilde{\mu}_L, \tilde{\chi}_1^0$  of 10 GeV. See their Fig. 16(b).

<sup>6</sup> AAD 20o reported on a search for electroweak production in models with charginos and sleptons decaying into final states with exactly two oppositely charged leptons and missing transverse momentum. A dataset of  $pp$  collisions at  $\sqrt{s} = 13$  TeV corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$  was used. Light-flavour sleptons  $\tilde{e}$  and  $\tilde{\mu}$  are constrained at 95% C.L. to have masses above 700 GeV for massless lightest neutralino, see their Fig. 7(c). Exclusion limits are also set for selectrons and smuons separately, considering either right- or left-handed components, by including only the di-electron and di-muon same-flavour signal regions defined in the search, see their Fig. 8.

<sup>7</sup> SIRUNYAN 19AW searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for direct electroweak pair production of selectrons or smuons in events with two leptons (electrons or muons) of the opposite electric charge and same flavour, no jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass assuming left-handed, right-handed or both left- and right-handed (mass degenerate) production, see their Figure 6. Similarly, limits are set on the smuon mass, see their Figure 7. Limits are also set on slepton masses under the assumption that the selection and smuon are mass degenerate, see their Figure 5.

<sup>8</sup> AABOUD 18R searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in slepton pair production models with a fourfold degeneracy assumed in selection and smuon masses. The  $\tilde{\mu}$  masses are excluded up to 190 GeV for  $m_{\tilde{\mu}} - m_{\tilde{\chi}_1^0} = 5$  GeV. The exclusion limits extend down to mass splittings of 1 GeV, see their Fig. 11.

<sup>9</sup> CHATRCHYAN 14R searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in a stau (N)NLSP simplified model (GMSB) where the decay  $\tilde{\ell} \rightarrow \ell^\pm \tau^\pm \tau^\mp \tilde{G}$  takes place with a branching ratio of 100%, see Fig. 8.

<sup>10</sup> AAD 13b searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7$  TeV for sleptons decaying to a final state with two leptons (e and  $\mu$ ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Limits are derived in a simplified model of direct left-handed slepton pair production, where left-handed slepton masses between 85 and 195 GeV are excluded at 95% C.L. for  $m_{\tilde{\chi}_1^0} = 20$  GeV. See also Fig. 2(a). Exclusion limits are also derived in the phenomenological MSSM, see Fig. 3.

<sup>11</sup> ABBIENDI 04 search for  $\tilde{\mu}_R \tilde{\mu}_R$  production in acoplanar di-muon final states in the 183-208 GeV data. See Fig. 14 for the dependence of the limits on  $m_{\tilde{\chi}_1^0}$  and for the limit at  $\tan\beta = 35$ . Under the assumption of 100% branching ratio for  $\tilde{\mu}_R \rightarrow \mu \tilde{\chi}_1^0$ , the limit improves to 94.0 GeV for  $\Delta m > 4$  GeV. See Fig. 11 for the dependence of the limits on  $m_{\tilde{\chi}_1^0}$  at several values of the branching ratio. This limit supersedes ABBIENDI 00G.

<sup>12</sup> ACHARD 04 search for  $\tilde{\mu}_R \tilde{\mu}_R$  production in acoplanar di-muon final states in the 192-209 GeV data. Limits on  $m_{\tilde{\mu}_R}$  are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses  $m_{1/2}$  and  $m_0$ ,  $1 \leq \tan\beta \leq 60$  and  $-2 \leq \mu \leq 2$  TeV. See Fig. 4 for the dependence of the limits on  $m_{\tilde{\chi}_1^0}$ . This limit supersedes ACCIARRI 99w.

<sup>13</sup> ABDALLAH 03M looked for acoplanar dimuon +  $\cancel{E}$  final states at  $\sqrt{s} = 189$ -208 GeV. The limit assumes  $B(\tilde{\mu} \rightarrow \mu \tilde{\chi}_1^0) = 100\%$ . See Fig. 16 for limits on the  $(m_{\tilde{\mu}_R}, m_{\tilde{\chi}_1^0})$  plane. These limits include and update the results of ABREU 01.

<sup>14</sup> ABDALLAH 03M uses data from  $\sqrt{s} = 192$ -208 GeV to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays) and for sleptons. These limits are valid for values of  $M_2 < 1$  TeV,  $|\mu| \leq 1$  TeV with the  $\tilde{\chi}_1^0$  as LSP. The quoted limit is obtained when there is no mixing in the third family. See Fig. 43 for the mass limits as a function of  $\tan\beta$ . These limits update the results of ABREU 00w.

<sup>15</sup> HEISTER 02E looked for acoplanar dimuon +  $\cancel{E}_T$  final states from  $e^+e^-$  interactions between 183 and 209 GeV. The mass limit assumes  $B(\tilde{\mu} \rightarrow \mu \tilde{\chi}_1^0) = 1$ . See their Fig. 4 for the dependence of the limit on  $\Delta m$ . These limits include and update the results of BARATE 01.

<sup>16</sup> AABOUD 18BT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass up to 500 GeV for massless  $\tilde{\chi}_1^0$ , assuming degeneracy of  $\tilde{e}, \tilde{\mu}$ , and  $\tilde{\tau}$  and exploiting the  $2\ell$  signature, see their Figure 8(b).

See key on page 1171

## Searches Particle Listings Supersymmetric Particle Searches

- 17** AAD 14g searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of slepton pairs, decaying to a final state with two leptons ( $e$  and  $\mu$ ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of slepton pair production, see Fig. 8. An interpretation in the pMSSM is also given, see Fig. 10.
- 18** KHACHATRYAN 14t searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for electroweak production of slepton pairs decaying to a final state with opposite-sign lepton pairs ( $e$  or  $\mu$ ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Fig. 18.
- 19** ABREU 00v use data from  $\sqrt{s} = 130\text{--}189 \text{ GeV}$  to search for tracks with large impact parameter or visible decay vertices. Limits are obtained as function of  $m_{\tilde{G}}$ , after combining these results with the search for slepton pair production in the SUGRA framework from ABREU 01 to cover prompt decays and on stable particle searches from ABREU 00q. For limits at different  $m_{\tilde{G}}$ , see their Fig. 12.

- 1** AAD 22e searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry by measuring the yield asymmetry between events containing  $e^-\mu^+$  and those containing  $e^+\mu^-$ . This was found in agreement with the standard model prediction of 1. Limits are set on the RPV production of  $t\tilde{\mu}_L$  events with  $\tilde{\mu}_L \rightarrow \mu\tilde{\chi}_1^0$  for various values of  $\lambda'_{231}$ , see their figures 6 and 7.
- 2** AAD 21y searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tch1n12-GGM, and RPV models similar to Tch1n2l, Tglu1A (with  $q = u, d, s, c, b$ , with equal branching fractions), and  $\tilde{\ell}_L/\tilde{\nu} \rightarrow \ell/\nu\tilde{\chi}_1^0$  (mass-degenerate  $\tilde{\ell}_L$  and  $\tilde{\nu}$  of all 3 generations), all with  $\tilde{\chi}_1^0 \rightarrow \ell^\pm\tilde{\ell}\nu$  via  $\lambda_{12k}$  or  $\lambda_{i33}$  (where  $i, k = 1, 2$ ), see their Figure 11.
- 3** AABOUD 18z searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLPSP pair production with R-parity violating decays of the LSP via  $\lambda_{12k}$  or  $\lambda_{i33}$  to charged leptons, see their Figures 7, 8.
- 4** AAD 14x searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in an R-parity violating simplified model where the decay  $\tilde{\ell} \rightarrow \ell\tilde{\chi}_1^0$ , with  $\tilde{\chi}_1^0 \rightarrow \ell^\pm\tilde{\ell}\nu$ , takes place with a branching ratio of 100%, see Fig. 9.
- 5** SIRUNYAN 19Ao searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two same-sign muons and at least two jets, originating from resonant production of second-generation sleptons ( $\tilde{\mu}_L, \tilde{\nu}_\mu$ ) via the R-parity violating coupling  $\lambda'_{211}$  to quarks. No significant excess above the Standard Model expectations is observed. Upper limits on cross sections are derived in the context of two simplified models, see their Figure 4. The cross section limits are translated into limits on  $\lambda'_{211}$  for a modified CMSSM, see their Figure 5.
- 6** ABDALLAH 04M use data from  $\sqrt{s} = 192\text{--}208 \text{ GeV}$  to derive limits on sparticle masses under the assumption of RPV with  $L\tilde{L}\tilde{E}$  or  $U\tilde{D}\tilde{D}$  couplings. The results are valid for  $\mu = -200 \text{ GeV}, \tan\beta = 1.5, \Delta m \geq 5 \text{ GeV}$  and assuming a BR of 1 for the given decay. The limit quoted is for indirect  $U\tilde{D}\tilde{D}$  decays using the neutralino constraint of 39.5 GeV for  $L\tilde{L}\tilde{E}$  and of 38.0 GeV for  $U\tilde{D}\tilde{D}$  couplings, also derived in ABDALLAH 04M. For indirect decays via  $L\tilde{L}\tilde{E}$  the limit improves to 90 GeV if the constraint from the neutralino is used and remains at 87 GeV if it is not used. For indirect decays via  $U\tilde{D}\tilde{D}$  couplings it degrades to 85 GeV when the neutralino constraint is not used. Supersedes the result of ABREU 00u.
- 7** HEISTER 03G searches for the production of smuons in the case of RPV prompt decays with  $L\tilde{L}\tilde{E}, L\tilde{Q}\tilde{D}$  or  $U\tilde{D}\tilde{D}$  couplings at  $\sqrt{s} = 189\text{--}209 \text{ GeV}$ . The search is performed for direct and indirect decays, assuming one coupling at a time to be non-zero. The limit holds for direct decays mediated by RPV  $L\tilde{Q}\tilde{D}$  couplings and improves to 90 GeV for indirect decays (for  $\Delta m > 10 \text{ GeV}$ ). Limits are also given for  $L\tilde{L}\tilde{E}$  direct ( $m_{\tilde{\mu}R} > 87 \text{ GeV}$ ) and indirect decays ( $m_{\tilde{\mu}R} > 96 \text{ GeV}$  for  $m(\tilde{\chi}_1^0) > 23 \text{ GeV}$  from BARATE 98s) and for  $U\tilde{D}\tilde{D}$  indirect decays ( $m_{\tilde{\mu}R} > 85 \text{ GeV}$  for  $\Delta m > 10 \text{ GeV}$ ). Supersedes the results from BARATE 01b.

### R-parity conserving $\tilde{\tau}$ (Stau) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 1** TUMASYAN 23AG searched in  $138 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for or direct pair production of tau sleptons in events with two hadronically decaying tau leptons. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the tau slepton in models with  $\tilde{\tau} \rightarrow \tau\tilde{\chi}_1^0$  for mass-degenerate, pure left-handed and pure right-handed tau sleptons, see their figures 4–7. Limits are also set for the maximally mixed scenario with long-lived tau sleptons and  $\tilde{\tau}$  lifetimes of 0.01 mm to 2.5 mm, see their figure 8.
- 2** AAD 20H presented ATLAS searches for direct production for  $\tilde{\tau}$  in final states with two hadronically decaying leptons and  $\cancel{E}_T$ . The analysis uses a dataset of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  corresponding to an integrated luminosity of  $139 \text{ fb}^{-1}$ . Exclusion limits at 95% C.L. are derived in scenarios of direct production of  $\tilde{\tau}$  pairs with each  $\tilde{\tau}$  decaying into a  $\tau$  and the lightest neutralino  $\tilde{\chi}_1^0$  in simplified models where the  $\tilde{\tau}_R$  and  $\tilde{\tau}_L$  mass eigenstates are degenerate. Stau masses from 120 GeV to 390 GeV are excluded for a massless lightest neutralino, see their Fig. 7(a). If  $\tilde{\tau}$ -only pair production is considered, the exclusion region extends between 155 GeV to 310 GeV, see their Fig. 7(b).
- 3** SIRUNYAN 20P searched in  $77.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct pair production of tau sleptons in events with a tau lepton pair and significant missing transverse momentum. Final states with two double hadronic decay of the tau leptons are considered, as well as where one of the tau leptons decays into an electron or a muon. No significant excess above the Standard Model expectations is observed. Limits are set on the stau mass in a simplified model where two tau sleptons are pair produced and decay to a tau lepton and the lightest neutralino, assuming either only left-handed stau production, see Figure 8, or assuming degenerate left- and right-handed stau production, see Figure 9.
- 4** ABBIENDI 04 search for  $\tilde{\tau}\tilde{\tau}$  production in acoplanar di-tau final states in the 183–208 GeV data. See Fig. 15 for the dependence of the limits on  $m_{\tilde{\chi}_1^0}$  and for the limit at  $\tan\beta = 35$ . Under the assumption of 100% branching ratio for  $\tilde{\tau}_R \rightarrow \tau\tilde{\chi}_1^0$ , the limit improves to 89.8 GeV for  $\Delta m > 8 \text{ GeV}$ . See Fig. 12 for the dependence of the limits on  $m_{\tilde{\chi}_1^0}$  at several values of the branching ratio and for their dependence on  $\theta_\tau$ . This limit supersedes ABBIENDI 00g.
- 5** ACHARD 04 search for  $\tilde{\tau}\tilde{\tau}$  production in acoplanar di-tau final states in the 192–209 GeV data. Limits on  $m_{\tilde{\tau}_R}$  are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses  $m_{1/2}$  and  $m_0, 1 \leq \tan\beta \leq 60$  and  $-2 \leq \mu \leq 2 \text{ TeV}$ . See Fig. 4 for the dependence of the limits on  $m_{\tilde{\chi}_1^0}$ .
- 6** ABDALLAH 03M looked for acoplanar ditau and  $\cancel{E}_T$  final states at  $\sqrt{s} = 130\text{--}208 \text{ GeV}$ . A dedicated search was made for low mass  $\tilde{\tau}$ s decoupling from the  $Z^0$ . The limit assumes  $B(\tilde{\tau} \rightarrow \tau\tilde{\chi}_1^0) = 100\%$ . See Fig. 20 for limits on the  $(m_{\tilde{\tau}}, m_{\tilde{\chi}_1^0})$  plane and as function of the  $\tilde{\chi}_1^0$  mass and of the branching ratio. The limit in the low-mass region improves to 29.6 and 31.1 GeV for  $\tilde{\tau}_R$  and  $\tilde{\tau}_L$ , respectively, at  $\Delta m > m_{\tilde{\tau}}$ . The limit in the high-mass region improves to 84.7 GeV for  $\tilde{\tau}_R$  and  $\Delta m > 15 \text{ GeV}$ . These limits include and update the results of ABREU 01.
- 7** HEISTER 02E looked for acoplanar ditau and  $\cancel{E}_T$  final states from  $e^+e^-$  interactions between 183 and 209 GeV. The mass limit assumes  $B(\tilde{\tau} \rightarrow \tau\tilde{\chi}_1^0) = 1$ . See their Fig. 4 for the dependence of the limit on  $\Delta m$ . These limits include and update the results of BARATE 01.
- 8** AABOUD 18bT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations

# Searches Particle Listings

## Supersymmetric Particle Searches

is observed. Limits are set on the slepton mass up to 500 GeV for massless  $\tilde{\chi}_1^0$ , assuming degeneracy of  $\tilde{e}$ ,  $\tilde{\mu}$ , and  $\tilde{\tau}$  and exploiting the  $2\ell$  signature, see their Figure 8(b).

- <sup>9</sup> KHACHATRYAN 17L searched in about  $19 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two  $\tau$  (at least one decaying hadronically) and  $\cancel{E}_T$ . Results were interpreted to set constraints on the cross section for production of  $\tilde{\tau}_L$  pairs for  $m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$ . No mass constraints are set, see their Fig. 7.
- <sup>10</sup> AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons,  $\cancel{E}_T$ , with or without hadronic jets, in  $20 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . The paper reports 95% C.L. exclusion limits on the cross-section for production of  $\tilde{\tau}_R$  and  $\tilde{\tau}_L$  pairs for various  $m_{\tilde{\chi}_1^0}$ , using the 2 hadronic  $\tau + \cancel{E}_T$  analysis. The  $m_{\tilde{\tau}_{R/L}} = 109 \text{ GeV}$  is excluded for  $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$ , with the constraints being stronger for  $\tilde{\tau}_R$ . See their Fig. 12.
- <sup>11</sup> AAD 12AF searched in  $2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with two tau leptons, jets and large  $\cancel{E}_T$  in a GMSB framework. No significant excess above the expected background was found and an upper limit on the visible cross section for new phenomena is set. A 95% C.L. lower limit of 32 TeV on the mGMSB breaking scale  $\Lambda$  is set for  $M_{mess} = 250 \text{ TeV}$ ,  $N_S = 3$ ,  $\mu > 0$  and  $C_{grav} = 1$ , independent of  $\tan\beta$ .
- <sup>12</sup> AAD 12AG searched in  $2.05 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with at least one hadronically decaying tau lepton, jets, and large  $\cancel{E}_T$  in a GMSB framework. No significant excess above the expected background was found and an upper limit on the visible cross section for new phenomena is set. A 95% C.L. lower limit of 30 TeV on the mGMSB breaking scale  $\Lambda$  is set for  $M_{mess} = 250 \text{ TeV}$ ,  $N_S = 3$ ,  $\mu > 0$  and  $C_{grav} = 1$ , independent of  $\tan\beta$ . For large values of  $\tan\beta$ , the limit on  $\Lambda$  increases to 43 TeV.
- <sup>13</sup> AAD 12CM searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with at least one tau lepton, zero or one additional light lepton ( $e/\mu$ ) jets, and large  $\cancel{E}_T$  in a GMSB framework. No significant excess above the expected background was found and an upper limit on the visible cross section for new phenomena is set. A 95% C.L. lower limit of 54 TeV on the mGMSB breaking scale  $\Lambda$  is set for  $M_{mess} = 250 \text{ TeV}$ ,  $N_S = 3$ ,  $\mu > 0$  and  $C_{grav} = 1$ , for  $\tan\beta > 20$ . Here the  $\tilde{\tau}_1$  is the NLSP.
- <sup>14</sup> ABBIENDI 06b use  $600 \text{ pb}^{-1}$  of data from  $\sqrt{s} = 189\text{--}209 \text{ GeV}$ . They look for events from pair-produced staus in a GMSB scenario with  $\tilde{\tau}$  NLSP including prompt  $\tilde{\tau}$  decays to  $t$  quarks +  $\cancel{E}$  final states, large impact parameters, kinked tracks and heavy stable charged particles. Limits on the cross-section are computed as a function of  $m(\tilde{\tau})$  and the lifetime, see their Fig. 7. The limit is compared to the  $\sigma \cdot BR^2$  from a scan over the GMSB parameter space.
- <sup>15</sup> ABDALLAH 04H use data from LEP 1 and  $\sqrt{s} = 192\text{--}208 \text{ GeV}$ . They re-use results or re-analyze the data from ABDALLAH 03M to put limits on the parameter space of anomaly-mediated supersymmetry breaking (AMSB), which is scanned in the region  $1 < m_{3/2} < 50 \text{ TeV}$ ,  $0 < m_0 < 1000 \text{ GeV}$ ,  $1.5 < \tan\beta < 35$ , both signs of  $\mu$ . The constraints are obtained from the searches for mass degenerate chargino and neutralino, for SM-like and invisible Higgs, for leptonically decaying charginos and from the limit on non-SM Z width of 3.2 MeV. The limit is for  $m_{\tilde{t}} = 174.3 \text{ GeV}$  (see Table 2 for other  $m_{\tilde{t}}$  values). The limit improves to 75 GeV for  $\mu < 0$ .

### R-parity violating $\tilde{\tau}$ (Stau) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- <sup>1</sup> AAD 21Y searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on  $T\text{ch}1n12\text{-GGM}$ , and RPV models similar to  $T\text{ch}1n21$ ,  $T\text{glu}1A$  (with  $q = u, d, s, c, b$ , with equal branching fractions), and  $\tilde{\ell}_L/\tilde{\nu} \rightarrow \ell/\nu\tilde{\chi}_1^0$  (mass-degenerate  $\tilde{\ell}_L$  and  $\tilde{\nu}$  of all 3 generations), all with  $\tilde{\chi}_1^0 \rightarrow \ell^\pm \tilde{E}^\mp \nu$  via  $\lambda_{12k}$  or  $\lambda_{i33}$  (where  $i, k \in 1, 2$ ), see their Figure 11.
- <sup>2</sup> AABOUD 18Z searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry  $Tn1n1A/Tn1n1B/Tn1n1C$ , see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via  $\lambda_{12k}$  or  $\lambda_{i33}$  to charged leptons, see their Figures 7, 8.
- <sup>3</sup> ABDALLAH 04M use data from  $\sqrt{s} = 192\text{--}208 \text{ GeV}$  to derive limits on sparticle masses under the assumption of RPV with  $LL\bar{E}$  couplings. The results are valid for  $\mu = -200 \text{ GeV}$ ,  $\tan\beta = 1.5$ ,  $\Delta m > 5 \text{ GeV}$  and assuming a BR of 1 for the given decay. The limit quoted is for indirect decays using the neutralino constraint of 39.5 GeV, also derived in ABDALLAH 04M. For indirect decays via  $LL\bar{E}$  the limit decreases to 86 GeV if the constraint from the neutralino is not used. Supersedes the result of ABREU 00U.
- <sup>4</sup> ABBIENDI 04F use data from  $\sqrt{s} = 189\text{--}209 \text{ GeV}$ . They derive limits on sparticle masses under the assumption of RPV with  $LL\bar{E}$  or  $LQ\bar{D}$  couplings. The results are valid for

$\tan\beta = 1.5$ ,  $\mu = -200 \text{ GeV}$ , with, in addition,  $\Delta m > 5 \text{ GeV}$  for indirect decays via  $LQ\bar{D}$ . The limit quoted applies to direct decays with  $LL\bar{E}$  couplings and improves to 75 GeV for  $LQ\bar{D}$  couplings. The limit on the  $\tilde{\tau}_R$  mass for indirect decays is 92 GeV for  $LL\bar{E}$  couplings at  $m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$  and no exclusion is obtained for  $LQ\bar{D}$  couplings. Supersedes the results of ABBIENDI 00.

### Long-lived $\tilde{\ell}$ (Slepton) mass limit

Limits on scalar leptons which leave detector before decaying. Limits from Z decays are independent of lepton flavor. Limits from continuum  $e^+e^-$  annihilation are also independent of flavor for smuons and staus. Selection limits from  $e^+e^-$  collisions in the continuum depend on MSSM parameters because of the additional neutralino exchange contribution.

- <sup>1</sup> AAD 23BQ searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for pair production of long-lived  $\tilde{\mu}$  in events with muons with impact parameters in the millimeter range. No significant excess above the Standard Model predictions is observed. Limits are set on  $m_{\tilde{\mu}}$  as a function of the  $\tilde{\mu}$  lifetime, assuming the  $\tilde{\mu} \rightarrow \mu\tilde{G}$  decay and mass-degenerate  $\tilde{\mu}_L$  and  $\tilde{\mu}_R$ . See Figure 4.
- <sup>2</sup> AAD 23c searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for stau pair production in events with high-pt tracks with large ionisation in the pixel detector. No significant excess above the Standard Model predictions is observed. Limits are set on the stau mass as a function of its lifetime, see Figure 19.

- <sup>3</sup> TUMASYAN 23AG searched in  $138 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct pair production of tau sleptons in events with two hadronically decaying tau leptons. No significant excess above the Standard Model expectations is observed. Limits are set for the maximally mixed scenario with long-lived tau sleptons and  $\tilde{\tau}$  lifetimes of 0.01 mm to 2.5 mm, see their figure 8. Limits are also set on the mass of the tau slepton in models with  $\tilde{\tau} \rightarrow \tau \tilde{\chi}_1^0$  for mass-degenerate, pure left-handed and pure right-handed tau sleptons, see their figures 4–7.
- <sup>4</sup> TUMASYAN 22AF searched for evidence of new long-lived particles decaying to leptons in  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$ , corresponding to  $118 (113) \text{ fb}^{-1}$  in the  $e\mu$  and  $\mu\mu$  channels. The leptons are required to have transverse impact parameter values between 0.01 and 10 cm and are not required to form a common vertex. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the top squark in RPV models with top squark pair production and  $\tilde{t} \rightarrow b\tilde{\ell}$  and  $\tilde{t} \rightarrow d\tilde{\ell}$ , see their Figure 4, which contains a wider range of lifetime limits. Limits are also set on a gauge-mediated SUSY breaking model, where the next-to-lightest SUSY particle is a slepton and the lightest SUSY particle a gravitino  $\tilde{G}$ , see their Figure 5, which also contains a wider range of lifetime limits. Limits are also set in a model that produces BSM Higgs bosons ( $H$ ) with a mass of 125 GeV through gluon fusion, where the  $H$  decays to two long-lived scalars  $S$ , each of which decays to two oppositely charged and same-flavor leptons.
- <sup>5</sup> AAD 21AL searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for pair production of long-lived sleptons in events with highly displaced leptons. No significant excess above the Standard Model predictions is observed. Limits are set on  $m_{\tilde{e}}, m_{\tilde{\mu}}, m_{\tilde{\tau}}$  as a function of the slepton lifetime, assuming the  $\tilde{\ell} \rightarrow \ell \tilde{G}$  decay and mass-degenerate  $\tilde{\ell}_L$  and  $\tilde{\ell}_R$ . See Figures 2.
- <sup>6</sup> AABOUD 19AT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for metastable and stable  $R$ -hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Results are interpreted in terms of exclusion limits on long-lived stau in the context of GMSB models. Lower limits on the mass for direct production of staus are set at 430 GeV, see their Fig. 10 (left).
- <sup>7</sup> KHACHATRYAN 16BW searched in  $2.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with heavy stable charged particles, identified by their anomalously high energy deposits in the silicon tracker and/or long time-of-flight measurements by the muon system. No evidence for an excess over the expected background is observed. Limits are derived for pair production of tau sleptons as a function of mass, depending on their direct or inclusive production in a minimal GMSB scenario along the Snowmass Points and Slopes (SPS) line 7, see Fig. 4 and Table 7.
- <sup>8</sup> AAD 15AE searched in  $19.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ALTAS muon system. In the absence of an excess of events above the expected backgrounds, limits are set on stable  $\tilde{\tau}$  sleptons in various scenarios, see Figs. 5–7.
- <sup>9</sup> AAIJ 15BD searched in  $3.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7$  and 8 TeV for evidence of Drell-Yan pair production of long-lived  $\tilde{\tau}$  particles. No evidence for such particles is observed and 95% C.L. upper limits on the cross section of  $\tilde{\tau}$  pair production are derived, see Fig. 7. In the mGMSB, assuming the SPST benchmark scenario  $\tilde{\tau}$  masses between 124 and 309 GeV are excluded at 95% C.L.
- <sup>10</sup> ABBIENDI 03L used  $e^+e^-$  data at  $\sqrt{s} = 130\text{--}209 \text{ GeV}$  to select events with two high momentum tracks with anomalous  $dE/dx$ . The excluded cross section is compared to the theoretical expectation as a function of the heavy particle mass in their Fig. 3. The limit improves to 98.5 GeV for  $\tilde{\mu}_L$  and  $\tilde{\tau}_L$ . The bounds are valid for colorless spin 0 particles with lifetimes longer than  $10^{-6} \text{ s}$ . Supersedes the results from ACKERSTAFF 98P.
- <sup>11</sup> ABREU 00Q searches for the production of pairs of heavy, charged stable particles in  $e^+e^-$  annihilation at  $\sqrt{s} = 130\text{--}189 \text{ GeV}$ . The upper bound improves to 88 GeV for  $\tilde{\mu}_L$ ,  $\tilde{\tau}_L$ . These limits include and update the results of ABREU 98P.
- <sup>12</sup> ACCIARRI 99H searched for production of pairs of back-to-back heavy charged particles at  $\sqrt{s} = 130\text{--}183 \text{ GeV}$ . The upper bound improves to 82.2 GeV for  $\tilde{\mu}_L$ ,  $\tilde{\tau}_L$ .
- <sup>13</sup> The BARATE 98k mass limit improves to 82 GeV for  $\tilde{\mu}_L, \tilde{\tau}_L$ . Data collected at  $\sqrt{s} = 161\text{--}184 \text{ GeV}$ .
- <sup>14</sup> AAD 13AA searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing long-lived massive particles in a GMSB framework. No significant excess above the expected background was found. A 95% C.L. lower limit of 300 GeV is placed on long-lived  $\tilde{\tau}$ 's in the GMSB model with  $M_{\text{mess}} = 250 \text{ TeV}$ ,  $N_\zeta = 3$ ,  $\mu > 0$ , for  $\tan\beta = 5\text{--}20$ . The lower limit on the GMSB breaking scale  $\Lambda$  was found to be 99–110 TeV, for  $\tan\beta$  values between 5 and 40, see Fig. 4 (top). Also, directly produced long-lived sleptons, or sleptons decaying to long-lived ones, are excluded at 95% C.L. up to a  $\tilde{\tau}$  mass of 278 GeV for models with slepton splittings smaller than 50 GeV.
- <sup>15</sup> ABAZOV 13B looked in  $6.3 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for charged massive long-lived particles in events with muon-like particles that have both speed and ionization energy loss inconsistent with muons produced in beam collisions. In the absence of an excess, limits are set at 95% C.L. on the production cross section of stau leptons in the mass range 100–300 GeV, see their Table 20 and Fig. 23.
- <sup>16</sup> CHATRCHYAN 13AB looked in  $5.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  and in  $18.8 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with heavy stable particles, identified by their anomalous  $dE/dx$  in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of  $\tilde{\tau}_1$ 's. No evidence for an excess over the expected background is observed. Supersedes CHATRCHYAN 12L.
- <sup>17</sup> CHATRCHYAN 13AB limits are derived for pair production of  $\tilde{\tau}_1$  as a function of mass in minimal GMSB scenarios along the Snowmass Points and Slopes (SPS) line 7 (see Fig. 8 and Table 7). The limit given here is valid for direct pair  $\tilde{\tau}_1$  production.
- <sup>18</sup> CHATRCHYAN 13AB limits are derived for the production of  $\tilde{\tau}_1$  as a function of mass in minimal GMSB scenarios along the Snowmass Points and Slopes (SPS) line 7 (see Fig. 8 and Table 7). The limit given here is valid for the production of  $\tilde{\tau}_1$  from both direct pair production and from the decay of heavier supersymmetric particles.
- <sup>19</sup> CHATRCHYAN 12L looked in  $5.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with heavy stable particles, identified by their anomalous  $dE/dx$  in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of  $\tilde{\tau}_1$ 's. No evidence for an excess over the expected background is observed. Limits are derived for the production of  $\tilde{\tau}_1$  as a function of mass in minimal GMSB scenarios along the Snowmass Points and Slopes (SPS) line 7 (see Fig. 3). The limit given here is valid for the production of  $\tilde{\tau}_1$  in the decay of heavier supersymmetric particles.
- <sup>20</sup> AAD 11P looked in  $37 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with two heavy stable particles, reconstructed in the Inner tracker and the Muon System and identified by their time of flight in the Muon System. No evidence for an excess over the SM expectation is observed. Limits on the mass are derived, see Fig. 3, for  $\tilde{\tau}$  in a GMSB

scenario and for sleptons produced by electroweak processes only, in which case the limit degrades to 110 GeV.

### $\tilde{q}$ (Squark) mass limit

For  $m_{\tilde{q}} > 60\text{--}70 \text{ GeV}$ , it is expected that squarks would undergo a cascade decay via a number of neutralinos and/or charginos rather than undergo a direct decay to photinos as assumed by some papers. Limits obtained when direct decay is assumed are usually higher than limits when cascade decays are included.

Limits from  $e^+e^-$  collisions depend on the mixing angle of the lightest mass eigenstate  $\tilde{q}_1 = \tilde{q}_R \sin\theta_q + \tilde{q}_L \cos\theta_q$ . It is usually assumed that only the sbottom and stop squarks have non-trivial mixing angles (see the stop and sbottom sections). Here, unless otherwise noted, squarks are always taken to be either left/right degenerate, or purely of left or right type. Data from  $Z$  decays have set squark mass limits above 40 GeV, in the case of  $\tilde{q} \rightarrow q\tilde{\chi}_1^0$  decays if  $\Delta m = m_{\tilde{q}} - m_{\tilde{\chi}_1^0} \gtrsim 5 \text{ GeV}$ . For smaller values of  $\Delta m$ , current constraints on the invisible width of the  $Z$  ( $\Delta\Gamma_{\text{inv}} < 2.0 \text{ MeV}$ , LEP 00) exclude  $m_{\tilde{u}_{L,R}} < 44 \text{ GeV}$ ,  $m_{\tilde{d}_R} < 33 \text{ GeV}$ ,  $m_{\tilde{d}_L} < 44 \text{ GeV}$  and, assuming all squarks degenerate,  $m_{\tilde{q}} < 45 \text{ GeV}$ .

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

• • • We do not use the following data for averages, fits, limits, etc. • • •

1 AAD 23AE searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with  $2\ell$  with same flavour and opposite sign, plus jets and  $\cancel{E}_T$ , defining signal region with the dilepton invariant mass both on- and off-shell with respect to the Z boson. No significant excess above the Standard Model predictions is observed. Limits are set on models of strong and electroweak production. In this case, limits are placed on the mass of pair-produced squarks, assuming a scenario like in Tsqk2, see figure 16.

2 TUMASYAN 23x searched in  $138 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for squark pair production with cascade decays to CP-even singlet-like Higgs bosons ( $H_1$ ), leading to final states with small missing transverse momentum. This search targets  $H_1$  decays to  $b\bar{b}$ -pairs that are reconstructed in large-area (AK8) jets. No significant excess above the Standard Model expectations is observed. Limits are set in the next-to-minimal supersymmetric extension of the SM, where a singlino of small mass leads to squark and gluino cascade decays that can predominantly end in a highly Lorentz-boosted singlet-like  $H_1$  and a singlino-like neutralino  $\tilde{\chi}_2^0$  of small transverse momentum. The eight first- and second-generation squarks are assumed mass-degenerate, and the gluino mass is set at 1% larger.

3 AAD 21AK searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for pair production of gluinos and squarks in events with a single isolated electron or muon, originating from the decay of a W boson, multiple jets and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1B simplified model and on the squark mass in the Tsqk3 simplified model, see their Figure 8.

See key on page 1171

## Searches Particle Listings Supersymmetric Particle Searches

- 4 AAD 21F searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for pair production of squarks in events with a high- $p_T$  jet and  $\cancel{E}_T$ . No significant excess above the Standard Model predictions is observed. Limits are set on the  $\tilde{t}$  mass in the Tstop3 and Tstop4, on the  $\tilde{b}$  mass in the Tsb0t1, and on the  $\tilde{q}$  mass in the Tsqk1 simplified model (four-flavour, two chirality states degeneracy).
- 5 AAD 21L searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for pair production of gluinos and squarks in events with jets, large missing transverse momentum but no electrons or muons. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A and Tglu1B simplified models, on the squark mass in the Tsqk1 and Tsqk3 simplified models and in a simplified model for gluino-squark production, see their Figures 13-17.
- 6 SIRUNYAN 21M searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  mass in Tchi1n2Fa, see their Figure 11, on the  $\tilde{\chi}_1^0$  mass in Tn1n1C and Tn1n1B for  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$ , see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsb0t3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.
- 7 SIRUNYAN 19AG searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two photons and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4B simplified model and on the squark mass in the Tsqk4B simplified model, see their Figure 3.
- 8 SIRUNYAN 19CH searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing multiple jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A and Tglu3A simplified models, see their Figure 13. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 simplified models, see their Figure 14.
- 9 SIRUNYAN 19K searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with a photon, an electron or muon, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tchi1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.
- 10 AABOUD 18BJ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk2 model in case of  $m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$ : for any  $m_{\tilde{\chi}_2^0}$ , squark masses below  $1200 \text{ GeV}$  are excluded, see their Fig. 14(b).
- 11 AABOUD 18BV searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one jet identified as  $c$ -jet, large missing transverse energy and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tsqk1 models considering only  $\tilde{c}_1$ . In scenarios with massless neutralinos, scharm masses below  $850 \text{ GeV}$  are excluded. If the differences of the  $\tilde{c}_1$  and  $\tilde{\chi}_1^0$  masses is below  $100 \text{ GeV}$ , scharm masses below  $500 \text{ GeV}$  are excluded. See their Fig.6 and Fig.7.
- 12 AABOUD 18I searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one jet with a transverse momentum above  $250 \text{ GeV}$  and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tsqk1 models. In the compressed scenario with similar squark and neutralino masses, squark masses below  $710 \text{ GeV}$  are excluded. See their Fig.10(b).
- 13 AABOUD 18U searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results are interpreted in terms of lower limits on the masses of squark in Tsqk4B models. Masses below  $1820 \text{ GeV}$  are excluded for any NLSP mass, see their Fig. 9.
- 14 AABOUD 18V searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk1 model: squark masses below  $1550 \text{ GeV}$  are excluded for massless LSP, see their Fig. 13(a).
- 15 AABOUD 18V searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk3 model. Assuming that  $m_{\tilde{\chi}_1^\pm} = 0.5 (m_{\tilde{q}} + m_{\tilde{\chi}_1^0})$ , squark masses below  $1150 \text{ GeV}$  are excluded for massless LSP, see their Fig. 14(a). Exclusions are also shown assuming  $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$ , see their Fig. 14(b).
- 16 SIRUNYAN 18AA searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one photon and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking (GGM) scenario with bino-like  $\tilde{\chi}_1^0$  and wino-like  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0$ , see Figure 7. Limits are also set on the NLSP mass in the Tchi1n1A and Tchi1ch1A simplified models, see their Figure 8. Finally, limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, see their Figure 9, and on the squark mass in the Tsqk4A and Tsqk4B simplified models, see their Figure 10.
- 17 SIRUNYAN 18AY searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing one or more jets and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range  $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$ , see their Figure 4.
- 18 AABOUD 17AR searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one isolated lepton, at least two jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to  $1.25 \text{ TeV}$  are set on the 1st and 2nd generation squark masses in Tsqk3 simplified models, with  $x = (m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}) / (m_{\tilde{q}} - m_{\tilde{\chi}_1^0}) = 1/2$ . Similar limits are obtained for variable  $x$  and fixed neutralino mass,  $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$ . See their Figure 13.
- 19 AABOUD 17N searched in  $14.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with 2 same-flavour, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. The results are interpreted as 95% C.L. limits in Tsqk2 models, assuming  $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$  and  $m_{\tilde{\chi}_2^0} = 600 \text{ GeV}$ . See their Fig. 12 for exclusion limits as a function of  $m_{\tilde{\chi}_1^0} / m_{\tilde{\chi}_2^0}$ .
- 20 KHACHATRYAN 17P searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tsqk1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- 21 KHACHATRYAN 17V searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two photons and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino and squark mass in the context of general gauge mediation models Tglu4B and Tsqk4, see their Fig. 4.
- 22 SIRUNYAN 17AY searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one photon, jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, and on the squark mass in the Tsqk4A and Tsqk4B simplified models, see their Figure 6.
- 23 SIRUNYAN 17AZ searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tsqk1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb0t1 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- 24 SIRUNYAN 17P searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with multiple jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, Tglu3A and Tglu3D simplified models, see their Fig. 12. Limits are also set on the squark mass in the Tsqk1 simplified model, on the stop mass in the Tstop1 simplified model, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 13.
- 25 AABOUD 16D searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with an energetic jet and large missing transverse momentum. The results are interpreted as 95% C.L. limits on masses of first and second generation squarks decaying into a quark and the lightest neutralino in scenarios with  $m_{\tilde{q}} - m_{\tilde{\chi}_1^0} < 25 \text{ GeV}$ . See their Fig. 6.
- 26 AABOUD 16N searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing hadronic jets, large  $\cancel{E}_T$ , and no electrons or muons. No significant excess above the Standard Model expectations is observed. First- and second-generation squark masses below  $1030 \text{ GeV}$  are excluded at the 95% C.L. decaying to quarks and a massless lightest neutralino. See their Fig. 7a.
- 27 KHACHATRYAN 16BS searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one energetic jet, no isolated leptons, and significant  $\cancel{E}_T$ , using the transverse mass variable  $M_{T2}$  to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the squark mass in the Tsqk1 simplified model, both in the assumption of a single light quark and of 8 degenerate squarks, see Fig. 11 and Table 3.
- 28 AAD 15Bv summarized and extended ATLAS searches for gluinos and first- and second-generation squarks in final states containing jets and missing transverse momentum, with or without leptons or  $b$ -jets in the  $\sqrt{s} = 8 \text{ TeV}$  data set collected in 2012. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the squark mass in several R-parity conserving models. See their Figs. 9, 11, 18, 22, 24, 27, 28.
- 29 AAD 15Cs searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for evidence of pair production of squarks, decaying into a quark and a neutralino, where a photon was radiated either from an initial-state quark, from an intermediate squark, or from a final-state quark. No evidence was found for an excess above the expected level of Standard Model background and a 95% C.L. exclusion limit was set on the squark mass as a function of the squark-neutralino mass difference, see Fig. 19.
- 30 AAD 15k searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing at least two jets, where the two leading jets are each identified as originating from  $c$ -quarks, and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the mass of superpartners of charm quarks ( $\tilde{c}$ ). Assuming that the decay  $\tilde{c} \rightarrow c\tilde{\chi}_1^0$  takes place 100% of the time, a scalar charm mass below  $490 \text{ GeV}$  is excluded for  $m_{\tilde{\chi}_1^0} < 200 \text{ GeV}$ . For more details, see their Fig. 2.
- 31 KHACHATRYAN 15AF searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the transverse mass variable  $M_{T2}$  to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the squark mass in simplified models where the decay  $\tilde{q} \rightarrow q\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, both for the case of a single light squark or 8 degenerate squarks, see Fig. 12. See also Table 5. Exclusions in the CMSSM, assuming  $\tan\beta = 30$ ,  $A_0 = -2 \max(m_0, m_{1/2})$  and  $\mu > 0$ , are also presented, see Fig. 15.
- 32 AAD 14AE searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for strongly produced supersymmetric particles in events containing jets and large missing transverse momentum, and no electrons or muons. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing squarks that decay via  $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ , where either a single light state or two degenerate generations of squarks are assumed, see Fig. 10.
- 33 CHATRACHYAN 14AH searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the razor variables ( $M_R$  and  $R_2$ ) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on squark masses in simplified models where the decay  $\tilde{q} \rightarrow q\tilde{\chi}_1^0$  takes place with a branching ratio of 100%,

# Searches Particle Listings

## Supersymmetric Particle Searches

- see Fig. 28. Exclusions in the CMSSM, assuming  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , are also presented, see Fig. 26.
- 34 CHATRCHYAN 14I searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing multijets and large  $E_T$ . No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing squarks that decay via  $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ , where either a single light state or two degenerate generations of squarks are assumed, see Fig. 7a.
- 35 AAD 13L searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for the production of squarks and gluinos in events containing jets, missing transverse momentum and no high- $p_T$  electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , squarks and gluinos of equal mass are excluded for masses below 1360 GeV at 95% C.L. In a simplified model containing only squarks of the first two generations, a gluino octet and a massless neutralino, squark masses below 1320 GeV are excluded at 95% C.L. for gluino masses below 2 TeV. See Figures 10–15 for more precise bounds.
- 36 AAD 13Q searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing a high- $p_T$  isolated photon, at least one jet identified as originating from a bottom quark, and high missing transverse momentum. Such signatures may originate from supersymmetric models with gauge-mediated supersymmetry breaking in events in which one of a pair of higgsino-like neutralinos decays into a photon and a gravitino while the other decays into a Higgs boson and a gravitino. No significant excess above the expected background was found and limits were set on the squark mass as a function of the neutralino mass in a generalized GMSB model (GGM) with a higgsino-like neutralino NLSP, see their Fig. 4. For neutralino masses greater than 220 GeV, squark masses below 1020 GeV are excluded at 95% C.L.
- 37 CHATRCHYAN 13 looked in  $4.98 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with two opposite-sign leptons ( $e, \mu, \tau$ ), jets and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the mSUGRA/CMSSM model with  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , see Fig. 6.
- 38 CHATRCHYAN 13G searched in  $4.98 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for the production of squarks and gluinos in events containing  $0, 1, 2, \geq 3$  b-jets, missing transverse momentum and no electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with  $\tan\beta = 10$ ,  $A_0 = 0$ , and  $\mu > 0$ , squarks and gluinos of equal mass are excluded for masses below 1250 GeV at 95% C.L. Exclusions are also derived in various simplified models, see Fig. 7.
- 39 CHATRCHYAN 13H searched in  $4.96 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with two photons,  $\geq 4$  jets and low  $E_T$  due to  $\tilde{q} \rightarrow \gamma\tilde{\chi}_1^0$  decays in a stealth SUSY framework, where the  $\tilde{\chi}_1^0$  decays through a singlino ( $\tilde{S}$ ) intermediate state to  $\gamma S \tilde{G}$ , with the singlet state  $S$  decaying to two jets. No significant excess above the expected background was found and limits were set in a particular R-parity conserving stealth SUSY model. The model assumes  $m_{\tilde{\chi}_1^0} = 0.5 m_{\tilde{q}}$ ,  $m_{\tilde{S}} = 100 \text{ GeV}$  and  $m_S = 90 \text{ GeV}$ . Under these assumptions, squark masses less than 1430 GeV were excluded at the 95% C.L.
- 40 CHATRCHYAN 13T searched in  $11.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least two energetic jets and significant  $E_T$ , using the  $\alpha_T$  variable to discriminate between processes with genuine and misreconstructed  $E_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on squark masses in simplified models where the decay  $\tilde{q} \rightarrow q\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, assuming an eightfold degeneracy of the masses of the first two generation squarks, see Fig. 8 and Table 9. Also limits in the case of a single light squark are given.
- 41 AAD 12AX searched in  $1.04 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for supersymmetry in events containing jets, missing transverse momentum and one isolated electron or muon. No excess over the expected SM background is observed and model-independent limits are set on the cross section of new physics contributions to the signal regions. In mSUGRA/CMSSM models with  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , squarks and gluinos of equal mass are excluded for masses below 820 GeV at 95% C.L. Limits are also set on simplified models for squark production and decay via an intermediate chargino and on supersymmetric models with bilinear R-parity violation. Supersedes AAD 11c.
- 42 AAD 12CJ searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing one or more isolated leptons (electrons or muons), jets and  $E_T$ . The observations are in good agreement with the SM expectations and exclusion limits have been set in number of SUSY models. In the mSUGRA/CMSSM model with  $\tan\beta = 10$ ,  $A_0 = 0$ , and  $\mu > 0$ , 95% C.L. exclusion limits have been derived for  $m_{\tilde{q}} < 1200 \text{ GeV}$ , assuming equal squark and gluino masses. In minimal GMSB, values of the effective SUSY breaking scale  $\Lambda < 50 \text{ TeV}$  are excluded at 95% C.L. for  $\tan\beta < 45$ . Also exclusion limits in a number of simplified models have been presented, see Figs. 10 and 12.
- 43 AAD 12CP searched in  $4.8 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with two photons and large  $E_T$  due to  $\tilde{\chi}_1^0 \rightarrow \gamma\tilde{G}$  decays in a GMSB framework. No significant excess above the expected background was found and limits were set on the squark mass as a function of the neutralino mass in a generalized GMSB model (GGM) with a bino-like neutralino NLSP. The other sparticle masses were decoupled,  $\tan\beta = 2$  and  $c\tau_{\text{NLSP}} < 0.1 \text{ mm}$ . Also, in the framework of the SP58 model, a 95% C.L. lower limit was set on the breaking scale  $\Lambda$  of 196 TeV.
- 44 AAD 12W searched in  $1.04 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for the production of squarks and gluinos in events containing jets, missing transverse momentum and no electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , squarks and gluinos of equal mass are excluded for masses below 950 GeV at 95% C.L. In a simplified model containing only squarks of the first two generations, a gluino octet and a massless neutralino, squark masses below 875 GeV are excluded at 95% C.L.
- 45 CHATRCHYAN 12 looked in  $35 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with  $e$  and/or  $\mu$  and/or jets, a large total transverse energy, and  $E_T$ . The event selection is based on the dimensionless razor variable  $R$ , related to the  $E_T$  and  $M_{\tilde{p}}$ , an indicator of the heavy particle mass scale. No evidence for an excess over the expected background is observed. Limits are derived in the CMSSM ( $m_0, m_{1/2}$ ) plane for  $\tan\beta = 3, 10$  and 50 (see Fig. 7 and 8). Limits are also obtained for Simplified Model Spectra.
- 46 CHATRCHYAN 12AE searched in  $4.98 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with at least three jets and large missing transverse momentum. No significant excesses over the expected SM backgrounds are observed and 95% C.L. limits on the production cross section of squarks in a scenario where  $\tilde{q} \rightarrow q\tilde{\chi}_1^0$  with a 100% branching ratio, see Fig. 3. For  $m_{\tilde{\chi}_1^0} < 200 \text{ GeV}$ , values of  $m_{\tilde{q}}$  below 760 GeV are excluded at 95% C.L. Also limits in the CMSSM are presented, see Fig. 2.
- 47 CHATRCHYAN 12AT searched in  $4.73 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for the production of squarks and gluinos in events containing jets, missing transverse momentum and no electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , squarks with masses below 1110 GeV are excluded at 95% C.L. Squarks and gluinos of equal mass are excluded for masses below 1180 GeV at 95% C.L. Exclusions are also derived in various simplified models, see Fig. 6.
- 48 AABOUD 18V searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk5 model. Squark masses below 1100 GeV are excluded if  $(m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0})/(m_{\tilde{q}} - m_{\tilde{\chi}_1^0}) < 0.95$  and  $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$ , see their Fig. 16(a).
- 49 KHACHATRYAN 16BT performed a global Bayesian analysis of a wide range of CMS results obtained with data samples corresponding to  $5.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  and in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . The set of searches considered, both individually and in combination, includes those with all-hadronic final states, same-sign and opposite-sign dileptons, and multi-lepton final states. An interpretation was given in a scan of the 19-parameter pMSSM. No scan points with a gluino mass less than 500 GeV survived and 98% of models with a squark mass less than 300 GeV were excluded.
- 50 AAD 15AI searched in  $20 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing at least one isolated lepton (electron or muon), jets, and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the squark masses in the CMSSM/mSUGRA, see Fig. 15, in the NUHM2, see Fig. 16, and in various simplified models, see Figs. 19–21.
- 51 KHACHATRYAN 15AR searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing jets, either a charged lepton or a photon, and low missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the squark mass in a stealth SUSY model where the decays  $\tilde{q} \rightarrow q\tilde{\chi}_1^\pm$ ,  $\tilde{\chi}_1^\pm \rightarrow \tilde{S} W^\pm$ ,  $\tilde{S} \rightarrow S \tilde{G}$  and  $S \rightarrow g g$ , with  $m_{\tilde{S}} = 100 \text{ GeV}$  and  $m_S = 90 \text{ GeV}$ , take place with a branching ratio of 100%. See Fig. 6 for  $\gamma$  or Fig. 7 for  $e^\pm$  analyses.
- 52 KHACHATRYAN 15AZ searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with either at least one photon, hadronic jets and  $E_T$  (single photon channel) or with at least two photons and at least one jet and using the razor variables. No significant excess above the Standard Model expectations is observed. Limits are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for both a bino-like and wino-like neutralino NLSP scenario, see Fig. 8 and 9.
- 53 AAD 14E searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from  $b$ -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5 and 6. In the  $\tilde{q} \rightarrow q'\tilde{\chi}_1^\pm$ ,  $\tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_2^0$ ,  $\tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0$  simplified model, the following assumptions have been made:  $m_{\tilde{\chi}_1^\pm} = 0.5 m_{\tilde{\chi}_2^0} + m_{\tilde{g}}$ ,  $m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^\pm} + m_{\tilde{q}})$ . In the  $\tilde{q} \rightarrow q'\tilde{\chi}_1^\pm$  or  $\tilde{q} \rightarrow q'\tilde{\chi}_2^0$ ,  $\tilde{\chi}_1^\pm \rightarrow e^\pm \nu \tilde{\chi}_1^0$  or  $\tilde{\chi}_2^0 \rightarrow e^\pm \nu (\nu) \tilde{\chi}_1^0$  simplified model, the following assumptions have been made:  $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^\pm} + m_{\tilde{q}})$ ,  $m_{\tilde{\chi}_2^0} < 460 \text{ GeV}$ . Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.
- 54 CHATRCHYAN 13AO searched in  $4.98 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with two opposite-sign isolated leptons accompanied by hadronic jets and  $E_T$ . No significant excesses over the expected SM backgrounds are observed and 95% C.L. exclusion limits are derived in the mSUGRA/CMSSM model with  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , see Fig. 8.
- 55 CHATRCHYAN 13AV searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for new heavy particle pairs decaying into jets (possibly  $b$ -tagged), leptons and  $E_T$  using the Razor variables. No significant excesses over the expected SM backgrounds are observed and 95% C.L. exclusion limits are derived in the mSUGRA/CMSSM model with  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , see Fig. 3. The results are also interpreted in various simplified models, see Fig. 4.
- 56 CHATRCHYAN 13W searched in  $4.93 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with one or more photons, hadronic jets and  $E_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on squark masses in the general gauge-mediated SUSY breaking model (GGM), for both a wino-like and bino-like neutralino NLSP scenario, see Fig. 5.
- 57 DREINER 12A reassesses constraints from CMS (at 7 TeV,  $\sim 4.4 \text{ fb}^{-1}$ ) under the assumption that the first and second generation squarks and the lightest SUSY particle are quasi-degenerate in mass (compressed spectrum).
- 58 DREINER 12A reassesses constraints from CMS (at 7 TeV,  $\sim 4.4 \text{ fb}^{-1}$ ) under the assumption that the first and second generation squarks, the gluino, and the lightest SUSY particle are quasi-degenerate in mass (compressed spectrum).

### R-parity violating $\tilde{q}$ (Squark) mass limit

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
none	100–720	95	1 SIRUNYAN 18EA CMS	2 large jets with four-parton substructure, $\tilde{q} \rightarrow 4q$

>1000	95	3 AAD 15CB ATLS		jets, $\tilde{q} \rightarrow q\tilde{\chi}_1^0, \tilde{\chi}_1^0 \rightarrow \ell q q$ , $m_{\tilde{\chi}_1^0} = 108 \text{ GeV}$ and $2.5 < c\tau_{\tilde{\chi}_1^0} < 200 \text{ mm}$
		4 AAD 12AX ATLS		$\ell$ + jets + $E_T$ , CMSSM, $m_{\tilde{q}} = m_{\tilde{g}}$
		5 CHATRCHYAN 12AL CMS		$\geq 3e^\pm$

<sup>1</sup> SIRUNYAN 18EA searched in  $38.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for the pair production of resonances, each decaying to at least four quarks. Reconstructed particles are clustered into two large jets of similar mass, each consistent with four-parton substructure. No statistically significant excess over the Standard Model expectation is observed. Limits are set on the squark and gluino mass in RPV supersymmetry models where squarks (gluinos) decay, through intermediate higgsinos, to four (five) quarks, see their Figure 4.

<sup>2</sup> KHACHATRYAN 16BX searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing 4 leptons coming from R-parity-violating decays of  $\tilde{\chi}_1^0 \rightarrow \ell\ell\nu$  with  $\lambda_{121} \neq$

0 or  $\lambda_{122} \neq 0$ . No excess over the expected background is observed. Limits are derived on the gluino, squark and stop masses, see Fig. 23.

<sup>3</sup>AAD 15CB searched for events containing at least one long-lived particle that decays at a significant distance from its production point (displaced vertex, DV) into two leptons or into five or more charged particles in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . The dilepton signature is characterised by DV formed from at least two lepton candidates. Four different final states were considered for the multitrack signature, in which the DV must be accompanied by a high-transverse momentum muon or electron candidate that originates from the DV, jets or missing transverse momentum. No events were observed in any of the signal regions. Results were interpreted in SUSY scenarios involving R-parity violation, split supersymmetry, and gauge mediation. See their Fig. 14–20.

<sup>4</sup>AAD 12AX searched in  $1.04 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for supersymmetry in events containing jets, missing transverse momentum and one isolated electron or muon. No excess over the expected SM background is observed and model-independent limits are set on the cross section of new physics contributions to the signal regions. In mSUGRA/CMSSM models with  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , squarks and gluinos of equal mass are excluded for masses below 820 GeV at 95% C.L. Limits are also set on simplified models for squark production and decay via an intermediate chargino and on supersymmetric models with bilinear R-parity violation. Supersedes AAD 11G.

<sup>5</sup>CHATRCHYAN 12AL looked in  $4.98 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for anomalous production of events with three or more isolated leptons. Limits on squark and gluino masses are set in RPV SUSY models with leptonic  $LL\bar{E}$  couplings,  $\lambda_{123} > 0.05$ , and hadronic  $UDD$  couplings,  $\lambda_{112}^{\prime\prime} > 0.05$ , see their Fig. 5. In the  $UDD$  case the leptons arise from supersymmetric cascade decays. A very specific supersymmetric spectrum is assumed. All decays are prompt.

### Long-lived $\tilde{q}$ (Squark) mass limit

The following are bounds on long-lived scalar quarks, assumed to hadronise into hadrons with lifetime long enough to escape the detector prior to a possible decay. Limits may depend on the mixing angle of mass eigenstates:  $\tilde{q}_1 = \tilde{q}_L \cos\theta_q + \tilde{q}_R \sin\theta_q$ .

The coupling to the  $Z^0$  boson vanishes for up-type squarks when  $\theta_u = 0.98$ , and for down type squarks when  $\theta_d = 1.17$ .

<sup>1</sup>AABOUD 19AT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for metastable and stable R-hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Sbottom R-hadrons are excluded at 95% C.L. for masses below 1250 GeV. Less stringent constraints are achieved with the muon-spectrometer agnostic analysis. See their Figure 9 (bottom-left).

<sup>2</sup>AABOUD 19AT searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for metastable and stable R-hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Stop R-hadrons are excluded at 95% C.L. for masses below 1340 GeV. Similar constraints are achieved with the muon-spectrometer agnostic analysis. See their Figure 9 (bottom-right).

<sup>3</sup>SIRUNYAN 19BH searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for long-lived particles decaying into jets, with each long-lived particle having a decay vertex well displaced from the production vertex. The selected events are found to be consistent with standard model predictions. Limits are set on the gluino mass in a GMSB model where the gluino is decaying via  $\tilde{g} \rightarrow g\tilde{G}$ , see their Figure 4 and in an RPV model of supersymmetry where the gluino is decaying via  $\tilde{g} \rightarrow \tilde{t}\bar{b}$ , see their Figures 5. Limits are also set on the stop mass in two RPV models, see their Figure 6 (for  $\tilde{t} \rightarrow b\bar{l}$  decays) and Figure 7 (for  $\tilde{t} \rightarrow \bar{d}\bar{d}$  decays).

<sup>4</sup>AABOUD 16B searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for long-lived R-hadrons using observables related to large ionization losses and slow propagation velocities, which are signatures of heavy charged particles traveling significantly slower than the speed of light. Exclusion limits at 95% C.L. are set on the long-lived sbottom masses exceeding 805 GeV. See their Fig. 5.

<sup>5</sup>AABOUD 16B searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for long-lived R-hadrons using observables related to large ionization losses and slow propagation velocities, which are signatures of heavy charged particles traveling significantly slower than the speed of light. Exclusion limits at 95% C.L. are set on the long-lived stop masses exceeding 890 GeV. See their Fig. 5.

<sup>6</sup>KHACHATRYAN 16BW searched in  $2.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with heavy stable charged particles, identified by their anomalously high energy deposits in the silicon tracker and/or long time-of-flight measurements by the muon system. No evidence for an excess over the expected background is observed. Limits are derived for pair production of top squarks as a function of mass, depending on the interaction model, see Fig. 4 and Table 7.

<sup>7</sup>AAD 15AE searched in  $19.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ALTAS muon system. In the absence of an excess of events above the expected backgrounds, limits are set R-hadrons in various scenarios, see Fig. 11. Limits are also set in LeptoSUSY models where the gluino decays to stable 300 GeV leptons, see Fig. 9.

<sup>8</sup>AAD 15BM searched in  $18.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for stable and metastable non-relativistic charged particles through their anomalously specific ionization energy loss in the ATLAS pixel detector. In absence of an excess of events above the expected backgrounds, limits are set on stable bottom and top squark R-hadrons, see Table 5.

<sup>9</sup>KHACHATRYAN 15AK looked in a data set corresponding to  $\text{fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ , and a search interval corresponding to 281 h of trigger lifetime, for long-lived particles that have stopped in the CMS detector. No evidence for an excess over the expected background in a cloud interaction model is observed. Assuming the decay  $\tilde{t} \rightarrow t\bar{\chi}_1^0$  and lifetimes between  $1 \mu\text{s}$  and  $1000 \text{ s}$ , limits are derived on  $\tilde{t}$  production as a function of  $m_{\tilde{\chi}_1^0}$ , see Figs. 4 and 7. The exclusions require that  $m_{\tilde{\chi}_1^0}$  is kinematically consistent with the minimum values of the jet energy thresholds used.

<sup>10</sup>AAD 13AA searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing colored long-lived particles that hadronize forming R-hadrons. No significant excess above the expected background was found. Long-lived R-hadrons containing a  $\tilde{t}$  are excluded for masses up to 683 GeV at 95% C.L. in a general interaction model. Also, limits independent of the fraction of R-hadrons that arrive charged in the muon system were derived, see Fig. 6.

<sup>11</sup>AAD 13AA searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing colored long-lived particles that hadronize forming R-hadrons. No significant excess above the expected background was found. Long-lived R-hadrons containing a  $\tilde{b}$  are excluded for masses up to 612 GeV at 95% C.L. in a general interaction model. Also, limits independent of the fraction of R-hadrons that arrive charged in the muon system were derived, see Fig. 6.

<sup>12</sup>AAD 13BC searched in  $5.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  and in  $22.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for bottom squark R-hadrons that have come to rest within the ATLAS calorimeter and decay at some later time to hadronic jets and a neutralino. In absence of an excess of events above the expected backgrounds, limits are set on sbottom masses for the decay  $\tilde{b} \rightarrow b\bar{\chi}_1^0$  for different lifetimes, and for a neutralino mass of 100 GeV, see their Table 6 and Fig. 10.

<sup>13</sup>AAD 13BC searched in  $5.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  and in  $22.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for bottom squark R-hadrons that have come to rest within the ATLAS calorimeter and decay at some later time to hadronic jets and a neutralino. In absence of an excess of events above the expected backgrounds, limits are set on stop masses for the decay  $\tilde{t} \rightarrow t\bar{\chi}_1^0$  for different lifetimes, and for a neutralino mass of 100 GeV, see their Table 6 and Fig. 10.

<sup>14</sup>CHATRCHYAN 13AB looked in  $5.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  and in  $18.8 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with heavy stable particles, identified by their anomalously dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of  $\tilde{t}_1$ 's. No evidence for an excess over the expected background is observed. Limits are derived for pair production of stops as a function of mass in the cloud interaction model (see Fig. 8 and Table 6). In the charge-suppressed model, the limit decreases to 818 GeV.

### $\tilde{b}$ (Sbottom) mass limit

Limits in  $e^+e^-$  depend on the mixing angle of the mass eigenstate  $\tilde{b}_1 = \tilde{b}_L \cos\theta_b + \tilde{b}_R \sin\theta_b$ . Coupling to the Z vanishes for  $\theta_b \sim 1.17$ . As a consequence, no absolute constraint in the mass region  $\lesssim 40 \text{ GeV}$  is available in the literature at this time from  $e^+e^-$  collisions. In the Listings below, we use  $\Delta m = m_{\tilde{b}_1} - m_{\tilde{\chi}_1^0}$ .

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 7 AAD 19H searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with no charged leptons, three or more  $b$ -jets, and large  $\cancel{E}_T$ . Higgs boson candidates are reconstructed as  $b$ -jet pairs. No significant excess above the Standard Model expectations is observed. Limits up to  $1300 \text{ GeV}$  are set on the sbottom mass in the Tsb04 simplified model, see Figure 8(b), for  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^0} + 130 \text{ GeV}$  and  $m_{\tilde{\chi}_2^0}$  from 200 to  $750 \text{ GeV}$ .
- 8 SIRUNYAN 19CH searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing multiple jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A and Tglu3A simplified models, see their Figure 13. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb01, Tstop1 simplified models, see their Figure 14.
- 9 SIRUNYAN 19CI searched in  $77.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb04 simplified model, see Figure 3, and on the wino mass in the Tch1n2E simplified model, see their Figure 4. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 5.
- 10 AABOUD 18I searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one jet with a transverse momentum above  $250 \text{ GeV}$  and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tsb01 models. In the compressed scenario with sbottom and neutralino masses differing by  $m_b$ , sbottom masses below  $430 \text{ GeV}$  are excluded. For  $m_{\tilde{\chi}_1^0} = 0$  they exclude sbottom masses up to  $610 \text{ GeV}$ . See their Fig.10(a).
- 11 SIRUNYAN 18AL searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least three charged leptons, in any combination of electrons and muons, jets and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, see their Figure 5. Limits are also set on the sbottom mass in the Tsb02 simplified model, see their Figure 6, and on the stop mass in the Tstop7 simplified model, see their Figure 7.
- 12 SIRUNYAN 18AR searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tch1n2F simplified model, see their Figure 8, and on the neutralino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tsb03 simplified model, see their Figure 10.
- 13 SIRUNYAN 18AV searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing one or more jets and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb01, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range  $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$ , see their Figure 4.
- 14 SIRUNYAN 18B searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for the pair production of third-generation squarks in events with jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb01 simplified model, see their Figure 5, and on the stop mass in the Tstop4 simplified model, see their Figure 6.
- 15 SIRUNYAN 18X searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and  $\cancel{E}_T$ . The razor variables ( $M_R$  and  $R^2$ ) are used to categorise the events. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb04 simplified model and on the wino mass in the Tch1n2E simplified model, see their Figure 5. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 6.
- 16 AABOUD 17AJ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to  $700 \text{ GeV}$  are set on the bottom squark mass in Tsb02 simplified models assuming  $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$ . See their Figure 4(d).
- 17 AABOUD 17AX searched in  $36 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two jets identified as originating from  $b$ -quarks and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of bottom squarks. In the Tsb01 simplified model, a  $\tilde{b}_1$  mass below  $950 \text{ GeV}$  is excluded for  $m_{\tilde{\chi}_1^0} = 0$  ( $<420 \text{ GeV}$ ). See their Fig. 7(a).
- 18 AABOUD 17AX searched in  $36 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two jets identified as originating from  $b$ -quarks and large missing transverse momentum, with or without leptons. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of bottom squarks. Assuming 50% BR for Tsb01 and Tsb02 simplified models, a  $\tilde{b}_1$  mass below  $880$  ( $860$ ) GeV is excluded for  $m_{\tilde{\chi}_1^0} = 0$  ( $<250$ ) GeV. See their Fig. 7(b).
- 19 KHACHATRYAN 17A searched in  $18.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two forward jets, produced through vector boson fusion, and missing transverse momentum. No significant excess above the Standard Model expectations is observed. A limit is set on sbottom masses in the Tsb01 simplified model, see Fig. 3.
- 20 KHACHATRYAN 17AW searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least three charged leptons, in any combination of electrons and muons, and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, and on the sbottom mass in the Tsb02 simplified model, see their Figure 4.
- 21 KHACHATRYAN 17P searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tsqk1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb01 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- 22 SIRUNYAN 17AZ searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tsqk1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb01 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- 23 SIRUNYAN 17K searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct production of stop or sbottom pairs in events with multiple jets and significant  $\cancel{E}_T$ . A second search also requires an isolated lepton and is combined with the all-hadronic search. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop8 and Tstop4 simplified models, see their Figures 7, 8 and 9 (for the Tstop4 limits, only the results of the all-hadronic search are used). Limits are also set on the sbottom mass in the Tsb01 simplified model, see Fig. 10 (also here, only the results of the all-hadronic search are used).
- 24 SIRUNYAN 17S searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two isolated same-sign leptons, jets, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the gluino mass in the Tglu3A, Tglu3B, Tglu3C, Tglu3D and Tglu1B simplified models, see their Figures 5 and 6, and on the sbottom mass in the Tsb02 simplified model, see their Figure 6.
- 25 AABOUD 16D searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with an energetic jet and large missing transverse momentum. The results are interpreted as 95% C.L. limits on mass of sbottom decaying into a  $b$ -quark and the lightest neutralino in scenarios with  $m_{\tilde{b}_1} - m_{\tilde{\chi}_1^0}$  between 5 and  $20 \text{ GeV}$ . See their Fig. 6.
- 26 AABOUD 16Q searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two jets identified as originating from  $b$ -quarks and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks. Assuming that the decay  $\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0$  (Tsb01) takes place 100% of the time, a  $\tilde{b}_1$  mass below  $840$  ( $800$ ) GeV is excluded for  $m_{\tilde{\chi}_1^0} < 100$  ( $360$ ) GeV. Differences in mass above  $100 \text{ GeV}$  between the  $\tilde{b}_1$  and the  $\tilde{\chi}_1^0$  are excluded up to a  $\tilde{b}_1$  mass of  $500 \text{ GeV}$ . For more details, see their Fig. 4.
- 27 AAD 16BB searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with exactly two same-sign leptons or at least three leptons, multiple hadronic jets,  $b$ -jets, and  $\cancel{E}_T$ . No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. are set on the sbottom mass for the Tsb02 model, assuming  $m_{\tilde{\chi}_1^0} = m_{\tilde{\chi}_1^0} + 100 \text{ GeV}$ . See their Fig. 4c.
- 28 KHACHATRYAN 16BJ searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb02 simplified model, see Fig. 6.
- 29 KHACHATRYAN 16BS searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one energetic jet, no isolated leptons, and significant  $\cancel{E}_T$ , using the transverse mass variable  $M_{T2}$  to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb01 simplified model, see Fig. 11 and Table 3.
- 30 KHACHATRYAN 16BY searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two opposite-sign, same-flavour leptons, jets, and missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see Fig. 4, and on sbottom masses in the Tsb03 simplified model, see Fig. 5.
- 31 AAD 15CJ searched in  $20 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for evidence of third generation squarks by combining a large number of searches covering various final states. Limits on the sbottom mass are shown, either assuming the  $\tilde{b} \rightarrow b\tilde{\chi}_1^0$  decay, see Fig. 11, or assuming the  $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$  decay, with  $\tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_1^0$ , see Fig. 12a, or assuming the  $\tilde{b} \rightarrow b\tilde{\chi}_2^0$  decay, with  $\tilde{\chi}_2^0 \rightarrow h\tilde{\chi}_1^0$ , see Fig. 12b. Interpretations in the pMSSM are also discussed, see Figures 13–15.
- 32 KHACHATRYAN 15AF searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the transverse mass variable  $M_{T2}$  to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in simplified models where the decay  $\tilde{b} \rightarrow b\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Fig. 12. See also Table 5. Exclusions in the CMSSM, assuming  $\tan\beta = 30$ ,  $A_0 = -2 \max(m_0, m_{1/2})$  and  $\mu > 0$ , are also presented, see Fig. 15.
- 33 KHACHATRYAN 15AH searched in  $19.4$  or  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing either a fully reconstructed top quark, or events containing dijets requiring one or both jets to originate from  $b$ -quarks, or events containing a mono-jet. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in simplified models where the decay  $\tilde{b} \rightarrow b\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Fig. 12. Limits are also set in a simplified model where the decay  $\tilde{b} \rightarrow c\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Fig. 12.
- 34 KHACHATRYAN 15I searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events in which  $b$ -jets and four  $W$ -bosons are produced. Five individual search channels are combined (fully hadronic, single lepton, same-sign dilepton, opposite-sign dilepton, multi-lepton). No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in a simplified model where the decay  $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$ , with  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ , takes place with a branching ratio of 100%, see Fig. 7.
- 35 AAD 14T searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for monojet-like events. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which assume that the decay  $\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0$  takes place 100% of the time, see Fig. 12.
- 36 KHACHATRYAN 14AH searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the razor variables ( $M_R$  and  $R^2$ ) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a  $b$ -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay  $\tilde{b} \rightarrow b\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , are also presented, see Fig. 26.
- 37 KHACHATRYAN 14R searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least three leptons (electrons, muons, taus) in the final state. No significant

## Supersymmetric Particle Searches

- excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a simplified model where the decay  $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$ , with  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ , takes place with a branching ratio of 100%, see Fig. 11.
- 38 KHACHATRYAN 15AD searched in  $19.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two opposite-sign same flavor isolated leptons featuring either a kinematic edge, or a peak at the Z-boson mass, in the invariant mass spectrum. No evidence for a statistically significant excess over the expected SM backgrounds is observed and 95% C.L. exclusion limits are derived in a simplified model of sbottom pair production where the sbottom decays into a  $b$ -quark, two opposite-sign dileptons and a neutralino LSP, through an intermediate state containing either an off-shell Z-boson or a slepton, see Fig. 8.
- 39 AAD 14AX searched in  $20.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for the strong production of supersymmetric particles in events containing either zero or at last one high- $p_T$  lepton, large missing transverse momentum, high jet multiplicity and at least three jets identified as originating from  $b$ -quarks. No excess over the expected SM background is observed. Limits are derived in mSUGRA/CMSSM models with  $\tan\beta = 30$ ,  $A_0 = -2 m_0$  and  $\mu > 0$ , see their Fig. 14. Also, exclusion limits are set in simplified models containing scalar bottom quarks, where the decay  $\tilde{b} \rightarrow b\tilde{\chi}_2^0$  and  $\tilde{\chi}_2^0 \rightarrow h\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see their Figures 11.
- 40 AAD 14E searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from  $b$ -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing bottom, see Fig. 7. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.
- 41 CHATRCHYAN 14H searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in a simplified models where the decay  $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$ ,  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, with varying mass of the  $\tilde{\chi}_1^\pm$ , for  $m_{\tilde{\chi}_1^0} = 50 \text{ GeV}$ , see Fig. 6.
- 42 AAD 13AU searched in  $20.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing two jets identified as originating from  $b$ -quarks and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks. Assuming that the decay  $\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0$  takes place 100% of the time, a  $\tilde{b}_1$  mass below  $620 \text{ GeV}$  is excluded for  $m_{\tilde{\chi}_1^0} < 120 \text{ GeV}$ . For more details, see their Fig. 5.
- 43 CHATRCHYAN 13AT provides interpretations of various searches for supersymmetry by the CMS experiment based on  $4.73\text{--}4.98 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  in the framework of simplified models. Limits are set on the sbottom mass in a simplified models where sbottom quarks are pair-produced and the decay  $\tilde{b} \rightarrow b\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Fig. 4.
- 44 CHATRCHYAN 13T searched in  $11.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the  $\alpha_T$  variable to discriminate between processes with genuine and misreconstructed  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay  $\tilde{b} \rightarrow b\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Fig. 8 and Table 9.
- 45 CHATRCHYAN 13v searched in  $10.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two isolated same-sign dileptons and at least two  $b$ -jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the bottom mass in a simplified models where the decay  $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$ ,  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, with varying mass of the  $\tilde{\chi}_1^\pm$ , for  $m_{\tilde{\chi}_1^0} = 50 \text{ GeV}$ , see Fig. 4.
- 46 AAD 12AN searched in  $2.05 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for scalar bottom quarks in events with large missing transverse momentum and two  $b$ -jets in the final state. The data are found to be consistent with the Standard Model expectations. Limits are set in an R-parity conserving minimal supersymmetric scenario, assuming  $B(\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0) = 100\%$ , see their Fig. 2.
- 47 CHATRCHYAN 12Ai looked in  $4.98 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with two same-sign leptons ( $e, \mu$ ), but not necessarily same flavor, at least 2  $b$ -jets and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in a simplified model for sbottom pair production, where the sbottom decays through  $\tilde{b}_1 \rightarrow t\tilde{\chi}_1 W$ , see Fig. 8.
- 48 CHATRCHYAN 12Bo searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for scalar bottom quarks in events with large missing transverse momentum and two  $b$ -jets in the final state. The data are found to be consistent with the Standard Model expectations. Limits are set in an R-parity conserving minimal supersymmetric scenario, assuming  $B(\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0) = 100\%$ , see their Fig. 2.
- 49 AAD 11K looked in  $34 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with heavy stable particles, identified by their anomalous  $dE/dx$  in the tracker or time of flight in the tile calorimeter, from pair production of  $\tilde{b}$ . No evidence for an excess over the SM expectation is observed and limits on the mass are derived for pair production of sbottom, see Fig. 4.
- 50 AAD 11o looked in  $35 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with jets, of which at least one is a  $b$ -jet, and  $\cancel{E}_T$ . No excess above the Standard Model was found. Limits are derived in the  $(m_{\tilde{g}}, m_{\tilde{b}_1})$  plane (see Fig. 2) under the assumption of 100% branching ratios and  $\tilde{b}_1$  being the lightest squark. The quoted limit is valid for  $m_{\tilde{b}_1} < 500 \text{ GeV}$ . A similar approach for  $\tilde{t}_1$  as the lightest squark with  $\tilde{g} \rightarrow \tilde{t}_1 t$  and  $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm$  with 100% branching ratios leads to a gluino mass limit of  $520 \text{ GeV}$  for  $130 < m_{\tilde{t}_1} < 300 \text{ GeV}$ . Limits are also derived in the CMSSM  $(m_0, m_{1/2})$  plane for  $\tan\beta = 40$ , see Fig. 4, and in scenarios based on the gauge group SO(10).
- 51 CHATRCHYAN 11d looked in  $35 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with  $\geq 2$  jets, at least one of which is  $b$ -tagged, and  $\cancel{E}_T$ , where the  $b$ -jets are decay products of  $\tilde{t}$  or  $\tilde{b}$ . No evidence for an excess over the expected background is observed. Limits are derived in the CMSSM  $(m_0, m_{1/2})$  plane for  $\tan\beta = 50$  (see Fig. 2).
- 52 AALTONEN 10R searched in  $2.65 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for events with  $\cancel{E}_T$  and exactly two jets, at least one of which is  $b$ -tagged. The results are in agreement with the SM prediction, and a limit on the cross section of  $0.1 \text{ pb}$  is obtained for the

range of masses  $80 < m_{\tilde{b}_1} < 280 \text{ GeV}$  assuming that the sbottom decays exclusively to  $b\tilde{\chi}_1^0$ . The excluded mass region in the framework of conserved  $R_p$  is shown in a plane of  $(m_{\tilde{b}_1}, m_{\tilde{\chi}_1^0})$ , see their Fig.2.

- 53 ABAZOV 10L looked in  $5.2 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  for events with at least 2  $b$ -jets and  $\cancel{E}_T$  from the production of  $\tilde{b}_1\tilde{b}_1$ . No evidence for an excess over the SM expectation is observed, and a limit on the cross section is derived under the assumption of 100% branching ratio. The excluded mass region in the framework of conserved  $R_p$  is shown in a plane of  $(m_{\tilde{b}_1}, m_{\tilde{\chi}_1^0})$ , see their Fig. 3b. The exclusion also extends to  $m_{\tilde{\chi}_1^0} = 110 \text{ GeV}$  for  $160 < m_{\tilde{b}_1} < 200 \text{ GeV}$ .

### R-parity violating $\tilde{b}$ (Sbottom) mass limit

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>307	95	1 KHACHATRY...16BX CMS		RPV, $\tilde{b} \rightarrow td$ or $ts$ , $\lambda''_{332}$ or $\lambda''_{331}$ coupling

• • • We do not use the following data for averages, fits, limits, etc. • • •

- 2 AAD 14E ATLS  $\ell^\pm\ell^\pm(\ell\bar{\ell}) + \text{jets}, \tilde{b}_1 \rightarrow t\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm \rightarrow W^{(*)\pm}\tilde{\chi}_1^0$  simplified model,  $m_{\tilde{\chi}_1^\pm} = 2 m_{\tilde{\chi}_1^0}$
- 1 KHACHATRYAN 16BX searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing 2 leptons coming from R-parity-violating decays of supersymmetric particles. No excess over the expected background is observed. Limits are derived on the sbottom mass, assuming the RPV  $\tilde{b} \rightarrow td$  or  $\tilde{b} \rightarrow ts$  decay, see Fig. 15.
- 2 AAD 14E searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from  $b$ -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing bottom, see Fig. 7. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.

### $\tilde{t}$ (Stop) mass limit

Limits depend on the decay mode. In  $e^+e^-$  collisions they also depend on the mixing angle of the mass eigenstate  $\tilde{t}_1 = \tilde{t}_L \cos\theta_t + \tilde{t}_R \sin\theta_t$ . The coupling to the Z vanishes when  $\theta_t = 0.98$ . In the Listings below, we use  $\Delta m \equiv m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$  or  $\Delta m \equiv m_{\tilde{t}_1} - m_{\tilde{\nu}}$ , depending on relevant decay mode. See also bounds in "q (Squark) MASS LIMIT."

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

<sup>1</sup> HAYRAPETYAN 23E searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of gluino, top squark and electroweakino pair production in events with at least one photon, multiple jets, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set in models for strong production, Tglu4D, Tglu4E, Tglu4F and Tstop13, see their figure 9. They also interpret the results in the models for electroweak production, shown in their figure 10. Tch1n1A assumes wino-like  $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$  production, while Tch1ch1A assumes higgsino-like cross sections and includes  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm, \tilde{\chi}_1^0 \tilde{\chi}_2^0$  and  $\tilde{\chi}_1^0 \tilde{\chi}_2^\pm$  production. For  $\tilde{\chi}_1^0 \tilde{\chi}_2^0$  alone no mass point can be excluded in the model Tch1ch1A, but in another model for  $\tilde{\chi}_1^0 \tilde{\chi}_2^0$  production, Tn1n2A.

<sup>2</sup> TUMASYAN 23AB searched in  $138 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of top squark pair production in a final state with at least one hadronically decaying tau lepton and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of  $\tilde{t}$  for the model Tstop16, see their Figure 9. The exclusion limits are not very sensitive to the choice of the  $\tilde{\tau}$  mass parameter, chosen between  $0.25 < (m_{\tilde{\tau}^\pm} - m_{\tilde{\chi}_1^0}) / (m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}) < 0.75$  because of the complementary nature of the signal diagrams.

<sup>3</sup> TUMASYAN 23K searched in  $138 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of top squark pair production in events with a high-momentum jet, an electron or muon with low transverse momentum, and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass in the simplified model Tstop3 for  $10 \text{ GeV} < m_{\tilde{t}} - m_{\tilde{\chi}_1^0} < 80 \text{ GeV}$ , see their Figure 10.

<sup>4</sup> TUMASYAN 22Q searched in up to  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of electroweakino and top squark pair production with a small mass difference between the produced supersymmetric particles and the lightest neutralino in events with two or three low-momentum leptons and missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_1^\pm$  in the model Tch1n2F, see their Figure 8. Limits are also set in a higgsino simplified model with both  $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0 \tilde{\chi}_1^0$  production, where  $\tilde{\chi}_2^0 \rightarrow Z \tilde{\chi}_1^0$  and  $m_{\tilde{\chi}_1^\pm} = 1/2(m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})$ . A model inspired by the pMSSM is used for further interpretations in the case of a higgsino LSP, see their Figure 9. Limits are also set on the mass of the top squark in the models Tstop2 and Tstop3, see their Figure 10.

<sup>5</sup> AAD 21AW searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for pair production of stops in events with one or two hadronically decaying  $\tau$  leptons, jets,  $b$ -jets and  $\cancel{E}_T$ . No significant excess above the Standard Model predictions is observed. Limits are set on the  $\tilde{t}_1$  mass as a function of the  $\tilde{\tau}_1$  in the Tstop5 scenario. See their Fig. 8.

<sup>6</sup> AAD 21o searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for pair production of top squarks in events with one electron or muon, jets, and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass in the Tstop1 and Tstop3 simplified models and dark matter models, see their Figures 13, 14 and 15.

<sup>7</sup> AAD 21P searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for pair production of top squarks in events with two opposite-sign leptons, jets, and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass in the Tstop1, Tstop2, and Tstop3 simplified models, see their Figures 14.

<sup>8</sup> SIRUNYAN 21AD searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for supersymmetry in events with multiple jets, no leptons, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass in the simplified models Tstop1, Tstop2 with  $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{t}} + m_{\tilde{\chi}_1^0})/2$ , and a 50:50 mixture of these with  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$ , see their Figure 8. Limits are also set on the top squark mass for  $10 \text{ GeV} < m_{\tilde{t}} - m_{\tilde{\chi}_1^0} < 80 \text{ GeV}$  in the simplified models Tstop2, Tstop 3, and Tstop4, see their Figure 9. For indirect top squark production, limits are set on the gluino mass in the simplified models Tglu3A, Tglu3C with  $m_{\tilde{t}} - m_{\tilde{\chi}_1^0} = 20 \text{ GeV}$ , and Tglu3D with  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$ , see their Figure 10.

<sup>9</sup> SIRUNYAN 21B searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for the pair production of top squarks in events with two oppositely charged leptons (electrons or muons), jets identified as originating from a  $b$ -quark and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2 and Tstop11 simplified models, see their Figures 6 and 7.

<sup>10</sup> TUMASYAN 21i searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of top squarks in events with at least two jets and large  $\cancel{E}_T$ , categorized into events with 0, 1, or 2 leptons. No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass in the simplified model Tstop1 in the top corridor  $|m_{\tilde{t}} - m_{\tilde{\chi}_1^0} - 175 \text{ GeV}| < 30 \text{ GeV}$  using dilepton events, see their Figure 7. Limits are also set for a combination of earlier searches with 0, 1, and 2 leptons in

# Searches Particle Listings

## Supersymmetric Particle Searches

- the models Tstop1, Tstop2 and a 50:50 mixture of these models, see their Figure 9. The results are interpreted in an alternative signal model of dark matter production via a spin-0 mediator in association with a top quark pair as well.
- 11 AABOUD 20 searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing one electron-muon pair with opposite charge. The search targets a region of parameter space where the kinematics of top squark pair production and top quark pair production is very similar and makes use of the double-differential angular distributions of the leptons. No excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 model, see Figures 16 and 17.
  - 12 AAD 20As searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of top squarks in events containing either a pair of jets consistent with SM Higgs boson decay into  $b$ -quarks or a same-flavour opposite-sign dilepton pair with an invariant mass consistent with a  $Z$  boson. No significant excess over the expected background is observed. Limits at 95% C.L. are set in Tstop6 simplified model. Assuming  $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$ ,  $\tilde{t}_1$  masses up to 1220 GeV are excluded for  $m_{\tilde{\chi}_2^0}$  around 900 GeV. Limits reduce down to  $\tilde{t}_1$  masses up to 900 GeV for  $m_{\tilde{\chi}_2^0} = 130 \text{ GeV}$ . See their Fig. 10. Limits are presented also in case of  $B(\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 h) = 0$  and 1, see their Fig. 11.
  - 13 AAD 20As searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for evidence of top squarks in events containing either a pair of jets consistent with SM Higgs boson decay into  $b$ -quarks or a same-flavour opposite-sign dilepton pair with an invariant mass consistent with a  $Z$  boson. No significant excess over the expected background is observed. Limits at 95% C.L. are set in simplified model featuring  $\tilde{t}_2$  pair production,  $\tilde{t}_2 \rightarrow \tilde{t}_1 \bar{Z}$  and  $\tilde{t}_1 \rightarrow b f f \tilde{\chi}_1^0$ . Assuming  $m_{\tilde{\chi}_1^0} = 300 \text{ GeV}$ , and a mass difference between  $\tilde{t}_1$  and  $\tilde{\chi}_1^0$  of 40 GeV,  $\tilde{t}_2$  masses up to 860 GeV are excluded. See their Fig. 12.
  - 14 AAD 20s searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing multiple jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on top squark masses in the Tstop1 model up to 1250 GeV for lightest neutralino masses below 200 GeV. Additional constraints are set in the case where  $m_{\tilde{t}} - m_{\tilde{\chi}_1^0} \sim m_t$  for which top squark masses in the range 300–630 GeV are excluded. See their Fig. 13.
  - 15 AAD 20s searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing multiple jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on top squark masses in the Tstop3 model in the range 300–660 GeV. In case  $m_{\tilde{t}} - m_{\tilde{\chi}_1^0} \sim 5 \text{ GeV}$  or above,  $m_{\tilde{t}}$  below 500 GeV are excluded. See their Fig. 13(b).
  - 16 AAD 20v searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign charged leptons (electrons or muons) and jets. No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on the top squark mass up to 765 GeV assuming  $\tilde{t}_1 \rightarrow t \tilde{\chi}_2^0$  with  $\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^\pm W$  and  $\tilde{\chi}_1^\pm \rightarrow \tilde{\chi}_1^0 W$ . Masses of the charginos and lightest neutralinos are set as  $m_{\tilde{\chi}_1^0} = m_{\tilde{t}_1} - 275 \text{ GeV}$ ,  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^0} + 100 \text{ GeV}$  and  $m_{\tilde{\chi}_1^\pm} \sim m_{\tilde{\chi}_1^0}$ . See their Fig. 8(b).
  - 17 SIRUNYAN 20AH searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for pair production of top squarks in events with a single isolated electron or muon, multiple jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2 and Tstop8 simplified models, see Figures 6, 7 and 8, respectively.
  - 18 SIRUNYAN 20T searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least two jets, and two isolated same-sign or three or more charged leptons (electrons or muons). No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figure 7, and in the Tglu1C and Tglu1B simplified models, see their Figures 8 and 9. Limits are also set on the sbottom mass in the Tstop2 simplified model, see their Figure 10, and on the stop mass in the Tstop7 simplified model, see their Figure 11. Finally, limits are set on the gluino mass in RPV simplified models where the gluino decays either via  $\tilde{g} \rightarrow qq\bar{q}\bar{q} + e\mu/\tau$  or via  $\tilde{g} \rightarrow tbs$ , see Figure 12.
  - 19 SIRUNYAN 20u searched in  $77.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for the pair production of top squarks in events with two hadronically decaying taus, jets identified as originating from a  $b$ -quark and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop11 simplified model assuming the final state leptons are taus. Different values of the scalar tau mass are considered; the impact on the lower bound is negligible.
  - 20 SIRUNYAN 19AU searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one photon, jets, some of which are identified as originating from  $b$ -quarks, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the gluino mass in the Tglu4C, Tglu4D and Tglu4E simplified models, and on the top squark mass in the Tstop13 simplified model, see their Figure 5.
  - 21 SIRUNYAN 19CH searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing multiple jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A and Tglu3A simplified models, see their Figure 13. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tstop1, Tstop11 simplified models, see their Figure 14.
  - 22 SIRUNYAN 19s searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with zero or one charged leptons, jets and  $\cancel{E}_T$ . The razor variables ( $M_R$  and  $R^2$ ) are used to categorize the events. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu3C simplified models, see Figures 22 and 23, and on the stop mass in the Tstop1 simplified model, see their Figure 24.
  - 23 SIRUNYAN 19U searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing one electron-muon pair with opposite charge. The search targets a region of parameter space where the kinematics of top squark pair production and top quark pair production is very similar, due to the mass difference between the top squark and the neutralino being close to the top quark mass. No excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 model, with  $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$  close to  $m_t$ , see Figure 5.
  - 24 AABOUD 18AQ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for top squark pair production in final states with one isolated electron or muon, several energetic jets, and missing transverse momentum. No significant excess over the Standard Model prediction is observed. In case of Tstop1 models, top squark masses up to 940 GeV are excluded assuming  $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$ , see their Fig. 20. If the top quark is not on-shell (3-body) decay, exclusions up to 500 GeV are obtained for  $m_{\tilde{\chi}_1^0} = 300 \text{ GeV}$ . Exclusions as a function of  $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$  are given in their Fig. 21.
  - 25 AABOUD 18AQ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for top squark pair production in final states with one isolated electron or muon, several energetic jets, and missing transverse momentum. No significant excess over the Standard Model prediction is observed. In case of Tstop3 models (4-body), top squark masses up to 370 GeV are excluded for  $m_{\tilde{t}} - m_{\tilde{\chi}_1^0}$  as low as 20 GeV. Top squark masses below 195 GeV are excluded for all  $m_{\tilde{\chi}_1^0}$ , see their Fig. 20 and Fig. 21.
  - 26 AABOUD 18AQ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for top squark pair production in final states with one isolated electron or muon, several energetic jets, and missing transverse momentum. No significant excess over the Standard Model prediction is observed. In case of Tstop2 models, top squark masses up to 840 GeV are excluded for  $m_{\tilde{t}} - m_{\tilde{\chi}_1^\pm} = 10 \text{ GeV}$ . See their Fig. 23. Exclusion limits for this decay mode are presented also in the context of Higgsino-LSP phenomenological MSSM models, where  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$ , see their Fig. 26.
  - 27 AABOUD 18BV searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one jet identified as  $c$ -jet, large missing transverse energy and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop4 models. In scenarios with differences of the stop and neutralino masses below 100 GeV, stop masses below 500 GeV are excluded. See their Fig. 6 and Fig. 7.
  - 28 AABOUD 18BV searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one jet identified as  $c$ -jet, large missing transverse energy and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop1 models. In scenarios with massless neutralinos, top squark masses below 850 GeV are excluded. See their Fig. 6.
  - 29 AABOUD 18I searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one jet with a transverse momentum above 250 GeV and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop3 models. Stop masses below 390 GeV are excluded for  $m_{\tilde{t}} - m_{\tilde{\chi}_1^0} = m_b$ . See their Fig. 9(b).
  - 30 AABOUD 18I searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one jet with a transverse momentum above 250 GeV and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop4 models. In scenarios with differences of the stop and neutralino masses around 5 GeV, stop masses below 430 GeV are excluded. See their Fig. 9(a).
  - 31 AABOUD 18Y searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct pair production of top squarks in final states with two tau leptons,  $b$ -jets, and missing transverse momentum. At least one hadronic  $\tau$  is required. No significant deviation from the SM predictions is observed in the data. The analysis results are interpreted in Tstop5 models with a nearly massless gravitino. Top squark masses up to 1.16 TeV and tau slepton masses up to 1 TeV are excluded, see their Fig. 7.
  - 32 SIRUNYAN 18AJ searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two low-momentum, oppositely charged leptons (electrons or muons) and  $\cancel{E}_T$ . No excess over the expected background is observed. Limits are derived on the wino mass in the Tch1n2F simplified model, see their Figure 5. Limits are also set on the stop mass in the Tstop10 simplified model, see their Figure 6. Finally, limits are set on the Higgsino mass in the Tch1n2G simplified model, see Figure 8 and in the pMSSM, see their Figure 7.
  - 33 SIRUNYAN 18AL searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least three charged leptons, in any combination of electrons and muons, jets and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, see their Figure 5. Limits are also set on the sbottom mass in the Tstop2 simplified model, see their Figure 6, and on the stop mass in the Tstop7 simplified model, see their Figure 7.
  - 34 SIRUNYAN 18AN searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing one or two photons and a pair of top quarks from the decay of a pair of top squark in a natural gauge-mediated scenario. The final state consists of a lepton (electron or muon), jets and one or two photons. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop12 simplified model, see their Figure 6.
  - 35 SIRUNYAN 18AV searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing one or more jets and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tstop1, Tstop11 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range  $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$ , see their Figure 4.
  - 36 SIRUNYAN 18B searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for the pair production of third-generation squarks in events with jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tstop1 simplified model, see their Figure 5, and on the stop mass in the Tstop4 simplified model, see their Figure 6.
  - 37 SIRUNYAN 18C searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for the pair production of top squarks in events with two oppositely charged leptons (electrons or muons), jets identified as originating from a  $b$ -quark and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2 and Tstop11 simplified models, see their Figures 11 and 12. The Tstop1 and Tstop2 results are combined with complementary searches in the all-hadronic and single lepton channels, see their Figures 13 and 14.
  - 38 SIRUNYAN 18D searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing identified hadronically decaying top quarks, no leptons, and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see their Figure 8, and on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3E simplified models, see their Figure 9.
  - 39 SIRUNYAN 18DI searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for pair production of top squarks in events with a low transverse momentum lepton (electron or muon), a high-momentum jet and significant missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the

- stop mass in the Tstop3 and Tstop10 simplified models, see their Figures 7 and 8. A combination of this search with the all-hadronic search is presented in Figure 9.
- 40 SIRUNYAN 18DN searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct electroweak production of charginos and for pair production of top squarks in events with two leptons (electrons or muons) of the opposite electric charge. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tch1chi1C and Tch1chi1E simplified models, see their Figure 8. Limits are also set on the stop mass in the Tstop1 and Tstop2 simplified models, see their Figure 9.
- 41 AABOUD 17AJ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 700 GeV are set on the top squark mass in Tstop11 simplified models, assuming  $m_{\tilde{\chi}_1^0} = m_{\tilde{\tau}} - 275 \text{ GeV}$  and  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^0} + 100 \text{ GeV}$ . See their Figure 4(e).
- 42 AABOUD 17AX searched in  $36 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two jets identified as originating from  $b$ -quarks and large missing transverse momentum, with or without leptons. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of top squarks. Assuming 50% BR for Tstop1 and Tstop2 simplified models, a  $\tilde{t}_1$  mass below 880 (860) GeV is excluded for  $m_{\tilde{\chi}_1^0} = 0$  (<250) GeV. See their Fig. 7(b).
- 43 AABOUD 17AY searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits in the range 250–1000 GeV are set on the top squark mass in Tstop1 simplified models. For the first time, additional constraints are set for the region  $m_{\tilde{t}_1} \sim m_{\tilde{t}} + m_{\tilde{\chi}_1^0}$ , with exclusion of the  $\tilde{t}_1$  mass range 235–590 GeV. See their Figure 8.
- 44 AABOUD 17AZ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits in the range 450–850 GeV are set on the top squark mass in a mixture of Tstop1 and Tstop2 simplified models with BR=50% and assuming  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$  and  $m_{\tilde{\chi}_1^0} < 240 \text{ GeV}$ . Constraints are given for various values of the BR. See their Figure 9.
- 45 AABOUD 17BE searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 720 GeV are set on the top squark mass in Tstop1 simplified models, assuming massless neutralinos. See their Figure 9 (2-body area).
- 46 AABOUD 17BE searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 400 GeV are set on the top squark mass in Tstop3 simplified models, assuming  $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 40 \text{ GeV}$ . See their Figure 9 (4-body area).
- 47 AABOUD 17BE searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 430 GeV are set on the top squark mass in Tstop1 simplified models where top quarks are offshell, assuming  $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$  close to the  $W$  mass. See their Figure 9 (3-body area).
- 48 AABOUD 17BE searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 700 GeV are set on the top squark mass in Tstop2 simplified models, assuming  $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^\pm} = 10 \text{ GeV}$  and massless neutralinos. See their Figure 10.
- 49 KHACHATRYAN 17 searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing four or more jets, no more than one lepton, and missing transverse momentum, using the razor variables ( $M_{\tilde{p}}$  and  $R^2$ ) to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop1 simplified model, see Fig. 17.
- 50 KHACHATRYAN 17AD searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing at least four jets (including  $b$ -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Top squark masses in the range 250–740 GeV and neutralino masses up to 240 GeV are excluded at 95% C.L. See Fig. 12.
- 51 KHACHATRYAN 17AD searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing at least four jets (including  $b$ -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Limits are derived on the  $\tilde{t}$  mass in simplified models that are a mixture of Tstop1 and Tstop2 with branching fractions 50% for each of the two decay modes: top squark masses of up to 610 GeV and neutralino masses up to 190 GeV are excluded at 95% C.L. The  $\tilde{\chi}_1^\pm$  and the  $\tilde{\chi}_1^0$  are assumed to be nearly degenerate in mass, with a 5 GeV difference between their masses. See Fig. 12.
- 52 KHACHATRYAN 17P searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more jets and large  $E_{\cancel{T}}$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tsqk1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb01 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- 53 KHACHATRYAN 17S searched in  $18.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing multiple jets and missing transverse momentum, using the  $\alpha_T$  variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop4 model: for  $\Delta m = m_{\tilde{\tau}} - m_{\tilde{\chi}_1^0}$  equal to 10 and 80 GeV, masses of stop below 240 and 260 GeV are excluded, respectively. See their Fig.3.
- 54 KHACHATRYAN 17S searched in  $18.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing multiple jets and missing transverse momentum, using the  $\alpha_T$  variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop3 model: for  $\Delta m = m_{\tilde{\tau}} - m_{\tilde{\chi}_1^0}$  equal to 10 and 80 GeV, masses of stop below 225 and 130 GeV are excluded, respectively. See their Fig.3.
- 55 KHACHATRYAN 17S searched in  $18.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing multiple jets and missing transverse momentum, using the  $\alpha_T$  variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop2 model: assuming  $m_{\tilde{\chi}_1^\pm} = 0.25 m_{\tilde{\tau}} + 0.75 m_{\tilde{\chi}_1^0}$ , masses of stop up to 325 GeV and masses of the neutralino up to 225 GeV are excluded. See their Fig.3.
- 56 KHACHATRYAN 17S searched in  $18.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing multiple jets and missing transverse momentum, using the  $\alpha_T$  variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop2 model: assuming  $m_{\tilde{\chi}_1^\pm} = 0.75 m_{\tilde{\tau}} + 0.25 m_{\tilde{\chi}_1^0}$ , masses of stop up to 400 GeV are excluded for low neutralino masses. See their Fig.3.
- 57 KHACHATRYAN 17S searched in  $18.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing multiple jets and missing transverse momentum, using the  $\alpha_T$  variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop1 model: assuming masses of stop up to 500 GeV and masses of the neutralino up to 105 GeV are excluded. See their Fig.3.
- 58 SIRUNYAN 17As searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with a single lepton (electron or muon), jets, and large  $E_{\cancel{T}}$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2 and Tstop8 simplified models, see their Figures 5, 6 and 7.
- 59 SIRUNYAN 17AT searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct production of top squarks in events with jets and large  $E_{\cancel{T}}$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2, Tstop3, Tstop4, Tstop8 and Tstop10 simplified models, see their Figures 9 to 14.
- 60 SIRUNYAN 17AZ searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more jets and large  $E_{\cancel{T}}$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A and Tglu3D simplified models, see their Figures 6. Limits are also set on the squark mass in the Tsqk1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb01 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- 61 SIRUNYAN 17k searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for direct production of stop or sbottom pairs in events with multiple jets and significant  $E_{\cancel{T}}$ . A second search also requires an isolated lepton and is combined with the all-hadronic search. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop8 and Tstop4 simplified models, see their Figures 7, 8 and 9 (for the Tstop4 limits, only the results of the all-hadronic search are used). Limits are also set on the sbottom mass in the Tsb01 simplified model, see Fig. 10 (also here, only the results of the all-hadronic search are used).
- 62 SIRUNYAN 17P searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with multiple jets and large  $E_{\cancel{T}}$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, Tglu3A and Tglu3D simplified models, see their Fig. 12. Limits are also set on the squark mass in the Tsqk1 simplified model, on the stop mass in the Tstop1 simplified model, and on the sbottom mass in the Tsb01 simplified model, see Fig. 13.
- 63 AABOUD 16D searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with an energetic jet and large missing transverse momentum. The results are interpreted as 95% C.L. limits on mass of stop decaying into a charm-quark and the lightest neutralino in scenarios with  $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$  between 5 and 20 GeV. See their Fig. 5.
- 64 AABOUD 16J searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in final states with one isolated electron or muon, jets, and missing transverse momentum. For the direct stop pair production model where the stop decays via top and lightest neutralino, the results exclude at 95% C.L. stop masses between 745 GeV and 780 GeV for a massless  $\tilde{\chi}_1^0$ . See their Fig. 8.
- 65 AAD 16AY searched in  $20 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with either two hadronically decaying tau leptons, one hadronically decaying tau and one light lepton, or two light leptons. No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. on the mass of top squarks decaying via  $\tilde{\tau}$  to a nearly massless gravitino are placed depending on  $m_{\tilde{\tau}}$  which is ranging from the 87 GeV LEP limit to  $m_{\tilde{t}_1}$ . See their Figs. 9 and 10.
- 66 KHACHATRYAN 16AV searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with one or two isolated leptons, hadronic jets,  $b$ -jets and  $E_{\cancel{T}}$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 and Tstop2 simplified models, see Fig. 11.
- 67 KHACHATRYAN 16BK searched in  $18.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with hadronic jets and  $E_{\cancel{T}}$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 and Tstop2 simplified models, see Fig. 16.
- 68 KHACHATRYAN 16BS searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one energetic jet, no isolated leptons, and significant  $E_{\cancel{T}}$ , using the transverse mass variable  $M_{T2}$  to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see Fig. 11 and Table 3.
- 69 KHACHATRYAN 16V searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with one or two soft isolated leptons, hadronic jets, and  $E_{\cancel{T}}$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop3 simplified model, see Fig. 3.
- 70 AAD 15CJ searched in  $20 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for evidence of third generation squarks by combining a large number of searches covering various final states. Stop decays with and without charginos in the decay chain are considered and summaries of all ATLAS Run 1 searches for direct stop production can be found in Fig. 4 (no intermediate charginos) and Fig. 7 (intermediate charginos). Limits are set on stop masses in compressed mass regions regions, with  $B(\tilde{t} \rightarrow c\tilde{\chi}_1^0) + B(\tilde{t} \rightarrow b\tilde{\tau}'\tilde{\chi}_1^0) = 1$ , see Fig. 5. Limits are also set on stop masses assuming that both the decay  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  and  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$  are possible, with both their branching ratios summing up to 1, assuming  $\tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_1^0$  and  $m_{\tilde{\chi}_1^\pm} = 2 m_{\tilde{\chi}_1^0}$ , see Fig. 6. Limits on the mass of the next-to-lightest stop  $\tilde{t}_2$ , decaying either to  $Z\tilde{t}_1$ ,  $h\tilde{t}_1$  or  $t\tilde{\chi}_1^0$ , are also presented, see Figs. 9 and 10. Interpretations in the pMSSM are also discussed, see Figs 13–15.

## Supersymmetric Particle Searches

- 71** AAD 15J interpreted the measurement of spin correlations in  $t\bar{t}$  production using 20.3 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV in exclusion limits on the pair production of light  $\tilde{t}_1$  squarks with masses similar to the top quark mass. The  $\tilde{t}_1$  is assumed to decay through  $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$  with predominantly right-handed top and a 100% branching ratio. The data are found to be consistent with the Standard Model expectations and masses between the top quark mass and 191 GeV are excluded, see their Fig. 2
- 72** KHACHATRYAN 15AF searched in 19.5 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the transverse mass variable  $M_{T2}$  to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Fig. 12. See also Table 5. Exclusions in the CMSSM, assuming  $\tan\beta = 30$ ,  $A_0 = -2 \max(m_0, m_{1/2})$  and  $\mu > 0$ , are also presented, see Fig. 15.
- 73** KHACHATRYAN 15AH searched in 19.4 or 19.7 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events containing either a fully reconstructed top quark, or events containing dijets requiring one or both jets to originate from  $b$ -quarks, or events containing a mono-jet. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Fig. 9. Limits are also set in simplified models where the decays  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  and  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ , with  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5$  GeV, each take place with a branching ratio of 50%, see Fig. 10, or with other fractions, see Fig. 11. Finally, limits are set in a simplified model where the decay  $\tilde{t} \rightarrow c\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Figs. 9, 10 and 11.
- 74** KHACHATRYAN 15AH searched in 19.4 or 19.7 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events containing either a fully reconstructed top quark, or events containing dijets requiring one or both jets to originate from  $b$ -quarks, or events containing a mono-jet. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Fig. 9. Limits are also set in simplified models where the decays  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  and  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ , with  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5$  GeV, each take place with a branching ratio of 50%, see Fig. 10, or with other fractions, see Fig. 11. Finally, limits are set in a simplified model where the decay  $\tilde{t} \rightarrow c\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Figs. 9, 10, and 11.
- 75** KHACHATRYAN 15x searched in 19.3 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events with at least two energetic jets, at least one of which is required to originate from a  $b$  quark, possibly a lepton, and significant  $\cancel{E}_T$ , using the razor variables ( $M_R$  and  $R^2$ ) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  and the decay  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ , with  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5$  GeV, take place with branching ratios varying between 0 and 100%, see Figs. 15, 16 and 17.
- 76** AAD 14AJ searched in 20.1 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events containing four or more jets and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which either assume that the decay  $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$  takes place 100% of the time, see Fig. 8, or that this decay takes place 50% of the time, while the decay  $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm$  takes place the other 50% of the time, see Fig. 9.
- 77** AAD 14BD searched in 20 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events containing one isolated lepton, jets and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which either assume that the decay  $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$  takes place 100% of the time, see Fig. 15, or the decay  $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm$  takes place 100% of the time, see Fig. 16–22. For the mixed decay scenario, see Fig. 23.
- 78** AAD 14F searched in 20.3 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events containing two leptons ( $e$  or  $\mu$ ), and possibly jets and missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which either assume that the decay  $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm$  takes place 100% of the time, see Figs. 14–17 and 20, or that the decay  $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$  takes place 100% of the time, see Figs. 18 and 19.
- 79** AAD 14T searched in 20.3 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for monojet-like and  $c$ -tagged events. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which assume that the decay  $\tilde{t}_1 \rightarrow c\tilde{\chi}_1^0$  takes place 100% of the time, see Fig. 9 and 10. The results of the monojet-like analysis are also interpreted in terms of stop pair production in the four-body decay  $\tilde{t}_1 \rightarrow b\tilde{t}'\tilde{\chi}_1^0$ , see Fig. 11.
- 80** CHATRCHYAN 14AH searched in 4.7 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 7$  TeV for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the razor variables ( $M_R$  and  $R^2$ ) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a  $b$ -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , are also presented, see Fig. 26.
- 81** CHATRCHYAN 14R searched in 19.5 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in a natural higgsino NLSP simplified model (GMSB) where the decay  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ , with  $\tilde{\chi}_1^\pm \rightarrow (qq'/\ell\nu)H$ ,  $Z\tilde{G}$ , takes place with a branching ratio of 100% (the particles between brackets have a soft  $p_T$  spectrum), see Figs. 4–6.
- 82** AABOUD 17AF searched in 36 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for evidence of top squarks in events containing 2 leptons, jets,  $b$ -jets and  $\cancel{E}_T$ . In Tstop6 model, assuming  $m_{\tilde{\chi}_1^0} = 0$  GeV,  $\tilde{t}_1$  masses up to 850 GeV are excluded for  $m_{\tilde{\chi}_2^0} > 200$  GeV.
- 83** AABOUD 17AF searched in 36 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for evidence of  $\tilde{t}_2$  in events containing 2 leptons, jets,  $b$ -jets and  $\cancel{E}_T$ . In Tstop7 model, assuming  $m_{\tilde{\chi}_1^0} = 50$  GeV and 100% decays via  $Z$  boson,  $\tilde{t}_2$  masses up to 800 GeV are excluded. Exclusion limits are also shown as a function of the  $\tilde{t}_2$  branching ratios in their Figure 7.
- 84** AABOUD 17AF searched in 36 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for evidence of  $\tilde{t}_2$  in events containing 2 leptons, jets,  $b$ -jets and  $\cancel{E}_T$ . In Tstop7 model, assuming  $m_{\tilde{\chi}_1^0} = 50$  GeV and 100% decays via higgs boson,  $\tilde{t}_2$  masses up to 880 GeV are excluded. Exclusion limits are also shown as a function of the  $\tilde{t}_2$  branching ratios in their Figure 7.
- 85** AABOUD 17AY searched in 36.1 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the top quark mass assuming three pMSSM-inspired models. The first one, referred to as Higgsino LSP model, assumes  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5$  GeV and  $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = 10$  GeV, with a mixture of decay modes as in Tstop1, Tstop2 and Tstop6. See their Figure 10. The second and third models are referred to as Wino NLSP and well-tempered pMSSM models, respectively. See their Figure 11 and Figure 12, and text for details on assumptions.
- 86** AAD 14B searched in 20.3 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events containing a  $Z$  boson, with or without additional leptons, plus jets originating from  $b$ -quarks and significant missing transverse momentum. No excess over the expected SM background is observed. Limits are derived in simplified models featuring  $\tilde{t}_2$  production, with  $\tilde{t}_2 \rightarrow Z\tilde{t}_1$ ,  $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$  with a 100% branching ratio, see Fig. 4, and in the framework of natural GMSB, see Fig. 6.
- 87** CHATRCHYAN 14u searched in 19.7 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for evidence of direct pair production of top squarks, with Higgs bosons in the decay chain. The search is performed using a selection of events containing two Higgs bosons, each decaying to a photon pair, missing transverse energy and possibly  $b$ -quark jets. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of a “natural SUSY” simplified model where the decays  $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm$ , with  $\tilde{\chi}_1^\pm \rightarrow f'\tilde{\chi}_1^0$ , and  $\tilde{\chi}_1^0 \rightarrow H\tilde{G}$ , all happen with 100% branching ratio, see Fig. 4.
- 88** KHACHATRYAN 14C searched in 19.5 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for evidence of direct pair production of top squarks, with Higgs or  $Z$ -bosons in the decay chain. The search is performed using a selection of events containing leptons and  $b$ -quark jets. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of a simplified model with pair production of a heavier top-squark mass eigenstate  $\tilde{t}_2$  decaying to a lighter top-squark eigenstate  $\tilde{t}_1$  via either  $\tilde{t}_2 \rightarrow H\tilde{t}_1$  or  $\tilde{t}_2 \rightarrow Z\tilde{t}_1$ , followed in both cases by  $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$ . The interpretation is performed in the region where the mass difference between the  $\tilde{t}_1$  and  $\tilde{\chi}_1^0$  is approximately equal to the top-quark mass, which is not probed by searches for direct  $\tilde{t}_1$  pair production, see Figs. 5 and 6. The analysis excludes top squarks with masses  $m_{\tilde{t}_2} < 575$  GeV and  $m_{\tilde{t}_1} < 400$  GeV at 95% C.L.

1 TUMASYAN 23L searched in  $138 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for pairs of dijet resonances with the same mass in final states with at least four jets, for the case where the four-jet production proceeds via an intermediate resonant state and for nonresonant production. No significant excess above the Standard Model expectations is observed. Limits are set in the nonresonant search on the top squark mass in the simplified model Tstop1aRPV with  $\lambda_{312}$  coupling, assuming  $B(d/s) = 1$ , see their figure 12. Limits are also set on resonant pair production of dijet resonances via high mass intermediate states and compared to a signal model of diquarks that decay into pairs of vector-like quarks, see their figures 10 and 11.

2 TUMASYAN 22AF searched for evidence of new long-lived particles decaying to leptons in  $pp$  collisions at  $\sqrt{s} = 13$  TeV, corresponding to  $118$  ( $113$ )  $\text{fb}^{-1}$  in the  $ee$  ( $e\mu$  and  $\mu\mu$ ) channels. The leptons are required to have transverse impact parameter values between 0.01 and 10 cm and are not required to form a common vertex. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the top squark in RPV models with top squark pair production and  $\tilde{t} \rightarrow b\bar{\ell}$  and  $\tilde{t} \rightarrow d\bar{\ell}$ , see their Figure 4, which contains a wide range of lifetime limits. Limits are also set on a gauge-mediated SUSY breaking model, where the next-to-lightest SUSY particle is a slepton and the lightest SUSY particle a gravitino  $\tilde{G}$ , see their Figure 5, which also contains a wider range of lifetime limits. Limits are also set in a model that produces BSM Higgs bosons (H) with a mass of 125 GeV through gluon-gluon fusion, where the H decays to two long-lived scalars  $S_i$ , each of which decays to two oppositely charged and same-flavor leptons.

3 AAD 21BF searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for pair production of gluinos, stops, electroweakinos decaying RPV either directly or indirectly via the LSP. The final state in all cases is one or two leptons, many jets (up to fifteen) and  $b$ -jets. Different models with different branching fractions of the gluino or stop follow from the assumptions on the nature of the electroweakinos. No significant excess above the Standard Model predictions is observed. Limits are set on the *gluino*,  $\tilde{t}_1$ , electroweakino masses as a function of the  $\tilde{\chi}_1^0$  mass in several scenarios of gluino, stop and electroweakino pair production.

4 SIRUNYAN 21AF searched in  $140 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for supersymmetry in events with two displaced vertices from long-lived particles decaying into multijet or dijet final states. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu2RPV with  $\lambda''_{323}$  coupling, on the  $\tilde{\chi}_1^0$  mass in an RPV model with  $\tilde{\chi}_1^0$  pair production and the RPV decay  $\tilde{\chi}_1^0 \rightarrow tbs$  with  $\lambda''_{323}$  coupling and on the  $\tilde{t}$  mass in an RPV model with top squark pair production and the RPV decay  $\tilde{t} \rightarrow \bar{d}_i \bar{d}_j$  with  $\lambda''_{3ij}$  coupling, see their Figure 7.

5 SIRUNYAN 21U searched in  $132 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for supersymmetry in events with displaced tracks and displaced vertices associated with a dijet system. No significant excess above the Standard Model expectations is observed. Limits are set on long-lived gluinos in an RPC GMSB SUSY model of gluino pair production, with  $\tilde{g} \rightarrow g\tilde{G}$ , see their Figure 9, in Tglu1A in a mini-split model, see their Figure 10, and in an RPV model of gluino pair production, with  $\tilde{g} \rightarrow tbs$  with coupling  $\lambda''_{323}$ , see their Figure 11. Limits are also set on long-lived top squarks in Tstop2RPV, see their Figure 12, in an RPV model with  $\tilde{t} \rightarrow d\bar{\ell}$  and  $\lambda''_{331}$  coupling, see their Figure 13, and in a dynamical RPV model with  $\tilde{t} \rightarrow \bar{d}\bar{d}$  via a nonholomorphic RPV coupling  $\lambda''_{311}$ , see their Figure 14. The best mass limit is achieved in all cases at  $c\tau = 30$  mm.

6 SIRUNYAN 21V searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for supersymmetry in events with one charged lepton ( $e^{\pm}$  or  $\mu^{\pm}$ ) and  $\geq 7$  jets. No significant excess above the Standard Model expectations is observed. Limits are set on an RPV SUSY model like Tstop1 with the additional decay  $\tilde{\chi}_1^0 \rightarrow qq\bar{q}$  with coupling  $\lambda''_{abc}$ , with  $a, b, c \in 1, 2$ , and

on a stealth SUSY model called SYY, with one scalar particle  $S$  with even R-parity and its superpartner  $\tilde{S}$ , both singlets under all SM interactions, and with a portal mediated by loop interactions involving a new vectorlike messenger field ( $Y$ ), where pair produced top squarks decay as  $\tilde{t} \rightarrow t\tilde{g}S$ , and  $\tilde{S} \rightarrow \tilde{G}S$ , and  $S \rightarrow gg$ , see their Figure 6 and 7.

7 AAD 20M searched for long-lived particles decaying into hadrons and at least one muon in events containing a displaced muon track and a displaced vertex. The analysis uses a dataset of  $pp$  collisions at  $\sqrt{s} = 13$  TeV corresponding to an integrated luminosity of  $136 \text{ fb}^{-1}$ . Using the Tstop3RPV simplified model, top squarks with masses up to 1.7 TeV are excluded for a lifetime of 0.1 ns, and masses below 1.3 TeV are excluded for lifetimes between 0.01 ns and 30 ns, see their Fig. 7. The dependence on the RPV coupling  $\lambda''_{23k}$  multiplied by  $\cos\theta_t$ , with  $\theta_t$  the mixing angle between the left- and right-handed  $\tilde{t}$  squarks, is also shown, see their Fig. 7.

8 SIRUNYAN 19BI searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV in final states with two muons and two jets, or with one muon, two jets, and missing transverse momentum. Limits are set in a model of pair-produced, prompt or long-lived top squarks with R-parity violating decays to a  $b$ -quark and a lepton (Tstop2RPV), branching fraction of  $\tilde{t} \rightarrow b\mu$  equal to 1/3 and  $c\tau$  between 0.1 cm and 10 cm in the case of long-lived top squarks. See their Fig. 10.

9 SIRUNYAN 19BJ searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV in final states with two electrons and two jets, or with one electron, two jets, and missing transverse momentum. Limits are set in a model of pair-produced, prompt top squarks with R-parity violating decays to a  $b$ -quark and a lepton (Tstop2RPV), assuming branching fraction of  $\tilde{t} \rightarrow be$  equal to 1/3 and  $c\tau = 0$  cm. See their Fig. 10.

10 AABOUD 18BB searched in  $36.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for massive colored resonances which are pair-produced and decay into two jets. No significant deviation from the background prediction is observed. Results are interpreted in a SUSY simplified model as Tstop1RPV with  $\tilde{t} \rightarrow ds$ . Top squarks with masses in the range 100–410 GeV are excluded, see their Figure 9(a). The  $\lambda''_{312}$  coupling is assumed to be sufficiently large for the decays to be prompt, but small enough to neglect the single-top-squark resonant production through RPV couplings.

11 AABOUD 18BB searched in  $36.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for massive coloured resonances which are pair-produced and decay into two jets. No significant deviation from the background prediction is observed. Results are interpreted in Tstop1RPV. Top squarks with masses in the range 100–470 GeV or 480–610 GeV are excluded, see their Figure 9(b). The  $\lambda''_{323}$  coupling is assumed to be sufficiently large for the decays to be prompt, but small enough to neglect the single-top-squark resonant production through RPV couplings.

12 AABOUD 18P searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for pair-produced top squarks that decay through RPV  $\lambda''_{333}$  ( $i = 1, 2, 3$ ) couplings to a final state with two leptons and two jets, at least one of which is identified as a  $b$ -jet. No significant excess is observed over the SM background. In the Tstop2RPV model, lower limits on the top squark masses between 600 and 1500 GeV are set depending on the branching fraction to  $be$ ,  $b\mu$ , and  $b\tau$  final states. See their Figs 6 and 7.

13 SIRUNYAN 18AD searched in  $2.6 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for long-lived particles by exploiting the multiplicity of displaced jets to search for the presence of signal decays occurring at distances between 1 and 1000 mm. Limits are set in a model of pair-produced, long-lived top squarks with R-parity violating decays to a  $b$ -quark and a lepton, see their Figure 3.

14 SIRUNYAN 18DV searched in  $38.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for long-lived particles in events with multiple jets and two displaced vertices composed of many tracks. No events with two well-separated high-track-multiplicity vertices were observed. Limits are set on the stop and the gluino mass in RPV models of supersymmetry where the stop (gluino) is decaying solely into dijet (multijet) final states, see their Figures 6 and 7.

15 SIRUNYAN 18DY searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for the pair production of resonances, each decaying to two quarks. The search is conducted separately in a boosted (two-jet) and resolved (four-jet) jet topology. The mass spectra are found to be consistent with the Standard Model expectations. Limits are set on the stop mass in the Tstop3RPV and Tstop1RPV simplified models, see their Figure 11.

16 AABOUD 17AI searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with one or more isolated lepton, at least eight jets, either zero or many  $b$ -jets, for evidence of R-parity violating decays of the top squark. No significant excess above the Standard Model expectations is observed. Limits up to 1.25 (1.10) TeV are set on the top squark mass in R-parity-violating supersymmetry models where  $\tilde{t}_1$  decays for a bino LSP as:  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  and for a higgsino LSP as  $\tilde{t} \rightarrow t\tilde{\chi}_{1,2}^0/b\tilde{\chi}_1^{\pm}$ . These is followed by the decays through the non-zero  $\lambda''_{323}$  coupling  $\tilde{\chi}_1^{\pm} \rightarrow tbs$ ,  $\tilde{\chi}_1^{\pm} \rightarrow bbs$ . See their Figure 10 and text for details on model assumptions.

17 AAD 16AM searched in  $17.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events containing two large-radius hadronic jets. No deviation from the background prediction is observed. Top squarks with masses between 100 and 315 GeV are excluded at 95% C.L. in the hypothesis that they both decay via R-parity violating coupling  $\lambda''_{323}$  to  $b$ - and  $s$ -quarks. See their Fig. 10.

18 KHACHATRYAN 15L searched in  $19.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for pair production of heavy resonances decaying to pairs of jets in four jet events. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in R-parity-violating supersymmetry models where  $\tilde{t} \rightarrow qq$  ( $\lambda''_{312} \neq 0$ ), see Fig. 6 (top) and  $\tilde{t} \rightarrow qb$  ( $\lambda''_{323} \neq 0$ ), see Fig. 6 (bottom).

19 KHACHATRYAN 14T searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events with  $\tau$ -leptons and  $b$ -quark jets, possibly with extra light-flavour jets. No excess above the Standard Model expectations is observed. Limits are set on stop masses in RPV SUSY models with  $LQ\bar{D}$  couplings, in two simplified models. In the first model, the decay  $\tilde{t} \rightarrow \tau b$  is considered, with  $\lambda''_{333} \neq 0$ , see Fig. 3. In the second model, the decay  $\tilde{t} \rightarrow \tilde{\chi}^{\pm} b$ , with the subsequent decay  $\tilde{\chi}^{\pm} \rightarrow qq\tau^{\pm}$  is considered, with  $\lambda''_{3jk} \neq 0$  and the mass splitting between the top squark and the chargino chosen to be 100 GeV, see Fig. 4.

20 AAD 21B searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with at least eight jets and at least 5  $b$ -jets, for evidence of R-parity violating decays of the top squark. No significant excess above the Standard Model expectations is observed. Limits up to 950 GeV are set on the top squark mass in Tstop4RPV simplified model. See their Figure 7 for more detailed mass bounds.

21 KHACHATRYAN 16AC searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events with low missing transverse momentum, two oppositely charged electrons or muons, and at least five jets, at least one of which is a  $b$ -jet, for evidence of R-parity violating,

# Searches Particle Listings

## Supersymmetric Particle Searches

charging-mediated decays of the top squark. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in R-parity-violating supersymmetry models where  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm \rightarrow \ell^\pm jj, \lambda'_{ijk} \neq 0 (i, j, k \leq 2)$ , and with  $m_{\tilde{t}} - m_{\tilde{\chi}_1^\pm} = 100$  GeV, see Fig. 3.

**22 KHACHATRYAN 16BX** searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV for events containing 4 leptons coming from R-parity-violating decays of  $\tilde{\chi}_1^0 \rightarrow \ell\ell\nu$  with  $\lambda_{121} \neq 0$  or  $\lambda_{122} \neq 0$ . No excess over the expected background is observed. Limits are derived on the gluino, squark and stop masses, see Fig. 23.

**23 KHACHATRYAN 15E** searched for long-lived particles decaying to leptons in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8$  TeV. Events were selected with an electron and muon with opposite charges and each with transverse impact parameter values between 0.02 and 2 cm. Limits are set on SUSY benchmark models with pair production of top squarks decaying into an  $e\mu$  final state via RPV interactions. See their Fig. 2

### Heavy $\tilde{g}$ (Gluino) mass limit

For  $m_{\tilde{g}} > 60\text{--}70$  GeV, it is expected that gluinos would undergo a cascade decay via a number of neutralinos and/or charginos rather than undergo a direct decay to photinos as assumed by some papers. Limits obtained when direct decay is assumed are usually higher than limits when cascade decays are included.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

### R-parity conserving heavy $\tilde{g}$ (Gluino) mass limit

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT

<sup>1</sup> AAD 23AB searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for an excess of events with one photon, jets and  $\cancel{E}_T$ . No significant excess above the Standard Model predictions is observed. Limits are set on the mass of pair produced gluinos decaying to  $\tilde{g} \rightarrow q q \tilde{\chi}_1^0$  followed by  $\tilde{\chi}_1^0 \rightarrow \gamma \tilde{G}$  or  $\tilde{\chi}_1^0 \rightarrow X \tilde{G}$  with equal probability, see Figure 4.  $X$  can be  $Z$  (left figure) or  $h$  (right figure).

<sup>2</sup> AAD 23AE searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with 2  $\ell$  with same flavour and opposite sign, plus jets and  $\cancel{E}_T$ , defining signal region with the dilepton invariant mass both on- and off-shell with respect to the  $Z$  boson. No significant excess above the Standard Model predictions is observed. Limits are set on models of strong and electroweak production. In this case, limits are placed on the mass of pair-produced gluinos, assuming a scenario like in Tglu1G, see figure 16.

<sup>3</sup> AAD 23AE searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with 2  $\ell$  with same flavour and opposite sign, plus jets and  $\cancel{E}_T$ , defining signal region with the dilepton invariant mass both on- and off-shell with respect to the  $Z$  boson. No significant excess above the Standard Model predictions is observed. Limits are set on models of strong and electroweak production. In this case, limits are placed on the gluino mass assuming gluino pair production, assuming a scenario like in Tglu1H, see figure 16.

<sup>4</sup> AAD 23AL searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with 0 or 1 lepton and at least three  $b$ -tagged jets. No significant excess above the Standard Model prediction is observed. Results are interpreted in terms of gluino pair production followed by the decay of gluinos into off-shell third generation squarks, yielding final states with top and bottom quarks, and missing transverse momentum from a  $\tilde{\chi}_1^0$  LSP. Limits are set on the mass of the gluino as a function of the  $\tilde{\chi}_1^0$  assuming  $B(\tilde{g} \rightarrow \tilde{t} t) = 100\%$  or  $B(\tilde{g} \rightarrow \tilde{b} b) = 100\%$ , see figure 10.

<sup>5</sup> AAD 23AL searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with 0 or 1 lepton and at least three  $b$ -tagged jets. No significant excess above the Standard Model prediction is observed. Results are interpreted in terms of gluino pair production followed by the decay of gluinos into off-shell third generation squarks, yielding final states with top and bottom quarks, and missing transverse momentum from a  $\tilde{\chi}_1^0$  LSP. Limits are set on the mass of the gluino as a function of  $m_{\tilde{\chi}_1^0}$ , assuming  $B(\tilde{g} \rightarrow \tilde{t} t) + B(\tilde{g} \rightarrow \tilde{b} b) + B(\tilde{g} \rightarrow t b \tilde{\chi}_1^\pm) = 100\%$ , and  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 2 \text{ GeV}$ , see figures 11-13.

# Searches Particle Listings

## Supersymmetric Particle Searches

- 6** HAYRAPETYAN 23E searched in 137 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for evidence of gluino, top squark and electroweakino pair production in events with at least one photon, multiple jets, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set in models for strong production, Tglu4D, Tglu4E, Tglu4F and Tstop13, see their figure 9. They also interpret the results in the models for electroweak production, shown in their figure 10. Tchi1n1A assumes wino-like  $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$  production, while Tchi1chi1A assumes higgsino-like cross sections and includes  $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm$ ,  $\tilde{\chi}_1^0 \tilde{\chi}_2^0$  and  $\tilde{\chi}_{1,2}^0 \tilde{\chi}_1^\pm$  production. For  $\tilde{\chi}_1^0 \tilde{\chi}_2^0$  alone no mass point can be excluded in the model Tchi1chi1A, but in another model for  $\tilde{\chi}_1^0 \tilde{\chi}_2^0$  production, Tn1n2A.
- 7** TUMASYAN 23AY searched in 138 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for evidence of gluino pair production in events with a single electron or muon and multiple hadronic jets. No significant excess above the Standard Model expectations is observed. Limits are set in the models Tglu3A and Tglu1B, see their figure 11. For Tglu1B, the chargino mass is set to  $m_{\tilde{\chi}_1^\pm} = 0.5 (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})$ .
- 8** AAD 22U searched for the signature of disappearing track from a long-lived chargino in 139 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV. Long-lived charginos decay into quasi-degenerate neutralino emitting a low-momentum particle whose identification is not attempted. The signal is identified by requiring short tracklets in the four pixel layers with no continuation in the SCT (strip) detector. The main background from fake tracklets is estimated directly with the data. No significant excess above the background prediction is found. The results are interpreted in an AMSB scenario (win LSP), on  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}^\pm$  and  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}_1^0$ , assuming  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm) = 100\%$ , see their figure 7. Results are also interpreted in a higgsino-LSP model, with  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}^\mp$ , and  $pp \rightarrow \tilde{\chi}^\pm \tilde{\chi}_{1,2}^0$ , assuming  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm) = 95.5\%$ ,  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 e^\pm) = 3\%$ ,  $B(\tilde{\chi}^\pm \rightarrow \tilde{\chi}_1^0 \mu^\pm) = 1.5\%$ , see their figure 8. Finally, results are interpreted in a simplified model of gluino pair production, with  $pp \rightarrow \tilde{g} \tilde{g}$  and  $B(\tilde{g} \rightarrow qq\tilde{\chi}_1^0) = B(\tilde{g} \rightarrow qq\tilde{\chi}^\pm) = B(\tilde{g} \rightarrow qq\tilde{\chi}^\mp) = 1/3$ , see their figure 9.
- 9** TUMASYAN 22v searched in 137 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for evidence of electroweakino pair production with decay to two Higgs bosons  $H$ , with  $H \rightarrow b\bar{b}$ , resulting either in 4 resolved  $b$ -jets or two large-radius jets, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$  in the models Tn1n1A, see their Figures 11 and 12, or in a model where higgsino-like nearly mass degenerate  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$  are pair produced and each decay to  $H$  and a bino-like  $\tilde{\chi}_1^0$ , see their Figure 13. Limits are also set on the gluino mass in the model Tglu1I, see their Figure 14.
- 10** AAD 21AK searched in 139 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for pair production of gluinos and squarks in events with a single isolated electron or muon, originating from the decay of a  $W$  boson, multiple jets and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1B simplified model and on the squark mass in the Tsqk3 simplified model, see their Figure 8.
- 11** AAD 21L searched in 139 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for pair production of gluinos and squarks in events with jets, large missing transverse momentum but no electrons or muons. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A and Tglu1B simplified models, on the squark mass in the Tsqk1 and Tsqk3 simplified models and in a simplified model for gluino-squark production, see their Figures 13-17.
- 12** AAD 21x searched in 139 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for the decay of long-lived  $R$ -hadrons stopped by the calorimeter, producing high-momentum jets resulting in large out-of-time energy deposits in the calorimeters. These decays are detected using data collected during periods in the LHC bunch structure when collisions are absent. No significant excess above the predicted background is observed. Limits are set on the  $R$ -hadron mass in the Tglu1A simplified model as a function of the  $R$ -hadron lifetime, for different  $m_{\tilde{\chi}_1^0}$ . See Figures 9, 10.
- 13** SIRUNYAN 21AD searched in 137 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for supersymmetry in events with multiple jets, no leptons, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass in the simplified models Tstop1, Tstop2 with  $m_{\tilde{\chi}_1^\pm} = (m_T + m_{\tilde{\chi}_1^0})/2$ , and a 50:50 mixture of these with  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5$  GeV, see their Figure 8. Limits are also set on the top squark mass for  $10 \text{ GeV} < m_{\tilde{t}} - m_{\tilde{\chi}_1^0} < 80 \text{ GeV}$  in the simplified models Tstop2, Tstop 3, and Tstop4, see their Figure 9. For indirect top squark production, limits are set on the gluino mass in the simplified models Tglu3A, Tglu3C with  $m_{\tilde{t}} - m_{\tilde{\chi}_1^0} = 20 \text{ GeV}$ , and Tglu3D with  $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$ , see their Figure 10.
- 14** SIRUNYAN 21M searched in 137 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the  $\tilde{\chi}_2^0$  and  $\tilde{\chi}_3^0$  mass in Tchi1n2Fa, see their Figure 11, on the  $\tilde{\chi}_1^0$  mass in Tn1n1C and Tn1n1B for  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_3^0} = m_{\tilde{\chi}_1^0}$ , see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tstop3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.
- 15** AAD 20AL searched in 139 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with 8 or more jets and moderate missing transverse momentum. The selection makes requirements according to the number of  $b$ -tagged jets and the scalar sum of masses of large-radius jets. No significant excess above the Standard Model expectations is observed. Limits up to about 2 TeV are set on the gluino mass in Tglu1E simplified model. Limits up to about 1.8 TeV are set on the gluino mass in Tglu3A simplified model. See their Fig. 10(a).
- 16** AAD 20v searched in 139 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV in final states with same-sign charged leptons (electrons or muons) and jets. No significant excess over the Standard Model expectation is observed. In the Tglu1E model, considering off-shell intermediate  $W$  and  $Z$  bosons in the decay chains, gluino masses are excluded at 95% C.L. up to 1600 GeV for neutralino masses of 100 GeV or above (up to 1000 GeV). See their Fig. 7(a).
- 17** SIRUNYAN 20b searched in 35.9 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with at least one photon and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on chargino masses in a general gauge-mediated SUSY breaking (GGM) scenario Tchi1n12-GGM, see Figure 4. Limits are also set on the NLSP mass in the Tchi1chi1F and Tchi1chi1G simplified models, see their Figure 5. Finally, limits are set on the gluino mass in the Tglu4A simplified model, see Figure 6.
- 18** SIRUNYAN 20Bj searched in 137 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events containing two hadronically decaying, highly energetic  $Z$  bosons and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1H simplified model, see their Figure 9.
- 19** SIRUNYAN 20E searched in 137 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with a single electron or muon and multiple jets, including at least one identified as originating from a  $b$ -quark, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A simplified model, see their Fig. 10, and the Tglu3C simplified model, see their Fig. 11.
- 20** SIRUNYAN 20t searched in 137 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with at least two jets, and two isolated same-sign or three or more charged leptons (electrons or muons). No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figure 7, and in the Tglu1C and Tglu1B simplified models, see their Figures 8 and 9. Limits are also set on the sbottom mass in the Tstop2 simplified model, see their Figure 10, and on the stop mass in the Tstop7 simplified model, see their Figure 11. Finally, limits are set on the gluino mass in RPV simplified models where the gluino decays either via  $\tilde{g} \rightarrow qq\tilde{q}\tilde{q} + e/\mu/\tau$  or via  $\tilde{g} \rightarrow tbs$ , see Figure 12.
- 21** AABOU 19i searched in 36.1 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV in final states with hadronic jets, 1 or two hadronically decaying  $\tau$  and  $\cancel{E}_T$ . In Tglu1F, gluino masses are excluded at 95% C.L. up to 2000 GeV for neutralino masses of 100 GeV or below. Neutralino masses up to 1000 GeV are excluded for all gluino masses below 1400 GeV. See their Fig. 9. Limits are also presented in the context of Gauge-Mediated Symmetry Breaking models: in this case, values of  $A$  below 110 TeV are excluded at the 95% CL for all values of  $\tan\beta$  in the range  $2 < \tan\beta < 60$ , see their Fig. 10.
- 22** SIRUNYAN 19AG searched in 35.9 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with two photons and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4B simplified model and on the squark mass in the Tsqk4B simplified model, see their Figure 13.
- 23** SIRUNYAN 19AU searched in 35.9 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with at least one photon, jets, some of which are identified as originating from  $b$ -quarks, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the gluino mass in the Tglu4C, Tglu4D and Tglu4E simplified models, and on the top squark mass in the Tstop13 simplified model, see their Figure 5.
- 24** SIRUNYAN 19CE searched in 35.9 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for new particles decaying to a photon and two gluons in events with at least three large-radius jets of which two have substructure and are composed of a photon and two gluons. No statistically significant excess is observed above the SM background expectation. Upper limits at 95% confidence level on the cross section for gluino pair production are set, using a simplified Tglu1A-like stealth SUSY model. Gluino masses up to 1500-1700 GeV are excluded, depending on the neutralino mass, with the highest exclusion set for  $m_{\tilde{\chi}_1^0} = 200$  GeV. See their Fig. 4.
- 25** SIRUNYAN 19CH searched in 137 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events containing multiple jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A and Tglu3A simplified models, see their Figure 13. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tstop1, Tstop1 simplified models, see their Figure 14.
- 26** SIRUNYAN 19k searched in 35.9 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with a photon, an electron or muon, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tchi1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.
- 27** SIRUNYAN 19s searched in 35.9 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with zero or one charged leptons, jets and  $\cancel{E}_T$ . The razor variables ( $M_R$  and  $R^2$ ) are used to categorize the events. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu3C simplified models, see Figures 22 and 23, and on the stop mass in the Tstop1 simplified model, see their Figure 24.
- 28** AABOU 18AR searched in 36.1 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for gluino pair production in events containing large missing transverse momentum and several energetic jets, at least three of which must be identified as originating from  $b$ -quarks. No excess is found above the predicted background. In Tglu3A models, gluino masses of less than 1.97 TeV are excluded for  $m_{\tilde{\chi}_1^0}$  below 300 GeV, see their Fig. 10(a). Interpretations are also provided for scenarios where Tglu3A modes mix with Tglu2A and Tglu3D, see their Fig. 11.
- 29** AABOU 18AR searched in 36.1 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for gluino pair production in events containing large missing transverse momentum and several energetic jets, at least three of which must be identified as originating from  $b$ -quarks. No excess is found above the predicted background. In Tglu2A models, gluino masses of less than 1.92 TeV are excluded for  $m_{\tilde{\chi}_1^0}$  below 600 GeV, see their Fig. 10(b). Interpretations are also provided for scenarios where Tglu2A modes mix with Tglu3A and Tglu3D, see their Fig. 11.
- 30** AABOU 18AS searched for in 36.1 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for gluino pair production in the context of AMSB or phenomenological MSSM scenarios with wino-like LSP and long-lived charginos. Events with a disappearing track due to a low-momentum pion accompanied by at least four jets are considered. No significant excess above the Standard Model expectations is observed. Exclusion limits are set at 95% confidence level on the mass of gluinos for different chargino lifetimes. Gluino masses up to 1.65 TeV are excluded assuming a chargino mass of 460 GeV and lifetime of 0.2 ns, corresponding to a mass-splitting between the charged and neutral wino of around 160 MeV. See their Fig. 9.
- 31** AABOU 18Bj searched in 36.1 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 13$  TeV in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1G model: gluino masses below 1850 GeV are excluded for  $m_{\tilde{\chi}_1^0} = 100$  GeV, see their Fig. 12(a).

- <sup>32</sup> AABOUD 18BJ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1H model: gluino masses below 1650 GeV are excluded for  $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$ , see their Fig. 13(a).
- <sup>33</sup> AABOUD 18U searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results for the di-photon channel are interpreted in terms of lower limits on the masses of gluinos in GGM higgsino-bino models (mix of Tglu4B and Tglu4C), which reach as high as 2050 GeV. Gluino masses below 1600 GeV are excluded for any NLSP mass provided that  $m_{\tilde{g}} - m_{\tilde{\chi}_1^0} > 50 \text{ GeV}$ . See their Fig. 11.
- <sup>34</sup> AABOUD 18U searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results of the  $\gamma + \text{jets} + \cancel{E}_T$  channel are interpreted in terms of lower limits on the masses of gluinos in GGM higgsino-bino models (mix of Tglu4B and Tglu4C), which reach as high as 2050 GeV. Gluino masses below 1600 GeV are excluded for any NLSP mass provided that  $m_{\tilde{g}} - m_{\tilde{\chi}_1^0} > 50 \text{ GeV}$ . See their Fig. 11.
- <sup>35</sup> AABOUD 18V searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1A model: gluino masses below 2030 GeV are excluded for massless LSP, see their Fig. 13(b).
- <sup>36</sup> AABOUD 18V searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1B model. Assuming that  $m_{\tilde{\chi}_1^\pm} = 0.5 (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})$ , gluino masses below 1980 GeV are excluded for massless LSP, see their Fig. 14(c). Exclusions are also shown assuming  $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$ , see their Fig. 14(d).
- <sup>37</sup> AABOUD 18V searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1E model: gluino masses below 1750 GeV are excluded for  $m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$  and any  $m_{\tilde{\chi}_2^0}$  above 100 GeV, see their Fig. 15. Gluino mass exclusion up to 2 TeV is found for  $m_{\tilde{\chi}_2^0} = 1 \text{ TeV}$ .
- <sup>38</sup> SIRUNYAN 18AA searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one photon and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking (GGM) scenario with bino-like  $\tilde{\chi}_1^0$  and wino-like  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^0$ , see Figure 7. Limits are also set on the NLSP mass in the Tchl1n1A and Tchl1ch1A simplified models, see their Figure 8. Finally, limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, see their Figure 9, and on the squark mass in the Tsq4kA and Tsq4kB simplified models, see their Figure 10.
- <sup>39</sup> SIRUNYAN 18AC searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with a single electron or muon and multiple jets. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1B simplified models, see their Figure 5.
- <sup>40</sup> SIRUNYAN 18AL searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least three charged leptons, in any combination of electrons and muons, jets and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, see their Figure 5. Limits are also set on the sbottom mass in the Tsb02 simplified model, see their Figure 6, and on the stop mass in the Tstop7 simplified model, see their Figure 7.
- <sup>41</sup> SIRUNYAN 18AR searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tchl1n2F simplified models, see their Figure 8, and on the higgsino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tsb03 simplified model, see their Figure 10.
- <sup>42</sup> SIRUNYAN 18AY searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing one or more jets and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb01, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range  $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$ , see their Figure 4.
- <sup>43</sup> SIRUNYAN 18D searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing identified hadronically decaying top quarks, no leptons, and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see their Figure 8, and on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3E simplified models, see their Figure 9.
- <sup>44</sup> SIRUNYAN 18M searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more high-momentum Higgs bosons, decaying to pairs of  $b$ -quarks, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1I and Tglu1J simplified models, see their Figure 3.
- <sup>45</sup> AABOUD 17AJ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.75 TeV are set on the gluino mass in Tglu3A simplified models in case of off-shell top squarks and for  $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$ . See their Figure 4(a).
- <sup>46</sup> AABOUD 17AJ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.57 TeV are set on the gluino mass in Tglu1E simplified models (2-step models) for  $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$ . See their Figure 4(b).
- <sup>47</sup> AABOUD 17AJ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.86 TeV are set on the gluino mass in Tglu1G simplified models for  $m_{\tilde{\chi}_1^0} = 200 \text{ GeV}$ . See their Figure 4(c).
- <sup>48</sup> AABOUD 17AR searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one isolated lepton, at least two jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 2.1 TeV are set on the gluino mass in Tglu1B simplified models, with  $x = (m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}) / (m_{\tilde{g}} - m_{\tilde{\chi}_1^0}) = 1/2$ . Similar limits are obtained for variable  $x$  and fixed neutralino mass,  $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$ . See their Figure 13.
- <sup>49</sup> AABOUD 17AR searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one isolated lepton, at least two jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.74 TeV are set on the gluino mass in Tglu1E simplified model. Limits up to 1.7 TeV are also set on pMSSM models leading to similar signal event topologies. See their Figure 13.
- <sup>50</sup> AABOUD 17AY searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.8 TeV are set on the gluino mass in Tglu3A simplified models assuming  $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$ . See their Figure 13.
- <sup>51</sup> AABOUD 17AZ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large  $R$ -jets or  $b$ -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits up to 1.8 TeV are set on the gluino mass in Tglu1E simplified models. See their Figure 6b.
- <sup>52</sup> AABOUD 17AZ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large  $R$ -jets or  $b$ -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits up to 1.54 TeV are set on the gluino mass in Tglu3A simplified models. See their Figure 7a.
- <sup>53</sup> AABOUD 17N searched in  $14.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in final states with 2 same-flavor, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. In Tglu1J models, gluino masses are excluded at 95% C.L. up to 1300 GeV for  $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$  and  $m_{\tilde{\chi}_2^0} = 1100 \text{ GeV}$ . See their Fig. 12 for exclusion limits as a function of  $m_{\tilde{\chi}_2^0}$ . Limits are also presented assuming  $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^0} + 100 \text{ GeV}$ , see their Fig. 13.
- <sup>54</sup> AABOUD 17N searched in  $14.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in final states with 2 same-flavor, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. In Tglu1H models, gluino masses are excluded at 95% C.L. up to 1310 GeV for  $m_{\tilde{\chi}_1^0} < 400 \text{ GeV}$  and assuming  $m_{\tilde{\chi}_2^0} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$ . See their Fig. 15.
- <sup>55</sup> AABOUD 17N searched in  $14.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in final states with 2 same-flavor, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. In Tglu1G models, gluino masses are excluded at 95% C.L. up to 1700 GeV for small  $m_{\tilde{\chi}_1^0}$ . The results probe kinematic endpoints as small as  $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = (m_{\tilde{g}} - m_{\tilde{\chi}_1^0})/2 = 50 \text{ GeV}$ . See their Fig. 14.
- <sup>56</sup> KHACHATRYAN 17 searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing four or more jets, no more than one lepton, and missing transverse momentum, using the razor variables ( $M_R$  and  $R^2$ ) to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see Figs. 16 and 17. Also, assuming gluinos decay only via three-body processes involving third-generation quarks plus a neutralino/chargino, and assuming  $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0} + 5 \text{ GeV}$ , a branching ratio-independent limit on the gluino mass is given, see Fig. 16.
- <sup>57</sup> KHACHATRYAN 17AD searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing at least four jets (including  $b$ -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Gluino masses up to 1550 GeV and neutralino masses up to 900 GeV are excluded at 95% C.L. See Fig. 13.
- <sup>58</sup> KHACHATRYAN 17AD searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing at least four jets (including  $b$ -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Gluino masses up to 1450 GeV and neutralino masses up to 820 GeV are excluded at 95% C.L. See Fig. 13.
- <sup>59</sup> KHACHATRYAN 17AS searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with a single electron or muon and multiple jets. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1B simplified models, see their Fig. 7.
- <sup>60</sup> KHACHATRYAN 17AW searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least three charged leptons, in any combination of electrons and muons, and significant  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, and on the sbottom mass in the Tsb02 simplified model, see their Figure 4.
- <sup>61</sup> KHACHATRYAN 17P searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tsqk1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb01 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- <sup>62</sup> KHACHATRYAN 17V searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two photons and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino and squark mass in the context of general gauge mediation models Tglu4B and Tsqk4, see their Fig. 4.
- <sup>63</sup> SIRUNYAN 17AF searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with a single lepton (electron or muon), jets, including at least one jet originating from a  $b$ -quark, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu3B simplified models, see their Figure 2.
- <sup>64</sup> SIRUNYAN 17AY searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one photon, jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4A and Tglu4B

## Supersymmetric Particle Searches

- simplified models, and on the squark mass in the Tskq4A and Tskq4B simplified models, see their Figure 6.
- 65 SIRUNYAN 17AZ searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tskq1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb01 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- 66 SIRUNYAN 17P searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with multiple jets and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, Tglu3A and Tglu3D simplified models, see their Fig. 12. Limits are also set on the squark mass in the Tskq1 simplified model, on the stop mass in the Tstop1 simplified model, and on the sbottom mass in the Tsb01 simplified model, see Fig. 13.
- 67 SIRUNYAN 17S searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two isolated same-sign leptons, jets, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the gluino mass in the Tglu3A, Tglu3B, Tglu3C, Tglu3D and Tglu1B simplified models, see their Figures 5 and 6, and on the sbottom mass in the Tsb02 simplified model, see their Figure 6.
- 68 AABOUD 16AC searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in final states with hadronic jets, 1 or two hadronically decaying  $\tau$  and  $\cancel{E}_T$ . In Tglu1F, gluino masses are excluded at 95% C.L. up to 1570 GeV for neutralino masses of 100 GeV or below. Neutralino masses up to 700 GeV are excluded for all gluino masses between 800 GeV and 1500 GeV, while the strongest neutralino-mass exclusion of 750 GeV is achieved for gluino masses around 1400 GeV. See their Fig. 8. Limits are also presented in the context of Gauge-Mediated Symmetry Breaking models: in this case, values of  $A$  below 92 TeV are excluded at the 95% C.L. corresponding to gluino masses below 2000 GeV. See their Fig. 9.
- 69 AABOUD 16J searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in final states with one isolated electron or muon, hadronic jets, and  $\cancel{E}_T$ . Gluino-mediated pair production of stops with a nearly mass-degenerate stop and neutralino are targeted and gluino masses are excluded at 95% C.L. up to 1460 GeV. A 100% of stops decaying via  $\chi_{\tilde{t}_1}^{\pm}$  + neutralino is assumed. The results are also valid in case of 4-body decays  $\tilde{t}_1 \rightarrow f f' b \tilde{\chi}_{\tilde{t}_1}^0$ . See their Fig. 8.
- 70 AABOUD 16M searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two photons, hadronic jets and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for bino-like NLSP. See their Fig. 3.
- 71 AABOUD 16N searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing hadronic jets, large  $\cancel{E}_T$ , and no electrons or muons. No significant excess above the Standard Model expectations is observed. Gluino masses below 1510 GeV are excluded at the 95% C.L. in a simplified model with only gluinos and the lightest neutralino. See their Fig. 7b.
- 72 AABOUD 16N searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing hadronic jets, large  $\cancel{E}_T$ , and no electrons or muons. No significant excess above the Standard Model expectations is observed. Gluino masses below 1500 GeV are excluded at the 95% C.L. in a simplified model with gluinos decaying via an intermediate  $\tilde{\chi}_{\tilde{t}_1}^{\pm}$  to two quarks, a  $W$  boson and a  $\tilde{\chi}_{\tilde{t}_1}^0$  for  $m_{\tilde{\chi}_{\tilde{t}_1}^0} = 200 \text{ GeV}$ . See their Fig. 8.
- 73 AAD 16AD searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing several energetic jets, of which at least three must be identified as  $b$ -jets, large  $\cancel{E}_T$  and no electrons or muons. No significant excess above the Standard Model expectations is observed. For  $\tilde{\chi}_{\tilde{t}_1}^0$  below 800 GeV, gluino masses below 1780 GeV are excluded at 95% C.L. for gluinos decaying via bottom squarks. See their Fig. 7a.
- 74 AAD 16AD searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events containing several energetic jets, of which at least three must be identified as  $b$ -jets, large  $\cancel{E}_T$  and one electron or muon. Large-radius jets with a high mass are also used to identify highly boosted top quarks. No significant excess above the Standard Model expectations is observed. For  $\tilde{\chi}_{\tilde{t}_1}^0$  below 700 GeV, gluino masses below 1760 GeV are excluded at 95% C.L. for gluinos decaying via top squarks. See their Fig. 7b.
- 75 AAD 16BB searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with exactly two same-sign leptons or at least three leptons, multiple hadronic jets,  $b$ -jets, and  $\cancel{E}_T$ . No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. are set on the gluino mass in various simplified models (Tglu1D, Tglu1E, Tglu3A). See their Figs. 4.a, 4.b, and 4.d.
- 76 AAD 16BG searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in final states with one isolated electron or muon, hadronic jets, and  $\cancel{E}_T$ . The data agree with the SM background expectation in the six signal selections defined in the search, and the largest deviation is a 2.1 standard deviation excess. Gluinos are excluded at 95% C.L. up to 1600 GeV assuming they decay via the lightest chargino to the lightest neutralino as in the model Tglu1B for  $m_{\tilde{\chi}_{\tilde{t}_1}^0} = 100 \text{ GeV}$ , assuming  $m_{\tilde{\chi}_{\tilde{t}_1}^{\pm}} = (m_{\tilde{g}} + m_{\tilde{\chi}_{\tilde{t}_1}^0})/2$ . See their Fig. 6.
- 77 AAD 16V searched in  $3.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with  $\cancel{E}_T$  various hadronic jet multiplicities from  $\geq 7$  to  $\geq 10$  and with various  $b$ -jet multiplicity requirements. No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. are set on the gluino mass in one simplified model (Tglu1E) and a pMSSM-inspired model. See their Fig. 5.
- 78 KHACHATRYAN 16AM searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with highly boosted  $W$ -bosons and  $b$ -jets, using the razor variables ( $M_R$  and  $R^2$ ) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3C and Tglu3B simplified models, see Fig. 12.
- 79 KHACHATRYAN 16BJ searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the following simplified models: Tglu3A and Tglu3D, see Fig. 4, Tglu3B and Tglu3C, see Fig. 5, and Tglu1B, see Fig. 7.
- 80 KHACHATRYAN 16BS searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least one energetic jet, no isolated leptons, and significant  $\cancel{E}_T$ , using the transverse mass variable  $M_{T2}$  to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see Fig. 10 and Table 3.
- 81 KHACHATRYAN 16BY searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two opposite-sign, same-flavour leptons, jets, and missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see Fig. 4, and on sbottom masses in the Tsb03 simplified model, see Fig. 5.
- 82 KHACHATRYAN 16V searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least four energetic jets and significant  $\cancel{E}_T$ , no identified isolated electron or muon or charged track. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, and Tglu3A simplified models, see Fig. 8.
- 83 AAD 15BG searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with jets, missing  $E_T$ , and two opposite-sign same flavour isolated leptons featuring either a kinematic edge, or a peak at the  $Z$ -boson mass, in the invariant mass spectrum. No evidence for a statistically significant excess over the expected SM backgrounds are observed and 95% C.L. exclusion limits are derived in a GGM simplified model of gluino pair production where the gluino decays into quarks, a  $Z$ -boson, and a massless gravitino LSP, see Fig. 12. Also, limits are set in simplified models with slepton/sneutrino intermediate states, see Fig. 13.
- 84 AAD 15BV summarized and extended ATLAS searches for gluinos and first- and second-generation squarks in final states containing jets and missing transverse momentum, with or without leptons or  $b$ -jets in the  $\sqrt{s} = 8 \text{ TeV}$  data set collected in 2012. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the gluino mass in several R-parity conserving models, leading to a generalized constraint on gluino masses exceeding 1150 GeV for lightest supersymmetric particle masses below 100 GeV. See their Figs. 10, 19, 20, 21, 23, 25, 26, 29-37.
- 85 AAD 15BX interpreted the results of a wide range of ATLAS direct searches for supersymmetry, during the first run of the LHC using the  $\sqrt{s} = 7 \text{ TeV}$  and  $\sqrt{s} = 8 \text{ TeV}$  data set collected in 2012, within the wider framework of the phenomenological mSUSY (pMSSM). The integrated luminosity was up to  $20.3 \text{ fb}^{-1}$ . From an initial random sampling of 500 million pMSSM points, generated from the 19-parameter pMSSM, a total of 310,327 model points with  $\tilde{\chi}_{\tilde{t}_1}^0$  LSP were selected each of which satisfies constraints from previous collider searches, precision measurements, cold dark matter energy density measurements and direct dark matter searches. The impact of the ATLAS Run 1 searches on this space was presented, considering the fraction of model points surviving, after projection into two-dimensional spaces of sparticle masses. Good complementarity is observed between different ATLAS analyses, with almost all showing regions of unique sensitivity. ATLAS searches have good sensitivity at LSP mass below 800 GeV.
- 86 AAD 15CA searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with one or more photons, hadronic jets or  $b$ -jets and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for bino-like or higgsino-bino admixtures NLSP, see Fig. 8, 10, 11.
- 87 KHACHATRYAN 15AF searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the transverse mass variable  $M_{T2}$  to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_{\tilde{t}_1}^0$  takes place with a branching ratio of 100%, see Fig. 13(a), or where the decay  $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_{\tilde{t}_1}^0$  takes place with a branching ratio of 100%, see Fig. 13(b), or where the decay  $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_{\tilde{t}_1}^0$  takes place with a branching ratio of 100%, see Fig. 13(c). See also Table 5. Exclusions in the CMSSM, assuming  $\tan\beta = 30$ ,  $A_0 = -2 \max(m_0, m_{1/2})$  and  $\mu > 0$ , are also presented, see Fig. 15.
- 88 KHACHATRYAN 15I searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events in which  $b$ -jets and four  $W$ -bosons are produced. Five individual search channels are combined (fully hadronic, single lepton, same-sign dilepton, opposite-sign dilepton, multilepton). No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a simplified model where the decay  $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_{\tilde{t}_1}^0$  takes place with a branching ratio of 100%, see Fig. 5. Also a simplified model with gluinos decaying into on-shell top squarks is considered, see Fig. 6.
- 89 KHACHATRYAN 15X searched in  $19.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least two energetic jets, at least one of which is required to originate from a  $b$  quark, and significant  $\cancel{E}_T$ , using the razor variables ( $M_R$  and  $R^2$ ) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay  $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_{\tilde{t}_1}^0$  and the decay  $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_{\tilde{t}_1}^0$  take place with branching ratios varying between 0, 50 and 100%, see Figs. 13 and 14.
- 90 AAD 14AE searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for strongly produced supersymmetric particles in events containing jets and large missing transverse momentum, and no electrons or muons. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5, 6 and 7. Limits are also derived in the mSUGRA/CMSSM with parameters  $\tan\beta = 30$ ,  $A_0 = -2 m_0$  and  $\mu > 0$ , see their Fig. 8.
- 91 AAD 14AG searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing one hadronically decaying  $\tau$ -lepton, zero or one additional light leptons (electrons or muons), jets and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set in several SUSY scenarios. For an interpretation in the minimal GMSB model, see their Fig. 8. For an interpretation in the mSUGRA/CMSSM with parameters  $\tan\beta = 30$ ,  $A_0 = -2 m_0$  and  $\mu > 0$ , see their Fig. 9. For an interpretation in the framework of natural Gauge Mediation, see Fig. 10. For an interpretation in the bRPV scenario, see their Fig. 11.
- 92 AAD 14X searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a general gauge-mediation model (GGM) where the decay  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_{\tilde{t}_1}^0$ , with  $\tilde{\chi}_{\tilde{t}_1}^0 \rightarrow \ell^{\pm}\ell^{\mp}\tilde{G}$ , takes place with a branching ratio of 100%, for two choices of  $\tan\beta = 1.5$  and 30, see Fig. 11. Also some constraints on the higgsino mass parameter  $\mu$  are discussed.
- 93 KHACHATRYAN 14AH searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the razor variables ( $M_R$  and  $R^2$ ) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_{\tilde{t}_1}^0$  takes place with a branching ratio of 100%, see Fig. 28. Exclusions in the CMSSM, assuming  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , are also presented, see Fig. 26.

- <sup>94</sup> CHATRCHYAN 14AH searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the razor variables ( $M_R$  and  $R^2$ ) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a  $b$ -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay  $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , are also presented, see Fig. 26.
- <sup>95</sup> CHATRCHYAN 14AH searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with at least two energetic jets and significant  $\cancel{E}_T$ , using the razor variables ( $M_R$  and  $R^2$ ) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a  $b$ -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay  $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming  $\tan\beta = 10$ ,  $A_0 = 0$  and  $\mu > 0$ , are also presented, see Fig. 26.
- <sup>96</sup> CHATRCHYAN 14I searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing multijets and large  $\cancel{E}_T$ . No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos that decay via  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$  with a 100% branching ratio, see Fig. 7b, or via  $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$  with a 100% branching ratio, see Fig. 7c, or via  $\tilde{g} \rightarrow q\bar{q}W/Z\tilde{\chi}_1^0$ , see Fig. 7d.
- <sup>97</sup> CHATRCHYAN 14N searched in  $19.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing a single isolated electron or muon and multiple jets, at least two of which are identified as originating from a  $b$ -quark. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in three simplified models of gluino pair production with subsequent decay into virtual or on-shell top squarks, where each of the top squarks decays in turn into a top quark and a  $\tilde{\chi}_1^0$ , see Fig. 4. The models differ in which masses are allowed to vary.
- <sup>98</sup> CHATRCHYAN 14R searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a slepton co-NLSP simplified model (GMSB) where the decay  $\tilde{g} \rightarrow q\ell^\pm\ell^\mp\tilde{G}$  takes place with a branching ratio of 100%, see Fig. 8.
- <sup>99</sup> CHATRCHYAN 14R searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a simplified model where the decay  $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, see Fig. 11.
- <sup>100</sup> AABOUD 18BJ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1H model in case of  $m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$ : for any  $m_{\tilde{\chi}_2^0}$ , gluino masses below 1500 GeV are excluded, see their Fig. 14(a).
- <sup>101</sup> AABOUD 18v searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in a Tglu1C-like model, assuming 50% BR for each gluino decay mode. Gluino masses below 1770 GeV are excluded for any  $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$  and  $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$ , see their Fig. 16(b).
- <sup>102</sup> AABOUD 17AZ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large R-jets or  $b$ -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits are set for pMSSM models with  $M_1 = 60 \text{ GeV}$ ,  $\tan(\beta) = 10$ ,  $\mu < 0$  varying the soft-breaking parameters  $M_3$  and  $\mu$ . Gluino masses up to 1600 GeV are excluded for  $m_{\tilde{\chi}_1^\pm} = 200 \text{ GeV}$ . See their Figure 6a and text for details on the model.
- <sup>103</sup> KHACHATRYAN 16AY searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one isolated high transverse momentum lepton ( $e$  or  $\mu$ ), hadronic jets of which at least one is identified as coming from a  $b$ -quark, and large  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A simplified model, see Fig. 10, and in the Tglu3B model, see Fig. 11.
- <sup>104</sup> KHACHATRYAN 16BT performed a global Bayesian analysis of a wide range of CMS results obtained with data samples corresponding to  $5.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  and in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . The set of searches considered, both individually and in combination, includes those with all-hadronic final states, same-sign and opposite-sign dileptons, and multi-lepton final states. An interpretation was given in a scan of the 19-parameter pMSSM. No scan points with a gluino mass less than 500 GeV survived and 98% of models with a squark mass less than 300 GeV were excluded.
- <sup>105</sup> AAD 15AB searched for the decay of neutral, weakly interacting, long-lived particles in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . Signal events require at least two reconstructed vertices possibly originating from long-lived particles decaying to jets in the inner tracking detector and muon spectrometer. No significant excess of events over the expected background was found. Results were interpreted in Stealth SUSY benchmark models where a pair of gluinos decay to long-lived singlinos,  $\tilde{S}$ , which in turn each decay to a low-mass gravitino and a pair of jets. The 95% confidence-level limits are set on the cross section  $\times$  branching ratio for the decay  $\tilde{g} \rightarrow \tilde{S}g$ , as a function of the singlino proper lifetime ( $c\tau$ ). See their Fig. 10(f).
- <sup>106</sup> AAD 15AI searched in  $20 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing at least one isolated lepton (electron or muon), jets, and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the gluino mass in the CMSSM/mSUGRA, see Fig. 15, in the NUHMG, see Fig. 16, and in various simplified models, see Figs. 18–22.
- <sup>107</sup> AAD 15CB searched for events containing at least one long-lived particle that decays at a significant distance from its production point (displaced vertex, DV) into two leptons or into five or more charged particles in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . The dilepton signature is characterised by DV formed from at least two lepton candidates. Four different final states were considered for the multitrack signature, in which the DV must be accompanied by a high-transverse momentum muon or electron candidate that originates from the DV, jets or missing transverse momentum. No events were observed

in any of the signal regions. Results were interpreted in SUSY scenarios involving  $R$ -parity violation, split supersymmetry, and gauge mediation. See their Fig. 12–20.

- <sup>108</sup> KHACHATRYAN 15AD searched in  $19.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two opposite-sign same flavor isolated leptons featuring either a kinematic edge, or a peak at the  $Z$ -boson mass, in the invariant mass spectrum. No evidence for a statistically significant excess over the expected SM backgrounds is observed and 95% C.L. exclusion limits are derived in a simplified model of gluino pair production where the gluino decays into quarks, a  $Z$ -boson, and a massless gravitino LSP, see Fig. 9.
- <sup>109</sup> KHACHATRYAN 15AZ searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with either at least one photon, hadronic jets and  $\cancel{E}_T$  (single photon channel) or with at least two photons and at least one jet and using the razor variables. No significant excess above the Standard Model expectations is observed. Limits are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for both a bino-like and wino-like neutralino NLSP scenario, see Fig. 8 and 9.
- <sup>110</sup> AAD 14AX searched in  $20.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for the strong production of supersymmetric particles in events containing either zero or at least one high- $p_T$  lepton, large missing transverse momentum, high jet multiplicity and at least three jets identified as originating from  $b$ -quarks. No excess over the expected SM background is observed. Limits are derived in mSUGRA/CMSSM models with  $\tan\beta = 30$ ,  $A_0 = -2m_0$  and  $\mu > 0$ , see their Fig. 14. Also, exclusion limits in simplified models containing gluinos and scalar top and bottom quarks are set, see their Figures 12, 13.
- <sup>111</sup> AAD 14E searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from  $b$ -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5 and 6. In the  $\tilde{g} \rightarrow qq'\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0$  simplified model, the following assumptions have been made:  $m_{\tilde{\chi}_1^\pm} = 0.5 m_{\tilde{\chi}_2^0} + m_{\tilde{g}}$ ,  $m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{\chi}_1^\pm})$ ,  $m_{\tilde{\chi}_1^0} < 520 \text{ GeV}$ . In the  $\tilde{g} \rightarrow qq'\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow \ell^\pm\nu\tilde{\chi}_1^0$  or  $\tilde{g} \rightarrow qq'\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow \ell^\pm\ell^\mp(\nu\nu)\tilde{\chi}_1^0$  simplified model, the following assumptions have been made:  $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{g}})$ ,  $m_{\tilde{\chi}_1^0} < 660 \text{ GeV}$ . Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.
- <sup>112</sup> CHATRCHYAN 14H searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay  $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, or where the decay  $\tilde{g} \rightarrow \tilde{t}t, \tilde{t} \rightarrow t\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, with varying mass of the  $\tilde{\chi}_1^0$ , or where the decay  $\tilde{g} \rightarrow \tilde{b}b, \tilde{b} \rightarrow t\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, with varying mass of the  $\tilde{\chi}_1^\pm$ , see Fig. 5.
- <sup>113</sup> CHATRCHYAN 14H searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay  $\tilde{g} \rightarrow qq'\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, with varying mass of the  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_1^0$ , see Fig. 7.
- <sup>114</sup> CHATRCHYAN 14H searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay  $\tilde{g} \rightarrow b\bar{t}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$  takes place with a branching ratio of 100%, for two choices of  $m_{\tilde{\chi}_1^\pm}$  and fixed  $m_{\tilde{\chi}_1^0}$ , see Fig. 6.

1 AAD 21BF searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for pair production of gluinos, stops, electroweakinos decaying RPV either directly or indirectly via the LSP. The final state in all cases is one or two leptons, many jets (up to fifteen) and  $b$ -jets. Different models with different branching fractions of the gluino or stop follow from the assumptions on the nature of the electroweakinos. No significant excess above the Standard Model predictions is observed. Limits are set on the gluino,  $\tilde{t}_1$ , electroweakino masses as a function of the  $\tilde{\chi}_1^0$  mass in several scenarios of gluino, stop and electroweakino pair production.

2 AAD 21V searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tchl1n12-GGM, and RPV models similar to Tchl1n2l, Tglu1A (with  $q = u, d, s, c, b$  with equal branching fractions), and  $\tilde{t}_1/\tilde{\nu} \rightarrow \ell/\nu\tilde{\chi}_1^0$  (mass-degenerate  $\tilde{t}_1$  and  $\tilde{\nu}$  of all 3 generations), all with  $\tilde{\chi}_1^0 \rightarrow \ell^\pm e^\mp \nu$  via  $\lambda_{12k}$  or  $\lambda_{133}$  (where  $i, k \in \{1, 2\}$ ), see their Figure 11.

3 AAD 20AL searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with 8 or more jets and moderate missing transverse momentum. The selection makes requirements according to the number of  $b$ -tagged jets and the scalar sum of masses of large-radius jets. No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on the gluino mass in RPV simplified models where the gluino decays via  $\tilde{g} \rightarrow tbd$  or  $\tilde{g} \rightarrow tbs$ . They extend up to almost 1.6 TeV for a  $\tilde{t}_1$  mass of 900 GeV. See their Fig. 10(c).

4 AAD 20V searched in  $139 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with two same-sign charged leptons (electrons or muons) and jets. No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on the gluino mass in RPV simplified models where the gluino decays via  $\tilde{g} \rightarrow tbd$ , see Figure 7(b).

5 SIRUNYAN 20T searched in  $137 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events with at least two jets, and two isolated same-sign or three or more charged leptons (electrons or muons). No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figure 7, and in the Tglu1C and Tglu1B simplified models, see their Figures 8 and 9. Limits are also set on the sbottom mass in the Tstbot2 simplified model, see their Figure 10, and on the stop mass in the Tstop7 simplified model, see their Figure 11. Finally, limits are set on the gluino mass in RPV simplified models where the gluino decays either via  $\tilde{g} \rightarrow qq\bar{q} + e/\mu/\tau$  or via  $\tilde{g} \rightarrow tbs$ , see Figure 12.

6 SIRUNYAN 19F searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for three-jet resonances produced in the decay of a gluino in R-parity violating supersymmetric models. The mass range from 200 to 2000 GeV is explored in four separate mass regions. The observations show agreement with standard model expectations. The results are interpreted within the framework of R-parity violating SUSY, where pair-produced gluinos decay to a six quark final state. Gluino masses below 1500 GeV are excluded at 95% C.L. See their Figure 5.

7 AABOUD 18Z searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSF pair production with R-parity violating decays of the LSP via  $\lambda_{12k}$  or  $\lambda_{133}$  to charged leptons, see their Figures 7, 8.

8 SIRUNYAN 18AK searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events containing a single lepton, large jet and  $b$ -quark jet multiplicities, coming from R-parity-violating decays of gluinos. No excess over the expected background is observed. Limits are derived on the gluino mass, assuming the RPV  $\tilde{g} \rightarrow tbs$  decay, see their Figure 9.

9 SIRUNYAN 18D searched in  $35.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for events containing identified hadronically decaying top quarks, no leptons, and  $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see their Figure 8, and on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3E simplified models, see their Figure 9.

10 SIRUNYAN 18EA searched in  $38.2 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13$  TeV for the pair production of resonances, each decaying to at least four quarks. Reconstructed particles are clustered into two large jets of similar mass, each consistent with four-parton

substructure. No statistically significant excess over the Standard Model expectation is observed. Limits are set on the squark and gluino mass in RPV supersymmetry models where squarks (gluinos) decay, through intermediate higgsinos, to four (five) quarks, see their Figure 4.

11 AABOUD 17A1 searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more isolated lepton, at least eight jets, either zero or many  $b$ -jets, for evidence of R-parity violating decays of the gluino. No significant excess above the Standard Model expectations is observed. Limits up to 2.1 TeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu3A with LSP decay through the non-zero  $\lambda''_{112}$  coupling as  $\tilde{\chi}_1^0 \rightarrow uds$ . See their Figure 9.

12 AABOUD 17A1 searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more isolated lepton, at least eight jets, either zero or many  $b$ -jets, for evidence of R-parity violating decays of the gluino. No significant excess above the Standard Model expectations is observed. Limits up to 1.65 TeV are set on the gluino mass in R-parity-violating supersymmetry models with  $\tilde{g} \rightarrow t\bar{t}, \bar{t} \rightarrow b\bar{s}$  through the non-zero  $\lambda''_{323}$  coupling. See their Figure 9.

13 AABOUD 17A1 searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with one or more isolated lepton, at least eight jets, either zero or many  $b$ -jets, for evidence of R-parity violating decays of the gluino. No significant excess above the Standard Model expectations is observed. Limits up to 1.8 TeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu1A with the LSP decay through the non-zero  $\lambda'$  coupling as  $\tilde{\chi}_1^0 \rightarrow qq\ell$ . See their Figure 9.

14 AABOUD 17A1 searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.8 TeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu3A with LSP decaying through the non-zero  $\lambda''_{112}$  coupling as  $\tilde{\chi}_1^0 \rightarrow uds$ . See their Figure 5(d).

15 AABOUD 17A1 searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.75 TeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu1A with LSP decaying through the non-zero  $\lambda'$  coupling as  $\tilde{\chi}_1^0 \rightarrow qq\ell$ . See their Figure 5(c).

16 AABOUD 17A1 searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.45 TeV are set on the gluino mass in R-parity-violating supersymmetry models where  $\tilde{g} \rightarrow t\bar{t}_1$  and  $\bar{t}_1 \rightarrow s\bar{d}$  through the non-zero  $\lambda''_{321}$  coupling. See their Figure 5(b).

17 AABOUD 17A1 searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.45 TeV are set on the gluino mass in R-parity-violating supersymmetry models where  $\tilde{g} \rightarrow t\bar{t}_1$  and  $\bar{t}_1 \rightarrow b\bar{d}$  through the non-zero  $\lambda''_{313}$  coupling. See their Figure 5(a).

18 AABOUD 17A1 searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 400 GeV are set on the down type squark ( $\tilde{d}_R$  mass in R-parity-violating supersymmetry models where  $\tilde{d}_R \rightarrow t\bar{b}$  through the non-zero  $\lambda''_{313}$  coupling or  $\tilde{d}_R \rightarrow t\bar{s}$  through the non-zero  $\lambda''_{321}$ . See their Figure 5(e) and 5(f).

19 AABOUD 17AZ searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large R-jets or  $b$ -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits are set for R-parity violating decays of the gluino assuming  $\tilde{g} \rightarrow t\bar{t}_1$  and  $\bar{t}_1 \rightarrow b\bar{s}$  through the non-zero  $\lambda''_{223}$  couplings. The range 625–1375 GeV is excluded for  $m_{\tilde{t}_1} = 400 \text{ GeV}$ . See their Figure 7b.

20 KHACHATRYAN 17Y searched in  $19.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing at least 8 or 10 jets, possibly  $b$ -tagged, coming from R-parity-violating decays of supersymmetric particles. No excess over the expected background is observed. Limits are derived on the gluino mass, assuming various RPV decay modes, see Fig. 7.

21 KHACHATRYAN 16BJ searched in  $2.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the following simplified models: Tglu3A and Tglu3D, see Fig. 4, Tglu3B and Tglu3C, see Fig. 5, and Tglu1B, see Fig. 7.

22 KHACHATRYAN 16BX searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing 0 or 1 leptons and  $b$ -tagged jets, coming from R-parity-violating decays of supersymmetric particles. No excess over the expected background is observed. Limits are derived on the gluino mass, assuming the RPV  $\tilde{g} \rightarrow t\bar{b}s$  decay, see Fig. 7 and 10.

23 AAD 15BV summarized and extended ATLAS searches for gluinos and first- and second-generation squarks in final states containing jets and missing transverse momentum, with or without leptons or  $b$ -jets in the  $\sqrt{s} = 8 \text{ TeV}$  data set collected in 2012. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the gluino mass in several R-parity conserving models, leading to a generalized constraint on gluino masses exceeding 1150 GeV for lightest supersymmetric particle masses below 100 GeV. See their Figs. 10, 19, 20, 21, 23, 25, 26, 29–37.

24 AAD 14X searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in an R-parity violating simplified model where the decay  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$ , with  $\tilde{\chi}_1^0 \rightarrow \ell^\pm\ell^\mp\nu$ , takes place with a branching ratio of 100%, see Fig. 8.

25 CHATRCHYAN 14P searched in  $19.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for three-jet resonances produced in the decay of a gluino in R-parity violating supersymmetric models. No excess over the expected SM background is observed. Assuming a 100% branching ratio for the gluino decay into three light-flavour jets, limits are set on the cross section of gluino pair production, see Fig. 7, and gluino masses below 650 GeV are excluded at 95% C.L. Assuming a 100% branching ratio for the gluino decaying to one  $b$ -quark jet and two light-flavour jets, gluino masses between 200 GeV and 835 GeV are excluded at 95% C.L.

26 AABOUD 18CF searched in  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with several jets, possibly  $b$ -jets, and large-radius jets for evidence of R-parity violating decays of the gluino. No significant excess above the Standard Model expectations is

observed. Limits between 1000 and 1875 GeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu2RPV with the LSP decay through the non-zero  $\lambda''$  coupling as  $\tilde{\chi}_1^0 \rightarrow qq\ell$ . The most stringent limit is obtained for  $m_{\tilde{\chi}_1^0} = 1000 \text{ GeV}$ , the weakest for  $m_{\tilde{\chi}_1^0} = 50 \text{ GeV}$ . See their Figure 7(b). Figure 7(a) presents results for gluinos directly decaying into 3 quarks, Tglu1RPV.

27 KHACHATRYAN 16BX searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing 4 leptons coming from R-parity-violating decays of  $\tilde{\chi}_1^0 \rightarrow \ell\ell\nu$  with  $\lambda_{122} \neq 0$  or  $\lambda_{122} \neq 0$ . No excess over the expected background is observed. Limits are derived on the gluino, squark and stop masses, see Fig. 23.

28 AAD 15CB searched for events containing at least one long-lived particle that decays at a significant distance from its production point (displaced vertex, DV) into two leptons or into five or more charged particles in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . The dilepton signature is characterised by DV formed from at least two lepton candidates. Four different final states were considered for the multitrack signature, in which the DV must be accompanied by a high-transverse momentum muon or electron candidate that originates from the DV, jets or missing transverse momentum. No events were observed in any of the signal regions. Results were interpreted in SUSY scenarios involving R-parity violation, split supersymmetry, and gauge mediation. See their Fig. 12–20.

29 AAD 15X searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events containing large number of jets, no requirements on missing transverse momentum and no isolated electrons or muons. The sensitivity of the search is enhanced by considering the number of  $b$ -tagged jets and the scalar sum of masses of large-radius jets in an event. No evidence was found for excesses above the expected level of Standard Model background. Exclusion limits at 95% C.L. are set on the gluino mass assuming the gluino decays to various quark flavors, and for various neutralino masses. See their Fig. 11–16.

30 AAD 14AX searched in  $20.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for the strong production of supersymmetric particles in events containing either zero or at least one high  $p_T$  lepton, large missing transverse momentum, high jet multiplicity and at least three jets identified as originating from  $b$ -quarks. No excess over the expected SM background is observed. Limits are derived in mSUGRA/CMSSM models with  $\tan\beta = 30$ ,  $A_0 = -2m_0$  and  $\mu > 0$ , see their Fig. 14. Also, exclusion limits in simplified models containing gluinos and scalar top and bottom quarks are set, see their Figures 12, 13.

31 AAD 14E searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from  $b$ -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5 and 6. In the  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0$  simplified model, the following assumptions have been made:  $m_{\tilde{\chi}_1^\pm} = 0.5 m_{\tilde{\chi}_1^0} + m_{\tilde{g}}, m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{\chi}_1^\pm}), m_{\tilde{\chi}_1^0} < 520 \text{ GeV}$ . In the  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow \ell^\pm\nu\tilde{\chi}_1^0$  or  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow \ell^\pm\ell^\mp(\nu\nu)\tilde{\chi}_1^0$  simplified model, the following assumptions have been made:  $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{g}}), m_{\tilde{\chi}_1^0} < 660 \text{ GeV}$ . Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.

32 CHATRCHYAN 14H searched in  $19.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the R-parity violating decay  $\tilde{g} \rightarrow t\bar{b}s$  takes place with a branching ratio of 100%, see Fig. 8.

### Long-lived $\tilde{g}$ (Gluino) mass limit

Limits on light gluinos ( $m_{\tilde{g}} < 5 \text{ GeV}$ ) were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

No significant excess above the Standard Model predictions is observed. Limits are set on the R-hadron mass for different masses of the LSP and for different R-hadron lifetimes, see Figure 18.					
>1490	95	9	SIRUNYAN	18AY CMS	jets+ $\cancel{E}_T$ , Tglu1A, $c\tau = 100$ mm, $m_{\tilde{\chi}_1^0} = 100$ GeV	2 SIRUNYAN 21Af searched in 140 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with two displaced vertices from long-lived particles decaying into multijet or dijet final states. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu2RPV with $\lambda_{323}^0$ coupling, on the $\tilde{\chi}_1^0$ mass in an RPV model with $\tilde{\chi}_1^0$ pair production and the RPV decay $\tilde{\chi}_1^0 \rightarrow tbs$ with $\lambda_{323}^0$ coupling and on the $\tilde{t}$ mass in an RPV model with top squark pair production and the RPV decay $\tilde{t} \rightarrow \bar{d}_i\bar{d}_j$ with $\lambda_{3ij}^0$ coupling, see their Figure 7.					
>1300	95	9	SIRUNYAN	18AY CMS	jets+ $\cancel{E}_T$ , Tglu1A, $c\tau = 1$ m, $m_{\tilde{\chi}_1^0} = 100$ GeV	3 SIRUNYAN 21u searched in 132 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with displaced tracks and displaced vertices associated with a dijet system. No significant excess above the Standard Model expectations is observed. Limits are set on long-lived gluinos in an RPC GMSB SUSY model of gluino pair production, with $\tilde{g} \rightarrow g\tilde{G}$ , see their Figure 9, in Tglu1A in a mini-split model, see their Figure 10, and in an RPV model of gluino pair production, with $\tilde{g} \rightarrow tbs$ with coupling $\lambda_{323}^0$ , see their Figure 11. Limits are also set on long-lived top squarks in Tstop2RPV, see their Figure 12, in an RPV model with $\tilde{t} \rightarrow d\bar{d}$ and $\lambda_{331}^0$ coupling, see their Figure 13, and in a dynamical RPV model with $\tilde{t} \rightarrow \bar{d}\bar{d}$ via a nonholomorphic RPV coupling $\eta_{311}^0$ , see their Figure 14. The best mass limit is achieved in all cases at $c\tau = 30$ mm.					
> 960	95	9	SIRUNYAN	18AY CMS	jets+ $\cancel{E}_T$ , Tglu1A, $c\tau = 10$ m, $m_{\tilde{\chi}_1^0} = 100$ GeV	4 AABOUD 19AT searched in 36.1 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for metastable and stable R-hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Gluino R-hadrons with lifetimes of the order of 50 ns are excluded at 95% C.L. for masses below 1980 GeV using the muon-spectrometer agnostic analysis. Using the full-detector search, the observed lower limits on the mass are 2000 GeV. See their Figure 9 (top).					
> 900	95	9	SIRUNYAN	18AY CMS	jets+ $\cancel{E}_T$ , Tglu1A, $c\tau = 100$ m, $m_{\tilde{\chi}_1^0} = 100$ GeV	5 AABOUD 19C searched in 36.1 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for metastable and stable R-hadrons arising as excesses in the mass distribution of reconstructed tracks with high transverse momentum and large $dE/dx$ . Gluino R-hadrons with lifetimes above 10 ns are excluded at 95% C.L. with lower mass limit range between 1000 GeV and 2060 GeV, see their Figure 5(a). Masses smaller than 1290 GeV are excluded for a lifetime of 1 ns, see their Figure 6. In the case of stable R-hadrons, the lower mass limit is 1890 GeV, see their Figure 5(b).					
>2200	95	10	SIRUNYAN	18DV CMS	long-lived $\tilde{g}$ , RPV, $\tilde{g} \rightarrow \bar{t}b\bar{s}$ , $0.6$ mm $< c\tau < 80$ mm	6 SIRUNYAN 19BH searched in 35.9 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for long-lived particles decaying into jets, with each long-lived particle having a decay vertex well displaced from the production vertex. The selected events are found to be consistent with standard model predictions. Limits are set on the gluino mass in a GMSB model where the gluino is decaying via $\tilde{g} \rightarrow g\tilde{G}$ , see their Figure 4 and in an RPV model of supersymmetry where the gluino is decaying via $\tilde{g} \rightarrow \bar{t}b\bar{s}$ , see their Figures 5. Limits are also set on the stop mass in two RPV models, see their Figure 6 (for $t \rightarrow b\bar{l}$ decays) and Figure 7 (for $\tilde{t} \rightarrow \bar{d}\bar{d}$ decays).					
>1000	95	11	KHACHATRY...17AR	CMS	long-lived $\tilde{g}$ , RPV, $\tilde{g} \rightarrow \bar{t}b\bar{s}$ , $c\tau = 0.3$ mm	7 SIRUNYAN 19BT searched in 137 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for long-lived particles decaying to displaced, nonprompt jets and missing transverse momentum. Candidate signal events are identified using the timing capabilities of the CMS electromagnetic calorimeter. The results of the search are found to be consistent with the background predictions. Limits are set on the gluino mass in a GMSB model where long-lived gluinos are pair produced and decaying via $\tilde{g} \rightarrow g\tilde{G}$ , see their Figures 4 and 5.					
>1300	95	11	KHACHATRY...17AR	CMS	long-lived $\tilde{g}$ , RPV, $\tilde{g} \rightarrow \bar{t}b\bar{s}$ , $c\tau = 1.0$ mm	8 AABOUD 18s searched in 32.8 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for long-lived gluinos in final states with large missing transverse momentum and at least one high-mass displaced vertex with five or more tracks. The observed yield is consistent with the expected background. Exclusion limits are derived for Tglu1A models predicting the existence of long-lived gluinos reaching roughly $m(\tilde{g}) = 2000$ GeV to 2370 GeV for $m(\tilde{\chi}_1^0) = 100$ GeV and gluino lifetimes between 0.02 and 10 ns, see their Fig. 8. Limits are presented also as a function of the lifetime (for a fixed gluino-neutralino mass difference of 100 GeV) and of the gluino and neutralino masses (for a fixed lifetime of 1 ns). See their Fig. 9 and 10 respectively.					
>1400	95	11	KHACHATRY...17AR	CMS	long-lived $\tilde{g}$ , RPV, $\tilde{g} \rightarrow \bar{t}b\bar{s}$ , $2$ mm $< c\tau < 30$ mm	9 SIRUNYAN 18AY searched in 35.9 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for events containing one or more jets and significant $\cancel{E}_T$ . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb01, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range $10^{-3}$ mm $< c\tau < 10^5$ mm, see their Figure 4.					
>1580	95	12	AABOUD	16B ATLS	long-lived R-hadrons	10 SIRUNYAN 18DV searched in 38.5 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for long-lived particles in events with multiple jets and two displaced vertices composed of many tracks. No events with two well-separated high-track-multiplicity vertices were observed. Limits are set on the stop and the gluino mass in RPV models of supersymmetry where the stop (gluino) is decaying solely into dijet (multijet) final states, see their Figures 6 and 7.					
> 740-1590	95	13	AABOUD	16C ATLS	R-hadrons, Tglu1A, $\tau \geq 0.4$ ns, $m_{\tilde{\chi}_1^0} = 100$ GeV	11 KHACHATRYAN 17AR searched in 17.6 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 8$ TeV for R-parity-violating SUSY in which long-lived neutralinos or gluinos decay into multijet final states. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass for a range of mean proper decay lengths ( $c\tau$ ), see their Fig. 7. The upper limits on the production cross section times branching ratio squared (Fig. 7) are also applicable to long-lived neutralinos.					
>1570	95	13	AABOUD	16C ATLS	R-hadrons, Tglu1A, stable	12 AABOUD 16B searched in 3.2 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for long-lived R-hadrons using observables related to large ionization losses and slow propagation velocities, which are signatures of heavy charged particles traveling significantly slower than the speed of light. Exclusion limits at 95% C.L. are set on the long-lived gluino masses exceeding 1580 GeV. See their Fig. 5.					
>1610	95	14	KHACHATRY...16BW	CMS	long-lived $\tilde{g}$ forming R-hadrons, $f = 0.1$ , cloud interaction model	13 AABOUD 16c searched in 3.2 fb <sup>-1</sup> of $pp$ collisions at $\sqrt{s} = 13$ TeV for long-lived and stable R-hadrons identified by anomalous specific ionization energy loss in the ATLAS

- Pixel detector. Gluino  $R$ -hadrons with lifetimes above 0.4 ns are excluded at 95% C.L. with lower mass limit range between 740 GeV and 1590 GeV. In the case of stable  $R$ -hadrons, the lower mass limit is 1570 GeV. See their Figs. 5 and 6.
- 14 KHACHATRYAN 16BW searched in  $2.5 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  for events with heavy stable charged particles, identified by their anomalously high energy deposits in the silicon tracker and/or long time-of-flight measurements by the muon system. No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass, depending on the interaction model and on the fraction  $f$ , of produced gluinos hadronizing into a  $\tilde{g}$ -gluon state, see Fig. 4 and Table 7.
- 15 AAD 15AE searched in  $19.1 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ALTA5 muon system. In the absence of an excess of events above the expected backgrounds, limits are set  $R$ -hadrons in various scenarios, see Fig. 11. Limits are also set in LeptoSUSY models where the gluino decays to stable 300 GeV leptons, see Fig. 9.
- 16 AAD 15BM searched in  $18.4 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for stable and metastable non-relativistic charged particles through their anomalous specific ionization energy loss in the ATLAS pixel detector. In absence of an excess of events above the expected backgrounds, limits are set within a generic  $R$ -hadron model, on stable gluino  $R$ -hadrons (see Table 5) and on metastable gluino  $R$ -hadrons decaying to  $(g/q\bar{q})$  plus a light  $\tilde{\chi}_1^0$  (see Fig. 7) and decaying to  $t\bar{t}$  plus a light  $\tilde{\chi}_1^0$  (see Fig. 9).
- 17 KHACHATRYAN 15AK looked in a data set corresponding to  $18.6 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ , and a search interval corresponding to 281 h of trigger lifetime, for long-lived particles that have stopped in the CMS detector. No evidence for an excess over the expected background in a cloud interaction model is observed. Assuming the decay  $\tilde{g} \rightarrow g\tilde{\chi}_1^0$  and lifetimes between 1  $\mu\text{s}$  and 1000 s, limits are derived on  $\tilde{g}$  production as a function of  $m_{\tilde{\chi}_1^0}$ , see Figs. 4 and 6. The exclusions require that  $m_{\tilde{\chi}_1^0}$  is kinematically consistent with the minimum values of the jet energy thresholds used.
- 18 AAD 13AA searched in  $4.7 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events containing colored long-lived particles that hadronize forming  $R$ -hadrons. No significant excess above the expected background was found. Long-lived  $R$ -hadrons containing a  $\tilde{g}$  are excluded for masses up to 985 GeV at 95% C.L. in a general interaction model. Also, limits independent of the fraction of  $R$ -hadrons that arrive charged in the muon system were derived, see Fig. 6.
- 19 AAD 13BC searched in  $5.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  and in  $22.9 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for bottom squark  $R$ -hadrons that have come to rest within the ATLAS calorimeter and decay at some later time to hadronic jets and a neutralino. In absence of an excess of events above the expected backgrounds, limits are set on gluino masses for different decays, lifetimes, and neutralino masses, see their Table 6 and Fig. 10.
- 20 CHATRCHYAN 13AB looked in  $5.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  and in  $18.8 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for events with heavy stable particles, identified by their anomalous  $dE/dx$  in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of  $\tilde{g}$ 's. No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 8 and Table 5), depending on the fraction,  $f$ , of formation of  $\tilde{g}$ - $\tilde{g}$  ( $R$ -gluonball) states. The quoted limit is for  $f = 0.1$ , while for  $f = 0.5$  it degrades to 1276 GeV. In the conservative scenario where every hadronic interaction causes it to become neutral, the limit decreases to 928 GeV for  $f = 0.1$ .
- 21 AAD 12P looked in  $31 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with pair production of long-lived gluinos. The hadronization of the gluinos leads to  $R$ -hadrons which may stop inside the detector and later decay via  $\tilde{g} \rightarrow g\tilde{\chi}_1^0$  during gaps between the proton bunches. No significant excess over the expected background is observed. From a counting experiment, a limit at 95% C.L. on the cross section as a function of  $m_{\tilde{g}}$  is derived for  $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$ , see Fig. 4. The limit is valid for lifetimes between  $10^{-5}$  and  $10^3$  seconds and assumes the *Generic* matter interaction model for the production cross section.
- 22 CHATRCHYAN 12AN looked in  $4.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with pair production of long-lived gluinos. The hadronization of the gluinos leads to  $R$ -hadrons which may stop inside the detector and later decay via  $\tilde{g} \rightarrow g\tilde{\chi}_1^0$  during gaps between the proton bunches. No significant excess over the expected background is observed. From a counting experiment, a limit at 95% C.L. on the cross section as a function of  $m_{\tilde{g}}$  is derived, see Fig. 3. The mass limit is valid for lifetimes between  $10^{-5}$  and  $10^3$  seconds, for what they call "the daughter gluon energy  $E_{\tilde{g}} > 100 \text{ GeV}$  and assuming the *cloud* interaction model for  $R$ -hadrons. Supersedes KHACHATRYAN 11.
- 23 CHATRCHYAN 12L looked in  $5.0 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with heavy stable particles, identified by their anomalous  $dE/dx$  in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of  $\tilde{g}$ 's. No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 3), depending on the fraction,  $f$ , of formation of  $\tilde{g}$ - $\tilde{g}$  ( $R$ -glueball) states. The quoted limit is for  $f = 0.1$ , while for  $f = 0.5$  it degrades to 1046 GeV. In the conservative scenario where every hadronic interaction causes it to become neutral, the limit decreases to 928 GeV for  $f = 0.1$ . Supersedes KHACHATRYAN 11c.
- 24 AAD 11K looked in  $34 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with heavy stable particles, identified by their anomalous  $dE/dx$  in the tracker or time of flight in the tile calorimeter, from pair production of  $\tilde{g}$ . No evidence for an excess over the SM expectation is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 4), for a fraction,  $f = 10\%$ , of formation of  $\tilde{g}$ - $\tilde{g}$  ( $R$ -gluonball). If instead of a phase space driven approach for the hadronic scattering of the  $R$ -hadrons, a triple-Regge model or a bag-model is used, the limit degrades to 566 and 562 GeV, respectively.
- 25 AAD 11P looked in  $37 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with heavy stable particles, reconstructed and identified by their time of flight in the Muon System. There is no requirement on their observation in the tracker to increase the sensitivity to cases where gluinos have a large fraction,  $f$ , of formation of neutral  $\tilde{g}$ - $\tilde{g}$  ( $R$ -gluonball). No evidence for an excess over the SM expectation is observed. Limits are derived as a function of mass (see Fig. 4), for  $f = 0.1$ . For fractions  $f = 0.5$  and  $f = 1.0$  the limit degrades to 537 and 530 GeV, respectively.
- 26 KHACHATRYAN 11 looked in  $10 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with pair production of long-lived gluinos. The hadronization of the gluinos leads to  $R$ -hadrons which may stop inside the detector and later decay via  $\tilde{g} \rightarrow g\tilde{\chi}_1^0$  during gaps between the proton bunches. No significant excess over the expected background is observed.

From a counting experiment, a limit at 95% C.L. on the cross section times branching ratio is derived for  $m_{\tilde{g}} - m_{\tilde{\chi}_1^0} > 100 \text{ GeV}$ , see their Fig. 2. Assuming 100% branching

ratio, lifetimes between 75 ns and  $3 \times 10^5 \text{ s}$  are excluded for  $m_{\tilde{g}} = 300 \text{ GeV}$ . The  $\tilde{g}$  mass exclusion is obtained with the same assumptions for lifetimes between 10  $\mu\text{s}$  and 1000 s, but shows some dependence on the model for  $R$ -hadron interactions with matter, illustrated in Fig. 3. From a time-profile analysis, the mass exclusion is 382 GeV for a lifetime of 10  $\mu\text{s}$  under the same assumptions as above.

- 27 KHACHATRYAN 11C looked in  $3.1 \text{ pb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  for events with heavy stable particles, identified by their anomalous  $dE/dx$  in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of  $\tilde{g}$ . No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 3), depending on the fraction,  $f$ , of formation of  $\tilde{g}$ - $\tilde{g}$  ( $R$ -gluonball). The quoted limit is for  $f = 0.1$ , while for  $f = 0.5$  it degrades to 357 GeV. In the conservative scenario where every hadronic interaction causes it to become neutral, the limit decreases to 311 GeV for  $f = 0.1$ .

### Light $\tilde{G}$ (Gravitino) mass limits from collider experiments

The following are bounds on light ( $\ll 1 \text{ eV}$ ) gravitino indirectly inferred from its coupling to matter suppressed by the gravitino decay constant.

Unless otherwise stated, all limits assume that other supersymmetric particles besides the gravitino are too heavy to be produced. The gravitino is assumed to be undetected and to give rise to a missing energy ( $\cancel{E}$ ) signature.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 1 AAD 15BH searched in  $20.3 \text{ fb}^{-1}$  of  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  for associated production of a light gravitino and a squark or gluino. The squark (gluino) is assumed to decay exclusively to a quark (gluon) and a gravitino. No evidence was found for an excess above the expected level of Standard Model background and 95% C.L. lower limits were set on the gravitino mass as a function of the squark/gluino mass, both in the case of degenerate and non-degenerate squark/gluino masses, see Figs. 14 and 15.

- 2 ABDALLAH 05B use data from  $\sqrt{s} = 180$ -208 GeV. They look for events with a single photon +  $\cancel{E}$  final states from which a cross section limit of  $\sigma < 0.18 \text{ pb}$  at 208 GeV is obtained, allowing a limit on the mass to be set. Supersedes the results of ABREU 00z.
- 3 ACHARD 04E use data from  $\sqrt{s} = 189$ -209 GeV. They look for events with a single photon +  $\cancel{E}$  final states from which a limit on the Gravitino mass is set corresponding to  $\sqrt{F} > 238 \text{ GeV}$ . Supersedes the results of ACCIARRI 99R.
- 4 HEISTER 03c use the data from  $\sqrt{s} = 189$ -209 GeV to search for  $\gamma\cancel{E}_T$  final states.
- 5 ACOSTA 02h looked in  $87 \text{ pb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.8 \text{ TeV}$  for events with a high- $E_T$  photon and  $\cancel{E}_T$ . They compared the data with a GMSB model where the final state could arise from  $q\bar{q} \rightarrow \tilde{G}\tilde{G}\gamma$ . Since the cross section for this process scales as  $1/|F|^4$ , a limit at 95% CL is derived on  $|F|^{1/2} > 221 \text{ GeV}$ . A model independent limit for the above topology is also given in the paper.
- 6 ABBIENDI,G 00D searches for  $\gamma\cancel{E}$  final states from  $\sqrt{s} = 189 \text{ GeV}$ .

### Supersymmetry miscellaneous results

Results that do not appear under other headings or that make nonminimal assumptions.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 1 AAD 20c uses a statistical combination of six final states  $b\bar{b}b\bar{b}$ ,  $b\bar{b}W\bar{W}$ ,  $b\bar{b}\tau\tau$ ,  $W\bar{W}W\bar{W}$ ,  $b\bar{b}\gamma\gamma$ , and  $W\bar{W}\gamma\gamma$  to search for non-resonant and resonant production of Higgs boson pairs. The search uses  $36.1 \text{ fb}^{-1}$  of  $pp$  collisions data at  $\sqrt{s} = 13 \text{ TeV}$ . Constraints in the habemus Minimal Supersymmetric Standard Model in the  $(m_A, \tan\beta)$  parameter space are placed, see their Figure 7(b).

- 2 AAD 20L used  $27.8 \text{ fb}^{-1}$  of  $pp$  collision data at  $\sqrt{s} = 13 \text{ TeV}$  to search for heavy neutral Higgs bosons produced in association with at least one  $b$ -quark and decaying into a pair

# Searches Particle Listings

## Supersymmetric Particle Searches

of  $b$ -quarks. The data are compatible with SM expectations, yielding no significant excess of events in the mass range 450–1400 GeV, see their Fig. 11. Exclusion limits at 95% C.L. were derived in hMSSM scenarios as a function of  $m_A$  and  $\tan\beta$ , see their Fig. 9 and 10.

<sup>3</sup> ABOUD 16AF uses a selection of searches by ATLAS for the electroweak production of SUSY particles studying resulting constraints on dark matter candidates. They use 20 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV. A likelihood-driven scan of an effective model focusing on the gaugino-higgsino and Higgs sector of the pMSSM is performed. The ATLAS searches impact models where  $m_0 < 65$  GeV, excluding 86% of them. See their Figs. 2, 4, and 6.

<sup>4</sup> AAD 16AG searches for prompt lepton-jets using 20 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 8$  TeV collected with the ATLAS detector. Lepton-jets are expected from decays of low-mass dark photons in SUSY-portal and Higgs-portal models. No significant excess of events is observed and 95% CL upper limits are computed on the production cross section times branching ratio for two prompt lepton-jets in models predicting 2 or 4  $\gamma_D$  via SUSY-portal topologies, for  $\gamma_D$  mass values between 0 and 2 GeV. See their Figs 9 and 10. The results are also interpreted in terms of a 90% CL exclusion region in kinetic mixing and dark-photon mass parameter space. See their Fig. 13.

<sup>5</sup> AAD 13P searched in 5 fb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 7$  TeV for single lepton-jets with at least four muons; pairs of lepton-jets, each with two or more muons; and pairs of lepton-jets with two or more electrons. All of these could be signatures of Hidden Valley supersymmetric models. No statistically significant deviations from the Standard Model expectations are found. 95% C.L. limits are placed on the production cross section times branching ratio of dark photons for several parameter sets of a Hidden Valley model.

<sup>6</sup> AALTONEN 12AB looked in 5.1 fb<sup>-1</sup> of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV for anomalous production of multiple low-energy leptons in association with a  $W$  or  $Z$  boson. Such events may occur in hidden valley models in which a supersymmetric Higgs boson is produced in association with a  $W$  or  $Z$  boson, with  $H \rightarrow \tilde{\chi}_1^0 \tilde{\chi}_1^0$  pair and with the  $\tilde{\chi}_1^0$  further decaying into a dark photon ( $\gamma_D$ ) and the unobservable lightest SUSY particle of the hidden sector. As the  $\gamma_D$  is expected to be light, it may decay into a lepton pair. No significant excess over the SM expectation is observed and a limit at 95% C.L. is set on the cross section for a benchmark model of supersymmetric hidden-valley Higgs production.

<sup>7</sup> AAD 11AA looked in 34 pb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 7$  TeV for events with  $\geq 4$  jets originating from pair production of scalar gluons, each decaying to two gluons. No two-jet resonances are observed over the SM background. Limits are derived on the cross section times branching ratio (see Fig. 3). Assuming 100% branching ratio for the decay to two gluons, the quoted exclusion range is obtained, except for a 5 GeV mass window around 140 GeV.

<sup>8</sup> CHATRACHYAN 11E looked in 35 pb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 7$  TeV for events with collimated  $\mu$  pairs (leptonic jets) from the decay of hidden sector states. No evidence for new resonance production is found. Limits are derived and compared to various SUSY models (see Fig. 4) where the LSP, either the  $\tilde{\chi}_1^0$  or a  $\tilde{q}$ , decays to dark sector particles.

<sup>9</sup> ABAZOV 10N looked in 5.8 fb<sup>-1</sup> of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV for events from hidden valley models in which a  $\tilde{\chi}_1^0$  decays into a dark photon,  $\gamma_D$ , and the unobservable lightest SUSY particle of the hidden sector. As the  $\gamma_D$  is expected to be light, it may decay into a tightly collimated lepton pair, called lepton jet. They searched for events with  $B_T$  and two isolated lepton jets observable by an opposite charged lepton pair  $e, e, \mu$  or  $\mu, \mu$ . No significant excess over the SM expectation is observed, and a limit at 95% C.L. on the cross section times branching ratio is derived, see their Table I. They also examined the invariant mass of the lepton jets for a narrow resonance, see their Fig. 4, but found no evidence for a signal.

- AAD 20AM search for a top-color  $Z'$  decaying to  $t\bar{t}$  in  $pp$  collisions at  $\sqrt{s} = 13$  TeV. The quoted limit is for  $\Gamma_{Z'}/M_{Z'} = 0.01$ . The limit becomes  $M_{Z'} > 4700$  GeV for  $\Gamma_{Z'}/M_{Z'} = 0.03$ .
- AAD 20W search for techni- $\rho$  decaying to  $\pi_T W$  in  $pp$  collisions at  $\sqrt{s} = 13$  TeV. See their Fig. 5a for limits on  $\sigma_B$ .
- AAD 16W search for color octet vector resonance decaying to  $b\bar{b}$  in  $pp$  collisions at  $\sqrt{s} = 8$  TeV. The vector like quark  $B$  is assumed to decay to  $bH$ . See their Fig.3 and Fig.4 for limits on  $\sigma_B$ .
- KHACHATRYAN 16E search for top-color  $Z'$  decaying to  $t\bar{t}$ . The quoted limit is for  $\Gamma_{Z'}/M_{Z'} = 0.012$ . Also exclude  $M_{Z'} < 2.9$  TeV for wider topcolor  $Z'$  with  $\Gamma_{Z'}/M_{Z'} = 0.1$ .
- AAD 15AB search for long-lived hidden valley  $\pi_V$  particles which are produced in pairs by the decay of a scalar boson.  $\pi_V$  is assumed to decay into dijets. See their Fig. 10 for the limit on  $\sigma_B$ .
- AAD 15AO search for top-color  $Z'$  decaying to  $t\bar{t}$ . The quoted limit is for  $\Gamma_{Z'}/M_{Z'} = 0.012$ .
- AAD 15BB search for minimal walking technicolor (MWT) isotriplet vector and axial-vector resonances decaying to  $Wh$  or  $Zh$ . See their Fig. 3 for the exclusion limit in the MWT parameter space.
- AAD 15Q search for long-lived hidden valley  $\pi_V$  particles which are produced in pairs by the decay of scalar boson.  $\pi_V$  is assumed to decay into dijets. See their Fig. 5 and Fig. 6 for the limit on  $\sigma_B$ .

- AAIJ 15AN search for long-lived hidden valley  $\pi_V$  particles which are produced in pairs by the decay of scalar boson with a mass of 120GeV.  $\pi_V$  is assumed to decay into dijets. See their Fig. 4 for the limit on  $\sigma_B$ .
- KHACHATRYAN 15c search for a vector techni-resonance decaying to  $WZ$ . The limit assumes  $M_{\rho_T} = (3/4) M_{\rho_T} - 25$  GeV. See their Fig.3 for the limit in  $M_{\rho_T} - M_{\rho_T}$  plane of the low scale technicolor model.
- KHACHATRYAN 15W search for long-lived hidden valley  $\pi_V$  particles which are produced in pairs in the decay of heavy higgs boson  $H$ .  $\pi_V$  is assumed to decay into  $\ell^+ \ell^-$ . See their Fig. 7 and Fig. 8 for the limits on  $\sigma_B$ .
- AAD 14AT search for techni- $\omega$  and techni- $a$  resonances decaying to  $V\gamma$  with  $V = W(\rightarrow \ell\nu)$  or  $Z(\rightarrow \ell^+ \ell^-)$ .
- AAD 14V search for vector techni-resonances decaying into electron or muon pairs in  $pp$  collisions at  $\sqrt{s} = 8$  TeV. See their table IX for exclusion limits with various assumptions.
- AAD 13AN search for vector techni-resonance  $a_T$  decaying into  $W\gamma$ .
- AAD 13AN search for vector techni-resonance  $\omega_T$  decaying into  $Z\gamma$ .
- Search for top-color  $Z'$  decaying to  $t\bar{t}$ . The quoted limit is for  $\Gamma_{Z'}/M_{Z'} = 0.012$ .
- CHATRCHYAN 13AP search for top-color leptophobic  $Z'$  decaying to  $t\bar{t}$ . The quoted limit is for  $\Gamma_{Z'}/M_{Z'} = 0.012$ .
- BAAK 12 give electroweak oblique parameter constraints on the QCD-like technicolor models. See their Fig. 28.
- CHATRCHYAN 12AF search for a vector techni-resonance decaying to  $WZ$ . The limit assumes  $M_{\rho_T} = (3/4) M_{\rho_T} - 25$  GeV. See their Fig. 3 for the limit in  $M_{\rho_T} - M_{\rho_T}$  plane of the low scale technicolor model.
- Using the LHC limit on the Higgs boson production cross section, CHIVUKULA 11 obtain a limit on the top-Higgs mass  $> 300$  GeV at 95% CL assuming 150 GeV top-pion mass.
- Using the LHC limit on the Higgs boson production cross section, CHIVUKULA 11A obtain a limit on the technipion mass ruling out the region  $110 \text{ GeV} < m_P < 2m_T$ . Existence of color techni-fermions, top-color mechanism, and  $N_{TC} \geq 3$  are assumed.
- AALTONEN 10I search for the vector techni-resonances ( $\rho_T, \omega_T$ ) decaying into  $W\pi_T$  with  $W \rightarrow \ell\nu$  and  $\pi_T \rightarrow b\bar{b}, b\bar{c}$ , or  $b\bar{u}$ . See their Fig.3 for the exclusion plot in  $M_{\rho_T} - M_{\rho_T}$  plane.
- ABZOV 10A search for a vector techni-resonance decaying into  $WZ$ . The limit assumes  $M_{\rho_T} < M_{\rho_T} + MW$ .
- ABZOV 07I search for the vector techni-resonances ( $\rho_T, \omega_T$ ) decaying into  $W\pi_T$  with  $W \rightarrow e\nu$  and  $\pi_T \rightarrow b\bar{b}$  or  $b\bar{c}$ . See their Fig. 2 for the exclusion plot in  $M_{\rho_T} - M_{\rho_T}$  plane.
- ABULENCIA 05A search for resonances decaying to electron or muon pairs in  $\rho\bar{\rho}$  collisions. at  $\sqrt{s} = 1.96$  TeV. The limit assumes Technicolor-scale mass parameters  $M_V = M_A = 500$  GeV.
- CHEKANOV 02B search for color octet techni- $\pi$   $P$  decaying into dijets in  $ep$  collisions. See their Fig. 5 for the limit on  $\sigma(ep \rightarrow ePX) \cdot B(P \rightarrow 2j)$ .
- ABZOV 01B searches for vector techni-resonances ( $\rho_T, \omega_T$ ) decaying to  $e^+e^-$ . The limit assumes  $M_{\rho_T} = M_{\omega_T} < M_{\rho_T} + MW$ .
- The limit is independent of the  $\pi_T$  mass. See their Fig. 9 and Fig. 10 for the exclusion plot in the  $M_{\rho_T} - M_{\rho_T}$  plane. ABDALLAH 01 limit on the technipion mass is  $M_{\pi_T} > 79.8$  GeV for  $N_D = 2$ , assuming its point-like coupling to gauge bosons.
- AFFOLDER 00F search for  $\rho_T$  decaying into  $W\pi_T$  or  $\pi_T\pi_T$  with  $W \rightarrow \ell\nu$  and  $\pi_T \rightarrow \bar{b}b, \bar{b}c$ . See Fig. 1 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the exclusion plot in the  $M_{\rho_T} - M_{\rho_T}$  plane.
- AFFOLDER 00K search for the  $\rho_{T8}$  decaying into  $\pi_{LQ}\pi_{LQ}$  with  $\pi_{LQ} \rightarrow b\nu$ . For  $\pi_{LQ} \rightarrow c\nu$ , the limit is  $M_{\rho_{T8}} > 510$  GeV. See their Fig. 2 and Fig. 3 for the exclusion plot in the  $M_{\rho_{T8}} - M_{\rho_{LQ}}$  plane.
- ABE 99F search for a new particle  $X$  decaying into  $b\bar{b}$  in  $p\bar{p}$  collisions at  $E_{cm} = 1.8$  TeV. See Fig. 7 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the upper limit on  $\sigma(p\bar{p} \rightarrow X) \times B(X \rightarrow b\bar{b})$ . ABE 99F also exclude top gluons of width  $\Gamma = 0.3M$  in the mass interval  $280 < M < 670$  GeV, of width  $\Gamma = 0.5M$  in the mass interval  $340 < M < 640$  GeV, and of width  $\Gamma = 0.7M$  in the mass interval  $375 < M < 560$  GeV.
- ABE 99N search for the techni- $\omega$  decaying into  $\gamma\pi_T$ . The technipion is assumed to decay  $\pi_T \rightarrow b\bar{b}$ . See Fig. 2 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the exclusion plot in the  $M_{\omega_T} - M_{\rho_T}$  plane.
- ABE 97G search for a new particle  $X$  decaying into dijets in  $p\bar{p}$  collisions at  $E_{cm} = 1.8$  TeV. See Fig. 5 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the upper limit on  $\sigma(p\bar{p} \rightarrow X) \times B(X \rightarrow 2j)$ .

<sup>1</sup> AABOUD 17AT limits are from  $pp$  collisions at  $\sqrt{s} = 13$  TeV. The quoted limit uses a uniform positive prior in  $1/\Lambda^2$ .

<sup>2</sup> ABDALLAH 09 and SCHAE 07A limits are from  $R_b, A_{FB}^b$ .

<sup>3</sup> SCHAE 07A limits are from  $R_{e^+e^-}$ ,  $Q_{FB}^{depl}$ , and hadronic cross section measurements.

<sup>4</sup> CHEUNG 01B is an update of BARGER 98E.

<sup>5</sup> AAD 21AU search for new phenomena in final states with  $e^+e^-$  and one or no  $b$ -tagged jets in  $pp$  collisions at  $\sqrt{s} = 13$  TeV. The quoted limits assume  $g_*^2 = 4$ .

<sup>6</sup> AAD 21Q limits are from  $pp$  collisions at  $\sqrt{s} = 13$  TeV. A frequentist statistical framework is used to remove the prior dependence.

<sup>7</sup> SIRUNYAN 21N limits are from  $e^+e^-$  mass distribution in  $pp$  collisions at  $\sqrt{s} = 13$  TeV.

<sup>8</sup> AAD 20AP limits are from  $e^+e^-$  mass distribution in  $pp$  collisions at  $\sqrt{s} = 13$  TeV.

<sup>9</sup> ABRAMOWICZ 19 limits are from  $Q^2$  spectrum measurements of  $e^\pm p \rightarrow e^\pm X$ .

<sup>10</sup> SIRUNYAN 19AC limits are from  $e^+e^-$  mass distribution in  $pp$  collisions at  $\sqrt{s} = 13$  TeV.

<sup>11</sup> AABOUD 16U limits are from  $pp$  collisions at  $\sqrt{s} = 13$  TeV. The quoted limit uses a uniform positive prior in  $1/\Lambda^2$ .

<sup>12</sup> KHACHATRYAN 15AE limit is from  $e^+e^-$  mass distribution in  $pp$  collisions at  $E_{cm} = 8$  TeV.

<sup>13</sup> AAD 14BE limits are from  $pp$  collisions at  $\sqrt{s} = 8$  TeV. The quoted limit uses a uniform positive prior in  $1/\Lambda^2$ .

<sup>14</sup> AAD 13E limits are from  $e^+e^-$  mass distribution in  $pp$  collisions at  $E_{cm} = 7$  TeV.

<sup>15</sup> AAD 12AB limits are from  $e^+e^-$  mass distribution in  $pp$  collisions at  $E_{cm} = 7$  TeV.

<sup>16</sup> AARON 11c limits are from  $Q^2$  spectrum measurements of  $e^\pm p \rightarrow e^\pm X$ .

<sup>17</sup> ABDALLAH 11 limit is from  $e^+e^- \rightarrow t\bar{t}$  cross section.  $\Lambda_{LL} = \Lambda_{LR} = \Lambda_{RL} = \Lambda_{RR}$  is assumed.

<sup>18</sup> SCHAE 07A limit assumes quark flavor universality of the contact interactions.

<sup>19</sup> ABULENCIA 06L limits are from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV.

>6.5		3 DIAZCRUZ 94	RVUE	$\Lambda_{LL}^-(\tau\nu_\tau\mu\nu_\mu)$

- 1 JODIDIO 86 limit is from  $\mu^+ \rightarrow \nu_\mu e^+ \nu_e$ . Chirality invariant interactions  $L = (g^2/\Lambda^2)$  [ $\eta_{LL} (\overline{\nu}_\mu L \gamma^\alpha \mu_L) (\overline{e} L \gamma_\alpha \nu_e L) + \eta_{LR} (\overline{\nu}_\mu L \gamma^\alpha \nu_e L) (\overline{e} R \gamma_\alpha \mu_R)$ ] with  $g^2/4\pi = 1$  and  $(\eta_{LL}, \eta_{LR}) = (0, \pm 1)$  are taken. No limits are given for  $\Lambda_{LL}^\pm$  with  $(\eta_{LL}, \eta_{LR}) = (\pm 1, 0)$ . For more general constraints with right-handed neutrinos and chirality nonconserving contact interactions, see their text.
- 2 DIAZCRUZ 94 limits are from  $\Gamma(\tau \rightarrow e\nu\nu)$  and assume flavor-dependent contact interactions with  $\Lambda(\tau\nu_\tau e\nu_e) \ll \Lambda(\mu\nu_\mu e\nu_e)$ .
- 3 DIAZCRUZ 94 limits are from  $\Gamma(\tau \rightarrow \mu\nu\nu)$  and assume flavor-dependent contact interactions with  $\Lambda(\tau\nu_\tau\mu\nu_\mu) \ll \Lambda(\mu\nu_\mu e\nu_e)$ .

### SCALE LIMITS for Contact Interactions: $\Lambda(e\nu q\bar{q})$

- 1 AABOUD 17AK limit is from dijet angular distribution in  $pp$  collisions at  $\sqrt{s} = 13$  TeV.  $u, d,$  and  $s$  quarks are assumed to be composite.
- 2 AABOUD 18AV obtain limit on  $t_R$  compositeness  $2\pi/\Lambda_{RR}^2 < 1.6$  TeV $^{-2}$  at 95% CL from  $t\bar{t}t\bar{t}$  production in the  $pp$  collisions at  $E_{cm} = 13$  TeV.
- 3 SIRUNYAN 18DD limit is from dijet angular distribution in  $pp$  collisions at  $\sqrt{s} = 13$  TeV.

- 4 SIRUNYAN 17F limit is from dijet angular cross sections in  $pp$  collisions at  $E_{cm} = 13$  TeV. All quarks are assumed to be composite.
- 5 AAD 16S limit is from dijet angular selections in  $pp$  collisions at  $E_{cm} = 13$  TeV.  $u, d,$  and  $s$  quarks are assumed to be composite.
- 6 AAD 15AR obtain limit on the  $t_R$  compositeness  $2\pi/\Lambda_{RR}^2 < 6.6$  TeV $^{-2}$  at 95% CL from the  $t\bar{t}t\bar{t}$  production in the  $pp$  collisions at  $E_{cm} = 8$  TeV.
- 7 AAD 15BY obtain limit on the  $t_R$  compositeness  $2\pi/\Lambda_{RR}^2 < 15.1$  TeV $^{-2}$  at 95% CL from the  $t\bar{t}t\bar{t}$  production in the  $pp$  collisions at  $E_{cm} = 8$  TeV.
- 8 AAD 15L limit is from dijet angular distribution in  $pp$  collisions at  $E_{cm} = 8$  TeV.  $u, d,$  and  $s$  quarks are assumed to be composite.
- 9 KHACHATRYAN 15J limit is from dijet angular distribution in  $pp$  collisions at  $E_{cm} = 8$  TeV.  $u, d, s, c,$  and  $b$  quarks are assumed to be composite.
- 10 FABBRICHESI 14 obtain bounds on chromoelectric and chromomagnetic form factors of the top-quark using  $pp \rightarrow t\bar{t}$  and  $p\bar{p} \rightarrow t\bar{t}$  cross sections. The quoted limit on the  $q\bar{q}t\bar{t}$  contact interaction is derived from their bound on the chromoelectric form factor.

### SCALE LIMITS for Contact Interactions: $\Lambda(\nu\nu q\bar{q})$

Limits are for  $\Lambda_{LL}^\pm$  only. For other cases, see each reference.

$\Lambda_{LL}^+(TeV)$	$\Lambda_{LL}^-(TeV)$	CL%	DOCUMENT ID	TECN	COMMENT
>5.0	>5.4	95	1 MCFARLAND 98	CCFR	$\nu N$ scattering

- 1 MCFARLAND 98 assumed a flavor universal interaction. Neutrinos were mostly of muon type.

### MASS LIMITS for Excited $e$ ( $e^*$ )

Most  $e^+e^-$  experiments assume one-photon or  $Z$  exchange. The limits from some  $e^+e^-$  experiments which depend on  $\lambda$  have assumed transition couplings which are chirality violating ( $\eta_L = \eta_R$ ). However they can be interpreted as limits for chirality-conserving interactions after multiplying the coupling value  $\lambda$  by  $\sqrt{2}$ ; see Note.

Excited leptons have the same quantum numbers as other ortholeptons. See also the searches for ortholeptons in the "Searches for Heavy Leptons" section.

### Limits for Excited $e$ ( $e^*$ ) from Pair Production

These limits are obtained from  $e^+e^- \rightarrow e^*e^*$  and thus rely only on the (electroweak) charge of  $e^*$ . Form factor effects are ignored unless noted. For the case of limits from  $Z$  decay, the  $e^*$  coupling is assumed to be of sequential type. Possible  $t$  channel contribution from transition magnetic coupling is neglected. All limits assume a dominant  $e^* \rightarrow e\gamma$  decay except the limits from  $\Gamma(Z)$ .

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

- 1 From  $e^+e^-$  collisions at  $\sqrt{s} = 183-209$  GeV.  $f = f'$  is assumed.
- 2 From  $e^+e^-$  collisions at  $\sqrt{s} = 189-209$  GeV.  $f = f'$  is assumed. ACHARD 03B also obtain limit for  $f = -f'$ .  $m_{e^*} > 96.6$  GeV.

### Limits for Excited $e$ ( $e^*$ ) from Single Production

These limits are from  $e^+e^- \rightarrow e^*e, W \rightarrow e^*\nu, \text{ or } ep \rightarrow e^*X$  and depend on transition magnetic coupling between  $e$  and  $e^*$ . All limits assume  $e^* \rightarrow e\gamma$  decay except as noted. Limits from LEP, UA2, and H1 are for chiral coupling, whereas all other limits are for nonchiral coupling,  $\eta_L = \eta_R = 1$ . In most papers, the limit is expressed in the form of an excluded region in the  $\lambda - m_{e^*}$  plane. See the original papers.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

## Quark and Lepton Compositeness

- <sup>5</sup> AAD 15AP search for  $e^*$  production in evens with three or more charged leptons in  $pp$  collisions at  $\sqrt{s} = 8$  TeV. The quoted limit assumes  $\Lambda = m_{e^*}$ ,  $f = f' = 1$ . The contact interaction is included in the  $e^*$  production and decay amplitudes.
- <sup>6</sup> AAD 13BB search for single  $e^*$  production in  $pp$  collisions with  $e^* \rightarrow e\gamma$  decay.  $f = f' = 1$ , and  $e^*$  production via contact interaction with  $\Lambda = m_{e^*}$  are assumed.
- <sup>7</sup> CHATRCHYAN 13AE search for single  $e^*$  production in  $pp$  collisions with  $e^* \rightarrow e\gamma$  decay.  $f = f' = 1$ , and  $e^*$  production via contact interaction with  $\Lambda = m_{e^*}$  are assumed.
- <sup>8</sup> AAD 12AZ search for  $e^*$  production via four-fermion contact interaction in  $pp$  collisions with  $e^* \rightarrow e\gamma$  decay. The quoted limit assumes  $\Lambda = m_{e^*}$ . See their Fig. 8 for the exclusion plot in the mass-coupling plane.

### Limits for Excited $e$ ( $e^*$ ) from $e^+e^- \rightarrow \gamma\gamma$

These limits are derived from indirect effects due to  $e^*$  exchange in the  $t$  channel and depend on transition magnetic coupling between  $e$  and  $e^*$ . All limits are for  $\lambda_\gamma = 1$ . All limits except ABE 89J and ACHARD 02D are for nonchiral coupling with  $\eta_L = \eta_R = 1$ . We choose the chiral coupling limit as the best limit and list it in the Summary Table.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

- <sup>1</sup> ABDALLAH 04N also obtain a limit on the excited electron mass with  $e^*$  chiral coupling,  $m_{e^*} > 295$  GeV at 95% CL.

### Indirect Limits for Excited $e$ ( $e^*$ )

These limits make use of loop effects involving  $e^*$  and are therefore subject to theoretical uncertainty.

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
•••			We do not use the following data for averages, fits, limits, etc. •••
	<sup>1</sup> DORENBOS... 89	CHRM	$\mathcal{P}_\mu e \rightarrow \mathcal{P}_\mu e, \nu_\mu e \rightarrow \nu_\mu e$
	<sup>2</sup> GRIFOLS 86	THEO	$\nu_\mu e \rightarrow \nu_\mu e$
	<sup>3</sup> RENARD 82	THEO	$g-2$ of electron

- <sup>1</sup> DORENBOSCH 89 obtain the limit  $\lambda_\gamma^2 \Lambda_{\text{cut}}^2 / m_{e^*}^2 < 2.6$  (95% CL), where  $\Lambda_{\text{cut}}$  is the cutoff scale, based on the one-loop calculation by GRIFOLS 86. If one assumes that  $\Lambda_{\text{cut}} = 1$  TeV and  $\lambda_\gamma = 1$ , one obtains  $m_{e^*} > 620$  GeV. However, one generally expects  $\lambda_\gamma \approx m_{e^*} / \Lambda_{\text{cut}}$  in composite models.
- <sup>2</sup> GRIFOLS 86 uses  $\nu_\mu e \rightarrow \nu_\mu e$  and  $\mathcal{P}_\mu e \rightarrow \mathcal{P}_\mu e$  data from CHARM Collaboration to derive mass limits which depend on the scale of compositeness.
- <sup>3</sup> RENARD 82 derived from  $g-2$  data limits on mass and couplings of  $e^*$  and  $\mu^*$ . See figures 2 and 3 of the paper.

### MASS LIMITS for Excited $\mu$ ( $\mu^*$ )

#### Limits for Excited $\mu$ ( $\mu^*$ ) from Pair Production

These limits are obtained from  $e^+e^- \rightarrow \mu^* \mu^*$  and thus rely only on the (electroweak) charge of  $\mu^*$ . Form factor effects are ignored unless noted. For the case of limits from  $Z$  decay, the  $\mu^*$  coupling is assumed to be of sequential type. All limits assume a dominant  $\mu^* \rightarrow \mu\gamma$  decay except the limits from  $\Gamma(Z)$ .

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

- 7 Limit is for  $B(q^* \rightarrow qg) + B(q^* \rightarrow q\gamma) = 1$ .

#### Limits for Excited $q$ ( $q^*$ ) from Single Production

These limits are from  $e^+e^- \rightarrow q^*\bar{q}$ ,  $p\bar{p} \rightarrow q^*X$ , or  $pp \rightarrow q^*X$  and depend on transition magnetic couplings between  $q$  and  $q^*$ . Assumptions about  $q^*$  decay mode are given in the footnotes and comments.

- 1 TUMASYAN 23AF limit quoted above assumes  $b\bar{g} \rightarrow b^*$  production. The limit becomes  $m_{b^*} > 4$  TeV if contact interaction is included in the  $b^*$  production cross section. See their Fig. 5 for limits on  $\sigma_B$ .
- 2 TUMASYAN 23BC search for excited light flavor quark  $q^*$  in  $pp$  collisions at  $\sqrt{s} = 13$  TeV.  $f = 1.0$  is assumed.
- 3 TUMASYAN 23BC search for excited  $b$  quark  $b^*$  in  $pp$  collisions at  $\sqrt{s} = 13$  TeV.  $b^*$  production via gauge interactions and  $f = 1.0$  are assumed. The limit becomes  $m_{b^*} > 3.8$  TeV if contact interaction is included in the  $b^*$  production cross section.
- 4 AAD 20T search for resonances decaying into dijets in  $pp$  collisions at  $\sqrt{s} = 13$  TeV. Assume  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ .
- 5 SIRUNYAN 20AI search for resonances decaying into dijets in  $pp$  collisions at  $\sqrt{s} = 13$  TeV. Assume  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ .
- 6 AABOUD 18AB assume  $\Lambda = m_{b^*}$ ,  $f_5 = f = f' = 1$ . The contact interactions are not included in  $b^*$  production and decay amplitudes.
- 7 AABOUD 18BA search for first-generation excited quarks ( $u^*$  and  $d^*$ ) with degenerate mass, assuming  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ . The contact interactions are not included in  $q^*$  production and decay amplitudes.
- 8 SIRUNYAN 18AG search for first-generation excited quarks ( $u^*$  and  $d^*$ ) with degenerate mass, assuming  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ .
- 9 SIRUNYAN 18AG search for excited  $b$  quark assuming  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ .
- 10 SIRUNYAN 18B0 assume  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ . The contact interactions are not included in  $q^*$  production and decay amplitudes.
- 11 SIRUNYAN 18P use the hadronic decay of  $W$  or  $Z$ , assuming  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ .
- 12 AABOUD 17AK assume  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ . The contact interactions are not included in  $q^*$  production and decay amplitudes. Only the decay of  $q^* \rightarrow g\bar{u}$  and  $q^* \rightarrow g\bar{d}$  is simulated as the benchmark signals in the analysis.
- 13 TUMASYAN 220 search for  $b^*$  decaying to  $tW$  in  $pp$  collisions at  $\sqrt{s} = 13$  TeV. The limit quoted above assumes  $\kappa_L^b = g_L = 1$ ,  $\kappa_R^b = g_R = 0$ . The limit becomes  $m_{b^*} > 3.0$  TeV ( $> 3.2$  TeV) if we assume  $\kappa_L^b = g_L = 0$ ,  $\kappa_R^b = g_R = 1$  ( $\kappa_L^b = g_L = 1$ ,  $\kappa_R^b = g_R = 1$ ). See their Fig. 3 for limits on  $\sigma_B$ .
- 14 SIRUNYAN 21AG search for  $b^*$  decaying to  $tW$  in  $pp$  collisions at  $\sqrt{s} = 13$  TeV. The limit quoted above assumes  $\kappa_L^b = g_L = 1$ ,  $\kappa_R^b = g_R = 0$ . The limit becomes  $m_{b^*} > 2.8$  TeV ( $> 3.1$  TeV) if we assume  $\kappa_L^b = g_L = 0$ ,  $\kappa_R^b = g_R = 1$  ( $\kappa_L^b = g_L = \kappa_R^b = g_R = 1$ ). See their Fig. 5 for limits on  $\sigma_B$ .
- 15 KHACHATRYAN 17W assume  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ . The contact interactions are not included in  $q^*$  production and decay amplitudes.
- 16 AABOUD 16 assume  $\Lambda = m_{b^*}$ ,  $f_5 = f = f' = 1$ . The contact interactions are not included in the  $b^*$  production and decay amplitudes.
- 17 AAD 16AH search for  $b^*$  decaying to  $tW$  in  $pp$  collisions at  $\sqrt{s} = 8$  TeV.  $f_g = f_L = f_R = 1$  are assumed. See their Fig. 12b for limits on  $\sigma \cdot B$ .
- 18 AAD 16AI assume  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ .
- 19 AAD 16AV search for single production of vector-like quarks decaying to  $Wb$  in  $pp$  collisions. See their Fig. 8 for the limits on couplings and mixings.
- 20 AAD 16S assume  $\Lambda = m_{q^*}$ ,  $f_5 = f = f' = 1$ . The contact interactions are not included in  $q^*$  production and decay amplitudes.

## Searches Particle Listings

## Quark and Lepton Compositeness, Extra Dimensions

- 21 KHACHATRYAN 16i search for  $b^*$  decaying to  $tW$  in  $pp$  collisions at  $\sqrt{s} = 8$  TeV.  $\kappa_R^b = g_L = 1$ ,  $\kappa_R^b = g_R = 0$  are assumed. See their Fig. 8 for limits on  $\sigma \cdot B$ .
- 22 KHACHATRYAN 16k assume  $\Lambda = m_{q^*}$ ,  $f_S = f = f' = 1$ . The contact interactions are not included in  $q^*$  production and decay amplitudes.
- 23 KHACHATRYAN 16l search for resonances decaying to dijets in  $pp$  collisions at  $\sqrt{s} = 8$  TeV using the data scouting technique which increases the sensitivity to the low mass resonances.
- 24 AAD 15v assume  $\Lambda = m_{q^*}$ ,  $f_S = f = f' = 1$ . The contact interactions are not included in  $q^*$  production and decay amplitudes.
- 25 KHACHATRYAN 15v assume  $\Lambda = m_{q^*}$ ,  $f_S = f = f' = 1$ . The contact interactions are not included in  $q^*$  production and decay amplitudes.
- 26 AAD 14a assume  $\Lambda = m_{q^*}$ ,  $f_S = f = f' = 1$ .
- 27 KHACHATRYAN 14 use the hadronic decay of  $W$ , assuming  $\Lambda = m_{q^*}$ ,  $f_S = f = f' = 1$ .
- 28 KHACHATRYAN 14 use the hadronic decay of  $Z$ , assuming  $\Lambda = m_{q^*}$ ,  $f_S = f = f' = 1$ .
- 29 KHACHATRYAN 14j assume  $f_S = f = f' = \Lambda / m_{q^*}$ .
- 30 CHATRCHYAN 13AJ use the hadronic decay of  $W$ .
- 31 CHATRCHYAN 13AJ use the hadronic decay of  $Z$ .

MASS LIMITS for Color Sextet Quarks ( $q_6$ )

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>84	95	1 ABE 89D	89D CDF	$p\bar{p} \rightarrow q_6 \bar{q}_6$

1 ABE 89D look for pair production of unit-charged particles which leave the detector before decaying. In the above limit the color sextet quark is assumed to fragment into a unit-charged or neutral hadron with equal probability and to have long enough lifetime not to decay within the detector. A limit of 121 GeV is obtained for a color decuplet.

MASS LIMITS for Color Octet Charged Leptons ( $\ell_8$ )

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>86	95	1 ABE 89D	89D CDF	Stable $\ell_8$ ; $p\bar{p} \rightarrow \ell_8 \bar{\ell}_8$

• • • We do not use the following data for averages, fits, limits, etc. • • •

2 ABT 93 H1  $e_8$ ;  $e p \rightarrow e_8 X$

1 ABE 89D look for pair production of unit-charged particles which leave the detector before decaying. In the above limit the color octet lepton is assumed to fragment into a unit-charged or neutral hadron with equal probability and to have long enough lifetime not to decay within the detector. The limit improves to 99 GeV if it always fragments into a unit-charged hadron.

2 ABT 93 search for  $e_8$  production via  $e$ -gluon fusion in  $ep$  collisions with  $e_8 \rightarrow e g$ . See their Fig. 3 for exclusion plot in the  $m_{e_8}$ - $\Lambda$  plane for  $m_{e_8} = 35$ –220 GeV.

MASS LIMITS for Color Octet Neutrinos ( $\nu_8$ )

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>110	90	1 BARGER 89	RVUE	$\nu_8$ ; $p\bar{p} \rightarrow \nu_8 \bar{\nu}_8$

• • • We do not use the following data for averages, fits, limits, etc. • • •

none 3.8–29.8 95 2 KIM 90 AMY  $\nu_8$ ;  $e^+e^- \rightarrow$  acoplanar jets

none 9–21.9 95 3 BARTEL 87B JADE  $\nu_8$ ;  $e^+e^- \rightarrow$  acoplanar jets

1 BARGER 89 used ABE 89B limit for events with large missing transverse momentum. Two-body decay  $\nu_8 \rightarrow \nu g$  is assumed.

2 KIM 90 is at  $E_{cm} = 50$ –60.8 GeV. The same assumptions as in BARTEL 87B are used.

3 BARTEL 87B is at  $E_{cm} = 46.3$ –46.78 GeV. The limit assumes the  $\nu_8$  pair production cross section to be eight times larger than that of the corresponding heavy neutrino pair production. This assumption is not valid in general for the weak couplings, and the limit can be sensitive to its  $SU(2)_L \times U(1)_Y$  quantum numbers.

MASS LIMITS for  $W_8$  (Color Octet  $W$  Boson)

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
>110	1 ALBAJAR 89	UA1	$p\bar{p} \rightarrow W_8 X, W_8 \rightarrow W g$

1 ALBAJAR 89 give  $\sigma(W_8 \rightarrow W + \text{jet})/\sigma(W) < 0.019$  (90% CL) for  $m_{W_8} > 220$  GeV.

## Extra Dimensions

For explanation of terms used and discussion of significant model dependence of following limits, see the “Extra Dimensions” review. Footnotes describe originally quoted limit.  $\delta$  indicates the number of extra dimensions.

Limits not encoded here are summarized in the “Extra Dimensions” review, where the latest unpublished results are also described.

### Limits on $R$ from Deviations in Gravitational Force Law

This section includes limits on the size of extra dimensions from deviations in the Newtonian ( $1/r^2$ ) gravitational force law at short distances. Deviations are parametrized by a gravitational potential of the form  $V = -(G m m'/r) [1 + \alpha \exp(-r/R)]$ . For  $\delta$  toroidal extra dimensions of equal size,  $\alpha = 8\delta/3$ . Quoted bounds are for  $\delta = 2$  unless otherwise noted.

- 1 BLAKEMORE 21 obtain constraints on non-Newtonian forces with strengths  $|\alpha| \gtrsim 10^8$  and length scales  $R > 10 \mu\text{m}$ . See their Fig. 4 for more details including comparison with previous searches.
- 2 HEACOCK 21 obtain constraints on non-Newtonian forces with strengths  $10^{18} \lesssim |\alpha| \lesssim 10^{25}$  and length scales  $R \approx 0.02\text{--}10 \text{ nm}$ . See their Figure 3 for more details. This improves the results of HADDOCK 18. These constraints do not place limits on the size of extra flat dimensions.
- 3 LEE 20 search for new forces probing a range of  $|\alpha| \approx 0.1\text{--}10^5$  and length scales  $R \approx 7\text{--}90 \mu\text{m}$ . For  $\delta = 1$  the bound on  $R$  is  $30 \mu\text{m}$ . See their Fig. 5 for details on the bound.
- 4 TAN 20A search for new forces probing a range of  $|\alpha| \approx 4 \times 10^{-3}\text{--}1 \times 10^2$  and length scales  $R \approx 40\text{--}350 \mu\text{m}$ . See their Fig. 6 for details on the bound.
- 5 BERGE 18 uses results from the MICROSCOPE experiment to obtain constraints on non-Newtonian forces with strengths  $10^{-11} \lesssim |\alpha| \lesssim 10^{-7}$  and length scales  $R \gtrsim 10^5 \text{ m}$ . See their Figure 1 for more details. These constraints do not place limits on the size of extra flat dimensions.
- 6 FAYET 18A uses results from the MICROSCOPE experiment to obtain constraints on an EP-violating force possibly arising from a new  $U(1)$  gauge boson. For  $R \gtrsim 10^7 \text{ m}$  the limits are  $|\alpha| \lesssim$  a few  $10^{-13}$  to a few  $10^{-11}$  depending on the coupling, corresponding to  $|e| \lesssim 10^{-24}$  for the coupling of the new spin-1 or spin-0 mediator. These constraints do not place limits on the size of extra flat dimensions. This extends the results of FAYET 18.
- 7 KLIMCHITSKAYA 17A uses an experiment that measures the difference of Casimir forces to obtain bounds on non-Newtonian forces with strengths  $|\alpha| \approx 10^5\text{--}10^{17}$  and length scales  $R = 0.03\text{--}10 \mu\text{m}$ . See their Fig. 3. These constraints do not place limits on the size of extra flat dimensions.
- 8 XU 13 obtain constraints on non-Newtonian forces with strengths  $|\alpha| \approx 10^{34}\text{--}10^{36}$  and length scales  $R \approx 1\text{--}10 \text{ fm}$ . See their Fig. 4 for more details. These constraints do not place limits on the size of extra flat dimensions.
- 9 BEZERRA 11 obtain constraints on non-Newtonian forces with strengths  $10^{11} \lesssim |\alpha| \lesssim 10^{18}$  and length scales  $R = 30\text{--}1260 \text{ nm}$ . See their Fig. 2 for more details. These constraints do not place limits on the size of extra flat dimensions.
- 10 SUSHKOV 11 obtain improved limits on non-Newtonian forces with strengths  $10^7 \lesssim |\alpha| \lesssim 10^{11}$  and length scales  $0.4 \mu\text{m} < R < 4 \mu\text{m}$  (95% CL). See their Fig. 2. These bounds do not place limits on the size of extra flat dimensions. However, a model dependent bound of  $M_* > 70 \text{ TeV}$  is obtained assuming gauge bosons that couple to baryon number also propagate in  $(4 + \delta)$  dimensions.
- 11 BEZERRA 10 obtain improved constraints on non-Newtonian forces with strengths  $10^{19} \lesssim |\alpha| \lesssim 10^{29}$  and length scales  $R = 1.6\text{--}14 \text{ nm}$  (95% CL). See their Fig. 1. This bound does not place limits on the size of extra flat dimensions.
- 12 MASUDA 09 obtain improved constraints on non-Newtonian forces with strengths  $10^9 \lesssim |\alpha| \lesssim 10^{11}$  and length scales  $R = 1.0\text{--}2.9 \mu\text{m}$  (95% CL). See their Fig. 3. This bound does not place limits on the size of extra flat dimensions.
- 13 GERACI 08 obtain improved constraints on non-Newtonian forces with strengths  $|\alpha| > 14,000$  and length scales  $R = 5\text{--}15 \mu\text{m}$ . See their Fig. 9. This bound does not place limits on the size of extra flat dimensions.
- 14 TRENKEL 08 uses two independent measurements of Newton's constant  $G$  to constrain new forces with strength  $|\alpha| \approx 10^{-4}$  and length scales  $R = 0.02\text{--}1 \text{ m}$ . See their Fig. 1. This bound does not place limits on the size of extra flat dimensions.
- 15 DECCA 07A search for new forces and obtain bounds in the region with strengths  $|\alpha| \approx 10^{13}\text{--}10^{18}$  and length scales  $R = 20\text{--}86 \text{ nm}$ . See their Fig. 6. This bound does not place limits on the size of extra flat dimensions.
- 16 KAPNER 07 search for new forces, probing a range of  $|\alpha| \approx 10^{-3}\text{--}10^5$  and length scales  $R \approx 10\text{--}1000 \mu\text{m}$ . For  $\delta = 1$  the bound on  $R$  is  $44 \mu\text{m}$ . For  $\delta = 2$ , the bound is expressed in terms of  $M_*$ , here translated to a bound on the radius. See their Fig. 6 for details on the bound.
- 17 TU 07 search for new forces probing a range of  $|\alpha| \approx 10^{-1}\text{--}10^5$  and length scales  $R \approx 20\text{--}1000 \mu\text{m}$ . For  $\delta = 1$  the bound on  $R$  is  $53 \mu\text{m}$ . See their Fig. 3 for details on the bound.

- 18 SMULLIN 05 search for new forces, and obtain bounds in the region with strengths  $\alpha \approx 10^3\text{--}10^8$  and length scales  $R = 6\text{--}20 \mu\text{m}$ . See their Figs. 1 and 16 for details on the bound. This work does not place limits on the size of extra flat dimensions.
- 19 HOYLE 04 search for new forces, probing  $\alpha$  down to  $10^{-2}$  and distances down to  $10 \mu\text{m}$ . Quoted bound on  $R$  is for  $\delta = 2$ . For  $\delta = 1$ , bound goes to  $160 \mu\text{m}$ . See their Fig. 34 for details on the bound.
- 20 CHIAVERINI 03 search for new forces, probing  $\alpha$  above  $10^4$  and  $\lambda$  down to  $3 \mu\text{m}$ , finding no signal. See their Fig. 4 for details on the bound. This bound does not place limits on the size of extra flat dimensions.
- 21 LONG 03 search for new forces, probing  $\alpha$  down to 3, and distances down to about  $10 \mu\text{m}$ . See their Fig. 4 for details on the bound.
- 22 HOYLE 01 search for new forces, probing  $\alpha$  down to  $10^{-2}$  and distances down to  $20 \mu\text{m}$ . See their Fig. 4 for details on the bound. The quoted bound is for  $\alpha \geq 3$ .
- 23 HOSKINS 85 search for new forces, probing distances down to  $4 \text{ mm}$ . See their Fig. 13 for details on the bound. This bound does not place limits on the size of extra flat dimensions.

### Limits on $R$ from On-Shell Production of Gravitons: $\delta = 2$

This section includes limits on on-shell production of gravitons in collider and astrophysical processes. Bounds quoted are on  $R$ , the assumed common radius of the flat extra dimensions, for  $\delta = 2$  extra dimensions. Studies often quote bounds in terms of derived parameter; experiments are actually sensitive to the masses of the KK gravitons:  $m_{\vec{n}} = |\vec{n}|/R$ . See the Review on "Extra Dimensions" for details. Bounds are given in  $\mu\text{m}$  for  $\delta = 2$ .

- 1 AAD 21F search for  $pp \rightarrow jG$ , using  $139 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 13 \text{ TeV}$  to place lower limits on  $M_D$  for two to six extra dimensions (see their Table X), from which this bound on  $R$  is derived. This limit supersedes that in AABOUD 18f.
- 2 HANNESTAD 03 obtain a limit on  $R$  from the heating of old neutron stars by the surrounding cloud of trapped KK gravitons. Limits for all  $\delta \leq 7$  are given in their Tables V and VI. These limits supersede those in HANNESTAD 02.
- 3 SIRUNYAN 21A search for  $pp \rightarrow ZG$ , using  $137 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 13 \text{ TeV}$  to place lower limits on  $M_D$  for two to seven extra dimensions (see their Figure 12), from which this bound on  $R$  is derived. These limits supersede those obtained in SIRUNYAN 18b.
- 4 TUMASYAN 21D search for  $pp \rightarrow jG$ , using  $137 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 13 \text{ TeV}$  to place lower limits on  $M_D$  for two to seven extra dimensions (see their Table 3), from which this bound on  $R$  is derived. This limit supersedes that in SIRUNYAN 18s.
- 5 SIRUNYAN 17AQ search for  $pp \rightarrow \gamma G$ , using  $12.9 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 13 \text{ TeV}$  to place limits on  $M_D$  for three to six extra dimensions (see their Table 3).
- 6 AABOUD 16F search for  $pp \rightarrow \gamma G$ , using  $3.2 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 13 \text{ TeV}$  to place limits on  $M_D$  for two to six extra dimensions (see their Figure 9), from which this bound on  $R$  is derived.
- 7 KHACHATRYAN 16N search for  $pp \rightarrow \gamma G$ , using  $19.6 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 8 \text{ TeV}$  to place limits on  $M_D$  for three to six extra dimensions (see their Table 5).
- 8 AAD 15CS search for  $pp \rightarrow \gamma G$ , using  $20.3 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 8 \text{ TeV}$  to place lower limits on  $M_D$  for two to six extra dimensions (see their Fig. 18).
- 9 AAD 13C search for  $pp \rightarrow \gamma G$ , using  $4.6 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 7 \text{ TeV}$  to place bounds on  $M_D$  for two to six extra dimensions, from which this bound on  $R$  is derived.
- 10 AAD 13D search for the dijet decay of quantum black holes in  $4.8 \text{ fb}^{-1}$  of data produced in  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  to place bounds on  $M_D$  for two to seven extra dimensions, from which these bounds on  $R$  are derived. Limits on  $M_D$  for all  $\delta \leq 7$  are given in their Table 3.
- 11 AJELLO 12 obtain a limit on  $R$  from the gamma-ray emission of point  $\gamma$  sources that arise from the photon decay of KK gravitons which are gravitationally bound around neutron stars. Limits for all  $\delta \leq 7$  are given in their Table 7.
- 12 AALTONEN 08AC search for  $p\bar{p} \rightarrow \gamma G$  and  $p\bar{p} \rightarrow jG$  at  $\sqrt{s} = 1.96 \text{ TeV}$  with  $2.0 \text{ fb}^{-1}$  and  $1.1 \text{ fb}^{-1}$  respectively, in order to place bounds on the fundamental scale and size of the extra dimensions. See their Table III for limits on all  $\delta \leq 6$ .
- 13 ABAZOV 08S search for  $p\bar{p} \rightarrow \gamma G$ , using  $1 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$  to place bounds on  $M_D$  for two to eight extra dimensions, from which these bounds on  $R$  are derived. See their paper for intermediate values of  $\delta$ .

## Extra Dimensions

- <sup>14</sup> DAS 08 obtain a limit on  $R$  from Kaluza-Klein graviton cooling of SN1987A due to plasmon-plasmon annihilation.
- <sup>15</sup> ABULENCIA, A 06 search for  $p\bar{p} \rightarrow jG$  using  $368 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . See their Table II for bounds for all  $\delta \leq 6$ .
- <sup>16</sup> ABDALLAH 05B search for  $e^+e^- \rightarrow \gamma G$  at  $\sqrt{s} = 180\text{--}209 \text{ GeV}$  to place bounds on the size of extra dimensions and the fundamental scale. Limits for all  $\delta \leq 6$  are given in their Table 6. These limits supersede those in ABREU 00Z.
- <sup>17</sup> ACHARD 04E search for  $e^+e^- \rightarrow \gamma G$  at  $\sqrt{s} = 189\text{--}209 \text{ GeV}$  to place bounds on the size of extra dimensions and the fundamental scale. See their Table 8 for limits with  $\delta \leq 8$ . These limits supersede those in ACCIARRI 99R.
- <sup>18</sup> ACOSTA 04C search for  $p\bar{p} \rightarrow jG$  at  $\sqrt{s} = 1.8 \text{ TeV}$  to place bounds on the size of extra dimensions and the fundamental scale. See their paper for bounds on  $\delta = 4, 6$ .
- <sup>19</sup> CASSE 04 obtain a limit on  $R$  from the gamma-ray emission of point  $\gamma$  sources that arises from the photon decay of gravitons around newly born neutron stars, applying the technique of HANNESTAD 03 to neutron stars in the galactic bulge. Limits for all  $\delta \leq 7$  are given in their Table I.
- <sup>20</sup> ABAZOV 03 search for  $p\bar{p} \rightarrow jG$  at  $\sqrt{s} = 1.8 \text{ TeV}$  to place bounds on  $M_D$  for 2 to 7 extra dimensions, from which these bounds on  $R$  are derived. See their paper for bounds on intermediate values of  $\delta$ . We quote results without the approximate NLO scaling introduced in the paper.
- <sup>21</sup> HANNESTAD 03 obtain a limit on  $R$  from graviton cooling of supernova SN1987A. Limits for all  $\delta \leq 7$  are given in their Tables V and VI.
- <sup>22</sup> HANNESTAD 03 obtain a limit on  $R$  from gravitons emitted in supernovae and which subsequently decay, contaminating the diffuse cosmic  $\gamma$  background. Limits for all  $\delta \leq 7$  are given in their Tables V and VI. These limits supersede those in HANNESTAD 02.
- <sup>23</sup> HANNESTAD 03 obtain a limit on  $R$  from gravitons emitted in two recent supernovae and which subsequently decay, creating point  $\gamma$  sources. Limits for all  $\delta \leq 7$  are given in their Tables V and VI. These limits are corrected in the published erratum.
- <sup>24</sup> HEISTER 03C use the process  $e^+e^- \rightarrow \gamma G$  at  $\sqrt{s} = 189\text{--}209 \text{ GeV}$  to place bounds on the size of extra dimensions and the scale of gravity. See their Table 4 for limits with  $\delta \leq 6$  for derived limits on  $M_D$ .
- <sup>25</sup> FAIRBAIRN 01 obtains bounds on  $R$  from over production of KK gravitons in the early universe. Bounds are quoted in paper in terms of fundamental scale of gravity. Bounds depend strongly on temperature of QCD phase transition and range from  $R < 0.13 \mu\text{m}$  to  $0.001 \mu\text{m}$  for  $\delta=2$ ; bounds for  $\delta=3,4$  can be derived from Table 1 in the paper.
- <sup>26</sup> HANHART 01 obtain bounds on  $R$  from limits on graviton cooling of supernova SN1987A using numerical simulations of proto-neutron star neutrino emission.
- <sup>27</sup> CASSISI 00 obtain rough bounds on  $M_D$  (and thus  $R$ ) from red giant cooling for  $\delta=2,3$ . See their paper for details.
- <sup>28</sup> ACCIARRI 99s search for  $e^+e^- \rightarrow ZG$  at  $\sqrt{s}=189 \text{ GeV}$ . Limits on the gravity scale are found in their Table 2, for  $\delta \leq 4$ .

### Mass Limits on $M_{TT}$

This section includes limits on the cut-off mass scale,  $M_{TT}$ , of dimension-8 operators from KK graviton exchange in models of large extra dimensions. Ambiguities in the UV-divergent summation are absorbed into the parameter  $\lambda$ , which is taken to be  $\lambda = \pm 1$  in the following analyses. Bounds for  $\lambda = -1$  are shown in parenthesis after the bound for  $\lambda = +1$ , if appropriate. Different papers use slightly different definitions of the mass scale. The definition used here is related to another popular convention by  $M_{TT}^4 = (2/\pi) \Lambda_{*}^4$ , as discussed in the above Review on "Extra Dimensions."

- <sup>1</sup> SIRUNYAN 18DD use dijet angular distributions in  $35.9 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to place a lower bound on  $\Lambda_T$ , here converted to  $M_{TT}$ . This updates the results of SIRUNYAN 17F.
- <sup>2</sup> GIUDICE 03 place bounds on  $\Lambda_6$ , the coefficient of the gravitationally-induced dimension-6 operator  $(2\pi\lambda/\Lambda_6^2)(\sum \bar{T}_\gamma \mu^{\gamma 5} \eta)(\sum \bar{T}_\gamma \mu^{\gamma 5} \eta)$ , using data from a variety of experiments. Results are quoted for  $\lambda = \pm 1$  and are independent of  $\delta$ .
- <sup>3</sup> SIRUNYAN 21N use  $137 (140) \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in the dilepton (dimuon) channels to place a lower limit on  $\Lambda_T$ , here converted to  $M_{TT}$ . Bounds on individual channels can be found in their Table 7.
- <sup>4</sup> SIRUNYAN 19AC use  $35.9 (36.3) \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in the dilepton (dimuon) channels to place a lower limit on  $\Lambda_T$ , here converted to  $M_{TT}$ . The dilepton and dimuon channels are combined with previous results in the diphoton channel to set the best limit. Bounds on individual channels and different priors can be found in their Table 2. This updates the results in KHACHATRYAN 15AE.
- <sup>5</sup> SIRUNYAN 18DU use  $35.9 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to place lower limits on  $M_{TT}$  (equivalent to their  $M_S$ ). This updates the results of CHATRCHYAN 12R.
- <sup>6</sup> AABOUD 17AP use  $36.7 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to place lower limits on  $M_{TT}$  (equivalent to their  $M_S$ ). This updates the results of AAD 13AS.
- <sup>7</sup> AAD 14BE use  $20 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  in the dilepton channel to place lower limits on  $M_{TT}$  (equivalent to their  $M_S$ ).
- <sup>8</sup> AAD 13E use  $4.9$  and  $5.0 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  in the dilepton and dimuon channels, respectively, to place lower limits on  $M_{TT}$  (equivalent to their  $M_S$ ). The dilepton and dimuon channels are combined with previous results in the diphoton channel to set the best limit. Bounds on individual channels and different priors can be found in their Table VIII.
- <sup>9</sup> BAAK 12 use electroweak precision observables to place bounds on the ratio  $\Lambda_T/M_D$  as a function of  $M_D$ . See their Fig. 22 for constraints with a Higgs mass of  $120 \text{ GeV}$ .
- <sup>10</sup> AARON 11C search for deviations in the differential cross section of  $e^{\pm}p \rightarrow e^{\pm}X$  in  $446 \text{ pb}^{-1}$  of data taken at  $\sqrt{s} = 301$  and  $319 \text{ GeV}$  to place a bound on  $M_{TT}$ .
- <sup>11</sup> ABAZOV 09AE use dijet angular distributions in  $0.7 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to place lower bounds on  $\Lambda_T$  (equivalent to their  $M_S$ ), here converted to  $M_{TT}$ .
- <sup>12</sup> ABAZOV 09D use  $1.05 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to place lower bounds on  $\Lambda_T$  (equivalent to their  $M_S$ ), here converted to  $M_{TT}$ .
- <sup>13</sup> SCHAEEL 07A use  $e^+e^-$  collisions at  $\sqrt{s} = 189\text{--}209 \text{ GeV}$  to place lower limits on  $\Lambda_T$ , here converted to limits on  $M_{TT}$ .
- <sup>14</sup> ABDALLAH 06C use  $e^+e^-$  collisions at  $\sqrt{s} \sim 130\text{--}207 \text{ GeV}$  to place lower limits on  $M_{TT}$ , which is equivalent to their definition of  $M_S$ . Bound shown includes all possible final state leptons,  $\ell = e, \mu, \tau$ . Bounds on individual leptonic final states can be found in their Table 31.
- <sup>15</sup> GERDES 06 use  $100$  to  $110 \text{ pb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.8 \text{ TeV}$ , as recorded by the CDF Collaboration during Run I of the Tevatron. Bound shown includes a  $K$ -factor of  $1.3$ . Bounds on individual  $e^+e^-$  and  $\gamma\gamma$  final states are found in their Table 1.
- <sup>16</sup> ABAZOV 05V use  $246 \text{ pb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to search for deviations in the differential cross section to  $\mu^+\mu^-$  from graviton exchange.
- <sup>17</sup> CHEKANOV 04B search for deviations in the differential cross section of  $e^{\pm}p \rightarrow e^{\pm}X$  with  $130 \text{ pb}^{-1}$  of combined data and  $Q^2$  values up to  $40,000 \text{ GeV}^2$  to place a bound on  $M_{TT}$ .
- <sup>18</sup> ABBIENDI 03D use  $e^+e^-$  collisions at  $\sqrt{s}=181\text{--}209 \text{ GeV}$  to place bounds on the ultraviolet scale  $M_{TT}$ , which is equivalent to their definition of  $M_S$ .
- <sup>19</sup> ACHARD 03D look for deviations in the cross section for  $e^+e^- \rightarrow ZZ$  from  $\sqrt{s} = 200\text{--}209 \text{ GeV}$  to place a bound on  $M_{TT}$ .
- <sup>20</sup> ADLOFF 03 search for deviations in the differential cross section of  $e^{\pm}p \rightarrow e^{\pm}X$  at  $\sqrt{s}=301$  and  $319 \text{ GeV}$  to place bounds on  $M_{TT}$ .
- <sup>21</sup> GIUDICE 03 review existing experimental bounds on  $M_{TT}$  and derive a combined limit.
- <sup>22</sup> HEISTER 03C use  $e^+e^-$  collisions at  $\sqrt{s}=189\text{--}209 \text{ GeV}$  to place bounds on the scale of dim-8 gravitational interactions. Their  $M_S^{\pm}$  is equivalent to our  $M_{TT}$  with  $\lambda = \pm 1$ .
- <sup>23</sup> ACHARD 02 search for s-channel graviton exchange effects in  $e^+e^- \rightarrow \gamma\gamma$  at  $E_{\text{cm}} = 192\text{--}209 \text{ GeV}$ .
- <sup>24</sup> ABBOTT 01 search for variations in differential cross sections to  $e^+e^-$  and  $\gamma\gamma$  final states at the Tevatron.
- <sup>25</sup> ABBIENDI 00R uses  $e^+e^-$  collisions at  $\sqrt{s} = 189 \text{ GeV}$ .
- <sup>26</sup> ABREU 00A search for s-channel graviton exchange effects in  $e^+e^- \rightarrow \gamma\gamma$  at  $E_{\text{cm}} = 189\text{--}202 \text{ GeV}$ .
- <sup>27</sup> ABREU 00S uses  $e^+e^-$  collisions at  $\sqrt{s}=183$  and  $189 \text{ GeV}$ . Bounds on  $\mu$  and  $\tau$  individual final states given in paper.
- <sup>28</sup> CHANG 00B derive  $3\sigma$  limit on  $M_{TT}$  of  $(28,19,15) \text{ TeV}$  for  $\delta=(2,4,6)$  respectively assuming the presence of a torsional coupling in the gravitational action. Highly model dependent.
- <sup>29</sup> CHEUNG 00 obtains limits from anomalous diphoton production at OPAL due to graviton exchange. Original limit for  $\delta=4$ . However, unknown UV theory renders  $\delta$  dependence unreliable. Original paper works in HLZ convention.
- <sup>30</sup> GRAESSER 00 obtains a bound from graviton contributions to  $g-2$  of the muon through loops of  $0.29 \text{ TeV}$  for  $\delta=2$  and  $0.38 \text{ TeV}$  for  $\delta=4,6$ . Limits scale as  $\lambda^{1/2}$ . However calculational scheme not well-defined without specification of high-scale theory. See the "Extra Dimensions Review."
- <sup>31</sup> HAN 00 calculates corrections to gauge boson self-energies from KK graviton loops and constrain them using  $S$  and  $T$ . Bounds on  $M_{TT}$  range from  $0.5 \text{ TeV}$  ( $\delta=6$ ) to  $1.1 \text{ TeV}$  ( $\delta=2$ ); see text. Limits have strong dependence,  $\lambda^{\delta+2}$ , on unknown  $\lambda$  coefficient.
- <sup>32</sup> MATHEWS 00 search for evidence of graviton exchange in CDF and  $D0$  dijet production data. See their Table 2 for slightly stronger  $\delta$ -dependent bounds. Limits expressed in terms of  $\tilde{M}_S^4 = M_{TT}^4/8$ .
- <sup>33</sup> MELE 00 obtains bound from KK graviton contributions to  $e^+e^- \rightarrow VV$  ( $V=\gamma, W, Z$ ) at LEP. Authors use Hewett conventions.

- <sup>34</sup> ABBIENDI 99P search for  $s$ -channel graviton exchange effects in  $e^+e^- \rightarrow \gamma\gamma$  at  $E_{\text{cm}}=189$  GeV. The limits  $G_{\pm} > 660$  GeV and  $G_{\pm} > 634$  GeV are obtained from combined  $E_{\text{cm}}=183$  and 189 GeV data, where  $G_{\pm}$  is a scale related to the fundamental gravity scale.
- <sup>35</sup> ACCIARRI 99M search for the reaction  $e^+e^- \rightarrow \gamma G$  and  $s$ -channel graviton exchange effects in  $e^+e^- \rightarrow \gamma\gamma, W^+W^-, ZZ, e^+e^-, \mu^+\mu^-, \tau^+\tau^-, q\bar{q}$  at  $E_{\text{cm}}=183$  GeV. Limits on the gravity scale are listed in their Tables 1 and 2.
- <sup>36</sup> ACCIARRI 99S search for the reaction  $e^+e^- \rightarrow ZG$  and  $s$ -channel graviton exchange effects in  $e^+e^- \rightarrow \gamma\gamma, W^+W^-, ZZ, e^+e^-, \mu^+\mu^-, \tau^+\tau^-, q\bar{q}$  at  $E_{\text{cm}}=189$  GeV. Limits on the gravity scale are listed in their Tables 1 and 2.
- <sup>37</sup> BOURILKOV 99 performs global analysis of LEP data on  $e^+e^-$  collisions at  $\sqrt{s}=183$  and 189 GeV. Bound is on  $\Lambda_T$ .

### Limits on $1/R = M_C$

This section includes limits on  $1/R = M_C$ , the compactification scale in models with one TeV-sized extra dimension, due to exchange of Standard Model KK excitations. Bounds assume fermions are not in the bulk, unless stated otherwise. See the "Extra Dimensions" review for discussion of model dependence.

- <sup>1</sup> AAD 12CC use 4.9 and 5.0  $\text{fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 7$  TeV in the dielectron and dimuon channels, respectively, to place a lower bound on the mass of the lightest KK  $Z/\gamma$  boson (equivalent to  $1/R = M_C$ ). The limit quoted here assumes a flat prior corresponding to when the pure  $Z/\gamma$  KK cross section term dominates. See their Section 15 for more details.
- <sup>2</sup> BARBIERI 04 use electroweak precision observables to place a lower bound on the compactification scale  $1/R$ . Both the gauge bosons and the Higgs boson are assumed to propagate in the bulk.
- <sup>3</sup> FLORES 23 use a number of 13 TeV Run 2 searches at the LHC to place constraints on the compactification scale  $1/R$  and cutoff scale  $\Lambda$  in the minimal universal extra dimension model with Standard Model fields propagating in the bulk (see their Fig.6).
- <sup>4</sup> AVNISH 21 perform a study on the ATLAS collaboration search for multiple jets plus missing transverse energy from  $pp$  collisions at  $\sqrt{s} = 13$  TeV and integrated luminosity of 139  $\text{fb}^{-1}$ , to place constraints on the compactification scale and cutoff scale  $\Lambda$  in universal extra dimension models with Standard Model fields propagating in the bulk.
- <sup>5</sup> AABOUD 18AV use 36.1  $\text{fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13$  TeV in final states with multiple b-jets, to place a lower bound on the compactification scale in a model with two universal extra dimensions. Assuming the radii of the two extra dimensions are equal, a lower limit of 1.8 TeV for the Kaluza-Klein mass is obtained.
- <sup>6</sup> AABOUD 18CE use 36.1  $\text{fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13$  TeV in final states with same-charge leptons and b-jets, to place a lower bound on the compactification scale in a model with two universal extra dimensions. Assuming the radii of the two extra dimensions are equal, a lower limit of 1.45 TeV for the Kaluza-Klein mass is obtained.
- <sup>7</sup> ACCOMANDO 15 use electroweak precision observables to place a lower bound on the compactification scale  $1/R$ . See their Fig. 2 for the bound as a function of  $\sin\beta$ , which parametrizes the VEV contribution from brane and bulk Higgs fields. The quoted value is for the minimum bound which occurs at  $\sin\beta = 0.45$ .
- <sup>8</sup> KHACHATRYAN 15T use 19.7  $\text{fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8$  TeV to place a lower bound on the compactification scale  $1/R$ .
- <sup>9</sup> CHATRCHYAN 13AQ use 5.0  $\text{fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 7$  TeV and a further 3.7  $\text{fb}^{-1}$  of data at  $\sqrt{s} = 8$  TeV to place a lower bound on the compactification scale  $1/R$ , in models with universal extra dimensions and Standard Model fields propagating in the bulk. See their Fig. 5 for the bound as a function of the universal bulk fermion mass parameter  $\mu$ .
- <sup>10</sup> CHATRCHYAN 13W use diphoton events with large missing transverse momentum in 4.93  $\text{fb}^{-1}$  of data produced from  $pp$  collisions at  $\sqrt{s} = 7$  TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale  $\Lambda$ , for the radiative corrections to the Kaluza-Klein masses, satisfies  $\Lambda/M_C = 20$ . The model parameters are chosen such that the decay  $\gamma^* \rightarrow G\gamma$  occurs with an appreciable branching fraction.
- <sup>11</sup> EDELHAUSER 13 use 19.6 and 20.6  $\text{fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8$  TeV analyzed by the CMS Collaboration in the dielectron and dimuon channels, respectively, to place a lower bound on the mass of the second lightest Kaluza-Klein  $Z/\gamma$  boson (converted to a limit on  $1/R = M_C$ ). The bound assumes Standard Model fields propagating

in the bulk and that the cutoff scale  $\Lambda$ , for the radiative corrections to the Kaluza-Klein masses, satisfies  $\Lambda/M_C = 20$ .

- <sup>12</sup> AAD 12CP use diphoton events with large missing transverse momentum in 4.8  $\text{fb}^{-1}$  of data produced from  $pp$  collisions at  $\sqrt{s} = 7$  TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale  $\Lambda$ , for the radiative corrections to the Kaluza-Klein masses, satisfies  $\Lambda/M_C = 20$ . The model parameters are chosen such that the decay  $\gamma^* \rightarrow G\gamma$  occurs with an appreciable branching fraction.
- <sup>13</sup> AAD 12X use diphoton events with large missing transverse momentum in 1.07  $\text{fb}^{-1}$  of data produced from  $pp$  collisions at  $\sqrt{s} = 7$  TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale  $\Lambda$ , for the radiative corrections to the Kaluza-Klein masses, satisfies  $\Lambda/M_C = 20$ . The model parameters are chosen such that the decay  $\gamma^* \rightarrow G\gamma$  occurs with an appreciable branching fraction.
- <sup>14</sup> ABAZOV 12M use same-sign dimuon events in 7.3  $\text{fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV to place a lower bound on the compactification scale  $1/R$ , in models with universal extra dimensions where all Standard Model fields propagate in the bulk.
- <sup>15</sup> BAAK 12 use electroweak precision observables to place a lower bound on the compactification scale  $1/R$ , in models with universal extra dimensions and Standard Model fields propagating in the bulk. Bound assumes a 125 GeV Higgs mass. See their Fig. 25 for the bound as a function of the Higgs mass.
- <sup>16</sup> FLACKE 12 use electroweak precision observables to place a lower bound on the compactification scale  $1/R$ , in models with universal extra dimensions and Standard Model fields propagating in the bulk. See their Fig. 1 for the bound as a function of the universal bulk fermion mass parameter  $\mu$ .
- <sup>17</sup> NISHIWAKI 12 use up to 2  $\text{fb}^{-1}$  of data from the ATLAS and CMS experiments that constrains the production cross section of a Higgs-like particle to place a lower bound on the compactification scale  $1/R$  in universal extra dimension models. The quoted bound assumes Standard Model fields propagating in the bulk and a 125 GeV Higgs mass. See their Fig. 1 for the bound as a function of the Higgs mass.
- <sup>18</sup> AAD 11F use diphoton events with large missing transverse energy in 3.1  $\text{pb}^{-1}$  of data produced from  $pp$  collisions at  $\sqrt{s} = 7$  TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale  $\Lambda$ , for the radiative corrections to the Kaluza-Klein masses, satisfies  $\Lambda/M_C = 20$ . The model parameters are chosen such that the decay  $\gamma^* \rightarrow G\gamma$  occurs with an appreciable branching fraction.
- <sup>19</sup> AAD 11X use diphoton events with large missing transverse energy in 36  $\text{pb}^{-1}$  of data produced from  $pp$  collisions at  $\sqrt{s} = 7$  TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale  $\Lambda$ , for the radiative corrections to the Kaluza-Klein masses, satisfies  $\Lambda/M_C = 20$ . The model parameters are chosen such that the decay  $\gamma^* \rightarrow G\gamma$  occurs with an appreciable branching fraction.
- <sup>20</sup> ABAZOV 10P use diphoton events with large missing transverse energy in 6.3  $\text{fb}^{-1}$  of data produced from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale  $\Lambda$ , for the radiative corrections to the Kaluza-Klein masses, satisfies  $\Lambda/M_C = 20$ . The model parameters are chosen such that the decay  $\gamma^* \rightarrow G\gamma$  occurs with an appreciable branching fraction.
- <sup>21</sup> ABAZOV 09AE use dijet angular distributions in 0.7  $\text{fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV to place a lower bound on the compactification scale.
- <sup>22</sup> HAISCH 07 use inclusive  $\bar{B}$ -meson decays to place a Higgs mass independent bound on the compactification scale  $1/R$  in the minimal universal extra dimension model.
- <sup>23</sup> GOGOLADZE 06 use electroweak precision observables to place a lower bound on the compactification scale in models with universal extra dimensions. Bound assumes a 115 GeV Higgs mass. See their Fig. 3 for the bound as a function of the Higgs mass.
- <sup>24</sup> CORNET 00 translates a bound on the coefficient of the 4-fermion operator  $(\bar{\ell}\gamma_{\mu}\tau^{\alpha}\ell)(\bar{\ell}\gamma^{\mu}\tau^{\alpha}\ell)$  derived by Hagiwara and Matsumoto into a limit on the mass scale of KK  $W$  bosons.
- <sup>25</sup> RIZZO 00 obtains limits from global electroweak fits in models with a Higgs in the bulk (3.8 TeV) or on the standard brane (3.3 TeV).

### Limits on Kaluza-Klein Gravitons in Warped Extra Dimensions

This section places limits on the mass of the first Kaluza-Klein (KK) excitation of the graviton in the warped extra dimension model of Randall and Sundrum. Bounds in parenthesis assume Standard Model fields propagate in the bulk. Experimental bounds depend strongly on the warp parameter,  $k$ . See the "Extra Dimensions" review for a full discussion.

Here we list limits for the value of the warp parameter  $k/\overline{M}_P = 0.1$ .

- on the cross section times branching fraction as a function of the KK graviton mass for  $k/\overline{M}_P = 1$  and  $k/\overline{M}_P = 2$ .
- 16 AAD 19d use  $139 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for diboson resonances in the all-hadronic final state. See their Figure 9(b) for the limit on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for  $k/\overline{M}_P = 1$ . This updates the results of AABOUD 18F.
- 17 SIRUNYAN 19 use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production in the  $\gamma\gamma b\bar{b}$  final state. See their Figure 9 for limits on the cross section times branching fraction as a function of the KK graviton mass. Assuming  $k/\overline{M}_P = 1$ , gravitons in the mass range 290–810 GeV are excluded. This updates the result of KHACHATRYAN 16BQ.
- 18 SIRUNYAN 19BE use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production by combining the results from four final states:  $b\bar{b}\gamma\gamma$ ,  $b\bar{b}\tau\tau$ ,  $b\bar{b}b\bar{b}$ , and  $b\bar{b}VV$ . See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass.
- 19 AABOUD 18BI use  $36.1 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for top-quark pairs decaying into the lepton-plus jets topology. See their Figure 16 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for  $k/\overline{M}_P = 1$ .
- 20 AABOUD 18CJ combine the searches for heavy resonances decaying into bosonic and leptonic final states from  $36.1 \text{ fb}^{-1}$  of  $pp$  collision data at  $\sqrt{s} = 13 \text{ TeV}$ . The lower limit on the KK graviton mass, with  $k/\overline{M}_P = 1$ , is 2.3 TeV.
- 21 AABOUD 18CQ use  $36.1 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production in the  $b\bar{b}\tau^+\tau^-$  final state. See their Figure 2 for limits on the cross section times branching fraction as a function of the KK graviton mass. Assuming  $k/\overline{M}_P = 1$ , gravitons in the mass range 325–885 GeV are excluded.
- 22 AABOUD 18CW use  $36.1 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production in the  $\gamma\gamma b\bar{b}$  final state. See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass.
- 23 SIRUNYAN 18AF use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production in the  $b\bar{b}b\bar{b}$  final state. See their Figure 9 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for  $k/\overline{M}_P = 0.5$ . This updates the results of KHACHATRYAN 15R.
- 24 SIRUNYAN 18AS use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for ZZ resonances in the  $\ell\nu\ell\nu$  final state ( $\ell = e, \mu$ ). See their Figure 5 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for  $k/\overline{M}_P = 0.1, 0.5, \text{ and } 1.0$ .
- 25 SIRUNYAN 18CW use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production in the  $b\bar{b}b\bar{b}$  final state. See their Figure 8 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for  $k/\overline{M}_P = 0.5$ .
- 26 SIRUNYAN 18DU use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$ , in the diphoton channel to place a lower limit on the mass of the lightest KK graviton. See their paper for limits with other warp parameter values  $k/\overline{M}_P = 0.01 \text{ and } 0.2$ . This updates the results of KHACHATRYAN 16M.
- 27 SIRUNYAN 18I use  $19.7 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  to search for narrow resonances decaying to bottom quark pairs. See their Figure 3 for the limit on the KK graviton mass as a function of the cross section times branching fraction in the mass range of 325–1200 GeV.
- 28 AAD 16R use  $20.3 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  to place a lower bound on the mass of the lightest KK graviton. See their Figure 4 for the limit on the KK graviton mass as a function of the cross section times branching fraction.
- 29 AAD 15AZ use  $20.3 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  to place a lower bound on the mass of the lightest KK graviton. See their Figure 2 for limits on the KK graviton mass as a function of the cross section times branching ratio.
- 30 AAD 15CP use  $20.3 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  to place a lower bound on the mass of the lightest KK graviton. See their Figures 6b and 6c for the limit on the KK graviton mass as a function of the cross section times branching fraction.
- 31 AAD 14V use  $20.3 (20.5) \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  in the dielectron (dimuon) channels to place a lower bound on the mass of the lightest KK graviton. This updates the results of AAD 12cc.
- 32 AAD 13A use  $4.7 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  in the  $\ell\nu\ell\nu$  channel, to place a lower bound on the mass of the lightest KK graviton.
- 33 AAD 13AO use  $4.7 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  in the  $\ell\nu jj$  channel, to place a lower bound on the mass of the lightest KK graviton.
- 34 AAD 13AS use  $4.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  in the diphoton channel to place lower limits on the mass of the lightest KK graviton. The diphoton channel is combined with previous results in the dielectron and dimuon channels to set the best limit. See their Table 2 for warp parameter values  $k/\overline{M}_P$  between 0.01 and 0.1. This updates the results of AAD 12y.
- 35 AAD 12AD use  $1.02 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$  to search for KK gravitons in a warped extra dimension decaying to ZZ dibosons in the  $lljj$  and  $llll$  channels ( $\ell = e, \mu$ ). The limit is quoted for the combined  $lljj + llll$  channels. See their Figure 5 for limits on the cross section  $\sigma(G \rightarrow ZZ)$  as a function of the graviton mass.
- 36 AALTONEN 12v use  $6 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to search for KK gravitons in a warped extra dimension decaying to ZZ dibosons in the  $lljj$  and  $llll$  channels ( $\ell = e, \mu$ ). It provides improved limits over the previous analysis in AALTONEN 11G. See their Figure 16 for limits from all channels combined on the cross section times branching ratio  $\sigma(p\bar{p} \rightarrow G^* \rightarrow ZZ)$  as a function of the graviton mass.
- 37 BAAK 12 use electroweak precision observables to place a lower bound on the compactification scale  $k e^{-\pi k R}$ , assuming Standard Model fields propagate in the bulk and the Higgs is confined to the IR brane. See their Fig. 27 for more details.
- 38 AALTONEN 11G use  $2.5\text{--}2.9 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to search for KK gravitons in a warped extra dimension decaying to ZZ dibosons via the  $e e e, e e \mu\mu, \mu\mu\mu\mu, e e j j$ , and  $\mu\mu j j$  channels. See their Fig. 20 for limits on the cross section  $\sigma(G \rightarrow ZZ)$  as a function of the graviton mass.
- 39 AALTONEN 11R uses  $5.7 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  in the dielectron channel to place a lower bound on the mass of the lightest graviton. It provides combined limits with the diphoton channel analysis of AALTONEN 11U. For warp parameter values  $k/\overline{M}_P$  between 0.01 to 0.1 the lower limit on the mass of the lightest graviton is between 612 and 1058 GeV. See their Table 1 for more details.
- 40 ABAZOV 11H use  $5.4 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to place a lower bound on the mass of the lightest graviton. Their 95% C.L. exclusion limit does not include masses less than 300 GeV.
- 1 SIRUNYAN 21N use  $137 (140) \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for dilepton resonances in the dielectron (dimuon) channel. See Table 6 for other limits with warp parameter values  $k/\overline{M}_P = 0.01$  and  $0.05$ . This updates the results of SIRUNYAN 18BB.
- 2 TUMASYAN 23AP use  $138 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for  $WW, ZZ$  diboson resonances in  $q\bar{q}q\bar{q}$  final states. See their Figure 7 for the limit on the cross section times branching fraction as a function of the KK graviton mass. Assuming  $k/\overline{M}_P = 0.5$ , a graviton mass is excluded below 1400 GeV. This updates the result of SIRUNYAN 20q.
- 3 AAD 22F use  $126\text{--}139 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production in the  $b\bar{b}b\bar{b}$  final state. See their Figure 14 for limits on the cross section times branching fraction as a function of the KK graviton mass. Assuming  $k/\overline{M}_P = 1$ , gravitons in the mass range 298–1460 GeV are excluded. This updates the results of AABOUD 19A.
- 4 TUMASYAN 22D use  $137 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for  $WW$  resonances in  $\ell\nu q\bar{q}$  final states ( $\ell = e, \mu$ ). See their Figure 6 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for  $k/\overline{M}_P = 0.5$ . This updates the results of SIRUNYAN 18AX.
- 5 TUMASYAN 22J use  $137 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for ZZ resonances in the  $\nu\tau q\bar{q}$  final state. See their Figure 10 for the limit on the KK graviton mass as a function of the cross section times branching fraction, assuming  $k/\overline{M}_P = 0.5$ . This updates the result of SIRUNYAN 18BK.
- 6 TUMASYAN 22R use  $138 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for ZZ resonances in  $2\ell 2q$  final states ( $\ell = e, \mu$ ). See their Figure 8 for the limit on the KK graviton mass as a function of the cross section times branching fraction. Assuming  $k/\overline{M}_P = 0.5$ , a graviton mass is excluded below 1200 GeV. This updates the result of SIRUNYAN 18DJ.
- 7 TUMASYAN 22U use  $138 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production in the  $b\bar{b}q\bar{q} \ell\nu, b\bar{b}\ell\nu\ell\nu$  and  $b\bar{b}\ell\nu\nu\ell\nu$  final states ( $\ell = e, \mu$ ). See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for  $k/\overline{M}_P = 0.3$  and  $0.5$ . This updates the results of SIRUNYAN 19CF and SIRUNYAN 18F.
- 8 AAD 21AF use  $139 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for ZZ resonances in the  $\ell\ell\ell\ell$  and  $\ell\nu\ell\nu$  final states ( $\ell = e, \mu$ ). See their Figure 8 for the limit on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for  $k/\overline{M}_P = 1$ . This updates the results of AAD 15AU and AABOUD 18BF.
- 9 AAD 21AY use  $139 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  in the diphoton channel to place a lower limit on the mass of the lightest KK graviton. This updates the results of AABOUD 17AP.
- 10 AAD 20AT use  $139 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for diboson resonances in semileptonic final states ( $\ell\nu q\bar{q}, \ell\ell q\bar{q}, \nu\nu q\bar{q}$ ). See their Figure 15 for the limit on the cross section times branching fraction as a function of the KK graviton mass. Lower limits on the graviton mass are also given for  $k/\overline{M}_P = 1$ . This updates the results of AABOUD 18AK and AABOUD 18AL.
- 11 AAD 20C use  $36.1 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production in the  $b\bar{b}b\bar{b}, b\bar{b}W^+W^-, \text{ and } b\bar{b}\tau^+\tau^-$  final states. See their Figure 5(b)(c) for limits on the cross section as a function of the KK graviton mass. In the case of  $k/\overline{M}_P = 1$  and 2, gravitons are excluded in the mass range 260–3000 GeV and 260–1760 GeV, respectively.
- 12 AAD 20T use  $139 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for narrow resonances decaying to bottom quark pairs. See their Figure 7 for the limit on the product of the cross section, branching fraction, acceptance and  $b$ -tagging efficiency as a function of the KK graviton mass. In the case of  $k/\overline{M}_P = 0.2$ , KK gravitons in the mass range 1.25–2.8 TeV are excluded.
- 13 SIRUNYAN 20AI use  $137 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for dijet resonances. See their Figure 6 for the limit on the product of the cross section, branching fraction and acceptance as a function of the KK graviton mass. This updates the results of SIRUNYAN 18BQ.
- 14 SIRUNYAN 20F use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production in the  $b\bar{b}ZZ$  final state. See their Figure 4 for limits on the cross section times branching fraction as a function of the KK graviton mass, and Figure 5 for limits as a function of  $k/\overline{M}_P$ .
- 15 AABOUD 19O use  $36.1 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for Higgs boson pair production in the  $b\bar{b}WW$  final state. See their Figure 12 for limits

See key on page 1171

## Extra Dimensions

- <sup>41</sup> AALTONEN 10N use  $2.9 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to place a lower bound on the mass of the lightest graviton.
- <sup>42</sup> ABAZOV 10F use  $5.4 \text{ fb}^{-1}$  of data from  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to place a lower bound on the mass of the lightest graviton. For warp parameter values of  $k/\overline{M}_P$  between 0.01 and 0.1 the lower limit on the mass of the lightest graviton is between 560 and 1050 GeV. See their Fig. 3 for more details.
- <sup>43</sup> AALTONEN 08s use  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to four electrons via two  $Z$  bosons using  $1.1 \text{ fb}^{-1}$  of data. See their Fig. 8 for limits on  $\sigma \cdot \text{Br}(G \rightarrow ZZ)$  versus the graviton mass.
- <sup>44</sup> ABAZOV 08j use  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to electrons and photons using  $1 \text{ fb}^{-1}$  of data. For warp parameter values of  $k/\overline{M}_P$  between 0.01 and 0.1 the lower limit on the mass of the lightest excitation is between 300 and 900 GeV. See their Fig. 4 for more details.
- <sup>45</sup> AALTONEN 07G use  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to photons using  $1.2 \text{ fb}^{-1}$  of data. For warp parameter values of  $k/\overline{M}_P = 0.1, 0.05,$  and  $0.01$  the bounds on the graviton mass are 850, 694, and 230 GeV, respectively. See their Fig. 3 for more details. See also AALTONEN 07H.
- <sup>46</sup> AALTONEN 07H use  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to electrons using  $1.3 \text{ fb}^{-1}$  of data. For a warp parameter value of  $k/\overline{M}_P = 0.1$  the bound on the graviton mass is 807 GeV. See their Fig. 4 for more details. A combined analysis with the diphoton data of AALTONEN 07G yields for  $k/\overline{M}_P = 0.1$  a graviton mass lower bound of 889 GeV.
- <sup>47</sup> ABAZOV 05N use  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to muons, electrons or photons, using  $260 \text{ pb}^{-1}$  of data. For warp parameter values of  $k/\overline{M}_P = 0.1, 0.05,$  and  $0.01,$  the bounds on the graviton mass are 785, 650 and 250 GeV respectively. See their Fig. 3 for more details.
- <sup>48</sup> ABULENCIA 05A use  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to muons or electrons, using  $200 \text{ pb}^{-1}$  of data. For warp parameter values of  $k/\overline{M}_P = 0.1, 0.05,$  and  $0.01,$  the bounds on the graviton mass are 710, 510 and 170 GeV respectively.

### Limits on Kaluza-Klein Gluons in Warped Extra Dimensions

This section places limits on the mass of the first Kaluza-Klein (KK) excitation of the gluon in warped extra dimension models with Standard Model fields propagating in the bulk. Bounds are given for a specific benchmark model with  $\Gamma/m = 15.3\%$  where  $\Gamma$  is the width and  $m$  the mass of the KK gluon. See the "Extra Dimensions" review for more discussion.

- <sup>1</sup> AABOUD 18BI use  $36.1 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$ . This result updates AAD 13AQ.
- <sup>2</sup> TUMASYAN 22c use  $138 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to place limits on a KK gluon decaying to gluons via a spin-0 radion,  $R$ . See their Figure 5 for limits on the cross section times branching fraction as a function of the KK gluon mass and various values of the radion mass.
- <sup>3</sup> AABOUD 19AS use  $36.1 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$ . An upper bound of 3.4 TeV is placed on the KK gluon mass for  $\Gamma/m = 30\%$ .
- <sup>4</sup> SIRUNYAN 19AL use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to place limits on a KK gluon decaying to a top quark and a heavy vector-like fermion,  $T$ . KK gluon masses between 1.5 and 2.3 TeV and between 2.0 and 2.4 TeV are excluded for  $T$  masses of 1.2 and 1.5 TeV, respectively.
- <sup>5</sup> CHATRCHYAN 13BM use  $19.7 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . Bound is for a width of approximately 15–20% of the KK gluon mass.
- <sup>6</sup> CHEN 13A place limits on the KK mass scale for a specific warped model with custodial symmetry and bulk fermions. See their Figures 4 and 5.
- <sup>7</sup> AAD 12BV use  $2.05 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 7 \text{ TeV}$ .

### Black Hole Production Limits

#### Semiclassical Black Holes

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •			
	<sup>1</sup> SIRUNYAN 18DA CMS	$pp \rightarrow \text{multijet}$	
	<sup>2</sup> AAD 16N ATLS	$pp \rightarrow \text{multijet}$	
	<sup>3</sup> AAD 16O ATLS	$pp \rightarrow \ell + (\ell\ell/ j /jj)$	
	<sup>4</sup> AAD 13AW ATLS	$pp \rightarrow \mu\mu$	

- <sup>1</sup> SIRUNYAN 18DA use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for semiclassical black holes decaying to multijet final states. No excess of events above the expected level of standard model background was observed. Exclusions at 95% CL are set on the mass threshold for black hole production as a function of the higher-dimensional Planck scale for rotating and nonrotating black holes under several model assumptions (ADD, 2, 4, 6 extra dimensions model) in the 7.1–10.3 TeV range. These limits supersede those in SIRUNYAN 17CP.
- <sup>2</sup> AAD 16N use  $3.6 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for semiclassical black hole decays to multijet final states. No excess of events above the expected level of Standard Model background was observed. Exclusion contours at 95% C.L. are set on the mass threshold for black hole production versus higher-dimensional Planck scale for rotating black holes (ADD, 6 extra dimensions model).

- <sup>3</sup> AAD 16O use  $3.2 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for semiclassical black hole decays to high-mass final states with leptons and jets. No excess of events above the expected level of Standard Model background was observed. Exclusion contours at 95% C.L. are set on the mass threshold for black hole production versus higher-dimensional Planck scale for rotating black holes (ADD, 2 to 6 extra dimensions).
- <sup>4</sup> AAD 13AW use  $20.3 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  to search for semiclassical black hole decays to like-sign dimuon final states using large track multiplicity. No excess of events above the expected level of Standard Model background was observed. Exclusion contours at 95% C.L. are set on the mass threshold for black hole production versus higher-dimensional Planck scale in various extra dimensions, rotating and non-rotating models.

#### Quantum Black Holes

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •			
	<sup>1</sup> AAD 23CB ATLS	$pp \rightarrow e\mu, e\tau, \mu\tau$	
	<sup>2</sup> TUMASYAN 23AW CMS	$pp \rightarrow \tau\nu$	
	<sup>3</sup> TUMASYAN 23BC CMS	$pp \rightarrow \gamma j$	
	<sup>4</sup> TUMASYAN 23H CMS	$pp \rightarrow e\mu, e\tau, \mu\tau$	
	<sup>5</sup> AAD 20T ATLS	$pp \rightarrow jj$	
	<sup>6</sup> AABOUD 18BA ATLS	$pp \rightarrow \gamma j$	
	<sup>7</sup> SIRUNYAN 18AT CMS	$pp \rightarrow e\mu$	
	<sup>8</sup> SIRUNYAN 18DD CMS	$pp \rightarrow \text{dijet, ang. distrib.}$	
	<sup>9</sup> SIRUNYAN 17CP CMS	$pp \rightarrow jj$	
	<sup>10</sup> KHACHATRYAN 16BE CMS	$pp \rightarrow e\mu$	
	<sup>11</sup> KHACHATRYAN 15V CMS	$pp \rightarrow jj$	
	<sup>12</sup> AAD 14AL ATLS	$pp \rightarrow \ell j$	
	<sup>13</sup> AAD 14V ATLS	$pp \rightarrow ee, \mu\mu$	
	<sup>14</sup> CHATRCHYAN 13A CMS	$pp \rightarrow jj$	

- <sup>1</sup> AAD 23CB use  $139 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for quantum black hole decays with different-flavor high-mass dilepton final states. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in ADD (6 extra dimensions) and RS1 models. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 5.9 (3.8), 5.2 (3.0), and 5.1 (3.0) TeV are excluded in the  $e\mu, e\tau$  and  $\mu\tau$  channels for the ADD (RS1) models, respectively. These limits supersede those in AABOUD 18CM.
- <sup>2</sup> TUMASYAN 23AW use  $138 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for quantum black hole decays in the tau lepton plus missing transverse momentum final state. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, threshold masses below 6.6 TeV are excluded in the ADD model with four extra dimensions (see their Figure 8).
- <sup>3</sup> TUMASYAN 23BC use  $138 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for quantum black hole decays to final states with a photon and a jet. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in ADD (6 extra dimensions) and RS1 models. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 7.5 TeV and 5.2 TeV are excluded for the ADD and RS1 models, respectively (see their Figure 9).
- <sup>4</sup> TUMASYAN 23H use  $138 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for quantum black hole decays with different-flavor high-mass dilepton final states. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in the ADD model (with 4 extra dimensions). Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 5.6, 5.2, and 5.0 TeV are excluded in the  $e\mu, e\tau$  and  $\mu\tau$  channels, respectively.
- <sup>5</sup> AAD 20T use  $139 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for quantum black hole decays to final states with dijets. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in an ADD (6 extra dimensions) model. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 9.4 TeV are excluded. This limit supersedes AABOUD 17AK.
- <sup>6</sup> AABOUD 18BA use  $36.7 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for quantum black hole decays to final states with a photon and a jet. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in ADD (6 extra dimensions) and RS1 models. Assuming the black hole mass threshold is equal to the Planck scale, mass thresholds below 7.1 TeV and 4.4 TeV are excluded for the ADD and RS1 models, respectively. These limits supersede those in AAD 16AL.
- <sup>7</sup> SIRUNYAN 18AT use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for quantum black hole decays to  $e\mu$  final states. In Figure 4, lower mass limits of 5.3, 5.5 and 5.6 TeV are placed in a model with 4, 5 and 6 extra dimensions, respectively, and a lower mass limit of 3.6 TeV is found for a single warped dimension.
- <sup>8</sup> SIRUNYAN 18DD use  $35.9 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for quantum black hole decays in dijet angular distributions. A lower mass limit of 5.9 (8.2) TeV is placed in the RS (ADD) model with one (six) extra dimension(s).
- <sup>9</sup> SIRUNYAN 17CP use  $2.3 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$  to search for quantum black holes decaying to dijet final states. No excess of events above the expected level of standard model background was observed. Limits on the quantum black hole mass threshold are set as a function of the higher-dimensional Planck scale, under the assumption that the mass threshold must exceed the above Planck scale. Depending on the model, mass thresholds in the range up to 5.1–9.0 TeV are excluded.
- <sup>10</sup> KHACHATRYAN 16BE use  $19.7 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  to search for quantum black holes undergoing lepton flavor violating decay to the  $e\mu$  final state. No excess of events above the expected level of standard model background was observed. Exclusion limits at 95% CL are set on mass thresholds for black hole production in the ADD (2–6 flat extra dimensions), RS1 (1 warped extra dimension), and a model with a Planck scale at the TeV scale from a renormalization of the gravitational constant (no extra dimensions). Limits on the black hole mass threshold are set assuming that it is equal to the higher-dimensional Planck scale. Mass thresholds for quantum black holes in the range up to 3.15–3.63 TeV are excluded in the ADD model. In the RS1 model, mass thresholds below 2.81 TeV are excluded in the PDG convention for the Schwarzschild radius. In the model with no extra dimensions, mass thresholds below 1.99 TeV are excluded.
- <sup>11</sup> KHACHATRYAN 15V use  $19.7 \text{ fb}^{-1}$  of data from  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$  to search for quantum black holes decaying to dijet final states. No excess of events above

### WIMP and Dark Matter Searches

We omit papers on CHAMP's, millicharged particles, and other exotic particles.

#### GALACTIC WIMP SEARCHES

These limits are for weakly-interacting stable particles that may constitute the invisible mass in the galaxy. Unless otherwise noted, a local mass density of  $0.3 \text{ GeV/cm}^3$  is assumed; see each paper for velocity distribution assumptions. In the papers the limit is given as a function of the  $\chi^0$  mass. Here we list limits only for typical mass values of sub-GeV, GeV, 20 GeV, 100 GeV, and 1 TeV. Specific limits on supersymmetric dark matter particles may be found in the Supersymmetry section.

#### Spin-Independent Cross Section Limits for Dark Matter Particle ( $\chi^0$ ) on Nucleon

##### For $m_{\chi^0}$ in GeV range

We provide here limits for  $m_{\chi^0} < 5 \text{ GeV}$

- AALBERS 23A search for e recoil events from GeV scale WIMP scatter on Xe. No signal observed. Limits placed on 6 different models including  $\sigma^{SI} < 3 \times 10^{-3}$  for  $m(\chi) \sim 1 \text{ GeV}$  via Migdal scattering.
- AGNES 23 for light DM via e recoil/Migdal effect. No signal observed.  $\sigma^{SI}(\chi N) < 4 \times 10^{-7}$  pb for  $m(\chi) = 3 \text{ GeV}$ .
- AGNES 23B search for GeV-scale DM scatter on nucleons in Ar. No signal observed. Limit  $\sigma^{SI}(\chi N) < 6 \times 10^{-7}$  pb for  $m(\chi) = 3 \text{ GeV}$ .
- ALBAKRY 23 search for light DM via Migdal effect. No signal observed. Allow  $\sigma^{SI} < 0.5 \text{ pb}$  for  $m(\chi)=1 \text{ GeV}$  (see e.g. Fig. 7).
- AMBROSONE 23 derive limits on  $\sigma(\chi p)$  due to possible DM distortion of cosmic ray spectra in starburst galaxies. Limits placed in  $\sigma$  vs. mass ( $10^{-3}$ –10 MeV) plane, the most stringent given above being at 1 keV.
- ANGLOHER 23 search for light DM using Si target. No signal observed. Require  $\sigma^{SI} < 70 \text{ pb}$  for  $m(\chi) = 0.3 \text{ GeV}$  (see e.g. Fig. 5).
- LI 23F searches for SI light DM scatter from Xe. No signal observed. The quoted limit for  $m(\chi) = 4 \text{ GeV}$ .
- MA 23A search for GeV-scale DM using PandaX-4T. No signal observed.  $\sigma(\chi p) < 5 \times 10^{-10}$  pb for  $m(\chi) = 10 \text{ GeV}$ .
- ADHIKARI 22B search for sub-GeV WIMPs via SI and SD detection; no signal detected; limits placed in  $m(\chi)$  vs.  $\sigma$  plane for  $m(\chi)$ : 0.2–3 GeV; quoted limit is for  $m(\chi) = 1 \text{ GeV}$ .
- ARMENGAUD 22 search for GeV-scale DM scatter on Ge at EDELWEISS via Migdal effect; no signal observed; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\text{DM})$  plane; quoted limit is for  $m(\text{DM}) = 100 \text{ MeV}$ .
- CUI 22 search for sub-GeV boosted DM at PandaX-II at CJPL; no signal detected; limits set in  $\sigma^{SI}(\chi p)$  vs.  $m(\chi)$  plane; quoted limit for  $m(\chi) = 0.1 \text{ GeV}$ .
- XU 22 search for sub-GeV boosted DM in CDEX; no signal observed; limits placed in  $\sigma(\chi N)$  vs.  $m(\text{DM})$  plane; quoted limit is for  $m(\text{DM}) = 0.1 \text{ GeV}$ .
- AKERIB 21A present new technique for low mass WIMP detection. Require  $\sigma^{SI}(\rho \chi) < 2 \times 10^{-7}$  pb for  $m(\text{WIMP}) 10 \text{ GeV}$ .
- ALKHATIB 21 search for light DM using SuperCDMS; require  $\sigma^{SI}(\rho \chi) < 5 \times 10^6$  for  $m(\text{DM}) = 0.1 \text{ GeV}$ .
- ANDRIAMIRADO 21A search for upscattered (boosted) sub-GeV DM interacting with proton in PROSPECT detector. No signal observed. Limits placed in  $\sigma(\chi N)$  vs.  $m(\text{DM})$  plane for  $m(\text{DM}) \sim 1 \text{ keV} - 0.5 \text{ GeV}$ . The listed limit is for  $m(\text{DM}) = 1 \text{ keV}$ .
- APRILE 21 search for low recoil energy GeV-scale DM in XENON1T with 1.6 keV threshold. No signal in 0.6 t y exposure. Limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\text{DM})$  plane for  $m(\text{DM})$  between 3–12 GeV. The listed limit is for  $m(\text{DM}) = 5 \text{ GeV}$ .
- AGUILAR-AREVALO 20c search for WIMP SI scatter on Si using DAMIC at SNOLab; some excess; limits placed in  $\sigma$  vs  $m(\text{DM})$  for  $m(\text{DM})$  in 1.2–10 GeV; quoted limit for  $m(\text{WIMP}) = 2 \text{ GeV}$ .
- AKERIB 20A search for GeV-scale WIMPs via WIMP-nucleon scatter with single photon emission; no signal; limits placed in  $m(\text{WIMP})$  vs  $\sigma^{SI}$  plane: for example  $\sigma^{SI}(\chi n) < 8 \times 10^{-4}$  pb for  $m(\text{WIMP}) = 2.5 \text{ GeV}$ .
- ABDELHAMEED 19A search for GeV scale dark matter SI scatter on CaWO<sub>4</sub>; no signal, limits placed in  $\sigma$  vs. mass plane for  $m(\text{DM}) \sim 0.1$ –10 GeV. The listed limit is for  $m(\text{DM}) = 1 \text{ GeV}$ .
- AGNESE 19A search for 1.5–10 GeV WIMP scatter on Ge in CDMSlite dataset. Limits set in a likelihood analysis. No signal was observed. Limit reported for  $m(\chi) = 5 \text{ GeV}$ .
- AKERIB 19 search for 0.4–5 GeV DM using bremsstrahlung photons and "Migdal" electrons;  $1.4 \times 10^4 \text{ kg d}$  exposure of liquid Xe; constraint  $\sigma^{SI}(\chi N) < 1 \text{ pb}$  for  $m(\chi) = 5 \text{ GeV}$  in light scalar mediator model.
- AMOLE 19 search for SI WIMP scatter on C<sub>3</sub>F<sub>8</sub> in PICO-60 bubble chamber; no signal; set limit for spin independent coupling  $\sigma^{SI}(\chi N) < 1 \times 10^{-6}$  pb for  $m(\chi) = 5 \text{ GeV}$ .
- APRILE 19c search for light DM scatter on Xe via atomic excitation, ionization (Migdal effect) or bremsstrahlung; no signal, limits placed in  $\sigma$  vs.  $m(\text{DM})$  plane for  $m(\text{DM}) \sim 0.085$ –2 GeV. The listed limit is for  $m(\text{DM}) = 1 \text{ GeV}$ .
- APRILE 19d search for light DM scatter on Xe via ionization to probe SI, SD, and  $\chi e$  cross sections; with 22 t d exposure, limits placed in various  $\sigma$  vs.  $m(\text{DM})$  planes. Quoted limit is for  $m(\text{DM}) = 5 \text{ GeV}$ .
- ARMENGAUD 19 search for GeV scale WIMP scatter on Ge; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 0.045$ –10 GeV; quoted limit is for  $m(\chi) = 5 \text{ GeV}$ .
- KOBAYASHI 19 search for sub-GeV WIMP annual modulation in Xe via brems; no signal; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 0.3$ –1 GeV; quoted limit is for  $m(\chi) = 0.5 \text{ GeV}$ .
- LIU 19B search for sub-GeV DM using Migdal effect on Ge at CDEX-IB; no signal, require  $\sigma^{SI}(\chi M) < 7 \times 10^2$  pb for  $m(\chi) = 0.1 \text{ GeV}$ .
- AGNES 18 search for 1.8–20 GeV WIMP SI scatter on Ar; quoted limit is for  $m(\chi) = 5 \text{ GeV}$ .
- AGNESE 18 search for GeV scale WIMPs using CDMSlite; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 1.5$ –20 GeV; quoted limit is for  $m(\chi) = 5 \text{ GeV}$ .
- APRILE 18 search for WIMP scatter on 1 t yr Xe; no signal, limits set in  $\sigma(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 6$ –1000 GeV; quoted limit is for  $m = 6 \text{ GeV}$ .
- ARNAUD 18 search for low mass WIMP scatter on Ne via SPC at NEWS-G; limits set in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 0.5$ –20 GeV; quoted limit is for  $m = 5 \text{ GeV}$ .
- JIANG 18 search for GeV scale WIMP scatter on Ge; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 3$ –10 GeV; quoted limit is for  $m(\chi) = 5 \text{ GeV}$ .
- YANG 18 search for WIMP scatter on Ge; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 2$ –10 GeV; quoted limit is for  $m(\chi) = 5 \text{ GeV}$ .
- AKERIB 17 search for WIMP scatter on Xe; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5$ – $1 \times 10^5$  GeV; quoted limit is for  $m(\chi) = 5 \text{ GeV}$ .
- ANGLOHER 17A search for GeV scale WIMP scatter on Al<sub>2</sub>O<sub>3</sub> crystal; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 0.15$ –10 GeV; quoted limit is for  $m(\chi) = 5 \text{ GeV}$ .
- ANGLOHER 16 search for GeV scale WIMP scatter on CaWO<sub>4</sub>; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 0.5$ –30 GeV; quoted limit is for  $m(\chi) = 5 \text{ GeV}$ .
- APRILE 16 search for low mass WIMPs via ionization at XENON100; limits placed in  $\sigma^{SI}(\chi N)$  vs  $m(\chi)$  plane for  $m \sim 3.5$ –20 GeV; quoted limit is for  $m(\chi) = 5 \text{ GeV}$ .

## Searches Particle Listings

## WIMP and Dark Matter Searches

- <sup>38</sup> ARMENGAUD 16 search for GeV scale WIMP scatter on Ge; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}30$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- <sup>39</sup> HEHN 16 search for low mass WIMPs via SI scatter on Ge target using profile likelihood analysis; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}30$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- <sup>40</sup> ZHAO 16 search for GeV-scale WIMP scatter on Ge; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}30$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- <sup>41</sup> AMOLE 15 search for WIMP scatter on  $C_3F_8$  in PICO-2L; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}25$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- <sup>42</sup> XIAO 15 search for WIMP scatter on Xe with PandaX-I; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5\text{--}100$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- <sup>43</sup> AGNESE 14 search for GeV scale WIMPs SI scatter at SuperCDMS; no signal, limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 3.5\text{--}30$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- <sup>44</sup> AKERIB 14 search for WIMP scatter on Xe; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 3.5\text{--}5000$  GeV. Limit given for  $m(\chi) = 5$  GeV.
- <sup>45</sup> LI 13B search for WIMP scatter on Ge; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}100$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- <sup>46</sup> ARCHAMBAULT 12 search for low mass WIMP scatter on  $C_4F_{10}$ ; limits set in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 4\text{--}12$  GeV; quoted limit is for  $m = 5$  GeV.
- <sup>47</sup> AALSETH 11 search for GeV-scale SI WIMP scatter on Ge; limits placed on  $\sigma^{SI}(\chi N)$  for  $m(\chi) \sim 3.5\text{--}100$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- <sup>48</sup> AHMED 11B search for GeV scale WIMP scatter on Ge in CDMS II; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m \sim 4\text{--}12$  GeV.
- <sup>49</sup> ANGLE 11 search for GeV scale WIMPs in Xenon-10; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}20$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- <sup>50</sup> AKERIB 10 search for WIMP scatter on Ge/Si in CDMS II; limits place in  $\sigma_{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 3\text{--}100$  GeV. Limit given for  $m(\text{DM}) = 5$  GeV.

For  $m_{\chi_0} = 20$  GeV

For limits from  $X^0$  annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- <sup>1</sup> AALBERS 23 present first limits for WIMP scatter on Xe.  $\sigma^{SI}(\chi p) < 1 \times 10^{-11}$  pb for  $m(\chi) = 20$  GeV.
- <sup>2</sup> ABE 23E search for WIMP scatter on Xe in XMAS. No signal observed. Require  $\sigma^{SI} < 2 \times 10^{-7}$  pb for  $m(\chi) = 20$  GeV.
- <sup>3</sup> APRILE 23A present first results from Xe-nton SI WIMP search. No signal observed. Quoted limit is for  $m(\chi) = 20$  GeV.
- <sup>4</sup> MENG 21B search for SI WIMP interaction with 3.7 t Xe and 0.63 t yr exposure. No signal observed. Limits placed in  $m(\text{DM})$  vs.  $\sigma^{SI}$  plane.
- <sup>5</sup> FELIZARDO 20 presents 2014 SIMPLE bounds on WIMP DM using C<sub>2</sub>F<sub>5</sub> target.
- <sup>6</sup> WANG 20G search for SI WIMP scatter on Xe with 132 t d exposure of PANDAX-II.
- <sup>7</sup> ANGLOHER 19 search for low mass WIMP scatter on CaWO<sub>4</sub>; no signal; limits placed on Wilson coefficients for  $m(\chi) = 0.6\text{--}60$  GeV.
- <sup>8</sup> KIM 19A search for WIMP scatter in Nal KIMS experiment; no signal: require  $\sigma^{SI}(\chi n) < 7 \times 10^{-5}$  pb for  $m(\chi) = 20$  GeV.
- <sup>9</sup> KOBAYASHI 19 search for WIMP scatter in XMAS single-phase liquid Xe detector; no signal; require  $\sigma^{SI}(\chi N) < 3 \times 10^{-7}$  pb for  $m(\chi) = 20$  GeV.
- <sup>10</sup> SEONG 19 search for  $\tau \rightarrow \gamma A, A \rightarrow \chi\chi$  via CP-odd Higgs; no signal; limits on BF set; model dependent conversion to WIMP-nucleon scattering cross section limits  $\sigma^{SI} < 10^{-36}$  cm<sup>2</sup> for  $m(\chi) = 0.01\text{--}1$  GeV.
- <sup>11</sup> YANG 19 search for low mass wimps via annual modulation in Ge; no signal; require  $\sigma^{SI}(\chi N) < 3.5 \times 10^{-5}$  pb for  $m(\chi) = 20$  GeV.
- <sup>12</sup> ABE 18C search for WIMP annual modulation signal for  $m(\text{WIMP})$ : 6–20 GeV; limits set on SI WIMP-nucleon cross section: see Fig. 6.
- <sup>13</sup> ADHIKARI 18 search for WIMP scatter on Nal; no signal; require  $\sigma^{SI} < 1.44 \times 10^{-5}$  pb for  $m(\text{WIMP}) = 20$  GeV; inconsistent with DAMA/LIBRA result.
- <sup>14</sup> AGNES 18 search low mass  $m(\text{WIMP})$ : 1.8–20 GeV scatter on Ar; limits on SI WIMP-nucleon cross section set in Fig. 8.
- <sup>15</sup> AGNESE 18 give limits for  $\sigma^{SI}(\chi N)$  for  $m(\text{WIMP})$  between 1.5 and 20 GeV using CDMSlite mode data.
- <sup>16</sup> AGNESE 18A search for WIMP scatter on Ge at SuperCDMS; 1 event, consistent with expected background; set limit in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 10\text{--}250$  GeV.
- <sup>17</sup> APRILE 18 search for WIMP scatter on 1 t yr Xe; no signal, limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 6\text{--}1000$  GeV.
- <sup>18</sup> ARNAUD 18 search for low mass WIMP scatter on Ne via SPC at NEWS-G; limits set in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 0.5\text{--}20$  GeV.
- <sup>19</sup> AARTSEN 17 obtain  $\sigma(\text{SI}) < 6 \times 10^{-6}$  pb for  $m(\text{wimp}) = 20$  GeV from  $\nu$  from earth.
- <sup>20</sup> AKERIB 17 search for WIMP scatter on Xe; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5\text{--}1 \times 10^5$  GeV.
- <sup>21</sup> BARBOSA-DE-SOUZA 17 search for annual modulation of WIMP scatter on Nal using an exposure of 61 kg yr of DM-Ice17 for recoil energy in the 4–20 keV range (DAMA found modulation for recoil energy < 5 keV). No modulation seen. Sensitivity insufficient to distinguish DAMA signal from null.
- <sup>22</sup> CUI 17A search for SI WIMP scatter; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 10\text{--}1 \times 10^4$  GeV using 54 ton-day exposure of Xe.
- <sup>23</sup> AGNESE 16 CDMSlite excludes low mass WIMPs 1.6–5.5 GeV and SI scattering cross section depending on  $m(\text{WIMP})$ ; see Fig. 4.
- <sup>24</sup> AGUILAR-AREVALO 16 search low mass 1–10 GeV WIMP scatter on Si CCDs; set limits Fig. 11.
- <sup>25</sup> ANGLOHER 16 search for GeV scale WIMP scatter on CaWO<sub>4</sub>; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 0.5\text{--}30$  GeV.
- <sup>26</sup> APRILE 16 search for low mass WIMPs via ionization at XENON100; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 3.5\text{--}20$  GeV.
- <sup>27</sup> ARMENGAUD 16 search for GeV scale WIMP scatter on Ge; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}30$  GeV.
- <sup>28</sup> HEHN 16 search for low mass WIMPs via SI scatter on Ge target using profile likelihood analysis; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}30$  GeV.
- <sup>29</sup> ZHAO 16 search for GeV-scale WIMP scatter on Ge; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}30$  GeV.
- <sup>30</sup> AGNESE 15A reanalyse AHMED 11B low threshold data. See their Fig. 12 (left) for improved limits extending down to 5 GeV.
- <sup>31</sup> AGNESE 15B reanalyse AHMED 10 data.

See key on page 1171

# Searches Particle Listings

## WIMP and Dark Matter Searches

- 32 See their Fig. 7 for limits extending down to 4 GeV.
- 33 XIAO 15 search for WIMP scatter on Xe with PandaX-I; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5\text{--}100$  GeV.
- 34 This limit value is provided by the authors. See their Fig. 4 for limits extending down to  $m_{\chi^0} = 3.5$  GeV.
- 35 This limit value is provided by the authors. AGNESE 14A result is from CDMSlite mode operation with enhanced sensitivity to low mass  $m_{\chi^0}$ . See their Fig. 3 for limits extending down to  $m_{\chi^0} = 3.5$  GeV (see also Fig. 4 in AGNESE 14).
- 36 See their Fig. 5 for limits extending down to  $m_{\chi^0} = 5.5$  GeV.
- 37 See their Fig. 5 for limits extending down to  $m_{\chi^0} = 1$  GeV.
- 38 See their Fig. 5 for limits extending down to  $m_{\chi^0} = 5$  GeV.
- 39 LIU 14A result is based on prototype CDEX-0 detector. See their Fig. 13 for limits extending down to  $m_{\chi^0} = 2$  GeV.
- 40 See their Fig. 4 for limits extending down to  $m_{\chi^0} = 4.5$  GeV.
- 41 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken between June 2010 and May 2011.
- 42 See their Fig. 8 for limits extending down to  $m_{\chi^0} = 7$  GeV.
- 43 This limit value is provided by the authors. AGNESE 13 use data taken between Oct. 2006 and July 2007. See their Fig. 4 for limits extending down to  $m_{\chi^0} = 7$  GeV.
- 44 This limit value is provided by the authors. AGNESE 13A use data taken between July 2007 and Sep. 2008. Three candidate events are seen. Assuming these events are real, the best fit parameters are  $m_{\chi^0} = 8.6$  GeV and  $\sigma = 1.9 \times 10^{-5}$  pb.
- 45 This limit value is provided by the authors. Limit from combined data of AGNESE 13 and AGNESE 13A. See their Fig. 4 for limits extending down to  $m_{\chi^0} = 5.5$  GeV.
- 46 BERNABEI 13A search for annual modulation of counting rate in the 2–6 keV recoil energy interval, in a 14 yr live time exposure of 1.33 t yr. Find a modulation of  $0.0112 \pm 0.0012$  counts/(day kg keV) with 9.3 sigma C.L. Find period and phase in agreement with expectations from DM particles.
- 47 LI 13b search for WIMP scatter on Ge; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}100$  GeV.
- 48 See their Fig. 5 for limits for  $m_{\chi^0} = 4\text{--}12$  GeV.
- 49 ANGLÖHER 12 observe excess events above the expected background which are consistent with  $X^0$  with mass  $\sim 25$  GeV (or 12 GeV) and spin-independent  $X^0$ -nucleon cross section of  $2 \times 10^{-6}$  pb (or  $4 \times 10^{-5}$  pb).
- 50 Reanalysis of ANGLÖHER 09 data with all three nuclides. See also BROWN 12.
- 51 See also APRILE 14A.
- 52 See their Fig. 4 for limits extending down to  $m_{\chi^0} = 7$  GeV.
- 53 See their Fig. 13 for cross section limits for  $m_{\chi^0}$  between 1.2 and 10 GeV.
- 54 See also DAHL 12 for a criticism.
- 55 See their Fig. 4 for limits extending to  $m_{\chi^0} = 3.5$  GeV.
- 56 AALSETH 11A find indications of annual modulation of the data, the energy spectrum being compatible with  $X^0$  mass around 8 GeV. See also AALSETH 13.
- 57 AHMED 11 search for  $X^0$  inelastic scattering. See their Fig. 8–10 for limits. The inelastic cross section reduces to the elastic cross section at the limit of zero mass splitting (Fig. 8, left).
- 58 AHMED 11A combine CDMS II and EDELWEISS data.
- 59 ANGLE 11 show limits down to  $m_{\chi^0} = 4$  GeV on Fig. 3.
- 60 APRILE 11 reanalyze APRILE 10 data.
- 61 APRILE 11A search for  $X^0$  inelastic scattering. See their Fig. 2 and 3 for limits. See also APRILE 14A.
- 62 HORN 11 perform detector calibration by neutrons. Earlier results are only marginally affected.
- 63 See their Fig. 10 and 12 for limits extending to  $X^0$  mass of 1 GeV.
- 64 Superseded by AHMED 10.
- 65 See their Fig. 6(a) for cross section limits for  $m_{\chi^0}$  extending down to 2 GeV.
- 66 See their Fig. 2 for cross section limits for  $m_{\chi^0}$  between 4 and 10 GeV.

### For $m_{\chi^0} = 100$ GeV

For limits from  $X^0$  annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- 1 AALBERS 23 present first LZ limits on SI WIMP-nucleon scatter from Xe.  $\sigma^{SI}(\chi p) < 2.5 \times 10^{-11}$  pb for  $m(\chi) = 100$  GeV.
- 2 ABE 23E search for WIMP scatter on Xe in XMAS. No signal observed. Require  $\sigma^{SI} < 2 \times 10^{-7}$  pb for  $m(\chi) = 100$  GeV.
- 3 APRILE 23A present first results from Xe-nton SI WIMP search. No signal observed. Quoted limit is for  $m(\chi) = 100$  GeV.
- 4 MENG 21B search for SI WIMP interaction with 3.7 t Xe and 0.63 t yr exposure. No signal observed. Limits placed in  $m(\text{DM})$  vs.  $\sigma^{SI}$  plane.
- 5 ADHIKARI 20 search for SI WIMP scatter from Ar in AJAJ 19 data. No signal observed. Limits placed on  $\sigma^p$  vs.  $m(\text{WIMP})$  for various assumed operators and models.
- 6 FELIZARDO 20 presents 2014 SIMPLE bounds on WIMP DM using  $C_2ClF_5$  target.
- 7 WANG 20G search for SI WIMP scatter on Xe with 132 t d exposure of PANDAX-II.
- 8 ABE 19 search for SI-DD in single phase Xe; no signal; require  $\sigma^{SI}(\chi p) < 4 \times 10^{-8}$  pb for  $m(\chi) \sim 100$  GeV.
- 9 AJAJ 19 search for SI WIMP-nucleon scatter with 758 tonne day exposure of single phase liquid Ar; no signal; require  $\sigma^{SI}(\chi N) < 3.9 \times 10^{-9}$  pb for  $m(\chi) = 100$  GeV.
- 10 ADHIKARI 18 search for WIMP scatter on NaI; limit set  $\sigma^{SI}(\chi p) < 2.3 \times 10^{-6}$  pb for  $m(\chi) = 100$  GeV.
- 11 AGNES 18A search for WIMP scatter on 46.4 kg Ar; no signal; require  $\sigma^{SI}(\chi N) < 1.14 \times 10^{-8}$  pb for  $m(\chi) = 100$  GeV.
- 12 AGNESE 18A set limit  $\sigma^{SI}(\chi N) < 2 \times 10^{-8}$  pb for  $m(\text{WIMP}) = 100$  GeV.
- 13 AMAUDRUZ 18 search for WIMP scatter on Ar with DEAP-3600; limits set:  $\sigma^{SI}(\chi p) < 1.2 \times 10^{-8}$  pb for  $m(\text{WIMP}) = 100$  GeV.
- 14 APRILE 18 search for WIMP scatter on 1.3 t liquid Xe; no signal; require  $\sigma^{SI}(\chi p) < 9.12 \times 10^{-11}$  pb for  $m(\chi) = 100$  GeV.
- 15 REN 18 search for self-interacting DM at PandaX-II with a total exposure of 54 ton day; limits set in  $m(\text{DM})$  vs.  $m(\text{mediator})$  plane.
- 16 AKERIB 17 exclude SI cross section  $> 1.7 \times 10^{-10}$  pb for  $m(\text{WIMP}) = 100$  GeV. Uses complete LUX data set.
- 17 APRILE 17G set limit  $\sigma^{SI}(\chi p) < 1.2 \times 10^{-10}$  pb for  $m(\text{WIMP}) = 100$  GeV using 1 ton fiducial mass Xe TPC. Exposure is 34.2 live days.
- 18 CUI 17A search for SI WIMP scatter; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 10\text{--}1 \times 10^4$  GeV using 54 ton-day exposure of Xe.
- 19 AKERIB 16 re-analysis of 2013 data exclude SI cross section  $> 1 \times 10^{-9}$  pb for  $m(\text{WIMP}) = 100$  GeV on Xe target.
- 20 APRILE 16B combined 447 live days using Xe target exclude  $\sigma(\text{SI}) > 1.1 \times 10^{-9}$  pb for  $m(\text{WIMP}) = 50$  GeV.
- 21 TAN 16 search for WIMP scatter off Xe target; see SI exclusion plot Fig. 6.
- 22 TAN 16B search for WIMP-p scatter off Xe target; see Fig. 5 for SI exclusion.

# Searches Particle Listings

## WIMP and Dark Matter Searches

- <sup>23</sup> AGNESE 15B reanalyse AHMED 10 data.
- <sup>24</sup> XIAO 15 search for WIMP scatter on Xe with PandaX-I; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5\text{--}100$  GeV.
- <sup>25</sup> AVRORIN 14 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- <sup>26</sup> AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken between June 2010 and May 2011.
- <sup>27</sup> ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- <sup>28</sup> AGNESE 13 use data taken between Oct. 2006 and July 2007.
- <sup>29</sup> BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- <sup>30</sup> LI 13B search for WIMP scatter on Ge; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}100$  GeV.
- <sup>31</sup> ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the Sun. The amount of  $X^0$  depends on the  $X^0$ -proton cross section.
- <sup>32</sup> Reanalysis of ANGIOLOHER 09 data with all three nuclides. See also BROWN 12.
- <sup>33</sup> See also APRILE 14A.
- <sup>34</sup> See their Fig. 6 for a limit on inelastically scattering  $X^0$  for  $m_{X^0} = 70$  GeV.
- <sup>35</sup> AHMED 11 search for  $X^0$  inelastic scattering. See their Fig. 8–10 for limits.
- <sup>36</sup> AHMED 11A combine CDMS and EDELWEISS data.
- <sup>37</sup> AJELLO 11 search for  $e^\pm$  flux from  $X^0$  annihilations in the Sun. Models in which  $X^0$  annihilates into an intermediate long-lived weakly interacting particles or  $X^0$  scatter inelastically are constrained. See their Fig. 6–8 for limits.
- <sup>38</sup> APRILE 11 reanalyse APRILE 10 data.
- <sup>39</sup> APRILE 11A search for  $X^0$  inelastic scattering. See their Fig. 2 and 3 for limits. See also APRILE 14A.
- <sup>40</sup> Supersedes ARMENGAUD 10. A limit on inelastic cross section is also given.
- <sup>41</sup> HORN 11 perform detector calibration by neutrons. Earlier results are only marginally affected.
- <sup>42</sup> AKIMOV 10 give cross section limits for inelastically scattering dark matter. See their Fig. 4.
- <sup>43</sup> Superseded by AHMED 10.
- <sup>44</sup> ANGIOLOHER 09 search for  $X^0$  inelastic scattering. See their Fig. 4 for limits.
- <sup>45</sup> GIULIANI 05 analyzes the spin-independent  $X^0$ -nucleon cross section limits with both isoscalar and isovector couplings. See their Fig. 3 and 4 for limits on the couplings.

### For $m_{X^0} = 1$ TeV

For limits from  $X^0$  annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

<sup>1</sup> AALBERS 23 give first LZ limits on WIMP-nucleon scatter from Xe.  $\sigma^{SI} < 2.8 \times 10^{-10}$  pb for  $m(\chi) = 1$  TeV.

- <sup>2</sup> ABE 23E search for WIMP scatter on Xe in XMAS. No signal observed. Require  $\sigma^{SI} < 2 \times 10^{-7}$  pb for  $m(\chi) = 1000$  GeV.
- <sup>3</sup> MENG 21B search for SI WIMP interaction with 3.7 t Xe and 0.63 t yr exposure. No signal observed. Limits placed in  $m(\text{DM})$  vs.  $\sigma^{SI}$  plane.
- <sup>4</sup> ADHIKARI 20 search for SI WIMP scatter from Ar in AJAJ 19 data. No signal observed. Limits placed on  $\sigma^p$  vs.  $m(\text{WIMP})$  for various assumed operators and models.
- <sup>5</sup> WANG 20G search for SI WIMP scatter on Xe with 132 t d exposure of PANDAX-II.
- <sup>6</sup> YAGUNA 19 recasts DEAP-3600 single-phase liquid argon results in limit for isospin violating DM; for  $f_n/f_p = -0.69$ , requires  $\sigma^{SI}(\chi p) < 3 \times 10^{-6}$  pb for  $m(\chi) = 1$  TeV.
- <sup>7</sup> AGNES 18A search for WIMP scatter on 46.4 kg Ar; no signal; require  $\sigma^{SI}(\chi N) < 3.8 \times 10^{-8}$  pb for  $m(\chi) = 1$  TeV.
- <sup>8</sup> APRILE 18 search for WIMP scatter on 1.3 t Xe; no signal seen; require  $\sigma^{SI}(\chi p) < 8.24 \times 10^{-10}$  pb for  $m(\chi) = 1$  TeV.
- <sup>9</sup> AKERIB 17 search for WIMP scatter on Xe using complete LUX data set; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5\text{--}1 \times 10^5$  GeV.
- <sup>10</sup> CHEN 17E search for inelastic WIMP scatter on Xe; require  $\sigma^{SI}(\chi N) < 0.3$  pb for  $m(\chi) = 1$  TeV and (mass difference) = 300 keV.
- <sup>11</sup> CUI 17A search for WIMP scatter using 54 ton-day exposure of Xe; limits placed in  $\sigma^{SI}(\chi N)$  vs.  $m(\chi)$  plane for  $m \sim 10\text{--}1 \times 10^4$  GeV.
- <sup>12</sup> AGNESE 15B reanalyse AHMED 10 data.
- <sup>13</sup> AVRORIN 14 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- <sup>14</sup> AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken between June 2010 and May 2011.
- <sup>15</sup> ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- <sup>16</sup> BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- <sup>17</sup> ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the Sun. The amount of  $X^0$  depends on the  $X^0$ -proton cross section.
- <sup>18</sup> Reanalysis of ANGIOLOHER 09 data with all three nuclides. See also BROWN 12.
- <sup>19</sup> See also APRILE 14A.
- <sup>20</sup> AHMED 11 search for  $X^0$  inelastic scattering. See their Fig. 8–10 for limits.
- <sup>21</sup> AHMED 11A combine CDMS and EDELWEISS data.
- <sup>22</sup> APRILE 11 reanalyse APRILE 10 data.
- <sup>23</sup> Supersedes ARMENGAUD 10. A limit on inelastic cross section is also given.
- <sup>24</sup> HORN 11 perform detector calibration by neutrons. Earlier results are only marginally affected.
- <sup>25</sup> Superseded by AHMED 10.

### For Super-heavy dark matter ( $m_{X^0} > 10^{10}$ GeV)

VALUE	DOCUMENT ID	TECN	COMMENT
••• We do not use the following data for averages, fits, limits, etc. •••			
	1 ABREU	23 AUGÉ	DM decay to photons
	2 ACEVEDO	23	DM tracks in ancient mica
	<sup>1</sup> ABREU 23 search for superheavy DM $X$ decay to $q\bar{q}$ pairs via instanton, then to $\gamma\gamma$ . No signal detected. Exclude $m(X) > 3 \times 10^{13}$ GeV for dark gauge coupling $\alpha_X = 0.09$ .		
	<sup>2</sup> ACEVEDO 23 re-examine data from ancient mica to place limits on superheavy DM in the mass range $10^7\text{--}10^{25}$ GeV. See Fig. 3 for $\sigma^{SI}$ and $\sigma^{SD}$ limits.		

### Spin-Dependent Cross Section Limits for Dark Matter Particle ( $X^0$ ) on Proton

#### For $m_{X^0}$ in GeV range

We provide here limits for  $m_{X^0} < 5$  GeV

- <sup>1</sup> AALBERS 23A search for GeV-scale WIMP scatter on Xe. No signal observed. Limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane. Quoted limit is for  $m(\chi) = 1$  GeV via Migdal scattering.
- <sup>2</sup> ADHIKARI 22B search for sub-GeV WIMPs via SI and SD detection; no signal detected; limits placed in  $m(\chi)$  vs.  $\sigma$  plane for  $m(\chi)$ : 0.2–3 GeV; quoted limit is for SD  $m(\chi) = 1$  GeV.
- <sup>3</sup> ANGIOLOHER 22 search for SD WIMP-proton scatter from Li target; no signal detected; limits placed in  $\sigma$  vs.  $m(\text{WIMP})$  plane; limit quoted for  $m(\text{WIMP}) = 1$  GeV.
- <sup>4</sup> ANGIOLOHER 22A search for spin-dependent DM scatter on Li and Al for  $m(\text{DM}) \sim 0.2\text{--}6$  GeV; no signal observed; limits set in  $\sigma(\chi p)$  vs.  $m(\text{DM})$  plane; quoted limit is for  $m(\text{DM}) = 1$  GeV.
- <sup>5</sup> ABDELHAMEED 20A use LiAlO<sub>2</sub> target in CRESST to search for SD WIMP scatter on p; no signal; quoted limit is for  $m(\text{DM}) = 1$  GeV.

- 6 ABDELHAMEED 19 search for SD WIMP scatter on  ${}^7\text{Li}$ ; limits placed on  $\sigma^{SD}(\chi p)$  for  $m(\chi) \sim 0.8\text{--}20$  GeV; quoted limit is for  $m(\chi) = 1$  GeV.
- 7 AMOLE 19 search for SD WIMP scatter on  $\text{C}_3\text{F}_8$  in PICO-60 bubble chamber; no signal; set limit for spin dependent coupling  $\sigma^{SD}(\chi p) < 2 \times 10^{-4}$  pb for  $m(\chi) = 5$  GeV.
- 8 APRILE 19c search for light DM on Xe via Migdal/brem effect; no signal, require  $\sigma^{SD}(\chi p) < 1.7 \times 10^4$  pb for  $m(\chi) = 1$  GeV.
- 9 ARMENGAUD 19 search for GeV scale WIMP scatter on Ge; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 0.5\text{--}10$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 10 XIA 19a search for WIMP scatter on Xe in PandaX-II; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5\text{--}1 \times 10^5$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 11 AGNESE 18 search for GeV scale WIMPs with CDMSlite; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 1.5\text{--}20$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 12 AKERIB 17a search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 6\text{--}1 \times 10^5$  GeV.
- 13 FU 17 search for SD WIMP scatter on Xe; limits set in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}1 \times 10^3$  GeV.; quoted limit is for  $m(\chi) = 5$  GeV.
- 14 AMOLE 15 search for WIMP scatter on  $\text{C}_3\text{F}_8$  in PICO-2L; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}1 \times 10^4$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 15 ARCHAMBAULT 12 search for SD WIMP scatter in  ${}^{19}\text{F}$  with PICASSO; limits set in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m \sim 4\text{--}500$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.

**For  $m_{\chi 0} = 20$  GeV**

For limits from  $X^0$  annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

1 AALBERS 23 yield first SD LZ limits on WIMP-p scatter using Xe.  $\sigma^{SD}(\chi p) < 6 \times 10^{-5}$  pb for  $m(\chi) = 20$  GeV.

2 ABBASI 22B search for WIMP annihilation to  $b\bar{b}$ ,  $\tau\bar{\tau}$ ,  $\nu\bar{\nu}$  in Sun with 7 years data; no signal; limits set in  $m(\chi)$  vs.  $\sigma^{SD}(\chi p)$  plane for  $m(\chi)$ : 10–100 GeV; quoted limit for  $\nu\bar{\nu}$  channel.

3 ANGLÖHER 22 search for SD WIMP-proton scatter from Li target; no signal detected; limits placed in  $\sigma$  vs.  $m(\text{WIMP})$  plane.

4 HUANG 22 search for SD DM scatter on Xe; no signal observed; limits placed in  $\sigma(\chi n)$  vs.  $m(\text{DM})$  plane; quoted limit is for  $m(\text{DM}) = 20$  GeV.

5 AARTSEN 20c place combined IceCube and Pico-60 velocity-independent limits on spin-dependent WIMP-p scatter  $\sigma^{SD}(\chi p) < 9\text{--}5$  pb for  $m(\text{WIMP}) = 20$  GeV assuming dominant annihilation to  $\tau\bar{\tau}$ .

6 ABDELHAMEED 20A use  $\text{LiAlO}_2$  target in CRESST to search for spin-dependent WIMP scatter on p; limits set for  $m(\text{WIMP})$ : 0.3–30 GeV in Fig. 8. Quoted limit is for  $m(\text{WIMP}) = 30$  GeV.

7 FELIZARDO 20 presents 2014 SIMPLE bounds on WIMP DM using  $\text{C}_2\text{ClF}_5$  target.

8 ABDELHAMEED 19 uses  $\text{Li}_2\text{MoO}_4$  target to set limit for spin dependent coupling  $\sigma^{SD}(\chi p) < 3 \times 10^5$  pb for  $m(\chi) = 20$  GeV.

9 AMOLE 19 search for SD WIMP scatter on  $\text{C}_3\text{F}_8$  in PICO-60 bubble chamber; no signal; set limit for spin dependent coupling  $\sigma^{SD}(\chi p) < 2.5 \times 10^{-5}$  pb for  $m(\chi) = 20$  GeV.

10 APRILE 19a search for SD WIMP scatter on 1 t yr Xe; no signal, limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m \sim 6\text{--}1000$  GeV.

11 XIA 19a search for WIMP scatter on Xe in PandaX-II; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5\text{--}1 \times 10^5$  GeV.

12 AGNESE 18 give limits for  $\sigma^{SD}(\rho\chi)$  for  $m(\text{WIMP})$  between 1.5 and 20 GeV using CDMSlite mode data.

13 AKERIB 17a search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 6\text{--}1 \times 10^5$  GeV.

14 BEHNKE 17 show final Picasso results based on 231.4 kg d exposure at SNOLab for WIMP scatter on  $\text{C}_4\text{F}_{10}$  search via superheated droplet; require  $\sigma(\text{SD}) < 1.32 \times 10^{-2}$  pb for  $m(\text{WIMP}) = 20$  GeV.

15 FU 17 search for SD WIMP scatter on Xe; limits set in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4\text{--}1 \times 10^3$  GeV.

16 AMOLE 16a require SD WIMP-p scattering  $< 5 \times 10^{-4}$  pb for  $m(\text{WIMP}) = 20$  GeV; bubbles from  $\text{C}_3\text{F}_8$  target.

17 KHACHATRYAN 16AJ require SD WIMP-p  $< 2 \times 10^{-6}$  pb for  $m(\text{WIMP}) = 20$  GeV from  $pp \rightarrow Z + \cancel{e}\tau$ ; Z →  $\ell\bar{\ell}$  signal.

18 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken between June 2010 and May 2011.

19 The value has been provided by the authors. APRILE 13 note that the proton limits on Xe are highly sensitive to the theoretical model used. See also APRILE 14A.

20 ARCHAMBAULT 12 search for WIMP scatter on  $\text{C}_4\text{F}_{10}$ ; limits set in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m \sim 4\text{--}500$  GeV.

21 Use a direction-sensitive detector.

22 TANAKA 11 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the Sun. The amount of  $X^0$  depends on the  $X^0$ -proton cross section.

23 See also AKERIB 05.

**For  $m_{\chi 0} = 100$  GeV**

For limits from  $X^0$  annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- 1 AALBERS 23 yield first SD LZ limits on WIMP-p scatter using Xe.  $\sigma^{SD}(\chi p) < 1.5 \times 10^{-4}$  pb for  $m(\chi) = 100$  GeV.
- 2 ADHIKARI 23c search for SD WIMP scatter on I. No signal observed. Require  $\sigma^{SD}(\chi p) < 1$  pb for  $m(\chi) = 100$  GeV.
- 3 SHIMADA 23 search for WIMPs in NEWAGE directional detector. No signal observed. Limits placed in  $\sigma^{SD}(\chi p)$  vs. mass plane. Quoted limit for  $m(\chi) = 150$  GeV.
- 4 ABBASI 22b search for WIMP annihilation to  $b\bar{b}$ ,  $\tau\tau$ ,  $\nu\bar{\nu}$  in Sun with 7 years data; no signal; limits set in  $m(\chi)$  vs.  $\sigma^{SD}(\chi p)$  plane for  $m(\chi)$ : 10-100 GeV; quoted limit for  $\nu\bar{\nu}$  channel.
- 5 HUANG 22 search for SD DM scatter on Xe; no signal observed; limits placed in  $\sigma(\chi n)$  vs.  $m(\text{DM})$  plane; quoted limit is for  $m(\text{DM}) = 100$  GeV.
- 6 IKEDA 21 use direction sensitive TPC NEWAGE to search for SD WIMPs. No signal observed. Limits set in  $\sigma^{SD}(\chi p)$  vs.  $m$  plane;  $\sigma^{SD}(\chi p) < 50$  pb for  $m(\text{DM}) = 100$  GeV.
- 7 AARTSEN 20c place combined IceCube and Pico-60 velocity-independent limits on spin-dependent WIMP-p scatter  $\sigma^{SD}(\chi p) < 3.34 \times 10^{-4}$  pb for  $m(\text{WIMP}) = 100$  GeV assuming dominant annihilation to  $\tau\tau$ .
- 8 FELIZARDO 20 presents 2014 SIMPLE bounds on WIMP DM using C<sub>2</sub>ClF<sub>5</sub> target.
- 9 AMOLE 19 search for SD WIMP scatter on C<sub>3</sub>F<sub>8</sub> in PICO-60 bubble chamber; no signal; set limit for spin dependent coupling  $\sigma^{SD}(\chi p) < 4 \times 10^{-5}$  pb for  $m(\chi) = 100$  GeV.
- 10 APRILE 19A search for SD WIMP scatter on 1 t yr Xe; no signal, limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m \sim 6-1000$  GeV.
- 11 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5-1 \times 10^5$  GeV.
- 12 AKERIB 17A search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 6-1 \times 10^5$  GeV.
- 13 AMOLE 17 require  $\sigma(\text{WIMP-p})^{SD} < 5 \times 10^{-5}$  pb for  $m(\text{WIMP}) = 100$  GeV using PICO-60 1167 kg-days exposure at SNOLab.
- 14 APRILE 17A require  $\sigma(\text{WIMP-p})^{(inelastic)SD} < 3.3 \times 10^{-2}$  pb for  $m(\text{WIMP}) = 100$  GeV, based on 7640 kg day exposure at LNGS.
- 15 BATTAT 17 use directional detection of CS<sub>2</sub> ions to require  $\sigma(\text{SD}) < 2.8 \times 10^{-1}$  pb for 100 GeV WIMP with a 55 days exposure at the Boulby Underground Science Facility.
- 16 FU 17 from a 33000 kg d exposure at CJPL, PANDEX II derive for  $m(\text{DM}) = 100$  GeV,  $\sigma^{SD}(\text{WIMP-p}) < 2 \times 10^{-3}$  pb.
- 17 AABOUD 16d use ATLAS 13 TeV 3.2 fb<sup>-1</sup> of data to search for monojet plus missing  $E_T$ ; agree with SM rates; present limits on large extra dimensions, compressed SUSY spectra and wimp pair production.
- 18 AABOUD 16f search for monophoton plus missing  $E_T$  events at ATLAS with 13 TeV and 3.2 fb<sup>-1</sup>; signal agrees with SM background; place limits on SD WIMP-proton scattering vs. mediator mass and large extra dimension models.
- 19 AARTSEN 16c search for high energy  $\nu$ s from WIMP annihilation in solar core; limits set on SD WIMP-p scattering (Fig. 8).
- 20 ADRIAN-MARTINEZ 16 search for WIMP annihilation into  $\nu$ s from solar core; exclude SD cross section < few 10<sup>-4</sup> depending on  $m(\text{WIMP})$ .
- 21 AKERIB 16A using 2013 data exclude SD WIMP-proton scattering  $> 3 \times 10^{-3}$  pb for  $m(\text{WIMP}) = 100$  GeV.
- 22 AMOLE 16 use bubble technique on CF<sub>3</sub>I target to exclude SD WIMP-p scattering  $> 5 \times 10^{-4}$  pb for  $m(\text{WIMP}) = 100$  GeV.
- 23 Use a direction-sensitive detector.
- 24 AVRORIN 14 search for neutrinos from the Sun arising from the pair annihilation of X<sup>0</sup> trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- 25 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X<sup>0</sup> trapped by the sun in data taken between June 2010 and May 2011.
- 26 ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of X<sup>0</sup> trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- 27 The value has been provided by the authors. APRILE 13 note that the proton limits on Xe are highly sensitive to the theoretical model used. See also APRILE 14A.
- 28 BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of X<sup>0</sup> trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- 29 ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of X<sup>0</sup> trapped by the Sun. The amount of X<sup>0</sup> depends on the X<sup>0</sup>-proton cross section.
- 30 ARCHAMBAULT 12 search for WIMP scatter on C<sub>4</sub>F<sub>10</sub>; limits set in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m \sim 4-500$  GeV.
- 31 TANAKA 11 search for neutrinos from the Sun arising from the pair annihilation of X<sup>0</sup> trapped by the Sun. The amount of X<sup>0</sup> depends on the X<sup>0</sup>-proton cross section.

- 32 See their Fig. 3 for limits on spin-dependent proton couplings for X<sup>0</sup> mass of 50 GeV.
- 33 See also AKERIB 05.
- 34 GIULIANI 05A analyze available data and give combined limits.
- 35 GIULIANI 04 reanalyze COLLAR 00 data and give limits for spin-dependent X<sup>0</sup>-proton coupling.
- 36 GIULIANI 04A give limits for spin-dependent X<sup>0</sup>-proton couplings from existing data.

### For $m_{X^0} = 1$ TeV

For limits from X<sup>0</sup> annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- 1 AALBERS 23 yield first SD LZ limits on WIMP-p scatter using Xe.  $\sigma^{SD}(\chi p) < 2 \times 10^{-3}$  pb for  $m(\chi) = 1$  TeV.
- 2 ADHIKARI 23c search for SD WIMP scatter on I. No signal observed. Require  $\sigma^{SD}(\chi p) < 0.2$  pb for  $m(\chi) = 1$  TeV.
- 3 HUANG 22 search for SD DM scatter on Xe; no signal observed; limits placed in  $\sigma(\chi n)$  vs.  $m(\text{DM})$  plane; quoted limit is for  $m(\text{DM}) = 1$  TeV.
- 4 IKEDA 21 use direction sensitive TPC NEWAGE to search for SD WIMPs. No signal observed. Limits set in  $\sigma^{SD}(\chi p)$  vs.  $m$  plane;  $\sigma^{SD}(\chi p) < 200$  pb for  $m(\text{DM}) = 1000$  GeV.
- 5 AARTSEN 20c place combined IceCube and Pico-60 velocity-independent limits on spin-dependent WIMP-p scatter  $\sigma^{SD}(\chi p) < 3 \times 10^{-3}$  pb for  $m(\text{WIMP}) = 1$  TeV assuming dominant annihilation to  $W W$ .
- 6 AMOLE 19 search for SD WIMP scatter on C<sub>3</sub>F<sub>8</sub> in PICO-60 bubble chamber; no signal; set limit for spin dependent coupling  $\sigma^{SD}(\chi p) < 3 \times 10^{-4}$  pb for  $m(\chi) = 1000$  GeV.
- 7 APRILE 19A search for SD WIMP scatter on 1 t yr Xe; no signal, limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m \sim 6-1000$  GeV.
- 8 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5-1 \times 10^5$  GeV.

- 9 ALBERT 18c search for DM annihilation in Sun to long-lived mediator (LLM) which decays outside Sun, for DM masses above 1 TeV; assuming LLM, limits set on  $\sigma^{SD}(\chi p)$ .
- 10 AARTSEN 17A search for neutrinos from solar WIMP annihilation into  $\tau^+ \tau^-$  in 532 days of live time.
- 11 AKERIB 17A search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 6-1 \times 10^5$  GeV.
- 12 FU 17 search for SD WIMP scatter on Xe; limits set in  $\sigma^{SD}(\chi p)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4-1 \times 10^3$  GeV.
- 13 ADRIAN-MARTINEZ 16b search for secluded DM via WIMP annihilation in solar core into light mediator which later decays to  $\mu$  or  $\nu$ s; limits presented in Figures 3 and 4.
- 14 AVRORIN 14 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- 15 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken between June 2010 and May 2011.
- 16 ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- 17 The value has been provided by the authors. APRILE 13 note that the proton limits on Xe are highly sensitive to the theoretical model used. See also APRILE 14A.
- 18 BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- 19 ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the Sun. The amount of  $X^0$  depends on the  $X^0$ -proton cross section.
- 20 Use a direction-sensitive detector.
- 21 TANAKA 11 search for neutrinos from the Sun arising from the pair annihilation of  $X^0$  trapped by the Sun. The amount of  $X^0$  depends on the  $X^0$ -proton cross section.
- 22 ABBASI 10 search for  $\nu_\mu$  from annihilations of Kaluza-Klein photon dark matter in the Sun.
- 23 See also AKERIB 05.

**Spin-Dependent Cross Section Limits**  
**for Dark Matter Particle ( $X^0$ ) on Neutron**

**For  $m_{X^0}$  in GeV range**

We provide here limits for  $m_{X^0} < 5$  GeV

- 1 AALBERS 23A search for GeV-scale WIMP scatter on Xe. No signal observed. Limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane. Quoted limit is for  $m(\chi) = 1$  GeV via Migdal scattering.
- 2 ANGLOHER 22 search for SD WIMP scatter on Li target; no signal detected; limits placed on WIMP-neutron SD scatter versus  $m(\text{WIMP})$ ; limit quoted for  $m(\text{WIMP}) = 1$  GeV.
- 3 ANGLOHER 22A search for spin-dependent DM scatter on Li and Al for  $m(\text{DM}) \sim 0.2-6$  GeV; no signal observed; limits set in  $\sigma(\chi n)$  vs.  $m(\text{DM})$  plane; quoted limit is for  $m(\text{DM}) = 1$  GeV.
- 4 ABDELHAMEED 20A use LiAlO<sub>2</sub> target in CRESST to search for SD WIMP scatter; no signal; quoted limit is for  $m(\text{DM}) = 1$  GeV.
- 5 ABDELHAMEED 19 search for GeV-scale WIMP SD scatter on <sup>7</sup>Li crystal; set limit  $\sigma^{SD}(\chi n)$  for  $m(\chi) \sim 0.8-20$  GeV; quoted limit for  $m(\chi) = 1$  GeV.
- 6 APRILE 19C search for light DM on Xe via Migdal/bremsstrahlung effect; no signal, require  $\sigma^{SD}(\chi n) < 230$  pb for  $m(\chi) = 1$  GeV.
- 7 APRILE 19D search for light DM scatter on Xe via ionization; no signal, limits placed in  $\sigma$  vs.  $m(\text{DM}) \sim 3-6$  GeV; quoted limit is for  $m(\text{DM}) = 5$  GeV.
- 8 ARMENGAUD 19 search for GeV scale WIMP scatter on Ge; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 0.5-10$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 9 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5-1 \times 10^5$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 10 AGNESE 18 search for GeV scale WIMPs scatter at CDM2Site; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m \sim 1.5-20$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 11 JIANG 18 search for GeV scale WIMP scatter on Ge; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 3-10$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 12 YANG 18 search for WIMP scatter on Ge; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 2-10$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 13 AKERIB 17A search for SD WIMP scatter on Xe with 129.5 kg yr exposure; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5-1 \times 10^5$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 14 FU 17 search for SD WIMP scatter on Xe; limits set in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4-1 \times 10^3$  GeV.; quoted limit is for  $m(\chi) = 5$  GeV.
- 15 ZHAO 16 search for GeV-scale WIMP scatter on Ge; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4-30$  GeV; quoted limit is for  $m(\chi) = 5$  GeV.
- 16 AHMED 11B search for GeV scale WIMP scatter on Ge in CDM2 II; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m \sim 4-12$  GeV. Limit given for  $m(\chi) = 5$  GeV.

**For  $m_{X^0} = 20$  GeV**

- 1 AALBERS 23 yield first LZ limits on SD WIMP-n scatter using Xe.  $\sigma^{SD}(\chi n) < 2 \times 10^{-6}$  pb for  $m(\chi) = 20$  GeV.
- 2 ANGLOHER 22 search for SD WIMP-neutron scatter from Li target; no signal detected; limits placed in  $\sigma$  vs.  $m(\text{WIMP})$  plane.
- 3 HUANG 22 search for SD DM scatter on Xe; no signal observed; limits placed in  $\sigma(\chi n)$  vs.  $m(\text{DM})$  plane; quoted limit is for  $m(\text{DM}) = 20$  GeV.
- 4 ABDELHAMEED 20A use LiAlO<sub>2</sub> target in CRESST to search for SD WIMP scatter on n; limits placed for  $m(\text{WIMP})$ : 0.3-30 GeV in Fig. 8. Quoted limit is for  $M(\text{WIMP}) = 30$  GeV.
- 5 FELIZARDO 20 presents 2014 SIMPLE bounds on WIMP DM using C<sub>2</sub>F<sub>5</sub> target.
- 6 APRILE 19A search for SD WIMP scatter on 1 t yr Xe; no signal: limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m \sim 6-1000$  GeV.
- 7 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5-1 \times 10^5$  GeV.
- 8 AGNESE 18 give limits for  $\sigma^{SD}(n\chi)$  for  $m(\text{WIMP})$  between 1.5 and 20 GeV using CDM2Site mode data.
- 9 AKERIB 17A search for SD WIMP scatter on Xe with 129.5 kg yr exposure; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5-1 \times 10^5$  GeV.
- 10 FU 17 search for SD WIMP scatter on Xe; limits set in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4-1 \times 10^3$  GeV.
- 11 ZHAO 16 search for GeV-scale WIMP scatter on Ge; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4-30$  GeV.
- 12 Derived limit from search for inelastic scattering  $X^0 + ^{129}\text{Xe} \rightarrow X^0 + ^{129}\text{Xe}^*(39.58 \text{ keV})$ .
- 13 The value has been provided by the authors. See also APRILE 14A.
- 14 See their Fig. 6(b) for cross section limits for  $m_{X^0}$  extending down to 2 GeV.
- 15 See also AKERIB 05.

**For  $m_{X^0} = 100$  GeV**

1 AALBERS 23 yield first LZ limits on SD WIMP-n scatter using Xe.  $\sigma(\chi n) < 5 \times 10^{-6}$  pb for  $m(\chi) = 100$  GeV.

2 HUANG 22 search for SD DM scatter on Xe; no signal observed; limits placed in  $\sigma(\chi n)$  vs.  $m(\text{DM})$  plane; quoted limit is for  $m(\text{DM}) = 100$  GeV.

3 FELIZARDO 20 presents 2014 SIMPLE bounds on WIMP DM using  $\text{C}_2\text{ClF}_5$  target.

4 APRILE 19A search for SD WIMP scatter on 1 t yr Xe; no signal, limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m \sim 6$ -1000 GeV.

5 SUZUKI 19 search in single phase liquid xenon detector for inelastic scattering  $\chi^0 + ^{129}\text{Xe} \rightarrow \chi^0 + ^{129}\text{Xe}^*$  (39.58 keV); no signal; require  $\sigma(\chi n)^{SD} < 4 \times 10^{-3}$  pb for  $m(\chi) = 100$  GeV.

6 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5$ - $1 \times 10^5$  GeV.

7 AKERIB 17A search for SD WIMP scatter on Xe with 129.5 kg yr exposure; limits placed in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 5$ - $1 \times 10^5$  GeV.

8 FU 17 search for SD WIMP scatter on Xe; limits set in  $\sigma^{SD}(\chi n)$  vs.  $m(\chi)$  plane for  $m(\chi) \sim 4$ - $1 \times 10^3$  GeV.

9 UCHIDA 14 derived limit from search for inelastic scattering  $\chi^0 + ^{129}\text{Xe} \rightarrow \chi^0 + ^{129}\text{Xe}^*$  (39.58 keV).

10 The value has been provided by the authors. See also APRILE 14A.

11 See their Fig. 3 for limits on spin-dependent neutron couplings for  $X^0$  mass of 50 GeV.

12 BEDNYAKOV 08 reanalyze KLAPDOR-KLEINGROTHAUS 05 and BAUDIS 01 data.

13 See also AKERIB 05.

14 GIULIANI 05A analyze available data and give combined limits.

15 GIULIANI 04 reanalyze COLLAR 00 data and give limits for spin-dependent  $X^0$ -neutron coupling.

16 GIULIANI 04A give limits for spin-dependent  $X^0$ -neutron couplings from existing data.

17 MIUCHI 03 give model-independent limit for spin-dependent  $X^0$ -proton and neutron cross sections. See their Fig. 5.

- 1 UCHIDA 14 limit is for inelastic scattering  $\chi^0 + ^{129}\text{Xe}^* \rightarrow \chi^0 + ^{129}\text{Xe}^*$  (39.58 keV).
- 2 ANGLOHER 02 limit is for spin-dependent WIMP-Aluminum cross section.
- 3 BENOIT 00 find four event categories in Ge detectors and suggest that low-energy surface nuclear recoils can explain anomalous events reported by UKDMC and Saclay Nal experiments.
- 4 KLIMENKO 98 limit is for inelastic scattering  $\chi^0 \text{ } ^{73}\text{Ge} \rightarrow \chi^0 \text{ } ^{73}\text{Ge}^*$  (13.26 keV).
- 5 BELLI 96 limit for inelastic scattering  $\chi^0 \text{ } ^{129}\text{Xe} \rightarrow \chi^0 \text{ } ^{129}\text{Xe}^*$  (39.58 keV).
- 6 BELLI 96c use background subtraction and obtain  $\sigma < 150 \text{ pb}$  ( $< 1.5 \text{ fb}$ ) (90% CL) for spin-dependent (independent)  $\chi^0$ -proton cross section. The confidence level is from R. Bernabei, private communication, May 20, 1999.
- 7 BERNABEI 96 use pulse shape discrimination to enhance the possible signal. The limit here is from R. Bernabei, private communication, September 19, 1997.
- 8 SARSA 96 search for annual modulation of WIMP signal. See SARSA 97 for details of the analysis. The limit here is from M.L. Sarsa, private communication, May 26, 1997.
- 9 SMITH 96 use pulse shape discrimination to enhance the possible signal. A dark matter density of  $0.4 \text{ GeV cm}^{-3}$  is assumed.
- 10 GARCIA 95 limit is from the event rate. A weaker limit is obtained from searches for diurnal and annual modulation.
- 11 SNOWDEN-IFFT 95 look for recoil tracks in an ancient mica crystal. Similar limits are also given for  $^{27}\text{Al}$  and  $^{28}\text{Si}$ . See COLLAR 96 and SNOWDEN-IFFT 96 for discussion on potential backgrounds.
- 12 REUSSER 91 limit here is changed from published (0.04) after reanalysis by authors. J.L. Vuilleumier, private communication, March 29, 1996.

- 1 APRILE 21A search for inelastic DM scatter off  $^{129}\text{Xe}$  nuclei with 0.83 yr exposure. No signal observed. Limits placed in  $\sigma(\chi\text{Xe})$  vs.  $m(\text{DM})$  plane for WIMP mass between 20 GeV and 10 TeV.
- 2 UCHIDA 14 limit is for inelastic scattering  $\chi^0 + ^{129}\text{Xe}^* \rightarrow \chi^0 + ^{129}\text{Xe}^*$  (39.58 keV).

- 3 ANGLOHER 02 limit is for spin-dependent WIMP-Aluminum cross section.
- 4 BELLI 02 discuss dependence of the extracted WIMP cross section on the assumptions of the galactic halo structure.
- 5 BERNABEI 02c analyze the DAMA data in the scenario in which  $\chi^0$  scatters into a slightly heavier state as discussed by SMITH 01.
- 6 GREEN 02 discusses dependence of extracted WIMP cross section limits on the assumptions of the galactic halo structure.
- 7 ULLIO 01 disfavor the possibility that the BERNABEI 99 signal is due to spin-dependent WIMP coupling.
- 8 BENOIT 00 find four event categories in Ge detectors and suggest that low-energy surface nuclear recoils can explain anomalous events reported by UKDMC and Saclay Nal experiments.
- 9 BERNABEI 00d limit is for inelastic scattering  $\chi^0 \text{ } ^{129}\text{Xe} \rightarrow \chi^0 \text{ } ^{129}\text{Xe}^*$  (39.58 keV).
- 10 AMBROSIO 99 search for upgoing muon events induced by neutrinos originating from WIMP annihilations in the Sun and Earth.
- 11 BRHLIK 99 discuss the effect of astrophysical uncertainties on the WIMP interpretation of the BERNABEI 99 signal.
- 12 KLIMENKO 98 limit is for inelastic scattering  $\chi^0 \text{ } ^{73}\text{Ge} \rightarrow \chi^0 \text{ } ^{73}\text{Ge}^*$  (13.26 keV).
- 13 KLIMENKO 98 limit is for inelastic scattering  $\chi^0 \text{ } ^{73}\text{Ge} \rightarrow \chi^0 \text{ } ^{73}\text{Ge}^*$  (66.73 keV).
- 14 BELLI 96 limit for inelastic scattering  $\chi^0 \text{ } ^{129}\text{Xe} \rightarrow \chi^0 \text{ } ^{129}\text{Xe}^*$  (39.58 keV).
- 15 BELLI 96c use background subtraction and obtain  $\sigma < 0.35 \text{ pb}$  ( $< 0.15 \text{ fb}$ ) (90% CL) for spin-dependent (independent)  $\chi^0$ -proton cross section. The confidence level is from R. Bernabei, private communication, May 20, 1999.
- 16 BERNABEI 96 use pulse shape discrimination to enhance the possible signal. The limit here is from R. Bernabei, private communication, September 19, 1997.
- 17 SARSA 96 search for annual modulation of WIMP signal. See SARSA 97 for details of the analysis. The limit here is from M.L. Sarsa, private communication, May 26, 1997.
- 18 SMITH 96 use pulse shape discrimination to enhance the possible signal. A dark matter density of  $0.4 \text{ GeV cm}^{-3}$  is assumed.
- 19 GARCIA 95 limit is from the event rate. A weaker limit is obtained from searches for diurnal and annual modulation.
- 20 SNOWDEN-IFFT 95 look for recoil tracks in an ancient mica crystal. Similar limits are also given for  $^{27}\text{Al}$  and  $^{28}\text{Si}$ . See COLLAR 96 and SNOWDEN-IFFT 96 for discussion on potential backgrounds.
- 21 BECK 94 uses enriched  $^{76}\text{Ge}$  (86% purity).
- 22 REUSSER 91 limit here is changed from published (0.3) after reanalysis by authors. J.L. Vuilleumier, private communication, March 29, 1996.

- 9 BELLI 96 limit for inelastic scattering  $\chi^0 \text{ } ^{129}\text{Xe} \rightarrow \chi^0 \text{ } ^{129}\text{Xe}^*$  (236.14 keV).
- 10 BELLI 96c use background subtraction and obtain  $\sigma < 0.7 \text{ pb}$  ( $< 0.7 \text{ fb}$ ) (90% CL) for spin-dependent (independent)  $\chi^0$ -proton cross section. The confidence level is from R. Bernabei, private communication, May 20, 1999.
- 11 BERNABEI 96 use pulse shape discrimination to enhance the possible signal. The limit here is from R. Bernabei, private communication, September 19, 1997.
- 12 SARSA 96 search for annual modulation of WIMP signal. See SARSA 97 for details of the analysis. The limit here is from M.L. Sarsa, private communication, May 26, 1997.

# Searches Particle Listings

## WIMP and Dark Matter Searches

- <sup>13</sup> SMITH 96 use pulse shape discrimination to enhance the possible signal. A dark matter density of  $0.4 \text{ GeV cm}^{-3}$  is assumed.
- <sup>14</sup> GARCIA 95 limit is from the event rate. A weaker limit is obtained from searches for diurnal and annual modulation.
- <sup>15</sup> SNOWDEN-IFFT 95 look for recoil tracks in an ancient mica crystal. Similar limits are also given for  $^{27}\text{Al}$  and  $^{28}\text{Si}$ . See COLLAR 96 and SNOWDEN-IFFT 96 for discussion on potential backgrounds.
- <sup>16</sup> BECK 94 uses enriched  $^{76}\text{Ge}$  (86% purity).
- <sup>17</sup> REUSSER 91 limit here is changed from published (5) after reanalysis by authors. J.L. Vuilleumier, private communication, March 29, 1996.

- <sup>1</sup> ABE 23A search for boosted sub-GeV DM using 0.37 Mt-y exposure of SuperK data. No signal observed. Model dependent limits set, see Fig. 3 corrected in ABE 23G erratum.
- <sup>2</sup> ADAMS 23 search for inelastic DM scatter in fluorocarbons. No signal observed. Limits placed in  $\sigma$  vs.  $m(\chi)$  mass splitting plane.
- <sup>3</sup> ADHIKARI 23B search for boosted heavy photon DM in MeV range using Cosine-100. No signal observed. Limits placed in coupling vs. mass plane for masses 1–100 MeV.
- <sup>4</sup> AL-KHARUSI 23 search for absorption of MeV-scale DM with 234.1 kg-y exposure of  $^{136}\text{Xe}$ , triggering beta decay. No signal observed. Limit placed in cross section vs. mass plane for  $m(\chi) = 1.7\text{--}11.6$  MeV (see Fig. 5).
- <sup>5</sup> APRILE 23 search for multiple scatter events from Planck scale-DM particles. No signal observed. Limits set on  $\sigma^{SI}$  and  $\sigma^{SD}$  on  $n$  and  $p$ .
- <sup>6</sup> HUANG 23 search for MeV-scale scalar DM interacting via GeV-scale dark mediator. Limits placed on cross section vs. mass plane.
- <sup>7</sup> NING 23A search for boosted LDM arising from  $\eta$  decays which are produced in CR events with 0.63 t-y exposure. No signal observed. Limits placed in  $\sigma(\chi N)$  vs.  $m(\chi)$  plane for various mediator models and branching fraction assumptions (see Fig. 2).
- <sup>8</sup> ADHIKARI 22 search for multiple scatter of Planck scale DM on Ar using DEAP detector. No signal observed. Limits placed in mass vs. cross section plane for  $m(\text{DM})$ :  $10^7\text{--}10^{19}$  GeV.
- <sup>9</sup> ADHIKARI 22D report search for annual modulation signal of DM in a 173 kg-yr exposure of NaI; result consistent with both the modulation amplitude reported by DAMA/LIBRA and no-modulation.
- <sup>10</sup> DAI 22A search for MeV-scale exotic DM interaction with Ge; no signal observed; limits set in  $m(\text{DM})$  vs. cross section plane for  $m(\text{DM}) \sim 5\text{--}60$  MeV in simplified model.
- <sup>11</sup> GU 22 use PANDAX to search for absorption of fermionic DM in MeV range in Xe; no signal observed; limits set in  $m(\text{DM})$  vs. cross section plane for  $m(\text{DM}) \sim 30\text{--}125$  MeV.
- <sup>12</sup> ZHANG 22 search for light DM scatter on e; no signal observed; limits placed in  $\sigma$ - $v$  vs.  $m(\text{DM})$  plane for  $m(\text{DM}) \sim 10\text{--}180$  keV.

- <sup>13</sup> AKERIB 21B place limits on 15 WIMP non-relativistic EFT couplings for  $m(\text{DM})$ : 10–4000 GeV using 3.14 kg d exposure.
- <sup>14</sup> AMARE 21 search for WIMP annual modulation signal on NaI target in the Canfranc Underground Laboratory (LSC). With an effective exposure of 313.95 kg y, and a sensitivity of  $2.5 \sigma$  no signal is observed. Incompatible with DAMA/LIBRA at  $3.3 \sigma$  level.
- <sup>15</sup> WANG 21K use CDEX detector to search for WIMP dark matter scatter on Ge; no signal observed; limits placed on 14 non-relativistic effective operators along with WIMP-pion coupling for  $m(\text{WIMP}) \sim 3\text{--}20$  GeV.
- <sup>16</sup> AGOSTINI 20 search for keV–MeV scale super-WIMP absorption in Ge in GERDA; no signal; limits placed on keV–MeV scale bosonic superWIMPs in coupling vs. mass plane.
- <sup>17</sup> ANDRIANAVALOMAHEFA 20 search for hidden photon DM in eV range; place limits in  $m(\text{DM})$  vs  $\ln(\chi)$  plane: exclude coupling  $\chi \lesssim 1 \times 10^{-12}$  for  $m(\text{DM}) \sim 2.5\text{--}7$  eV.
- <sup>18</sup> CLARK 20 use Majorana and Xe-1-ton data to constrain superheavy multiply interacting dark matter (MIMP) in range  $m \sim 10^8\text{--}10^{17}$  GeV depending on interaction cross section.
- <sup>19</sup> ABRAMOFF 19 search for MeV scale DM via DM–e scattering and dark photon DM via absorption in Si; limits set in coupling vs.  $m(\chi)$  plane and on dark photon in  $m(A)$  vs. kinetic mixing parameter plane.
- <sup>20</sup> ADHIKARI 19 search for annual modulation signal from WIMP scatter on NaI with 1.7 yr exposure; result consistent with both DAMA/LIBRA and null hypothesis.
- <sup>21</sup> AMARE 19 is ANAIS-112 search for WIMP scatter annual modulation on NaI; 157.55 kg yr exposure; result compatible with null hypothesis; confirm goal of reaching sensitivity at  $3\sigma$  to DAMA/LIBRA result in 5 years.
- <sup>22</sup> APRILE 19 search for WIMP-pion scattering in Xe; no signal: require  $\sigma(\chi\pi) < 6.4 \times 10^{-10}$  pb for  $m(\chi) = 30$  GeV.
- <sup>23</sup> BRINGMANN 19 derive theoretically limits on GeV and sub-GeV mass dark matter, in its high energy component generated by interaction with cosmic rays; place limits on  $\sigma^{SI}$  and  $\sigma^{SD} < 10^5$  pb.
- <sup>24</sup> BRUNE 19 examine possibility of Majoron dark matter; limits placed on Majoron mass vs. coupling from SN1987a and  $\nu$ -less double beta decay.
- <sup>25</sup> CHOI 19 from multimessenger observation finds limit on  $\sigma(\nu\chi)/m(\text{DM}) < 5.1 \times 10^{-23}$  cm<sup>2</sup>/GeV based on 290 TeV IceCube neutrino event.
- <sup>26</sup> HA 19 search for inelastic boosted MeV scale dark photon using COSINE-100 data; limits placed in  $m$  vs. epsilon plane for various mediators.
- <sup>27</sup> KLOPF 19 search for DM via  $n \rightarrow \chi e^+ e^-$ ; no signal: limits placed in branching fraction vs.  $m(e^+ e^-)$  plane.
- <sup>28</sup> AARTSEN 18D search for long-lived DM particles decaying  $\chi \rightarrow \nu X$ ; no excess seen; for DM masses above 10 TeV, excluding lifetimes shorter than  $10^{28}$  s.
- <sup>29</sup> ABE 18F search for keV mass ALPs and hidden photons (HP) scatter on electrons; limits set on mass vs. coupling.
- <sup>30</sup> AGNES 18B search for MeV-scale DM scatter on electrons in Ar; no signal; require  $\sigma(\chi e) < 9 \times 10^{-3}$  pb for DM form factor  $F(\text{DM}) = 1$  and  $< 300$  pb for  $F(\text{DM})$  proportional to  $1/q^2$  for  $m(\chi) = 100$  MeV.
- <sup>31</sup> AGNESE 18B search for MeV scale DM via DM–e scattering and dark photon DM via absorption in Si; limits set on MeV DM in coupling vs.  $m(\chi)$  plane and on dark photon in  $m(A')$  vs. kinetic mixing plane.
- <sup>32</sup> AKERIB 18A search for annual and diurnal modulation of DM scattering rate on electrons for recoil energy between 2 and 6 keVee; no signal found.
- <sup>33</sup> ARMENGAUD 18 search for ALP from the Sun and galactic bosonic DM, interacting in Ge; no signal; limits set for 0.8–500 keV DM particles.
- <sup>34</sup> KACHULIS 18 search for an excess of elastically scattered electrons above the atmospheric neutrino background in Super-K; limits placed for simple annihilation or decay in the Sun or galactic center producing “boosted” dark matter.
- <sup>35</sup> AGUILAR-AREVALO 17 search for hidden photon DM scatter on Si target CCD; limit kinetic mixing  $\kappa < 1 \times 10^{-12}$  for  $m = 10$  eV.
- <sup>36</sup> APRILE 17 search for WIMP–e annual modulation signal for recoil energy in the 2.0–5.8 keV interval using 4 years data with Xe. No significant effect seen.
- <sup>37</sup> APRILE 17D set limits on 14 WIMP-nucleon different interaction operators. No deviations found using 225 live days in the 6.6–240 keV recoil energy range.
- <sup>38</sup> APRILE 17H search for keV bosonic DM via  $e\chi \rightarrow e$ , looking for electronic recoils with 224.6 live days of data and 34 kg of LXe. Limits set on  $\chi e e$  coupling for  $m(\chi) = 8\text{--}125$  keV.
- <sup>39</sup> APRILE 17K search for magnetic inelastic DM via  $\chi N \rightarrow \chi^* \rightarrow \chi \gamma$ . Limits set in DM magnetic moment vs. mass splitting plane for two DM masses corresponding to the DAMA/LIBRA best fit values.
- <sup>40</sup> ANGLOHER 16A require  $q^2$  dependent scattering  $< 8 \times 10^{-3}$  pb for asymmetric DM  $m(\text{WIMP}) = 3$  GeV on CaWO<sub>4</sub> target. It uses a local dark matter density of  $0.38 \text{ GeV/cm}^3$ .
- <sup>41</sup> APRILE 15 search for periodic variation of electronic recoil event rate in the data between Feb. 2011 and Mar. 2012. No significant modulation is found for periods up to 500 days.
- <sup>42</sup> APRILE 15A search for  $X^0$  scattering off electrons. See their Fig. 4 for limits on cross section through axial-vector coupling for  $m_{X^0}$  between 0.6 GeV and 1 TeV. For  $m_{X^0} = 2$  GeV,  $\sigma < 60$  pb (90%CL) is obtained.

### $X^0$ Annihilation Cross Section

Limits are on  $\sigma v$  for  $X^0$  pair annihilation for the  $X^0$  mass specified in the footnote when needed.

		2	ABBASI	23B	search for PeV-scale WIMP-WIMP annihilation to $\mu$ or $b$ pairs. No signal observed. Require $\langle\sigma v\rangle < 10^{-22} \text{ cm}^3/\text{s}$ for $\chi\chi \rightarrow b\bar{b}$ with $m(\chi)$ about 1 PeV or $\langle\sigma v\rangle < 10^{-23} \text{ cm}^3/\text{s}$ for $\chi\chi \rightarrow \mu^+\mu^-$ with $m(\chi)$ about 1 PeV.
		3	ABE	23B	search for WIMP-WIMP annihilation to $\gamma$ in GC. No signal observed. Require $\langle\sigma v\rangle < 5 \times 10^{-28} \text{ cm}^3/\text{s}$ for $m(\chi) = 1 \text{ TeV}$ or $\langle\sigma v\rangle < 1 \times 10^{-25} \text{ cm}^3/\text{s}$ for $m(\chi) = 100 \text{ TeV}$ .
		4	ALBERT	23	search for WIMP pair annihilation to $\gamma$ in galactic halo. No signal observed. Limits placed in $\langle\sigma v\rangle$ vs. mass (10–100 TeV) plane for various annihilation channels.
		5	CHENG	23A	provide updated combined Fermi-LAT/DAMPE search for gamma line from WIMP annihilation. No signal observed. Limits placed in $\langle\sigma v\rangle$ vs. mass (6–200 GeV) plane for various halo profiles.
		6	FOSTER	23	search for gamma ray line in Fermi-LAT data. No signal observed. Limits placed in $\langle\sigma v\rangle$ vs. $m(\chi)$ plane. For Higgsino DM limit see Fig. 12.
		7	GUO	23	search with Five-hundred-meter Aperture Spherical Radio Telescope for synchrotron emission radio signal of DM annihilation from dwarf spheroidal galaxy. No signal observed. Limits set in $\langle\sigma v\rangle$ vs. $m(\chi)$ plane for various annihilation final states.
		8	GUO	23A	search in public IceCube data for DM annihilation to neutrinos. No signal observed. Limits placed in $\langle\sigma v\rangle$ vs $m(\chi)$ plane for various annihilation assumptions.
		9	LAVIS	23	search for 2HDM+S DM and generic spectra using MeerKAT. No signal observed. Limits placed in $\langle\sigma v\rangle$ vs. mass (10–1000 GeV) plane for various annihilation channels.
		10	ABDALLA	22	search for WIMP annihilation in galactic center to gamma rays using HESS; no signal observed; limits set in mass vs $\langle\sigma v\rangle$ plane for dominant annihilation to $W W$ or $\tau\tau$ . Limit here for $\tau\tau$ channel 0.7 TeV mass.
		11	ALBERT	22A	search for secluded PeV-scale DM annihilation to four final states; no signal detected; limits placed in $\langle\sigma v\rangle$ vs. $m(\chi)$ plane for $m(\chi)$ : 6–6000 TeV for $m(\text{mediator}) = 50, 250, \text{ and } 1000 \text{ GeV}$ .
		12	CHAN	22	derive a variety of limits on DM annihilation to various channels resulting in X-rays from dwarf galaxy Omega Centauri. Limits are very dependent on assumed DM density and diffusion coefficient. Quoted limit is for $m(\text{WIMP}) = 100 \text{ GeV}$ annihilating to $W W$ with parameters as in Fig. 4.
		13	EGOROV	22	derives limits on DM annihilation to $b\bar{b}$ or $\tau\tau$ via radio signals from M31; quoted limit from $b\bar{b}$ channel with LOFAR telescope as main data source, using parameters as in Fig. 10 (green curve) for $m(\chi) = 100 \text{ GeV}$ .
		14	MANCONI	22	use polarized synchrotron emission data from Planck to constrain WIMP annihilation cross section in Galaxy; limits set in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane.
		15	ABDALLAH	21	search for WIMP-WIMP annihilation into 2 monoenergetic $\gamma$ rays in WLM dwarf irregular galaxy using HESS data. No signal. Limits placed in $\langle\sigma v\rangle$ vs. $m(\text{WIMP})$ plane for a mass of 370 GeV.
		16	CIRELLI	21	derive limits on light DM annihilation to $ee, \mu\mu, \pi\pi$ that then produce X-rays using data published by INTEGRAL telescope. Limits placed in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane for $m(\text{DM}) = 1\text{--}5000 \text{ MeV}$ .
		17	JOHN	21	derive limits on leptophilic DM annihilating to positrons by comparing expected spectra to AMS-02 data. The range $m(\text{DM}): 60\text{--}300 \text{ GeV}$ appears excluded for this type of model, see Fig. 3.
		18	ABAZAJIAN	20	derive new limits on WIMP annihilation in galactic center (GC): $\langle\sigma v\rangle < 2.5 \times 10^{-27} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 50 \text{ GeV}$ ; seems to rule out WIMP explanation for GC $\gamma$ excess, favouring an astrophysics origin.
		19	ABDALLAH	20	search for WIMP annihilation in newly discovered by DES dwarf satellite galaxies using HESS; limits placed in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane depending on annihilation channel and which dwarf satellite.
		20	ABE	20G	search Super-Kamiokande data for WIMP annihilation to neutrinos in galactic center/halo; no signal; limits placed in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane depending on annihilation channel and $m(\text{WIMP})$ . Reported limit for annihilation to $\nu\bar{\nu}$ at 1 GeV.
		21	ALBERT	20	search for TeV-scale WIMP annihilation to $\gamma\gamma$ in dwarf spheroidal galaxies; no signal; limits placed in $\sigma v$ vs $m(\text{WIMP})$ plane: e.g. $\sigma v < 2.2 \times 10^{-24} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1 \text{ TeV}$ .
		22	ALBERT	20A	search for WIMP annihilation to $\nu S$ in galactic center using Antares; limits placed in $\sigma v$ vs $m(\text{WIMP})$ plane e.g. $\sigma v < 5 \times 10^{-24} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1 \text{ TeV}$ assuming annihilation dominantly to $\tau\tau$ .
		23	ALBERT	20C	report combined Antares + IceCube search for WIMP annihilation to $\tau\tau$ ; for RFW halo profile report $\sigma v < 1 \times 10^{-23} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 100 \text{ GeV}$ .
		24	ALVAREZ	20	use profiling over J-factor distributions and background to derive new limits on $\sigma v$ ; e.g. $\sigma v < 8 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 100 \text{ GeV}$ .
		25	HOOF	20	examine $\gamma$ rays from 27 dwarf spheroidals using Fermi-LAT data; place limits in $\sigma v$ vs $m(\text{WIMP})$ plane using profile likelihood and marginalized posterior techniques for DM annihilation to $\tau\tau$ and $b\bar{b}$ ; quoted limit uses first technique and $b\bar{b}$ channel for $m(\text{WIMP}) = 100 \text{ GeV}$ ; results rule out WIMP explanation of galactic center excess.
		26	MAZZIOTTA	20	use Fermi-LAT pointed-at-Sun data to search for DM annihilation in the Sun to long-lived mediators decaying into gamma rays, i.e. $\chi\chi \rightarrow \phi\phi \rightarrow 4\gamma$ . Limits placed on the SI and SD DM-nucleon cross sections in the $\sigma$ -DM mass plane for DM masses in the range 3 GeV – 1.8 TeV. Limits are evaluated in both cases of equilibrium and non-equilibrium.
		27	ABEYSEKARA	19	search for $\gamma S$ from DM annihilation in galactic substructures with HAWC; no signal, limits placed in $J(\sigma v)$ vs. declination plane for $m(\text{DM}) \sim 1\text{--}108 \text{ TeV}$ .
		28	ALBERT	19B	search for DM signal from M31 galaxy in $\mu, \tau, t, b, W$ channels using HAWC for $m(\text{DM}) \sim 1\text{--}100 \text{ TeV}$ ; no signal, limits placed in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane.
		29	CHEUNG	19	derive model-dependent bounds on $\langle\sigma v\rangle$ from EDGES data: $< 4 \times 10^{-26} \text{ cm}^3/\text{s}$ for $e^+e^-$ and $b\bar{b}$ for $m(\chi) = 100 \text{ GeV}$ (including boost factor).
		30	DI-MAURO	19	place limits on WIMP annihilation via Fermi-LAT observation of M31 and M33 galaxies: $\langle\sigma v\rangle < 7 \times 10^{-27} \text{ cm}^3/\text{s}$ for $m(\chi) = 20 \text{ GeV}$ from M31.
		31	JOHNSON	19	search for $\gamma$ -rays, 10–600 GeV energy, from P-wave annihilating DM around SgrA* BH using Fermi-LAT; limits set for various models.
		32	LI	19D	search for $\chi\chi \rightarrow \gamma$ in Fermi-LAT data; no signal, require $\langle\sigma v\rangle < 2 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\chi) = 100 \text{ GeV}$ .
		33	NG	19	search for X-ray line from sterile $\nu$ decay/annihilation using NuStar M-31; no signal: limits placed in $m(\nu)$ vs mixing angle and $\langle\sigma v\rangle$ vs $m(\nu)$ .
		34	QUEIROZ	19	examine $\chi\chi \rightarrow \chi SM$ semi-annihilation of DM reaction; limits placed for various assumed $SM$ particles in $\langle\sigma v\rangle$ vs. $m(\chi)$ plane.
		35	ABDALLAH	18	search for WIMP WIMP $\rightarrow \gamma X$ in central galactic halo, 10 years of data; limits placed in $\langle\sigma v\rangle$ vs. $m(\text{WIMP})$ plane for $m(\text{WIMP}): 0.3\text{--}70 \text{ TeV}$ .

<sup>1</sup>ABBASI 23A search for WIMP-WIMP annihilation to  $\nu S$ . No signal observed. Require  $\langle\sigma v\rangle < 10^{-24} \text{ cm}^3/\text{s}$  for  $m(\chi) \sim 10\text{--}10^4 \text{ GeV}$  for various halo profiles.

# Searches Particle Listings

## WIMP and Dark Matter Searches

- 36 AHNEN 18 search for WIMP  $WIMP \rightarrow \gamma X$  from Ursa Major II; limits set in  $\langle \sigma \cdot v \rangle$  vs.  $m(WIMP)$  plane for  $b\bar{b}$ ,  $W^+ W^-$ ,  $\tau^+ \tau^-$ , and  $\mu^+ \mu^-$  annihilation modes.
- 37 ALBERT 18b search for TeV-scale WIMPs with WIMP  $WIMP \rightarrow \gamma X$  in Andromeda galaxy using HAWC Observatory; limits set in  $\langle \sigma \cdot v \rangle$  vs  $m(WIMP)$  plane.
- 38 CHANG 18a examine  $\chi\chi \rightarrow b\bar{b} \rightarrow \gamma$  using Fermi Pass 8 data; no signal; require  $\langle \sigma \cdot v \rangle < 10^{-26} \text{ cm}^3/\text{s}$  for  $m(\chi) = 50 \text{ GeV}$ .
- 39 LISANTI 18 examine Fermi Pass 8  $\gamma$ -ray data from galaxy groups; report  $m(WIMP) > 30 \text{ GeV}$  for annihilation in  $b\bar{b}$  channel.
- 40 MAZZIOTTA 18 examine Fermi-LAT electron and positron spectra searching for features originating from DM particles annihilation into  $e^+ e^-$  pairs, from 45 GeV to 2 TeV; no signal found, limits are obtained.
- 41 AARTSEN 17c use 1005 days of IceCube data to search for  $\chi\chi \rightarrow$  neutrinos via various annihilation channels. Limits set.
- 42 ALBERT 17a search for DM annihilation to  $\nu s$  using ANTARES data from 2007–2015. No signal. Limits set in  $\langle \sigma \cdot v \rangle$  vs.  $m(DM)$  plane for  $m(DM) \sim 10\text{--}10 \times 10^5 \text{ GeV}$ . The listed limit is for  $m(DM) = 100 \text{ TeV}$ .
- 43 ARCHAMBAULT 17 set limits for WIMP mass between 100 GeV and 1 TeV on  $\langle \sigma \cdot v \rangle$  for  $W^+ W^-$ ,  $Z Z$ ,  $b\bar{b}$ ,  $s\bar{s}$ ,  $u\bar{u}$ ,  $d\bar{d}$ ,  $t\bar{t}$ ,  $e^+ e^-$ ,  $g g$ ,  $c\bar{c}$ ,  $h h$ ,  $\gamma\gamma$ ,  $\mu^+ \mu^-$ ,  $\tau^+ \tau^-$  annihilation channels.
- 44 AVRORIN 17 find upper limits for the annihilation cross section in various channels for DM particle mass between 30 GeV and 10 TeV. Strongest upper limits coming from the two neutrino channel require  $\langle \sigma \cdot v \rangle < 6 \times 10^{-20} \text{ cm}^3/\text{s}$  in dwarf galaxies and  $\langle \sigma \cdot v \rangle < 7 \times 10^{-21} \text{ cm}^3/\text{s}$  in LMC for 5 TeV WIMP mass.
- 45 BOUDAUD 17 use data from the spacecraft Voyager 1, beyond the heliopause, and from AMS02 on  $\chi\chi \rightarrow e^+ e^-$  to require  $\langle \sigma \cdot v \rangle < 1. \times 10^{-28} \text{ cm}^3/\text{s}$  for  $m(\chi) = 10 \text{ MeV}$ .
- 46 AARTSEN 16d search for GeV  $\nu s$  from WIMP annihilation in galaxy; limits set on  $\langle \sigma \cdot v \rangle$  in Fig. 6, 7.
- 47 ABDALLAH 16 require  $\langle \sigma \cdot v \rangle < 6 \times 10^{-26} \text{ cm}^3/\text{s}$  for  $m(WIMP) = 1.5 \text{ TeV}$  from 254 hours observation ( $W W$  channel) and  $< 2 \times 10^{-26} \text{ cm}^3/\text{s}$  for  $m(WIMP) = 1.0 \text{ TeV}$  in  $\tau^+ \tau^-$  channel.
- 48 ABDALLAH 16a search for line spectra from WIMP + WIMP  $\rightarrow \gamma\gamma$  in 18 hr HESS data; rule out previous 130 GeV WIMP hint from Fermi-LAT data.
- 49 AHNEN 16 require  $\langle \sigma \cdot v \rangle < 3 \times 10^{-26} \text{ cm}^3/\text{s}$  for  $m(WIMP) = 100 \text{ GeV}$  ( $W W$  channel).
- 50 AVRORIN 16 require  $\langle \sigma \cdot v \rangle < 1.91 \times 10^{-21} \text{ cm}^3/\text{s}$  from WIMP annihilation to  $\nu s$  via  $W W$  channel for  $m(WIMP) = 1 \text{ TeV}$ .
- 51 CAPUTO 16 place limits on WIMPs from annihilation to gamma rays in Small Magellanic Cloud using Fermi-LAT data:  $\langle \sigma \cdot v \rangle < 3 \times 10^{-26} \text{ cm}^3/\text{s}$  for  $m(WIMP) = 10 \text{ GeV}$ .
- 52 FORNASE 16 use anisotropies in the  $\gamma$ -ray diffuse emission detected by Fermi-LAT to bound  $\langle \sigma \cdot v \rangle < 10^{-25} \text{ cm}^3/\text{s}$  for  $m(WIMP) = 100 \text{ GeV}$  in  $b\bar{b}$  channel: see Fig. 28. The limit is driven by dark-matter subhalos in the Milky Way and it refers to their Most Constraining Scenario.
- 53 LEITE 16 constrain WIMP annihilation via search for radio emissions from Smith cloud;  $\langle \sigma \cdot v \rangle < 5 \times 10^{-27} \text{ cm}^3/\text{s}$  in  $ee$  channel for  $m(WIMP) = 5 \text{ GeV}$ .
- 54 LI 16 re-analyze Fermi-LAT data on 8 dwarf spheroidals; set limit  $\langle \sigma \cdot v \rangle < 2 \times 10^{-26} \text{ cm}^3/\text{s}$  for  $m(WIMP) = 100 \text{ GeV}$  in  $b\bar{b}$  mode with substructures included.
- 55 LI 16a constrain  $\langle \sigma \cdot v \rangle < 10^{-25} \text{ cm}^3/\text{s}$  in  $b\bar{b}$  channel for  $m(WIMP) = 100 \text{ GeV}$  using Fermi-LAT data from M31; see Fig. 6.
- 56 LIANG 16 search dwarf spheroidal galaxies, Large Magellanic Cloud, and Small Magellanic Cloud for  $\gamma$ -line in Fermi-LAT data.
- 57 LU 16 re-analyze Fermi-LAT and AMS-02 data; require  $\langle \sigma \cdot v \rangle < 10^{-25} \text{ cm}^3/\text{s}$  for  $m_m(WIMP) = 1 \text{ TeV}$  in  $b\bar{b}$  channel.
- 58 SHIRASAKI 16 re-analyze Fermi-LAT extra-galactic data; require  $\langle \sigma \cdot v \rangle < 10^{-23} \text{ cm}^3/\text{s}$  for  $m(WIMP) = 1 \text{ TeV}$  in  $b\bar{b}$  channel; see Fig. 8.
- 59 AARTSEN 15c search for neutrinos from  $X^0$  annihilation in the Galactic halo. See their Figs. 16 and 17, and Table 5 for limits on  $\sigma \cdot v$  for  $X^0$  mass between 100 GeV and 100 TeV.
- 60 AARTSEN 15E search for neutrinos from  $X^0$  annihilation in the Galactic center. See their Figs. 7 and 9, and Table 3 for limits on  $\sigma \cdot v$  for  $X^0$  mass between 30 GeV and 10 TeV.
- 61 ABRAMOWSKI 15 search for  $\gamma$  from  $X^0$  annihilation in the Galactic center. See their Fig. 4 for limits on  $\sigma \cdot v$  for  $X^0$  mass between 250 GeV and 10 TeV.
- 62 ACKERMANN 15 search for monochromatic  $\gamma$  from  $X^0$  annihilation in the Galactic halo. See their Fig. 8 and Tables 2–4 for limits on  $\sigma \cdot v$  for  $X^0$  mass between 0.2 GeV and 500 GeV.
- 63 ACKERMANN 15A search for  $\gamma$  from  $X^0$  annihilation (both Galactic and extragalactic) in the isotropic  $\gamma$  background. See their Fig. 7 for limits on  $\sigma \cdot v$  for  $X^0$  mass between 10 GeV and 30 TeV.
- 64 ACKERMANN 15B search for  $\gamma$  from  $X^0$  annihilation in 15 dwarf spheroidal satellite galaxies of the Milky Way. See their Figs. 1 and 2 for limits on  $\sigma \cdot v$  for  $X^0$  mass between 2 GeV and 10 TeV.
- 65 ADRIAN-MARTINEZ 15 search for neutrinos from  $X^0$  annihilation in the Galactic center. See their Figs. 10 and 11 and Tables 1 and 2 for limits on  $\sigma \cdot v$  for  $X^0$  mass between 25 GeV and 10 TeV.
- 66 ACKERMANN 14 search for  $\gamma$  from  $X^0$  annihilation in 25 dwarf spheroidal satellite galaxies of the Milky Way. See their Tables II–VII for limits assuming annihilation into  $e^+ e^-$ ,  $\mu^+ \mu^-$ ,  $\tau^+ \tau^-$ ,  $u\bar{u}$ ,  $b\bar{b}$ , and  $W^+ W^-$ , for  $X^0$  mass ranging from 2 GeV to 10 TeV.
- 67 Limit assuming  $X^0$  pair annihilation into  $b\bar{b}$ .
- 68 Limit assuming  $X^0$  pair annihilation into  $W^+ W^-$ .
- 69 ALEKSIC 14 search for  $\gamma$  from  $X^0$  annihilation in the dwarf spheroidal galaxy Segue 1. The listed limit assumes annihilation into  $W^+ W^-$ . See their Figs. 6, 7, and 16 for limits on  $\sigma \cdot v$  for annihilation channels  $\mu^+ \mu^-$ ,  $\tau^+ \tau^-$ ,  $b\bar{b}$ ,  $t\bar{t}$ ,  $\gamma\gamma$ ,  $\gamma Z$ ,  $W^+ W^-$ ,  $Z Z$  for  $X^0$  mass between  $10^2$  and  $10^4 \text{ GeV}$ .
- 70 AARTSEN 13c search for neutrinos from  $X^0$  annihilation in nearby galaxies and galaxy clusters. See their Figs. 5–7 for limits on  $\sigma \cdot v$  for  $X^0 \rightarrow \nu\bar{\nu}$ ,  $\mu^+ \mu^-$ ,  $\tau^+ \tau^-$ , and  $W^+ W^-$  for  $X^0$  mass between 300 GeV and 100 TeV.
- 71 ABRAMOWSKI 13 search for monochromatic  $\gamma$  from  $X^0$  annihilation in the Milky Way halo in the central region. Limit on  $\sigma \cdot v$  between  $10^{-28}$  and  $10^{-25} \text{ cm}^3 \text{ s}^{-1}$  (95% CL) is obtained for  $X^0$  mass between 500 GeV and 20 TeV for  $X^0 X^0 \rightarrow \gamma\gamma$ .  $X^0$  density distribution in the Galaxy by Einasto is assumed. See their Fig. 4.

- 72 ACKERMANN 13A search for monochromatic  $\gamma$  from  $X^0$  annihilation in the Milky Way. Limit on  $\sigma \cdot v$  for the process  $X^0 X^0 \rightarrow \gamma\gamma$  in the range  $10^{-29}\text{--}10^{-27} \text{ cm}^3 \text{ s}^{-1}$  (95% CL) is obtained for  $X^0$  mass between 5 and 300 GeV. The limit depends slightly on the assumed density profile of  $X^0$  in the Galaxy. See their Tables VII–X and Fig. 10. Supersedes ACKERMANN 12.
- 73 ABRAMOWSKI 12 search for  $\gamma$ 's from  $X^0$  annihilation in the Fornax galaxy cluster. See their Fig. 7 for limits on  $\sigma \cdot v$  for  $X^0$  mass between 0.1 and 100 TeV for the annihilation channels  $\tau^+ \tau^-$ ,  $b\bar{b}$ , and  $W^+ W^-$ .
- 74 ACKERMANN 12 search for monochromatic  $\gamma$  from  $X^0$  annihilation in the Milky Way. Limit on  $\sigma \cdot v$  in the range  $10^{-28}\text{--}10^{-26} \text{ cm}^3 \text{ s}^{-1}$  (95% CL) is obtained for  $X^0$  mass between 7 and 200 GeV if  $X^0$  annihilates into  $\gamma\gamma$ . The limit depends slightly on the assumed density profile of  $X^0$  in the Galaxy. See their Table III and Fig. 15.
- 75 ACKERMANN 12 search for  $\gamma$  from  $X^0$  annihilation in the Milky Way in the diffuse  $\gamma$  background. Limit on  $\sigma \cdot v$  of  $10^{-24} \text{ cm}^3 \text{ s}^{-1}$  or larger is obtained for  $X^0$  mass between 5 GeV and 10 TeV for various annihilation channels including  $W^+ W^-$ ,  $b\bar{b}$ ,  $g g$ ,  $e^+ e^-$ ,  $\mu^+ \mu^-$ ,  $\tau^+ \tau^-$ . The limit depends slightly on the assumed density profile of  $X^0$  in the Galaxy. See their Figs. 17–20.
- 76 ALIU 12 search for  $\gamma$ 's from  $X^0$  annihilation in the dwarf spheroidal galaxy Segue 1. Limit on  $\sigma \cdot v$  in the range  $10^{-24}\text{--}10^{-20} \text{ cm}^3 \text{ s}^{-1}$  (95% CL) is obtained for  $X^0$  mass between 10 GeV and 2 TeV for annihilation channels  $e^+ e^-$ ,  $\mu^+ \mu^-$ ,  $\tau^+ \tau^-$ ,  $b\bar{b}$ , and  $W^+ W^-$ . See their Fig. 3.
- 77 ABBASI 11c search for  $\nu_\mu$  from  $X^0$  annihilation in the outer halo of the Milky Way. The limit assumes annihilation into  $\nu\nu$ . See their Fig. 9 for limits with other annihilation channels.
- 78 ABRAMOWSKI 11 search for  $\gamma$  from  $X^0$  annihilation near the Galactic center. The limit assumes Einasto DM density profile.
- 79 ACKERMANN 11 search for  $\gamma$  from  $X^0$  annihilation in ten dwarf spheroidal satellite galaxies of the Milky Way. The limit for  $m = 10 \text{ GeV}$  assumes annihilation into  $b\bar{b}$ , the others  $W^+ W^-$ . See their Fig. 2 for limits with other final states. See also GERINGER-SAMETH 11 for a different analysis of the same data.

### Dark Matter Particle ( $X^0$ ) Production in Hadron Collisions

Searches for  $X^0$  production in association with observable particles ( $\gamma$ , jets, ...) in high energy hadron collisions. If a specific form of effective interaction Lagrangian is assumed, the limits may be translated into limits on  $X^0$ -nucleon scattering cross section.

- 1 AAD 23A search for  $H \rightarrow \text{invisible}$ . No signal observed. Results interpreted in terms of several DM Higgs portal simplified models.
- 2 AAD 23AF search for  $\tilde{t}t + H \rightarrow \text{invisible}$  with 139 fb<sup>-1</sup> of data. No signal observed. Limits placed on branching fractions of  $H$  decays etc. for various DM mediator models. Result also included in AAD 23A.
- 3 AAD 23AJ search for  $tW\chi\chi$  production in mediator-extended 2HDM with 139 fb<sup>-1</sup> of data. No signal observed. Limits placed in  $m(H)$  vs.  $m(\text{mediator})$  and  $\tan(\beta)$  vs.  $m(H)$  planes.
- 4 AAD 23BX search for  $A \rightarrow Ha$  production where  $H \rightarrow \tau\bar{\tau}$  and  $a \rightarrow \chi\chi$ . No signal observed. Limits placed on 2HDM+a model.
- 5 AAD 23W search for DM in dark Higgs model via  $WW\chi\chi$  final state with 139 fb<sup>-1</sup> of data. No signal detected. Limits set in  $m(\text{dark Higgs})$  vs.  $m(Z')$  plane.
- 6 AKIMOV 23 search for light DM via COHERENT CsI detector at SNS. No signal observed. For scalar DM model, limits set for  $m(\chi) = 1\text{--}300$  MeV. Limit of  $\sigma(\chi N) < 1 \times 10^1$  pb set at peak sensitivity  $m(\chi) = 25$  MeV.
- 7 LIN 23C search for  $\chi \rightarrow \gamma\gamma$  decay where  $p \rightarrow \chi\chi$  at KOTO. No signal observed. Limits placed on  $K_L^0$  branching fraction.
- 8 AAD 22D search for  $Z+H$  production with  $Z \rightarrow \ell\bar{\ell}$  and  $H \rightarrow \chi\chi$  with 139 fb<sup>-1</sup> at 13 TeV; no signal found; limits placed in various simplified models depending on Higgs portal and DM mediator.
- 9 AAD 22P search for  $H$  production via VBF with  $H \rightarrow \chi\chi$  with 139 fb<sup>-1</sup> at 13 TeV; no signal found; limits placed for various Higgs DM portal simplified models.
- 10 AGUILAR-AREVALO 22A report search for MeV vector portal and leptophobic DM via scatter on liquid Ar at the Lujan stopped pion source at LANL; no signal detected; limits placed on vector portal and leptophobic DM vs.  $m(\chi)$ : 1–40 MeV.
- 11 TUMASYAN 22AA search for  $Z'$  decay to dark quarks with 138 fb<sup>-1</sup> at 13 TeV; no signal observed; limits exclude a wide range of strongly coupled hidden sector models.
- 12 TUMASYAN 22AG search for strongly interacting dark matter production via scalar mediator, with SIMP decay to trackless jets with 16.1 fb<sup>-1</sup> at 13 TeV; no signal detected; limits placed in mass vs. cross section plane for simplified models.
- 13 TUMASYAN 22G search for VBF production of Higgs with  $H \rightarrow \chi\chi$  with 101 fb<sup>-1</sup> at 13 TeV, combined with earlier searches, in total 19.7 fb<sup>-1</sup> at 8 TeV and 140 fb<sup>-1</sup> at 13 TeV are used; no signal detected; limits placed in mass vs. cross section plane for various Higgs portal simplified models.
- 14 AAD 21AZ search for DM in  $H \cancel{E}_T \rightarrow \gamma\gamma \cancel{E}_T$  events with 139 fb<sup>-1</sup> at 13 TeV. No signal observed. Limits placed for several simplified models.
- 15 AAD 21BB search for DM in  $H \cancel{E}_T \rightarrow b\bar{b} \cancel{E}_T$  events with 139 fb<sup>-1</sup> at 13 TeV. No signal observed. Limits placed for several simplified models.
- 16 AAD 21D search for  $VV + \chi\chi, V \rightarrow q\bar{q}$  with 139 fb<sup>-1</sup> at 13 TeV LHC. No signal detected. Limits placed in dark Higgs boson mass vs.  $m(Z')$  plane. Here  $VV$  stand for  $W^\pm W^\mp, ZZ$ .
- 17 AAD 21F search for monojet recoiling against invisibles with 139 fb<sup>-1</sup> at 13 TeV LHC. No signal detected. Limits placed in various simplified dark matter models.
- 18 AAD 21K search for a photon recoiling against dark matter with 139 fb<sup>-1</sup> at 13 TeV LHC. No signal detected. Limits placed on parameter space of various simplified models.
- 19 AAD 21O search for  $\ell + \text{jets} + \cancel{E}_T$  to search for  $t$ -pairs + DM particles with 139 fb<sup>-1</sup> at LHC 13 TeV LHC. No signal detected. Limits placed in the cross-section vs. mediator mass plane, assuming light DM states.
- 20 AAD 21P search for  $\ell^+\ell^- + \text{jets} + \cancel{E}_T$  in context of various BSM models with 139 fb<sup>-1</sup> at 13 TeV LHC. No signal observed. Limits placed in parameter space of dark matter models and SUSY.
- 21 AAD 21S search for  $b$ -jets +  $\cancel{E}_T$  signal from BSM/DM models with 139 fb<sup>-1</sup> at 13 TeV LHC. No signal observed. Limits placed on parameter space of DM models.
- 22 SIRUNYAN 21A search for DM production in association with leptonically decaying  $Z$  boson in 137 fb<sup>-1</sup> at 13 TeV; no signal; limits set in large variety of simplified DM models.
- 23 TUMASYAN 21D search for DM and other exotica at CMS in jets +  $\cancel{E}_T$  events with 137 fb<sup>-1</sup> at 13 TeV. No signal observed. Limits placed for a variety of simplified models.
- 24 SIRUNYAN 20X search for DM in  $pp \rightarrow Z' \rightarrow A(Z')h \rightarrow h + \cancel{E}_T$  in CMS at 13 TeV with 35.9 fb<sup>-1</sup>; no signal; limits placed in  $\sigma^{SI}$  vs.  $m(\chi)$ , and  $\sigma, m(A)$  and  $\tan\beta$  vs  $m(Z')$  for considered DM models.
- 25 AABOUD 19AA searches for BSM physics in more than 700 event classes with more than 10<sup>5</sup> regions at 13 TeV with 3.2 fb<sup>-1</sup>; no significant signal.
- 26 AABOUD 19AI searches for vector boson fusion  $pp \rightarrow Hq\bar{q}, H \rightarrow \text{invisible}$  at 13 TeV with 36.1 fb<sup>-1</sup>; no signal; require  $B(H \rightarrow \text{invisible}) < 0.37$  (0.28 expected).
- 27 AABOUD 19AL perform search in three different channels for  $H \rightarrow \chi\chi$  at 7, 8 and 13 TeV; combined result  $B(H \rightarrow \text{invisible}) < 0.26$  (0.17 expected).
- 28 AABOUD 19Q search for single  $t + \cancel{E}_T$  at 13 TeV with 36.1 fb<sup>-1</sup> of data; no signal; limits set in  $\sigma$  or coupling vs. mass plane for simplified models.
- 29 AABOUD 19V review ATLAS results from 7, 8 and 13 TeV searches for mediator-based DM and DE scalar which couples to gravity; no signal; limits set for large variety of simplified models.
- 30 BANERJEE 19 search for dark photon via  $eN \rightarrow eN + \cancel{E}$  in NA64; no signal, limits placed in kinetic mixing  $\epsilon$  vs.  $m(\text{DM})$  plane for  $m(\text{DM}) \sim 0.001\text{--}1$  GeV.
- 31 SIRUNYAN 19AN search at 13 TeV with 35.9 fb<sup>-1</sup> for  $pp \rightarrow H\chi\chi \rightarrow b\bar{b} \cancel{E}_T$ ; no signal; limits set in the context of a 2HDM + pseudoscalar ( $a$ ) model and a baryonic  $Z'$  model.
- 32 SIRUNYAN 19BC search for DM via LeptoQuark pair annihilation  $LQ LQ \rightarrow \mu j \chi\chi \rightarrow \mu j \cancel{E}_T$  with 77.4 fb<sup>-1</sup>, 13 TeV; no signal; limits placed in  $m(\chi)$  vs.  $m(LQ)$  plane. Model dependent limits on DM mass up to 600 GeV depending on  $m(LQ)$  placed.
- 33 SIRUNYAN 19BO search for vector boson fusion  $VV \rightarrow qqH$  with  $H \rightarrow \chi\chi$  at 13 TeV with 38.2 fb<sup>-1</sup>; no signal; limits placed for several models. Also search for  $H \rightarrow \text{invisible}$  at 7, 8, and 13 TeV; no signal; limit placed on  $BF < 0.19$ .
- 34 SIRUNYAN 19C search for DM via  $pp \rightarrow t\bar{t}\chi\chi$  at 13 TeV, 35.9 fb<sup>-1</sup>; no signal; limits placed on coupling vs. mediator mass for various simplified models.
- 35 SIRUNYAN 19O search for  $pp \rightarrow \gamma$  at 13 TeV with 35.9 fb<sup>-1</sup>; no signal; limits placed on parameters of various models.
- 36 SIRUNYAN 19X search for  $pp \rightarrow t\bar{t} \cancel{E}_T$  and  $pp \rightarrow t \cancel{E}_T + \dots$  at 13 TeV with 35.9 fb<sup>-1</sup>; no signal; limits placed on  $\chi$  production  $\sigma$  for various simplified models with  $m(\chi) = 1$  GeV.
- 37 AABOUD 18 search for  $pp \rightarrow Z + \cancel{E}_T$  with  $Z \rightarrow \ell\ell$  at 13 TeV with 36.1 fb<sup>-1</sup> of data. Limits set for simplified models.
- 38 AABOUD 18A search for  $pp \rightarrow t\bar{t} \cancel{E}_T$  or  $pp \rightarrow b\bar{b} \cancel{E}_T$  at 13 TeV, 36.1 fb<sup>-1</sup> of data. Limits set for simplified models.
- 39 AABOUD 18CA search for  $pp \rightarrow V\chi\chi$  with  $V \rightarrow jj$  at 13 TeV, 36.1 fb<sup>-1</sup>; no signal; limits set in  $m(\text{DM})$  vs  $m(\text{mediator})$  simplified model plane.
- 40 AABOUD 18 search for  $pp \rightarrow j + \cancel{E}_T$  at 13 TeV with 36.1 fb<sup>-1</sup> of data. Limits set for simplified models with pair-produced weakly interacting dark-matter candidates.
- 41 AGUILAR-AREVALO 18B search for WIMP production in MiniBooNE  $p$  beam dump; no signal; limits set for  $m(\chi) \sim 5\text{--}50$  MeV in vector portal DM model.
- 42 KHACHATRYAN 18 search for  $pp \rightarrow Z(\ell\ell) + \cancel{E}_T$ ; no signal; limits set on effective dark matter interactions and other exotic physics models.
- 43 SIRUNYAN 18BF search for  $pp \rightarrow t \cancel{E}_T$  at 13 TeV and 36 fb<sup>-1</sup>; no signal; limits placed on DM models involving a flavor changing neutral current, scalar resonance decaying to top quark and DM.
- 44 SIRUNYAN 18BO search for high mass dijet resonances at 13 TeV and 36 fb<sup>-1</sup>; no signal; limits placed on various models, including simplified DM models involving a spin = 1  $Z'$  mediator.
- 45 SIRUNYAN 18BV search for  $pp \rightarrow Z \cancel{E}_T$  at 13 TeV; no signal, limits placed for various exotic physics models including DM.
- 46 SIRUNYAN 18C search for new physics in  $pp \rightarrow$  final states with two oppositely charged leptons at 13 TeV with 35.9 fb<sup>-1</sup>. Limits placed on  $m(\text{mediator})$  and top squark for various simplified models.
- 47 SIRUNYAN 18CU search for  $pp \rightarrow Z \cancel{E}_T$  at 13 TeV and 2.3 fb<sup>-1</sup>; no signal; limits placed for various exotic models including DM.
- 48 SIRUNYAN 18DH search for  $pp \rightarrow \chi\chi h; h \rightarrow \gamma\gamma \text{ or } \tau\tau$  at 13 TeV, 35.9 fb<sup>-1</sup>; no signal; limits placed on massive boson mediator  $Z'$  in the context of  $Z'+2\text{HDM}$  and baryonic  $Z'$  models. Limits also cast in terms of spin-independent WIMP-nucleon cross section for masses 1–200 GeV.
- 49 SIRUNYAN 18S search for  $pp \rightarrow \text{jets } \cancel{E}_T$  at 13 TeV; no signal; limits placed on simplified dark matter models, on the branching ratio of the Higgs boson to invisible particles, and on several other exotic physics models including fermion portal DM.
- 50 AABOUD 17A search for  $H \rightarrow b\bar{b} + \cancel{E}_T$ . See Fig. 4b for limits set on VB mediator vs WIMP mass.
- 51 AABOUD 17AM search for  $pp \rightarrow Z' \rightarrow Ah \rightarrow h(b\bar{b}) + \cancel{E}_T$  at 13 TeV. Limits set in  $m(Z')$  vs.  $m(A)$  plane and on the visible cross section of  $h(b\bar{b}) + \cancel{E}_T$  events in bins of  $\cancel{E}_T$ .
- 52 AABOUD 17AQ search for WIMP in  $pp \rightarrow h(\gamma\gamma) + \cancel{E}_T$  in 36.1 fb<sup>-1</sup> of data. Limits on the visible cross section are also provided. Model dependent limits on spin independent DM - Nucleon cross-section are also presented, which are more stringent than those from direct searches for DM mass smaller than 2.5 GeV.
- 53 AABOUD 17BD search for  $pp \rightarrow \text{jet}(s) + \cancel{E}_T$  at 13 TeV with 3.2 fb<sup>-1</sup> of data. Limits set for simplified models. Observables corrected for detector effects can be used to constrain other models.
- 54 AABOUD 17R, for an axial vector mediator in the s-channel, excludes  $m(\text{mediator}) < 750\text{--}1200$  GeV for  $m(\text{DM}) < 230\text{--}480$  GeV, depending on the couplings.
- 55 AGUILAR-AREVALO 17A search for DM produced in 8 GeV proton collisions with steel beam dump followed by DM-nucleon scattering in MiniBooNE detector. Limit placed on

# Searches Particle Listings

## WIMP and Dark Matter Searches

- DM cross section parameter  $\gamma < 2 \times 10^{-8}$  for  $\alpha_D = 0.5$  and for  $0.01 < m(\text{DM}) < 0.3$  GeV.
- 56 BANERJEE 17 search for dark photon invisible decay via  $eN$  scattering; exclude  $m(\gamma')$  < 100 MeV as an explanation of  $(g_\mu - 2)$  muon anomaly.
- 57 KHACHATRYAN 17A search for WIMPs in forward jets +  $E_T$  channel with 18.5 fb $^{-1}$  at 8 TeV; limits set in effective theory model, Fig. 3.
- 58 KHACHATRYAN 17F search for  $H \rightarrow$  invisibles in  $pp$  collisions at 7, 8, and 13 TeV; place limits on Higgs portal DM.
- 59 SIRUNYAN 17 search for  $pp \rightarrow Z + E_T$  with 2.3 fb $^{-1}$  at 13 TeV; no signal seen; limits placed on WIMPs and unparticles.
- 60 SIRUNYAN 17AP search for  $pp \rightarrow Z' \rightarrow Ah \rightarrow h + E_T$  with  $h \rightarrow b\bar{b}$  or  $\gamma\gamma$  and  $A \rightarrow \chi\chi$  with 2.3 fb $^{-1}$  at 13 TeV. Limits set in  $m(Z')$  vs.  $m(A)$  plane.
- 61 SIRUNYAN 17AQ search for  $pp \rightarrow \gamma + E_T$  at 13 TeV with 12.9 fb $^{-1}$ . Limits derived for simplified DM models, effective electroweak-DM interaction and Extra Dimensions models.
- 62 SIRUNYAN 17BB search for WIMPs via  $pp \rightarrow t\bar{t} + E_T, pp \rightarrow b\bar{b} + E_T$  at 13 TeV with 2.2 fb $^{-1}$ . Limits derived for various simplified models.
- 63 SIRUNYAN 17G search for  $pp \rightarrow j + E_T$  with 12.9 fb $^{-1}$  at 13 TeV; limits placed on WIMP mass/mediators in DM simplified models.
- 64 SIRUNYAN 17U search for WIMPs/unparticles via  $pp \rightarrow Z\chi\chi, Z \rightarrow \ell\bar{\ell}$  at 13 TeV with 2.3 fb $^{-1}$ . Limits derived for various simplified models.
- 65 AABOUD 16AD place limits on  $VVXX$  effective theory via search for hadronic  $W$  or  $Z$  plus WIMP pair production. See Fig. 5.
- 66 AAD 16AF search for  $VV \rightarrow (H \rightarrow \text{WIMP pair}) +$  forward jets with 20.3 fb $^{-1}$  at 8 TeV; set limits in Higgs portal model, Fig. 8.
- 67 AAD 16AG search for lepton jets with 20.3 fb $^{-1}$  of data at 8 TeV; Fig. 13 excludes dark photons around 0.1–1 GeV for kinetic mixing  $10^{-6}$ – $10^{-2}$ .
- 68 AAD 16M search with 20.3 fb $^{-1}$  of data at 8 TeV  $pp$  collisions; limits placed on EFT model (Fig. 7) and simplified  $Z'$  model (Fig. 6).
- 69 KHACHATRYAN 16BZ search for jet(s) +  $E_T$  in 19.7 fb $^{-1}$  at 8 TeV; limits set for variety of simplified models.
- 70 KHACHATRYAN 16CA search for WIMPs via jet(s) +  $E_T$  using razor variable; require mediator scale > 1 TeV for various effective theories.
- 71 KHACHATRYAN 16N search for  $\gamma +$  WIMPs in 19.6 fb $^{-1}$  at 8 TeV; limits set on SI and SD WIMP- $p$  scattering in Fig. 3.
- 72 AAD 15AS search for events with one or more bottom quark and missing  $E_T$ , and also events with a top quark pair and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8$  TeV with  $L = 20.3$  fb $^{-1}$ . See their Figs. 5 and 6 for translated limits on  $X^0$ -nucleon cross section for  $m = 1$ –700 GeV.
- 73 AAD 15BH search for events with a jet and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8$  TeV with  $L = 20.3$  fb $^{-1}$ . See their Fig. 12 for translated limits on  $X^0$ -nucleon cross section for  $m = 1$ –1200 GeV.
- 74 AAD 15CF search for events with a  $H^0 (\rightarrow \gamma\gamma)$  and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8$  TeV with  $L = 20.3$  fb $^{-1}$ . See paper for limits on the strength of some contact interactions containing  $X^0$  and the Higgs fields.
- 75 AAD 15CS search for events with a photon and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8$  TeV with  $L = 20.3$  fb $^{-1}$ . See their Fig. 13 (see also erratum) for translated limits on  $X^0$ -nucleon cross section for  $m = 1$ –1000 GeV.
- 76 KHACHATRYAN 15AG search for events with a top quark pair and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8$  TeV with  $L = 19.7$  fb $^{-1}$ . See their Fig. 8 for translated limits on  $X^0$ -nucleon cross section for  $m = 1$ –200 GeV.
- 77 KHACHATRYAN 15AL search for events with a jet and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8$  TeV with  $L = 19.7$  fb $^{-1}$ . See their Fig. 5 and Tables 4–6 for translated limits on  $X^0$ -nucleon cross section for  $m = 1$ –1000 GeV.
- 78 KHACHATRYAN 15T search for events with a lepton and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8$  TeV with  $L = 19.7$  fb $^{-1}$ . See their Fig. 17 for translated limits on  $X^0$ -proton cross section for  $m = 1$ –1000 GeV.
- 79 AAD 14AI search for events with a  $W$  and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8$  TeV with  $L = 20.3$  fb $^{-1}$ . See their Fig. 4 for translated limits on  $X^0$ -nucleon cross section for  $m = 1$ –1500 GeV.
- 80 AAD 14BK search for hadronically decaying  $W, Z$  in association with  $E_T$  in 20.3 fb $^{-1}$  at 8 TeV  $pp$  collisions. Fig. 5 presents exclusion results for SI and SD scattering cross section. In addition, cross section limits on the anomalous production of  $W$  or  $Z$  bosons with large missing transverse momentum are also set in two fiducial regions.
- 81 AAD 14K search for events with a  $Z$  and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8$  TeV with  $L = 20.3$  fb $^{-1}$ . See their Fig. 5 and 6 for translated limits on  $X^0$ -nucleon cross section for  $m = 1$ – $10^3$  GeV.
- 82 AAD 14O search for  $ZH^0$  production with  $H^0$  decaying to invisible final states. See their Fig. 4 for translated limits on  $X^0$ -nucleon cross section for  $m = 1$ –60 GeV in Higgs-portal  $X^0$  scenario.
- 83 AAD 13AD search for events with a jet and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7$  TeV with  $L = 4.7$  fb $^{-1}$ . See their Figs. 5 and 6 for translated limits on  $X^0$ -nucleon cross section for  $m = 1$ –1300 GeV.
- 84 AAD 13C search for events with a photon and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7$  TeV with  $L = 4.6$  fb $^{-1}$ . See their Fig. 3 for translated limits on  $X^0$ -nucleon cross section for  $m = 1$ –1000 GeV.
- 85 AALTONEN 12K search for events with a top quark and missing  $E_T$  in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96$  TeV with  $L = 7.7$  fb $^{-1}$ . Upper limits on  $\sigma(tX^0)$  in the range 0.4–2 pb (95% CL) is given for  $m_{X^0} = 0$ –150 GeV.
- 86 AALTONEN 12M search for events with a jet and missing  $E_T$  in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96$  TeV with  $L = 6.7$  fb $^{-1}$ . Upper limits on the cross section in the range 2–10 pb (90% CL) is given for  $m_{X^0} = 1$ –300 GeV. See their Fig. 2 for translated limits on  $X^0$ -nucleon cross section.
- 87 CHATRCHYAN 12AP search for events with a jet and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7$  TeV with  $L = 5.0$  fb $^{-1}$ . See their Fig. 4 for translated limits on  $X^0$ -nucleon cross section for  $m_{X^0} = 0.1$ –1000 GeV.
- 88 CHATRCHYAN 12T search for events with a photon and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7$  TeV with  $L = 5.0$  fb $^{-1}$ . Upper limits on the cross section in the range 13–15 fb (90% CL) is given for  $m_{X^0} = 1$ –1000 GeV. See their Fig. 2 for translated limits on  $X^0$ -nucleon cross section.

## Other Particle Searches

OMITTED FROM SUMMARY TABLE

## OTHER PARTICLE SEARCHES

Revised February 2018 by K. Hikasa (Tohoku University).

We collect here those searches which do not appear in any other search categories. These are listed in the following order:

- Concentration of stable particles in matter
- General new physics searches
- Limits on jet-jet resonance in hadron collisions
- Limits on neutral particle production at accelerators
- Limits on charged particles in  $e^+e^-$  collisions
- Limits on charged particles in hadron reactions
- Limits on charged particles in cosmic rays
- Searches for quantum black hole production

Note that searches appear in separate sections elsewhere for Higgs bosons (and technipions), other heavy bosons (including  $W_R, W', Z'$ , leptoquarks, axiglons), axions (including pseudo-Goldstone bosons, Majorons, familons), WIMPs, heavy leptons, heavy neutrinos, free quarks, monopoles, supersymmetric particles, and compositeness.

We no longer list for limits on tachyons and centauros. See our 1994 edition for these limits.

## CONCENTRATION OF STABLE PARTICLES IN MATTER

## Concentration of Heavy (Charge +1) Stable Particles in Matter

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
$< 4 \times 10^{-17}$	95	1 YAMAGATA	93 SPEC	Deep sea water, $M=5-1600 m_p$
$< 6 \times 10^{-15}$	95	2 VERKERK	92 SPEC	Water, $M=10^5$ to $3 \times 10^7$ GeV
$< 7 \times 10^{-15}$	95	2 VERKERK	92 SPEC	Water, $M=10^4, 6 \times 10^7$ GeV
$< 9 \times 10^{-15}$	95	2 VERKERK	92 SPEC	Water, $M=10^8$ GeV
$< 3 \times 10^{-23}$	90	3 HEMMICK	90 SPEC	Water, $M=1000 m_p$
$< 2 \times 10^{-21}$	90	3 HEMMICK	90 SPEC	Water, $M=5000 m_p$
$< 3 \times 10^{-20}$	90	3 HEMMICK	90 SPEC	Water, $M=10000 m_p$
$< 1. \times 10^{-29}$		SMITH	82B SPEC	Water, $M=30-400 m_p$
$< 2. \times 10^{-28}$		SMITH	82B SPEC	Water, $M=12-1000 m_p$
$< 1. \times 10^{-14}$		SMITH	82B SPEC	Water, $M > 1000 m_p$
$< (0.2-1.) \times 10^{-21}$		SMITH	79 SPEC	Water, $M=6-350 m_p$

1 YAMAGATA 93 used deep sea water at 4000 m since the concentration is enhanced in deep sea due to gravity.

2 VERKERK 92 looked for heavy isotopes in sea water and put a bound on concentration of stable charged massive particle in sea water. The above bound can be translated into a bound on charged dark matter particle ( $5 \times 10^6$  GeV), assuming the local density,  $\rho=0.3$  GeV/cm<sup>3</sup>, and the mean velocity ( $v$ )=300 km/s.

3 See HEMMICK 90 Fig. 7 for other masses 100-10000  $m_p$ .

## Other Particle Searches

$<4 \times 10^{-17}$	90	<sup>4</sup> HEMMICK	90	SPEC	O, $M = 1000m_p$
$<4 \times 10^{-15}$	90	<sup>4</sup> HEMMICK	90	SPEC	F, $M = 1000m_p$
$<1.5 \times 10^{-13}/\text{nucleon}$	68	<sup>5</sup> NORMAN	89	SPEC	$^{206}\text{Pb}X^-$
$<1.2 \times 10^{-12}/\text{nucleon}$	68	<sup>5</sup> NORMAN	87	SPEC	$^{56,58}\text{Fe}X^-$

<sup>1</sup>AFEK 21 search for millicharged particles bound to matter using an optomechanical device. No signal was observed. Limits placed in the abundance vs. charge plane (Fig. 3). This is translated to the mass versus charge plane by requiring bound states to be stable.

<sup>2</sup>JAVORSEK 01 search for (neutral) SIMPs (strongly interacting massive particles) bound to Au nuclei. Here  $M$  is the effective SIMP mass.

<sup>3</sup>JAVORSEK 01B search for (neutral) SIMPs (strongly interacting massive particles) bound to Au and Fe nuclei from various origins with exposures on the earth's surface, in a satellite, heavy ion collisions, etc. Here  $M$  is the mass of the anomalous nucleus. See also JAVORSEK 02.

<sup>4</sup>See HEMMICK 90 Fig. 7 for other masses 100–10000  $m_p$ .

<sup>5</sup>Bound valid up to  $m_{X^-} \sim 100 \text{ TeV}$ .

### GENERAL NEW PHYSICS SEARCHES

This subsection lists some of the search experiments which look for general signatures characteristic of new physics, independent of the framework of a specific model.

The observed events are compatible with Standard Model expectation, unless noted otherwise.

	<sup>24</sup> AALTONEN 09AF	CDF	$\ell\gamma b \cancel{E}_T$
	<sup>25</sup> AALTONEN 09G	CDF	$\ell\ell\ell \cancel{E}_T$

<sup>1</sup>ALKHATIB 21A search for lightly ionizing fractionally charged relics scattering from Ge. No signal observed. Limits plotted in fractional charge  $f$  vs. vertical intensity plane for  $m \sim 5 \text{ MeV}$  to  $100 \text{ TeV}$ .

<sup>2</sup>AGUILAR-AREVALO 20B search for light BSM mediator effect on  $\nu$  elastic scatter on nuclei; no signal; limits placed in  $m(\text{mediator})$  vs. coupling plane for two classes of MeV-scale mediators.

<sup>3</sup>FEDDERKE 20 place limits on cosmic relic charged massive particles (CHAMPs) due to their capture and subsequent disruption of old white dwarf stars; limits placed in the  $m(\text{CHAMP})$  vs. relic density parameter plane.

<sup>4</sup>SIRUNYAN 20A search for SUSY and LQ production using mT2 or presence of long-lived charged particle; no signal, limits placed in various mass planes for different BSM scenarios and various assumed lifetimes.

<sup>5</sup>ALCANTARA 19 place limits on  $m(W/\text{MIPZilla}=X)$  vs lifetime from upper bound on ultra high energy cosmic rays at Auger experiment: e.g.  $\tau(X) < 4 \times 10^{22} \text{ yr}$  for  $m(X) = 10^{16} \text{ GeV}$ .

<sup>6</sup>PORAYKO 18 search for deviations in the residuals of pulsar timing data using PPTA. No signal observed. Limits set on fuzzy DM with  $3 \times 10^{-24} < m(\text{DM}) < 2 \times 10^{-22} \text{ eV}$ .

<sup>7</sup>AAD 15AT search for events with a top quark and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8 \text{ TeV}$  with  $L = 20.3 \text{ fb}^{-1}$ .

<sup>8</sup>KHACHATRYAN 15F search for events with a top quark and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 8 \text{ TeV}$  with  $L = 19.7 \text{ fb}^{-1}$ .

<sup>9</sup>AALTONEN 14J examine events with a  $W$  and two jets in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96 \text{ TeV}$  with  $L = 8.9 \text{ fb}^{-1}$ . Invariant mass distributions of the two jets are consistent with the Standard Model expectation.

<sup>10</sup>AAD 13A search for resonant  $WW$  production in  $pp$  collisions at  $E_{\text{cm}} = 7 \text{ TeV}$  with  $L = 4.7 \text{ fb}^{-1}$ .

<sup>11</sup>AAD 13C search for events with a photon and missing  $\cancel{E}_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7 \text{ TeV}$  with  $L = 4.6 \text{ fb}^{-1}$ .

<sup>12</sup>AALTONEN 13I search for events with a photon and missing  $E_T$ , where the photon is detected after the expected timing, in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96 \text{ TeV}$  with  $L = 6.3 \text{ fb}^{-1}$ . The data are consistent with the Standard Model expectation.

<sup>13</sup>CHATRCHYAN 13 search for events with an opposite-sign lepton pair, jets, and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7 \text{ TeV}$  with  $L = 4.98 \text{ fb}^{-1}$ .

<sup>14</sup>AAD 12C search for events with a  $t\bar{t}$  pair and missing  $\cancel{E}_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7 \text{ TeV}$  with  $L = 1.04 \text{ fb}^{-1}$ .

<sup>15</sup>AALTONEN 12M search for events with a jet and missing  $E_T$  in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96 \text{ TeV}$  with  $L = 6.7 \text{ fb}^{-1}$ .

<sup>16</sup>CHATRCHYAN 12AP search for events with a jet and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7 \text{ TeV}$  with  $L = 5.0 \text{ fb}^{-1}$ .

<sup>17</sup>CHATRCHYAN 12Q search for events with a  $Z$ , jets, and missing  $\cancel{E}_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7 \text{ TeV}$  with  $L = 4.98 \text{ fb}^{-1}$ .

<sup>18</sup>CHATRCHYAN 12T search for events with a photon and missing  $\cancel{E}_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7 \text{ TeV}$  with  $L = 5.0 \text{ fb}^{-1}$ .

<sup>19</sup>AAD 11S search for events with one jet and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7 \text{ TeV}$  with  $L = 33 \text{ pb}^{-1}$ .

<sup>20</sup>AALTONEN 11AF search for high- $p_T$  like-sign dileptons in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96 \text{ TeV}$  with  $L = 6.1 \text{ fb}^{-1}$ .

<sup>21</sup>CHATRCHYAN 11C search for events with an opposite-sign lepton pair, jets, and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7 \text{ TeV}$  with  $L = 34 \text{ pb}^{-1}$ .

<sup>22</sup>CHATRCHYAN 11U search for events with one jet and missing  $E_T$  in  $pp$  collisions at  $E_{\text{cm}} = 7 \text{ TeV}$  with  $L = 36 \text{ pb}^{-1}$ .

<sup>23</sup>AALTONEN 10AF search for  $\gamma\gamma$  events with  $e, \mu, \tau$ , or missing  $E_T$  in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96 \text{ TeV}$  with  $L = 1.1\text{--}2.0 \text{ fb}^{-1}$ .

<sup>24</sup>AALTONEN 09AF search for  $\ell\gamma b$  events with missing  $E_T$  in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96 \text{ TeV}$  with  $L = 1.9 \text{ fb}^{-1}$ . The observed events are compatible with Standard Model expectation including  $t\bar{t}\gamma$  production.

<sup>25</sup>AALTONEN 09G search for  $\mu\mu\mu$  and  $\mu\mu e$  events with missing  $E_T$  in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96 \text{ TeV}$  with  $L = 976 \text{ pb}^{-1}$ .

### LIMITS ON JET-JET RESONANCES

#### Heavy Particle Production Cross Section

Limits are for a particle decaying to two hadronic jets.

<sup>1</sup>TUMASYAN 23L search for dijet resonance in 4-jet events with  $138 \text{ fb}^{-1}$  fb of data. There are two events in the tails of the distributions, each with a four-jet mass of 8 TeV and an average dijet mass of 2 TeV, resulting in local and global significances of 3.9 and 1.6 standard deviations, respectively, if interpreted as a signal. Limits set for simplified diquark model.

<sup>2</sup>AAD 20AD search for weakly supervised dijet resonance in ATLAS with  $139 \text{ fb}^{-1}$  at 13 TeV; no signal; various limits placed depending on kinematics and production cross section.

<sup>3</sup>AAD 20T search for dijet resonance with or without  $b$ -jets at 13 TeV and  $139 \text{ fb}^{-1}$ ; no signal; limits placed in  $\sigma \cdot \text{BF}$  vs mass plane for various BSM models.

<sup>4</sup>AAD 20W search for dijet resonance plus lepton with ATLAS at 13 TeV and  $139 \text{ fb}^{-1}$ ; no signal; limits placed in  $\sigma \cdot \text{BF}$  vs. mass plane for various BSM models.

<sup>5</sup>SIRUNYAN 20AI search for dijet resonance in CMS at 13 TeV with  $137 \text{ fb}^{-1}$ ; no signal; limits set in  $\sigma$  vs. mass plane for various BSM models.

# Searches Particle Listings

## Other Particle Searches

- 6 AABOUD 19AJ search for low mass dijet resonance in  $pp \rightarrow \gamma X, X \rightarrow jj$  at 13 TeV with 79.8 fb<sup>-1</sup> of data; no signal found; limits placed on Z' model in coupling vs. m(Z') plane.
- 7 SIRUNYAN 19b search for low mass resonance  $pp \rightarrow jA, A \rightarrow b\bar{b}$  at 13 TeV using 35.9 fb<sup>-1</sup>; no signal; exclude resonances 50–350 GeV depending on production and decay.
- 8 SIRUNYAN 19CD search for  $pp \rightarrow Z'\gamma, Z' \rightarrow jj$  with fat jet ( $jj$ ); no signal, limits placed in m(Z') vs. coupling plane for Z' masses from 10 to 125 GeV.
- 9 AABOUD 18AD search for new heavy particle  $Y \rightarrow HX \rightarrow (bb) + (qq)$ . No signal observed. Limits set on m(Y) vs. m(X) in the ranges of m(Y) in 1–4 TeV and m(X) in 50–1000 GeV.
- 10 AABOUD 18ck search for SUSY Higgsinos in gauge-mediation via  $pp \rightarrow bbb + \cancel{E}_T$  at 13 TeV using two complementary analyses with 24.3/36.1 fb<sup>-1</sup>; no signal is found and Higgsinos with masses between 130 and 230 GeV and between 290 and 880 GeV are excluded at the 95% confidence level.
- 11 AABOUD 18cl search for  $pp \rightarrow$  vector-like quarks  $\rightarrow$  jets at 13 TeV with 36 fb<sup>-1</sup>; no signal seen; limits set on various VLQ scenarios. For pure  $B \rightarrow Hb$  or  $T \rightarrow Ht$ , set the mass limit  $m > 1010$  GeV.
- 12 AABOUD 18n search for dijet resonance at Atlas with 13 TeV and 29.3 fb<sup>-1</sup>; limits set on m(Z') in the mass range of 450–1800 GeV.
- 13 SIRUNYAN 18DJ search for  $pp \rightarrow ZZ$  or  $WZ \rightarrow \ell\bar{\ell}jj$  resonance at 13 TeV, 35.9 fb<sup>-1</sup>; no signal; limits set in the 400–450 GeV mass range, exclusion of W' up to 2270 GeV in the HVT model A, and up to 2330 GeV for HVT model B. WED bulk graviton exclusion up to 925 GeV.
- 14 SIRUNYAN 18DY search for  $pp \rightarrow RR, R \rightarrow jj$  two dijet resonances at 13 TeV 35.9 fb<sup>-1</sup>; no signal; limits placed on RPV top-squark pair production.
- 15 KHACHATRYAN 17W search for dijet resonance in 12.9 fb<sup>-1</sup> data at 13 TeV; see Fig. 2 for limits on axiguons, diquarks, dark matter mediators etc.
- 16 KHACHATRYAN 17Y search for  $pp \rightarrow (8-10)j$  in 19.7 fb<sup>-1</sup> at 8 TeV. No signal seen. Limits set on colorons, axiguons, RPV, and SUSY.
- 17 SIRUNYAN 17F measure  $pp \rightarrow jj$  angular distribution in 2.6 fb<sup>-1</sup> at 13 TeV; limits set on LEDs and quantum black holes.
- 18 AABOUD 16 search for resonant dijets including one or two b-jets with 3.2 fb<sup>-1</sup> at 13 TeV; exclude excited b\* quark from 1.1–2.1 TeV; exclude leptophilic Z' with SM couplings from 1.1–1.5 TeV.
- 19 AAD 16N search for  $\geq 3$  jets with 3.6 fb<sup>-1</sup> at 13 TeV; limits placed on micro black holes (Fig. 10) and string balls (Fig. 11).
- 20 AAD 16s search for high mass jet-jet resonance with 3.6 fb<sup>-1</sup> at 13 TeV; exclude portions of excited quarks, W', Z' and contact interaction parameter space.
- 21 KHACHATRYAN 16K search for dijet resonance in 2.4 fb<sup>-1</sup> data at 13 TeV; see Fig. 3 for limits on axiguons, diquarks etc.
- 22 KHACHATRYAN 16L use data scouting technique to search for jj resonance on 18.8 fb<sup>-1</sup> of data at 8 TeV. Limits on the coupling of a leptophobic Z' to quarks are set, improving on the results by other experiments in the mass range between 500–800 GeV.
- 23 AAD 13D search for dijet resonances in pp collisions at E<sub>cm</sub> = 7 TeV with L = 4.8 fb<sup>-1</sup>. The observed events are compatible with Standard Model expectation. See their Fig. 6 and Table 2 for limits on resonance cross section in the range m = 1.0–4.0 TeV.
- 24 AALTONEN 13R search for production of a pair of jet-jet resonances in p $\bar{p}$  collisions at E<sub>cm</sub> = 1.96 TeV with L = 6.6 fb<sup>-1</sup>. See their Fig. 5 and Tables I, II for cross section limits.
- 25 CHATRCHYAN 13A search for qq, qg, and gg resonances in pp collisions at E<sub>cm</sub> = 7 TeV with L = 4.8 fb<sup>-1</sup>. See their Fig. 3 and Table 1 for limits on resonance cross section in the range m = 1.0–4.3 TeV.
- 26 CHATRCHYAN 13A search for b $\bar{b}$  resonances in pp collisions at E<sub>cm</sub> = 7 TeV with L = 4.8 fb<sup>-1</sup>. See their Fig. 8 and Table 4 for limits on resonance cross section in the range m = 1.0–4.0 TeV.
- 27 AAD 12s search for dijet resonances in pp collisions at E<sub>cm</sub> = 7 TeV with L = 1.0 fb<sup>-1</sup>. See their Fig. 3 and Table 2 for limits on resonance cross section in the range m = 0.9–4.0 TeV.
- 28 CHATRCHYAN 12BL search for t $\bar{t}$  resonances in pp collisions at E<sub>cm</sub> = 7 TeV with L = 4.4 fb<sup>-1</sup>. See their Fig. 4 for limits on resonance cross section in the range m = 0.5–3.0 TeV.
- 29 AAD 11AG search for dijet resonances in pp collisions at E<sub>cm</sub> = 7 TeV with L = 36 pb<sup>-1</sup>. Limits on number of events for m = 0.6–4 TeV are given in their Table 3.
- 30 AALTONEN 11M find a peak in two jet invariant mass distribution around 140 GeV in W + 2 jet events in p $\bar{p}$  collisions at E<sub>cm</sub> = 1.96 TeV with L = 4.3 fb<sup>-1</sup>.
- 31 ABZOV 11I search for two-jet resonances in W + 2 jet events in p $\bar{p}$  collisions at E<sub>cm</sub> = 1.96 TeV with L = 4.3 fb<sup>-1</sup> and give limits  $\sigma < (2.6-1.3)$  pb (95% CL) for m = 110–170 GeV. The result is incompatible with AALTONEN 11M.
- 32 AAD 10 search for narrow dijet resonances in pp collisions at E<sub>cm</sub> = 7 TeV with L = 315 nb<sup>-1</sup>. Limits on the cross section in the range 10–10<sup>3</sup> pb is given for m = 0.3–1.7 TeV.
- 33 KHACHATRYAN 10 search for narrow dijet resonances in pp collisions at E<sub>cm</sub> = 7 TeV with L = 2.9 pb<sup>-1</sup>. Limits on the cross section in the range 1–300 pb is given for m = 0.5–2.6 TeV separately in the final states qq, qg, and gg.
- 34 ABE 99F search for narrow b $\bar{b}$  resonances in p $\bar{p}$  collisions at E<sub>cm</sub>=1.8 TeV. Limits on  $\sigma(p\bar{p} \rightarrow X + \text{anything}) \times B(X \rightarrow b\bar{b})$  in the range 3–10<sup>3</sup> pb (95%CL) are given for m<sub>X</sub>=200–750 GeV. See their Table I.
- 35 ABE 97G search for narrow dijet resonances in p $\bar{p}$  collisions with 106 pb<sup>-1</sup> of data at E<sub>cm</sub> = 1.8 TeV. Limits on  $\sigma(p\bar{p} \rightarrow X + \text{anything}) \times B(X \rightarrow jj)$  in the range 10<sup>4</sup>–10<sup>-1</sup> pb (95%CL) are given for dijet mass m=200–1150 GeV with both jets having  $|\eta| < 2.0$  and the dijet system having  $|\cos\theta^*| < 0.67$ . See their Table I for the list of limits. Supersedes ABE 93c.
- 36 ABE 93c give cross section times branching ratio into light (d, u, s, c, b) quarks for  $\Gamma = 0.02 M$ . Their Table II gives limits for M = 200–900 GeV and  $\Gamma = (0.02-0.2) M$ .

## LIMITS ON NEUTRAL PARTICLE PRODUCTION

### Production Cross Section of Radiatively-Decaying Neutral Particle

VALUE (pb)	CL%	DOCUMENT ID	TECN	COMMENT

<(1.6-0.9)	95			
1 ALBERT 18c search for WIMP annihilation in Sun to long-lived, radiatively decaying mediator; no signal; limits set on $\sigma^{SD}(\chi p)$ assuming long-lived mediator.				
2 KHACHATRYAN 17D search for new scalar resonance decaying to Z $\gamma$ with Z $\rightarrow e^+e^-$ , $\mu^+\mu^-$ in pp collisions at 8 and 13 TeV; no signal seen.				
3 AAD 16AI search for excited quarks (EQ) and quantum black holes (QBH) in 3.2 fb <sup>-1</sup> at 13 TeV of data; exclude EQ below 4.4 TeV and QBH below 3.8 (6.2) TeV for RS1 (ADD) models. The visible cross section limit was obtained for 5 TeV resonances with $\sigma_G/M_G = 2\%$ .				
4 KHACHATRYAN 16M search for $\gamma\gamma$ resonance using 19.7 fb <sup>-1</sup> at 8 TeV and 3.3 fb <sup>-1</sup> at 13 TeV; slight excess at 750 GeV noted; limit set on RS graviton.				
5 ABBIENDI 00D associated production limit is for $m_{X^0} = 90-188$ GeV, $m_{\gamma^0} = 0$ at $E_{cm} = 189$ GeV. See also their Fig. 9.				
6 ABBIENDI 00D pair production limit is for $m_{X^0} = 45-94$ GeV, $m_{\gamma^0} = 0$ at $E_{cm} = 189$ GeV. See also their Fig. 12.				
7 ACKERSTAFF 97B associated production limit is for $m_{X^0} = 80-160$ GeV, $m_{\gamma^0} = 0$ from 10.0 pb <sup>-1</sup> at $E_{cm} = 161$ GeV. See their Fig. 3(a).				
8 ACKERSTAFF 97B pair production limit is for $m_{X^0} = 40-80$ GeV, $m_{\gamma^0} = 0$ from 10.0 pb <sup>-1</sup> at $E_{cm} = 161$ GeV. See their Fig. 3(b).

1 AAD 23P search in 22 channels for exotica produced in association with $h \rightarrow \gamma\gamma$ in 139 fb <sup>-1</sup> of data. No signal observed. Limits placed on production cross section in various channels.				

- 2 TUMASYAN 23BC search for  $\gamma$ -jet resonance at CMS with  $138 \text{ fb}^{-1}$  of data. No signal observed. Limits placed on quantum black hole and excited quark models.
- 3 TUMASYAN 23BF search for  $pp \rightarrow pp + \gamma/Z + X$  search where  $X$  is missing particle using CMS-TOTEM with  $37.2 \text{ fb}^{-1}$  of data. No signal observed. Limits placed on  $\sigma$  vs.  $m$  plane.
- 4 TUMASYAN 22AG search for strongly interacting neutral massive particles via trackless jets with  $16.1 \text{ fb}^{-1}$  at 13 TeV; no signal detected; limits placed in mass vs. cross section plane for various simplified models.
- 5 AAD 21F search for hard monojet production at ATLAS with  $139 \text{ fb}^{-1}$  of 13 TeV data. No signal observed. Limits placed on invisible production cross-section recoiling against ISR and interpreted in variety of BSM models.
- 6 AAIJ 20AL search for dimuon resonance from promptly decaying  $X$  particle; no signal; limits placed on  $m(X)$  up to 60 GeV depending on mixing in 2HDM.
- 7 SIRUNYAN 20AV measured  $\Upsilon(1S)$  pair production cross section and searched for new states decaying into  $\Upsilon(1S)\mu^+\mu^-$  at CMS with 13 TeV with  $35.9 \text{ fb}^{-1}$ . No signal is found and limits are set in  $\sigma$ -BF vs. mass plane for tetra- $b$ -quarks with masses between 17.5 and 19 GeV and for generic search for narrow resonances with mass between 16.5 and 27 GeV.
- 8 SIRUNYAN 20Z search for BSM physics via multilepton production with CMS at 13 TeV with  $137 \text{ fb}^{-1}$ ; no signal is found and limits are set on type-III seesaw and other BSM models.
- 9 AABOUD 19H searches for di-photon-jet resonance at 13 TeV and  $36.7 \text{ fb}^{-1}$  of data; no signal found and limits placed on  $\sigma$ -BR vs. mass plane for various simplified models.
- 10 AABOUD 19V review ATLAS searches for mediator-based DM at 7, 8, and 13 TeV with up to  $37 \text{ fb}^{-1}$  of data; no signal found and limits set for wide variety of simplified models of dark matter.
- 11 SIRUNYAN 19O search for  $pp \rightarrow \gamma \bar{\nu}_T$  at 13 TeV with  $36.1 \text{ fb}^{-1}$ ; no signal found and limits set for various simplified models.
- 12 AABOUD 18CJ make multichannel search for  $pp \rightarrow VV/\ell\ell/\ell\nu$ ,  $V = W, Z, h$  at 13 TeV,  $36.1 \text{ fb}^{-1}$ ; no signal found; limits placed for several BSM models.
- 13 AABOUD 18CM search for lepton-flavor violating resonance in  $pp \rightarrow e\mu/\tau\mu/\tau\tau$  at 13 TeV,  $36.1 \text{ fb}^{-1}$ ; no signal is found and limits placed for various BSM models.
- 14 AAIJ 18AJ search for prompt and delayed dark photon decay  $A' \rightarrow \mu^+\mu^-$  at LHCb detector using  $1.6 \text{ fb}^{-1}$  of  $pp$  collisions at 13 TeV; limits on  $m(A')$  vs. kinetic mixing are set.
- 15 BANERJEE 18 search for dark photon  $A'/16.7 \text{ MeV}$  boson  $X$  at NA64 via  $eZ \rightarrow eZX(A')$ ; no signal found and limits set on the  $X$ - $e^-$  coupling  $\epsilon_e$  in the range  $1.3 \times 10^{-4} \leq \epsilon_e \leq 4.2 \times 10^{-4}$  excluding part of the allowed parameter space.
- 16 BANERJEE 18A search for invisibly decaying dark photons in  $eZ \rightarrow eZA', A' \rightarrow$  invisible; no signal found and limits set on mixing for  $m(A') < 1 \text{ GeV}$ .
- 17 MARSICANO 18 search for dark photon  $e^+e^- \rightarrow A'(\gamma)$  visible decay in SLAC E137 e beam dump data. No signal observed and limits set in  $\epsilon$  coupling vs  $m(A')$  plane, see their figure 7.
- 18 SIRUNYAN 18BB search for high mass dilepton resonance; no signal found and exclude portions of  $p$ -space of  $Z'$ , KK graviton models.
- 19 SIRUNYAN 18DA search for  $pp \rightarrow$  Black Hole, string ball, sphaleron via high multiplicity events at 13 TeV,  $35.9 \text{ fb}^{-1}$ ; no signal, require e.g.  $m(\text{BH}) > 10.1 \text{ TeV}$ .
- 20 SIRUNYAN 18DD search for  $pp \rightarrow jj$  deviations in dijet angular distribution. No signal observed. Set limits on large extra dimensions, black holes and DM mediators e.g.  $m(\text{BH}) > 5.9\text{--}8.2 \text{ TeV}$ .
- 21 SIRUNYAN 18DR search for dimuon resonance in  $pp \rightarrow b\mu\bar{\mu}$  at 8 and 13 TeV. Slight excess seen at  $m(\mu\bar{\mu}) \sim 28 \text{ GeV}$  in some channels.
- 22 SIRUNYAN 18DU search for high mass diphoton resonance in  $pp \rightarrow \gamma\gamma$  at 13 TeV using  $35.9 \text{ fb}^{-1}$ ; no signal; limits placed on RS Graviton, LED, and clockwork.
- 23 SIRUNYAN 18ED search for  $pp \rightarrow V \rightarrow Wh; h \rightarrow b\bar{b}; W \rightarrow \ell\nu$  at 13 TeV with  $35.9 \text{ fb}^{-1}$ ; no signal; limits set on  $m(W') > 2.9 \text{ TeV}$ .
- 24 AABOUD 17B exclude  $m(W', Z') < 1.49\text{--}2.31 \text{ TeV}$  depending on the couplings and  $W'/Z'$  degeneracy assumptions via  $WH, ZH$  search in  $pp$  collisions at 13 TeV with  $3.2 \text{ fb}^{-1}$  of data.
- 25 AAIJ 17BR search for long-lived hidden valley pions from Higgs decay. Limits are set on the signal strength as a function of the mass and lifetime of the long-lived particle in their Fig. 4 and Tab. 4.
- 26 AAD 16O search for high  $E_T \ell + (\ell s \text{ or jets})$  with  $3.2 \text{ fb}^{-1}$  at 13 TeV; exclude micro black holes mass  $< 8 \text{ TeV}$  (Fig. 3) for models with two extra dimensions.
- 27 AAD 16R search for  $WW, WZ, ZZ$  resonance in  $20.3 \text{ fb}^{-1}$  at 8 TeV data; limits placed on massive RS graviton (Fig. 4).
- 28 KRASNAHORKAY 16 report  $p\text{Li} \rightarrow \text{Be} \rightarrow e\bar{\nu}N 5\sigma$  resonance at 16.7 MeV— possible evidence for nuclear interference or new light boson. However, such nuclear interference was ruled out already by ZANG 17.
- 29 LEES 15E search for long-lived neutral particles produced in  $e^+e^-$  collisions in the Upsilon region, which decays into  $e^+e^-, \mu^+\mu^-, e^\pm\mu^\mp, \pi^+\pi^-, K^+K^-, \text{ or } \pi^\pm K^\mp$ . See their Fig. 2 for cross section limits.
- 30 ADAMS 97B search for a hadron-like neutral particle produced in  $pN$  interactions, which decays into a  $\rho^0$  and a weakly interacting massive particle. Upper limits are given for the ratio to  $K_S$  production for the mass range 1.2–5 GeV and lifetime  $10^{-9}\text{--}10^{-4} \text{ s}$ . See also our Light Gluino Section.
- 31 GALLAS 95 limit is for a weakly interacting neutral particle produced in 800 GeV/ $c$   $pN$  interactions decaying with a lifetime of  $10^{-4}\text{--}10^{-8} \text{ s}$ . See their Figs. 8 and 9. Similar limits are obtained for a stable particle with interaction cross section  $10^{-29}\text{--}10^{-33} \text{ cm}^2$ . See Fig. 10.
- 32 AKESSON 91 limit is from weakly interacting neutral long-lived particles produced in  $pN$  reaction at 450 GeV/ $c$  performed at CERN SPS. Bourquin-Gaillard formula is used as the production model. The above limit is for  $\tau > 10^{-7} \text{ s}$ . For  $\tau > 10^{-9} \text{ s}$ ,  $\sigma < 10^{-30} \text{ cm}^2/\text{nucleon}$  is obtained.
- 33 BADIER 86 looked for long-lived particles at 300 GeV  $\pi^-$  beam dump. The limit applies for particle modes,  $\mu^+\pi^-, \mu^+\mu^-, \pi^+\pi^-, \pi^+\pi^+X, \pi^+\pi^-\pi^\pm$  etc. See their figure 5 for the contours of limits in the mass- $\tau$  plane for each mode.
- 34 GUSTAFSON 76 is a 300 GeV FNAL experiment looking for heavy ( $m > 2 \text{ GeV}$ ) long-lived neutral hadrons in the M4 neutral beam. The above typical value is for  $m = 3 \text{ GeV}$  and assumes an interaction cross section of 1 mb. Values as a function of mass and interaction cross section are given in figure 2.

Production of New Penetrating Non- $\nu$  Like States in Beam Dump

VALUE	DOCUMENT ID	TECN	COMMENT
••• We do not use the following data for averages, fits, limits, etc. •••			
	1 ABRATENKO 22A	MCBN	search for LLPs
	2 ANDREEV 22A	NA64	search for new boson $X$ in $eZ \rightarrow eZX$
	3 ANDREEV 21	NA64	search for new boson $X$ in $eZ \rightarrow eZX$
	4 LOSECCO 81	CALO	28 GeV protons
1 ABRATENKO 22A	search for LLPs from kaon decay in MicroBooNE absorber; no signal observed; limits placed for heavy neutral leptons (HNLs) and Higgs portal scalars (HPSS) in the MeV mass range.		
2 ANDREEV 22A	search for new light B-L gauge boson $Z' \rightarrow \nu\bar{\nu}$ in electron beam dump at NA64; no signal observed; limits set in $m(Z')$ vs coupling plane for $m(Z') \sim 10^{-6}\text{--}1 \text{ GeV}$ .		
3 ANDREEV 21	search for new invisibly decaying boson $X$ in $eZ \rightarrow eZX$ at NA64. No signal observed. Limits set in coupling vs. $m(X)$ plane for $m(X) \sim 10^{-3}$ to 1 GeV.		
4	No excess neutral-current events leads to $\sigma(\text{production}) \times \sigma(\text{interaction}) \times \text{acceptance} < 2.26 \times 10^{-71} \text{ cm}^4/\text{nucleon}^2$ (CL = 90%) for light neutrals. Acceptance depends on models ( $0.1$ to $4. \times 10^{-4}$ ).		

LIMITS ON CHARGED PARTICLES IN  $e^+e^-$ Heavy Particle Production Cross Section in  $e^+e^-$ 

Ratio to  $\sigma(e^+e^- \rightarrow \mu^+\mu^-)$  unless noted. See also entries in Free Quark Search and Magnetic Monopole Searches.

- 1 ADACHI 23K search for spin-0 LLP called  $S$  in  $B$  decays. No signal observed. Limits placed in branching fraction vs.  $m(S)$  plane.
- 2 KILE 18 investigate archived ALEPH  $e^+e^- \rightarrow 4$  jets data and see 4–5  $\sigma$  excess at 110 GeV.
- 3 ABLIKIM 17AA search for dark photon  $A \rightarrow \ell\bar{\ell}$  at 3.773 GeV with  $2.93 \text{ fb}^{-1}$ . Limits are set in  $\epsilon$  vs  $m(A)$  plane.
- 4 ACKERSTAFF 98P search for pair production of long-lived charged particles at  $E_{\text{cm}}$  between 130 and 183 GeV and give limits  $\sigma < (0.05\text{--}0.2) \text{ pb}$  (95%CL) for spin-0 and spin-1/2 particles with  $m=45\text{--}89.5 \text{ GeV}$ , charge 1 and 2/3. The limit is translated to the cross section at  $E_{\text{cm}}=183 \text{ GeV}$  with the  $s$  dependence described in the paper. See their Figs. 2–4.
- 5 ABREU 97D search for pair production of long-lived particles and give limits  $\sigma < (0.4\text{--}2.3) \text{ pb}$  (95%CL) for various center-of-mass energies  $E_{\text{cm}}=130\text{--}136, 161,$  and  $172 \text{ GeV}$ , assuming an almost flat production distribution in  $\cos\theta$ .
- 6 BARATE 97K search for pair production of long-lived charged particles at  $E_{\text{cm}} = 130, 136, 161,$  and  $172 \text{ GeV}$  and give limits  $\sigma < (0.2\text{--}0.4) \text{ pb}$  (95%CL) for spin-0 and spin-1/2 particles with  $m=45\text{--}85 \text{ GeV}$ . The limit is translated to the cross section at  $E_{\text{cm}}=172 \text{ GeV}$  with the  $E_{\text{cm}}$  dependence described in the paper. See their Figs. 2 and 3 for limits on  $J = 1/2$  and  $J = 0$  cases.
- 7 AKERS 95R is a CERN-LEP experiment with  $W_{\text{cm}} \sim m_Z$ . The limit is for the production of a stable particle in multihadron events normalized to  $\sigma(e^+e^- \rightarrow \text{hadrons})$ . Constant phase space distribution is assumed. See their Fig. 3 for bounds for  $Q = \pm 2/3, \pm 4/3$ .
- 8 BUSKULIC 93C is a CERN-LEP experiment with  $W_{\text{cm}} = m_Z$ . The limit is for a pair or single production of heavy particles with unusual ionization loss in TPC. See their Fig. 5 and Table 1.
- 9 ADACHI 90C is a KEK-TRISTAN experiment with  $W_{\text{cm}} = 52\text{--}60 \text{ GeV}$ . The limit is for pair production of a scalar or spin-1/2 particle. See Figs. 3 and 4.
- 10 ADACHI 90E is KEK-TRISTAN experiment with  $W_{\text{cm}} = 52\text{--}61.4 \text{ GeV}$ . The above limit is for inclusive production cross section normalized to  $\sigma(e^+e^- \rightarrow \mu^+\mu^-) \cdot \beta(3-\beta^2)/2$ , where  $\beta = (1 - 4m^2/W_{\text{cm}}^2)^{1/2}$ . See the paper for the assumption about the production mechanism.
- 11 KINOSHITA 82 is SLAC PEP experiment at  $W_{\text{cm}} = 29 \text{ GeV}$  using lexan and  $^{39}\text{Cr}$  plastic sheets sensitive to highly ionizing particles.
- 12 BARTEL 80 is DESY-PETRA experiment with  $W_{\text{cm}} = 27\text{--}35 \text{ GeV}$ . Above limit is for inclusive pair production and ranges between  $1. \times 10^{-1}$  and  $1. \times 10^{-2}$  depending on mass and production momentum distributions. (See their figures 9, 10, 11).

Branching Fraction of  $Z^0$  to a Pair of Stable Charged Heavy Fermions

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
••• We do not use the following data for averages, fits, limits, etc. •••				
$< 5 \times 10^{-6}$	95	1 AKERS 95R	OPAL	$m = 40.4\text{--}45.6 \text{ GeV}$
$< 1 \times 10^{-3}$	95	AKRAWY 90O	OPAL	$m = 29\text{--}40 \text{ GeV}$
1 AKERS 95R	give the 95% CL limit $\sigma(X\bar{X})/\sigma(\mu\mu) < 1.8 \times 10^{-4}$ for the pair production of singly- or doubly-charged stable particles. The limit applies for the mass range 40.4–45.6 GeV for $X^\pm$ and $< 45.6 \text{ GeV}$ for $X^\pm$ . See the paper for bounds for $Q = \pm 2/3, \pm 4/3$ .

### LIMITS ON CHARGED PARTICLES IN HADRONIC REACTIONS

#### MASS LIMITS for Long-Lived Charged Heavy Fermions

Limits are for spin  $1/2$  particles with no color and  $SU(2)_L$  charge. The electric charge  $Q$  of the particle (in the unit of  $e$ ) is therefore equal to its weak hypercharge. Pair production by Drell-Yan like  $\gamma$  and  $Z$  exchange is assumed to derive the limits.

- 1 AAD 24B search for non-resonant jets +MET at  $\sqrt{s} = 13$  TeV with 139 fb<sup>-1</sup>. No excess observed. Limits placed on dark sector model mediator mass and coupling.
- 2 AAD 22G search for single vector-like quark  $T$  with  $T \rightarrow th$  in all hadronic mode with 139 fb<sup>-1</sup> at 13 TeV; no signal observed; limits placed in mass vs. coupling plane.
- 3 TUMASYAN 22H search for new states of matter via non-resonant multilepton production based on a luminosity of 138 fb<sup>-1</sup>; no signal observed; limits placed on vector-like leptons, leptoquarks, and new fermions from type-III seesaw model.
- 4 SIRUNYAN 21T perform model unspecific search for deviations from SM with CMS at 13 TeV with 35.9 fb<sup>-1</sup> data in numerous signature channels. No deviations from SM found.
- 5 SIRUNYAN 20C search for four top-quark production with decay to multileptons at CMS at 13 TeV with 137 fb<sup>-1</sup>; no signal is found and limits are placed on the Higgs boson oblique parameter in the effective field theory framework (EFT) and the model parameters ( $\tan\beta$ ).
- 6 AABOUD 19AA search for BSM physics at 13 TeV with 3.2 fb<sup>-1</sup> in  $> 10^5$  regions of  $> 700$  event classes; no significant signal found.
- 7 AABOUD 19Q search for single top+MET events at 13 TeV with 36.1 fb<sup>-1</sup> of data; no signal found and limits set in  $\sigma$  or coupling vs. mass plane for variety of simplified models including DM and vector-like top quark  $T$ .
- 8 AABOUD 17D search for  $WWjj, WZjj$  in  $pp$  collisions at 8 TeV with 3.2 fb<sup>-1</sup>; set limits on anomalous couplings.
- 9 AABOUD 17L search for the pair production of heavy vector-like  $T$  quarks in the  $Z(\rightarrow \nu\nu) tX$  final state.
- 10 SIRUNYAN 17B search for vector-like quark  $pp \rightarrow TX \rightarrow tHX$  in 2.3 fb<sup>-1</sup> at 13 TeV; no signal seen; limits placed.
- 11 SIRUNYAN 17C search for vector-like quark  $pp \rightarrow TX \rightarrow Z + (t \text{ or } b)$  in 2.3 fb<sup>-1</sup> at 13 TeV; no signal seen; limits placed.
- 12 SIRUNYAN 17J search for  $pp \rightarrow X_{5/3} X_{5/3} \rightarrow tWtW$  with 2.3 fb<sup>-1</sup> at 13 TeV. No signal seen:  $m(X) > 1020$  (990) GeV for RH (LH) new charge  $5/3$  quark.
- 13 AAIJ 15BD search for production of long-lived particles in  $pp$  collisions at  $E_{\text{cm}} = 7$  and 8 TeV. See their Table 6 for cross section limits.

- 14 AAD 13AH search for production of long-lived particles with  $|q|=(2-6)e$  in  $pp$  collisions at  $E_{\text{cm}} = 7$  TeV with 4.4 fb<sup>-1</sup>. See their Fig. 8 for cross section limits.
- 15 AAD 11I search for production of highly ionizing massive particles in  $pp$  collisions at  $E_{\text{cm}} = 7$  TeV with  $L = 3.1$  pb<sup>-1</sup>. See their Table 5 for similar limits for  $|q| = 6e$  and 17e, Table 6 for limits on pair production cross section.
- 16 AALTONEN 09Z search for long-lived charged particles in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96$  TeV with  $L = 1.0$  fb<sup>-1</sup>. The limits are on production cross section for a particle of mass above 100 GeV in the region  $|\eta| \lesssim 0.7, p_T > 40$  GeV, and  $0.4 < \beta < 1.0$ .
- 17 Limit for weakly interacting charge-1 particle.
- 18 Limit for up-quark like particle.
- 19 ABAZOV 09M search for pair production of long-lived charged particles in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96$  TeV with  $L = 1.1$  fb<sup>-1</sup>. Limit on the cross section of (0.31-0.04) pb (95% CL) is given for the mass range of 60-300 GeV, assuming the kinematics of stau pair production.
- 20 AKTAS 04c look for charged particle photoproduction at HERA with mean c.m. energy of 200 GeV.
- 21 ABE 92J look for pair production of unit-charged particles which leave detector before decaying. Limit shown here is for  $m=50$  GeV. See their Fig. 5 for different charges and stronger limits for higher mass.
- 22 CARROLL 78 look for neutral,  $S = -2$  dihyperon resonance in  $pp \rightarrow 2K^+X$ . Cross section varies within above limits over mass range and  $p_{\text{lab}} = 5.1-5.9$  GeV/c.
- 23 LEIPUNER 73 is a NAL 300 GeV  $p$  experiment. Would have detected particles with lifetime greater than 200 ns.

- 1 HAYRAPETYAN 23F search for anomalous top  $\rightarrow$  leptons decay via effective operators. No signal observed. Limits placed on EFT operators.
- 2 BALDIN 76 is a 70 GeV Serpukhov experiment. Value is per Al nucleus at  $\theta = 0$ . For other charges in range  $-0.5$  to  $-3.0$ , CL = 90% limit is  $(2.6 \times 10^{-36})/|(\text{charge})|$  for mass range  $(2.1-9.4 \text{ GeV}) \times |(\text{charge})|$ . Assumes stable particle interacting with matter as do antiprotons.
- 3 ALBROW 75 is a CERN ISR experiment with  $E_{\text{cm}} = 53$  GeV.  $\theta = 40$  mr. See figure 5 for mass ranges up to 35 GeV.
- 4 JOVANOVIICH 75 is a CERN ISR 26+26 and 15+15 GeV  $pp$  experiment. Figure 4 covers ranges  $Q = 1/3$  to 2 and  $m = 3$  to 26 GeV. Value is per GeV momentum.
- 5 APPEL 74 is NAL 300 GeV  $pW$  experiment. Studies forward production of heavy (up to 24 GeV) charged particles with momenta 24-200 GeV ( $-$ charge) and 40-150 GeV ( $+$ charge). Above typical value is for 75 GeV and is per GeV momentum per nucleon.
- 6 ALPER 73 is CERN ISR 26+26 GeV  $pp$  experiment.  $p > 0.9$  GeV,  $0.2 < \beta < 0.65$ .
- 7 ANTIPOV 71B is from same 70 GeV  $p$  experiment as ANTIPOV 71C and BINON 69.
- 8 ANTIPOV 71C limit inferred from flux ratio. 70 GeV  $p$  experiment.
- 9 DORFAN 65 is a 30 GeV/c  $p$  experiment at BNL. Units are per GeV momentum per nucleus.

- 1 BERNSTEIN 88 limits apply at  $x = 0.2$  and  $p_T = 0$ . Mass and lifetime dependence of limits are shown in the regions:  $m = 1.5-7.5$  GeV and  $\tau = 10^{-8}-2 \times 10^{-6}$  s. First number is for hadrons; second is for weakly interacting particles.
- 2 THRON 85 is FNAL 400 GeV proton experiment. Mass determined from measured velocity and momentum. Limits are for  $\tau > 3 \times 10^{-9}$  s.
- 3 ARMITAGE 79 is CERN-ISR experiment at  $E_{\text{cm}} = 53$  GeV. Value is for  $x = 0.1$  and  $p_T = 0.15$ . Observed particles at  $m = 1.87$  GeV are found all consistent with being antideuteron.
- 4 BOZZOLI 79 is CERN-SPS 200 GeV  $pN$  experiment. Looks for particle with  $\tau$  larger than  $10^{-8}$  s. See their figure 11-18 for production cross-section upper limits vs mass.
- 5 CUTTS 78 is pBe experiment at FNAL sensitive to particles of  $\tau > 5 \times 10^{-8}$  s. Value is for  $-0.3 < x < 0$  and  $p_T = 0.175$ .
- 6 VIDAL 78 is FNAL 400 GeV proton experiment. Value is for  $x = 0$  and  $p_T = 0$ . Puts lifetime limit of  $< 5 \times 10^{-8}$  s on particle in this mass range.

See key on page 1171

1 AAD 23AM search for long-lived higgsinos from gauge-mediation which decay to $Z$ or $H$ . No signal observed. Limits placed in $c\tau$ vs $m(X)$ plane for various simplified models.				
2 AAD 23AR search for long-lived particles via decay to displaced $\gamma$ with 139 $\text{fb}^{-1}$ of data. No signal observed. Limits placed in $m$ vs. $\tau$ and BF vs. $\tau$ planes for gauge-mediated SUSY model.				

3 AAD 23BQ	search for displaced dimuon events in ATLAS detector. No signal observed. Limits placed in smuon lifetime vs. mass plane for long-lived smuon model.
4 AAD 23CO	search for monopoles and high-electric-charge LLPs in ATLAS with 139 $\text{fb}^{-1}$ of data. No signal observed. Limits placed in mass vs. charge plane.
5 AAD 23G	search for heavy highly ionizing long-lived particles with 139 $\text{fb}^{-1}$ of data. No signal observed. Limits placed in $m$ vs. $\tau$ plane for several SUSY models.
6 AAD 23I	search for light long-lived particles decaying to collimated decay products (e.g. dileptons). No signal observed. Limits placed in BF vs. $\tau$ plane.
7 TUMASYAN 23AO	search for trackless jets from LLP production at CMS. No signal observed. Limits placed for SUSY model with long-lived neutralino in $m(\chi)$ vs. $c\tau$ plane.
8 TUMASYAN 23G	search for LLP decaying to displaced dimuons at CM with 97.6 $\text{fb}^{-1}$ of data. No signal observed. Limits placed in $c\tau$ vs. $m$ plane for hidden Abelian Higgs simplified model.
9 AAD 22H	search for scalar mediator decay to two LLPs which decay in muon chambers with 139 $\text{fb}^{-1}$ at 13 TeV; no signal detected; limits placed on various simplified models.
10 AAD 22K	search for LLP pair production via scalar mediator with LLP decay in hadron calorimeter; no signal detected; limits placed for various simplified models.
11 AAD 22U	search for chargino LLP via disappearing tracks; no signal observed; limits placed in $m(\text{chargino})$ vs lifetime plane for cases of higgsino- or wino-like chargino.
12 AAIJ 22U	reports search for LLP production at LHCB with 5.4 $\text{fb}^{-1}$ at 13 TeV followed by semileptonic decay to muon; no signal detected; limits placed in mass or lifetime vs. cross section plane for several simplified models.
13 ACHARYA 22A	report search for monopole and HECO production via DY at 8 TeV LHC with 2.2 $\text{fb}^{-1}$ with MoEDAL detector; no signal detected; limits placed in mass vs. cross section plane for various electric/magnetic charge scenarios.
14 TUMASYAN 22AD	search for heavy neutral lepton which decays as LLP to trilepton state with 138 $\text{fb}^{-1}$ at 13 TeV; no signal detected; limits placed in mass vs. coupling plane.
15 TUMASYAN 22AF	search for LLPs via displaced lepton vertices. The analysis is performed with an integrated luminosity of 118 (113) $\text{fb}^{-1}$ when analyzing the $e\bar{e}$ ( $e\mu$ , $\mu\mu$ ) channel; no signal detected; limits placed for a variety of simplified models.
16 TUMASYAN 22M	search in 117 $\text{fb}^{-1}$ of 13 TeV data for $ZH$ production with $H \rightarrow S S$ where $S$ is a LLP; no signal observed; limits placed in decay length vs. branching fraction plane.
17 TUMASYAN 22N	search in 101 $\text{fb}^{-1}$ of 13 TeV data for LLP production via decay to dimuons; no signal observed; limits placed on mass vs. coupling or lifetime for a variety of simplified models.
18 AAD 21AL	reports on ATLAS search for long-lived charged particles with 139 $\text{fb}^{-1}$ at 13 TeV. No signal observed. Limits placed in lifetime vs. mass plane: e.g. for $\tau(\text{LLP}) \sim 0.1$ ns, $m(\text{selectron}) > 720$ GeV.
19 AAD 21BA	search for long-lived particles from $ZH$ production ( $H \rightarrow b\bar{b}$ ) with 2 displaced vertices in 139 $\text{fb}^{-1}$ of data at 13 TeV. No signal detected. Limits placed in branching fraction vs. lifetime plane.
20 AAIJ 21V	search for $pp \rightarrow \text{LLP} + \text{LLP}$ with LLP $\rightarrow e\mu\nu$ in the lifetime range between 2 and 50 ps at LHCB with 5.4 $\text{fb}^{-1}$ at 13 TeV. No signal observed. Limits placed in LLP cross section vs. mass or lifetime plane for $m(\text{LLP}) \sim 7$ to 50 GeV.
21 SIRUNYAN 21AF	search for LLPs at CMS via jets with 2 displaced vertices in 140 $\text{fb}^{-1}$ of data at 13 TeV. No signal observed. Limits placed for RPV SUSY models in which a long-lived neutralino or gluino decays into a multijet final state with top, bottom, and strange quarks.
22 SIRUNYAN 21U	search for long-lived particles (LLPs) via displaced jets at CMS with LHC13 and 132 $\text{fb}^{-1}$ . No signal detected. Limits placed on simplified model production of LLP $X \rightarrow q\bar{q}$ with $\sigma < 0.07$ fb for $m(X) > 500$ GeV and $c\tau \sim 2$ to 250 mm.
23 TUMASYAN 21	search for long-lived particles in CMS muon endcap detector in 137 $\text{fb}^{-1}$ of data at 13 TeV. No signal detected. Limits are placed depending on the branching fraction of Higgs boson to LLP decaying to $dd$ , $bb$ , and $\tau^+\tau^-$ , depending on proper decay length, and LLP masses.
24 AAD 20D	search for opposite-sign dileptons originating from long-lived particles in $pp$ collisions at 13 TeV with 32.8 $\text{fb}^{-1}$ ; limits placed in squark cross section vs. $c\tau$ plane for RPV SUSY.
25 AAD 20J	search for scalar boson decay to two long-lived particles; no signal; limits placed in BF vs $c\tau$ plane for various mass hypotheses. This search is also combined with other ATLAS displaced-jet searches.
26 AAD 20M	search for long-lived top-squarks decay to $\mu$ and hadrons; no signal; limits placed in cross section vs. mass and mass vs. lifetime planes.
27 AAD 20P	search for long-lived dark photons produced from the decay of a scalar boson, with each dark photon decaying into displaced collimated leptons or light hadrons at 13 TeV with 36 $\text{fb}^{-1}$ ; no signal; limits placed in $\sigma \cdot \text{BF}$ vs. $c\tau$ and other planes.
28 AAIJ 20AL	search for long-lived $X \rightarrow \mu^+\mu^-$ decays in 5.1 $\text{fb}^{-1}$ of LHCB data at 13 TeV; no signal; limits placed on $m(X)$ up to 3 GeV depending on kinetic mixing.
29 BALL 20	search for long-lived milli-charged particles produced at LHC; limits placed in charge vs. mass plane (Fig. 8).
30 AABOUD 19AE	search for long-lived particles via displaced jets using 10.8 $\text{fb}^{-1}$ or 33.0 $\text{fb}^{-1}$ data (depending on a trigger) at 13 TeV; no signal found and limits set in branching ratio vs. decay length plane.
31 AABOUD 19AK	searches for long-lived particle $Z_d$ via $pp \rightarrow \Phi \rightarrow ZZ_d$ at 13 TeV with 36.1 $\text{fb}^{-1}$ ; no signal found and limits set in $\sigma \times \text{BR}$ vs. lifetime plane for simplified model.
32 AABOUD 19AM	search for Drell-Yan (DY) production of long-lived multi-charge particles at 13 TeV with 36.1 $\text{fb}^{-1}$ of data; no signal found and exclude 50 GeV $< m(\text{LLMCP}) < 980$ –1220 GeV for electric charge $ q  = (2-7)e$ .
33 AABOUD 19AO	search for neutral long-lived particles producing displaced jets at 13 TeV with 36.1 $\text{fb}^{-1}$ of data; no signal found and exclude regions of $\sigma \cdot \text{BR}$ vs. lifetime plane for various models.
34 AABOUD 19AT	search for heavy, charged long-lived particles at 13 TeV with 36.1 $\text{fb}^{-1}$ ; no signal found and upper limits set on masses of various hypothetical particles.
35 AABOUD 19G	search for long-lived particle with decay to $\mu^+\mu^-$ at 13 TeV with 32.9 $\text{fb}^{-1}$ ; no signal found and limits set in combinations of lifetime, mass and coupling planes for various simplified models.
36 SIRUNYAN 19BH	search for long-lived SUSY particles via displaced jets at 13 TeV with 35.9 $\text{fb}^{-1}$ ; no signal found and limits placed in mass vs lifetime plane for various hypothetical models.

# Searches Particle Listings

## Other Particle Searches

- <sup>37</sup> SIRUNYAN 19BT search for displaced jet(s)+ $E_T$  at 13 TeV with 137 fb<sup>-1</sup>; no signal found and limits placed in mass vs lifetime plane for gauge mediated SUSY breaking models.
- <sup>38</sup> SIRUNYAN 19CA search for gluino/squark decay to long-lived neutralino, decay to  $\gamma$  in GMSB; no signal, limits placed in  $m(\chi)$  vs. lifetime plane for SPS8 GMSB benchmark point.
- <sup>39</sup> SIRUNYAN 19Q search for  $pp \rightarrow j +$  displaced jet via dark quark with 13 TeV at 16.1 fb<sup>-1</sup>; no signal found and limits set in mass vs lifetime plane for dark quark/dark pion model.
- <sup>40</sup> SIRUNYAN 18AW search for very long lived particles (LLPs) decaying hadronically or to  $\mu\bar{\mu}$  in CMS detector; none seen/limits set on lifetime vs. cross section.
- <sup>41</sup> AAIJ 16AR search for long lived particles from  $H \rightarrow XX$  with displaced  $X$  decay vertex using 0.62 fb<sup>-1</sup> at 7 TeV; limits set in Fig. 7.
- <sup>42</sup> KHACHATRYAN 16BW search for heavy stable charged particles via ToF with 2.5 fb<sup>-1</sup> at 13 TeV; require stable  $m(\text{gluinoball}) > 1610$  GeV.
- <sup>43</sup> BADIÉ 86 looked for long-lived particles at 300 GeV  $\pi^-$  beam dump. The limit applies for nonstrongly interacting neutral or charged particles with mass  $> 2$  GeV. The limit applies for particle modes,  $\mu^+\pi^-$ ,  $\mu^+\mu^-$ ,  $\pi^+\pi^-X$ ,  $\pi^+\pi^-\pi^\pm$  etc. See their figure 5 for the contours of limits in the mass- $\tau$  plane for each mode.

### Long-Lived Heavy Particle Cross Section

VALUE (pb/sr)	CL%	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •				
<34	95	<sup>1</sup> RAM	94 SPEC	1015 < $m_{X^{++}}$ < 1085 MeV
<75	95	<sup>1</sup> RAM	94 SPEC	920 < $m_{X^{++}}$ < 1025 MeV

- <sup>1</sup>RAM 94 search for a long-lived doubly-charged fermion  $X^{++}$  with mass between  $m_N$  and  $m_N + m_\pi$  and baryon number +1 in the reaction  $pp \rightarrow X^{++}n$ . No candidate is found. The limit is for the cross section at 15° scattering angle at 460 MeV incident energy and applies for  $\tau(X^{++}) \gg 0.1 \mu\text{s}$ .

- <sup>1</sup>ALEMANN0 22 search for flux of fractionally charged particles (FCPs) in space; no signal observed; limits set in flux vs decay plane for mass as low as GeV.
- <sup>2</sup>CAO 22 search for superheavy DM decaying to gamma rays; no signal observed; limits placed in mass vs. lifetime plane for  $m \sim 10^5-10^9$  GeV for DM decays to  $b\bar{b}$  or  $\tau\bar{\tau}$ .
- <sup>3</sup>ALVIS 18 search for fractional charged flux of cosmic matter at Majorana demonstrator; no signal observed and limits are set on the flux of lightly ionizing particles for charge as low as  $e/1000$ .
- <sup>4</sup>See AGNESE 15 Fig. 6 for limits extending down to  $Q = 1/200$ .
- <sup>5</sup>SAITO 90 candidates carry about 450 MeV/nucleon. Cannot be accounted for by conventional backgrounds. Consistent with strange quark matter hypothesis.
- <sup>6</sup>MINCER 85 is high statistics study of calorimeter signals delayed by 20–200 ns. Calibration with AGS beam shows they can be accounted for by rare fluctuations in signals from low-energy hadrons in the shower. Claim that previous delayed signals including BJORNBOE 68, DARDO 72, BHAT 82, SAKUYAMA 83B below may be due to this fake effect.
- <sup>7</sup>SAKUYAMA 83B analyzed 6000 extended air shower events. Increase of delayed particles and change of lateral distribution above  $10^{17}$  eV may indicate production of very heavy parent at top of atmosphere.
- <sup>8</sup>BHAT 82 observed 12 events with delay  $> 2. \times 10^{-8}$  s and with more than 40 particles. 1 eV has good hadron shower. However all events are delayed in only one of two detectors in cloud chamber, and could not be due to strongly interacting massive particle.
- <sup>9</sup>MARINI 82 applied PEP-counter for TOF. Above limit is for velocity = 0.54 of light. Limit is inconsistent with YOCK 80 YOCK 81 events if isotropic dependence on zenith angle is assumed.
- <sup>10</sup>YOCK 81 saw another 3 events with  $Q = \pm 1$  and  $m$  about  $4.5 m_p$  as well as 2 events with  $m > 5.3 m_p$ ,  $Q = \pm 0.75 \pm 0.05$  and  $m > 2.8 m_p$ ,  $Q = \pm 0.70 \pm 0.05$  and 1 event with  $m = (9.3 \pm 3.) m_p$ ,  $Q = \pm 0.89 \pm 0.06$  as possible heavy candidates.
- <sup>11</sup>YOCK 80 events are with charge exactly or approximately equal to unity.
- <sup>12</sup>BHAT 78 is at Kolar gold fields. Limit is for  $\tau > 10^{-6}$  s.
- <sup>13</sup>YOCK 74 events could be tritons.

### Superheavy Particle (Quark Matter) Flux in Cosmic Rays

VALUE (cm <sup>-2</sup> sr <sup>-1</sup> s <sup>-1</sup> )	CL%	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •

				<sup>10</sup> ULLMAN 81

- <sup>1</sup>ADRIANI 15 search for relatively light quark matter with charge  $Z = 1-8$ . See their Figs. 2 and 3 for flux upper limits.
- <sup>2</sup>AMBROSIO 00B searched for quark matter ("nuclearites") in the velocity range  $(10^{-5}-1)$  c. The listed limit is for  $2 \times 10^{-3}$  c.
- <sup>3</sup>ASTONE 93 searched for quark matter ("nuclearites") in the velocity range  $(10^{-3}-1)$  c. Their Table 1 gives a compilation of searches for nuclearites.
- <sup>4</sup>AHLEN 92 searched for quark matter ("nuclearites"). The bound applies to velocity  $< 2.5 \times 10^{-3}$  c. See their Fig. 3 for other velocity/c and heavier mass range.
- <sup>5</sup>NAKAMURA 91 searched for quark matter in the velocity range  $(4 \times 10^{-5}-1)$  c.
- <sup>6</sup>ORITO 91 searched for quark matter. The limit is for the velocity range  $(10^{-4}-10^{-3})$  c.
- <sup>7</sup>LIU 88 searched for quark matter ("nuclearites") in the velocity range  $(2.5 \times 10^{-3}-1)$  c. A less stringent limit of  $5.8 \times 10^{-11}$  applies for  $(1-2.5) \times 10^{-3}$  c.
- <sup>8</sup>BARISH 87 searched for quark matter ("nuclearites") in the velocity range  $(2.7 \times 10^{-4}-5 \times 10^{-3})$  c.
- <sup>9</sup>NAKAMURA 85 at KEK searched for quark-matter. These might be lumps of strange quark matter with roughly equal numbers of  $u, d, s$  quarks. These lumps or nuclearites were assumed to have velocity of  $(10^{-4}-10^{-3})$  c.
- <sup>10</sup>ULLMAN 81 is sensitive for heavy slow singly charge particle reaching earth with vertical velocity 100–350 km/s.
