1 AAD 23N based on 36.1 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. The second error is the sum of systematic ( $\pm 0.66$ ) and that from changing parton-shower gluon recoil scheme ( $\pm 0.25$ ) uncertainties. The distribution of the invariant mass  $m_{\ell\mu}$  ( $\ell$  from  $W$  and  $\mu$  from  $b$ -hadron decay) is used, which is less sensitive to jet energy uncertainties and top production modelling.

2 TUMASYAN 23BB based on 36.3 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. For each event, the mass is reconstructed from a kinematic fit of the decay products to a  $t\bar{t}$  hypothesis. A profile likelihood method is applied using up to four observables per event.

3 TUMASYAN 23Z based on 138 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. The second error is the sum of experimental ( $\pm 0.61$ ), model ( $\pm 0.47$ ), and theoretical ( $\pm 0.23$ ) uncertainties. The products of the hadronic decay of a top quark with  $p_T > 400$  GeV, in the  $\ell + \text{jets}$  channel of  $t\bar{t}$ , are reconstructed as a single jet. The top quark mass is determined from the normalized differential cross section measurement in the  $m_{\text{jet}}$  distribution.

4 TUMASYAN 21G based on 35.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. Events are selected by requiring  $1\ell + 2\text{jets}(1b \text{ jet})$  final state.

5 SIRUNYAN 20AR based on 35.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. The products of the hadronic decay of a top quark with  $p_T > 400$  GeV, in the  $\ell + \text{jets}$  channel of  $t\bar{t}$  are reconstructed as a single jet. The top quark mass is determined from the normalized differential cross section measurement in the  $m_{\text{jet}}$  distribution.

## Quark Particle Listings

 $t$ 

- <sup>6</sup> AABOUD 19AC is an ATLAS combination of 7 and 8 TeV top-quark mass determination in the dilepton, lepton + jets, and all jets channels.
- <sup>7</sup> SIRUNYAN 19AP based on 35.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. A kinematical fit is applied to each event assuming the signal event topology.  $m_t$  is determined simultaneously with a jet energy scale factor (JSF). The second error represents stat.+JSF. Modeling uncertainties are larger than in the measurements at  $\sqrt{s} = 7$  and 8 TeV because of the use of new alternative color reconnection models.
- <sup>8</sup> SIRUNYAN 19AR based on 35.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. Obtained from a simultaneous fit of the cross section and the top quark mass in the POWHEG simulation. The cross section is used also to extract the  $M_S$  mass and the strong coupling constant for different PDF sets.
- <sup>9</sup> KHACHATRYAN 16AK based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. Combination of the three top mass measurements in KHACHATRYAN 16AK and with the CMS results at  $\sqrt{s} = 7$  TeV.
- <sup>10</sup> TEVEWWG 16 is the latest Tevatron average (July 2016) provided by the Tevatron Electroweak Working Group. It takes correlated uncertainties into account and has a  $\chi^2$  of 10.8 for 11 degrees of freedom.
- <sup>11</sup> AABOUD 19AC based on 20.2 fb<sup>-1</sup> in  $pp$  collisions at  $\sqrt{s} = 8$  TeV. Uses optimized event selection to suppress less-well-reconstructed events and template fits to determine  $m_t$  together with a global jet energy scale factor and a relative  $b$ -to-light-jet energy scale factor.
- <sup>12</sup> SIRUNYAN 19AP based on 35.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. A combined measurement using the lepton+jets and all-jets channels through a single likelihood function. See SIRUNYAN 18DE.
- <sup>13</sup> SIRUNYAN 18DE based on 35.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV.  $m_t$  is determined simultaneously with an overall jet energy scale factor constrained by the mass of the hadronically decayed  $W$ . Compared to the Run 1 analysis a more advanced treatment of modeling uncertainties are employed, in particular concerning color-reconnection models. Superseded by TUMASYAN 23BB.
- <sup>14</sup> AABOUD 17AH based on 20.2 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. Uses template fits to the ratio of the masses of three-jets (from  $t$  candidate) and dijets (from  $W$  candidate), to suppress jet energy scale uncertainty. Large QCD background is modelled using a data-driven method.
- <sup>15</sup> ABAZOV 17B is a combination of measurements of the top quark mass by D0 in the lepton+jets and dilepton channels, using all data collected in Run I (1992–1996) at  $\sqrt{s} = 1.8$  TeV and Run II (2001–2011) at  $\sqrt{s} = 1.96$  TeV of the Tevatron, corresponding to integrated luminosities of 0.1 fb<sup>-1</sup> and 9.7 fb<sup>-1</sup>, respectively.
- <sup>16</sup> SIRUNYAN 17L based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV.  $m_t$  is reconstructed from a fit to the invariant mass distribution of  $\mu\nu b$ , where  $p_{T}^{\mu\nu}$  and  $W$  mass constraint are used to reconstruct  $\nu$  momentum. The number of events for various contributions, except for the  $t$ -channel single top one, are fixed to the values extracted from simulation. Superseded by TUMASYAN 21G.
- <sup>17</sup> SIRUNYAN 17N based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. The fully hadronic decay of a highly-boosted  $t$  is reconstructed in the  $\ell$ +jets channel and unfolded at the particle level. The sensitivity of the peak position of the  $m_{jet}$  distribution is used to test quality of the modelling by the simulation.
- <sup>18</sup> SIRUNYAN 17O based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. Analysis is based on the kinematical observables  $M(b\ell)$ ,  $M_{T2}$  and  $M(b\ell\nu)$ . A fit is performed to determine  $m_t$  and an overall jet energy scale factor simultaneously.
- <sup>19</sup> AABOUD 16T based on 20.2 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. The analysis is refined using the  $p_T$  and invariant mass distributions of  $\ell$ + $b$ -jet system. A combination with measurements from  $\sqrt{s} = 7$  TeV data in the dilepton and lepton+jets channels gives  $172.84 \pm 0.34 \pm 0.61$  GeV.
- <sup>20</sup> AABOUD 16T is an ATLAS combination of 8 TeV top-quark mass in the dilepton channel with previous measurements from  $\sqrt{s} = 7$  TeV data in the dilepton and lepton + jets channels.
- <sup>21</sup> ABAZOV 16 based on 9.7 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. Employs improved fit to minimize statistical errors and improved jet energy calibration, using lepton + jets mode, which reduces error of jet energy scale. Based on previous determination in ABAZOV 12AB with increased integrated luminosity and improved fit and calibrations.
- <sup>22</sup> ABAZOV 16D based on 9.7 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV, using the matrix element technique. Based on previous determination in ABAZOV 11R with increased integrated luminosity. There is a strong correlation with the determination in ABAZOV 16. (See ABAZOV 17B.)
- <sup>23</sup> KHACHATRYAN 16AK based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. Combination of the three top mass measurements in KHACHATRYAN 16AK and with the CMS results at  $\sqrt{s} = 7$  TeV gives  $172.44 \pm 0.13 \pm 0.47$  GeV.
- <sup>24</sup> The top mass and jet energy scale factor are determined by a fit.
- <sup>25</sup> Uses the analytical matrix weighting technique method.
- <sup>26</sup> KHACHATRYAN 16AL based on 19.7 fb<sup>-1</sup> in  $pp$  collisions at  $\sqrt{s} = 8$  TeV. Determined from the invariant mass distribution of leptons and reconstructed secondary vertices from  $b$  decays using only charged particles. The uncertainty is dominated by modeling of  $b$  fragmentation and top  $p_T$  distribution.
- <sup>27</sup> KHACHATRYAN 16CB based on 666 candidate reconstructed events corresponding to 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. The measurement exploits correlation of  $m_t$  with  $M(\mu\nu\ell)$  in the same top quark decay, using a high-purity event sample. A study on modeling of  $b$ -quark fragmentation is given in Sec.3.3.
- <sup>28</sup> AAD 15AW based on 4.6 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. Uses template fits to the ratio of the masses of three-jets (from  $t$  candidate) and dijets (from  $W$  candidate). Large background from multijet production is modeled with data-driven methods.
- <sup>29</sup> AAD 15BF based on 4.6 fb<sup>-1</sup> in  $pp$  collisions at  $\sqrt{s} = 7$  TeV. Using a three-dimensional template likelihood technique the lepton plus jets ( $\geq 1b$ -tagged) channel gives  $172.33 \pm 0.75 \pm 1.02$  GeV, while exploiting a one dimensional template method using  $m_{\ell b}$  the dilepton channel (1 or 2 $b$ -tags) gives  $173.79 \pm 0.54 \pm 1.30$  GeV. The results are combined.
- <sup>30</sup> AALTONEN 15D based on 9.1 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 1.96$  TeV. Uses a template technique to fit a distribution of a variable defined by a linear combination of variables sensitive and insensitive to jet energy scale to optimize reduction of systematic errors.  $b$ -tagged and non- $b$ -tagged events are separately analyzed and combined.
- <sup>31</sup> Based on 9.3 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 1.96$  TeV. Multivariate algorithm is used to discriminate signal from backgrounds, and templates are used to measure  $m_t$ .
- <sup>32</sup> Based on 9.7 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 1.96$  TeV. A matrix element method is used to calculate the probability of an event to be signal or background, and the overall jet energy scale is constrained *in situ* by  $m_W$ . See ABAZOV 15G for further details.
- <sup>33</sup> Based on 3.54 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. The mass is reconstructed for each event employing a kinematical fit of the jets to a  $t\bar{t}$  hypothesis. The combination with the previous CMS measurements in the dilepton and the lepton+jets channels gives  $173.54 \pm 0.33 \pm 0.96$  GeV.
- <sup>34</sup> Based on 8.7 fb<sup>-1</sup> in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. Events with an identified charged lepton or small  $E_T$  are rejected from the event sample, so that the measurement is statistically independent from those in the  $\ell$  + jets and all hadronic channels while being sensitive to those events with a  $\tau$  lepton in the final state.
- <sup>35</sup> Based on 5.0 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. CHATRCHYAN 13s studied events with di-lepton +  $E_T + \geq 2$   $b$ -jets, and looked for kinematical endpoints of MT2, MT2 $_T$ , and subsystem variables.
- <sup>36</sup> AAD 12i based on 1.04 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. Uses 2d-template analysis (MT) with  $m_t$  and jet energy scale factor (JSF) from  $m_W$  mass fit.
- <sup>37</sup> Based on 8.7 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at 1.96 TeV. The JES is calibrated by using the dijet mass from the  $W$  boson decay.
- <sup>38</sup> Use the ME method based on 2.2 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at 1.96 TeV.
- <sup>39</sup> Combination based on up to 5.8 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at 1.96 TeV.
- <sup>40</sup> Based on 5.8 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at 1.96 TeV the quoted value is  $m_t = 172.5 \pm 1.4(\text{stat}) \pm 1.0(\text{JES}) \pm 1.1(\text{syst})$  GeV. The measurement is performed with a likelihood fit technique which simultaneously determines  $m_t$  and JES (Jet Energy Scale).
- <sup>41</sup> Based on 4.3 fb<sup>-1</sup> of data in  $p$ - $\bar{p}$  collisions at 1.96 TeV. The measurement reduces the JES uncertainty by using the single lepton channel study of ABAZOV 11P.
- <sup>42</sup> Combination with the result in 1 fb<sup>-1</sup> of preceding data reported in ABAZOV 09AH as well as the MWT result of ABAZOV 11R with a statistical correlation of 60%.
- <sup>43</sup> Based on 5.0 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. Uses an analytical matrix weighting technique (AMWT) and full kinematic analysis (KIN).
- <sup>44</sup> Based on 5.0 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. The first error is statistical and JES combined, and the second is systematic. Ideogram method is used to obtain 2D likelihood for the kinematical fit with two parameters  $m_{top}$  and JES.
- <sup>45</sup> Based on 3.2 fb<sup>-1</sup> in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. The first error is from statistics and JES combined, and the latter is from the other systematic uncertainties. The result is obtained using an unbinned maximum likelihood method where the top quark mass and the JES are measured simultaneously, with  $\Delta_{JES} = 0.3 \pm 0.3(\text{stat})$ .
- <sup>46</sup> Based on 5.7 fb<sup>-1</sup> in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. Events with an identified charged lepton or small  $E_T$  are rejected from the event sample, so that the measurement is statistically independent from those in the  $\ell$  + jets and all hadronic channels while being sensitive to those events with a  $\tau$  lepton in the final state. Supersedes AALTONEN 07B.
- <sup>47</sup> AALTONEN 11E based on 5.6 fb<sup>-1</sup> in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. Employs a multi-dimensional template likelihood technique where the lepton plus jets (one or two  $b$ -tags) channel gives  $172.2 \pm 1.2 \pm 0.9$  GeV while the dilepton channel yields  $170.3 \pm 2.0 \pm 3.1$  GeV. The results are combined. OUR EVALUATION includes the measurement in the dilepton channel only.
- <sup>48</sup> Uses a likelihood fit of the lepton  $p_T$  distribution based on 2.7 fb<sup>-1</sup> in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV.
- <sup>49</sup> Based on 3.6 fb<sup>-1</sup> in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. ABAZOV 11P reports  $174.94 \pm 0.83 \pm 0.78 \pm 0.96$  GeV, where the first uncertainty is from statistics, the second from JES, and the last from other systematic uncertainties. We combine the JES and systematic uncertainties. A matrix-element method is used where the JES uncertainty is constrained by the  $W$  mass. ABAZOV 11P describes a measurement based on 2.6 fb<sup>-1</sup> that is combined with ABAZOV 08AH, which employs an independent 1 fb<sup>-1</sup> of data.
- <sup>50</sup> Based on a matrix-element method which employs 5.4 fb<sup>-1</sup> in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. Superseded by ABAZOV 12AB.
- <sup>51</sup> Based on 36 pb<sup>-1</sup> of  $pp$  collisions at  $\sqrt{s} = 7$  TeV. A Kinematic Method using  $b$ -tagging and an analytical Matrix Weighting Technique give consistent results and are combined. Superseded by CHATRCHYAN 12BA.
- <sup>52</sup> Based on 5.6 fb<sup>-1</sup> in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. The likelihood calculated using a matrix element method gives  $m_t = 173.0 \pm 0.7(\text{stat}) \pm 0.6(\text{JES}) \pm 0.9(\text{syst})$  GeV, for a total uncertainty of 1.2 GeV.
- <sup>53</sup> Based on 3.4 fb<sup>-1</sup> of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. The result is obtained by combining the MT2 variable method and the NVA (Neutrino Weighting Algorithm). The MT2 method alone gives  $m_t = 168.0^{+4.8}_{-4.0}(\text{stat}) \pm 2.9(\text{syst})$  GeV with smaller systematic error due to small JES uncertainty.
- <sup>54</sup> Based on 1.9 fb<sup>-1</sup> in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. The result is from the measurement using the transverse decay length of  $b$ -hadrons and that using the transverse momentum of the  $W$  decay muons, which are both insensitive to the JES (jet energy scale) uncertainty. OUR EVALUATION uses only the measurement exploiting the decay length significance which yields  $166.9^{+9.5}_{-8.5}(\text{stat}) \pm 2.9(\text{syst})$  GeV. The measurement that uses the lepton transverse momentum is excluded from the average because of a statistical correlation with other samples.
- <sup>55</sup> Based on 2.9 fb<sup>-1</sup> of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. The first error is from statistics and JES uncertainty, and the latter is from the other systematics. Neural-network-based kinematical selection of 6 highest  $E_T$  jets with a vtx  $b$ -tag is used to distinguish signal from background. Superseded by AALTONEN 12G.
- <sup>56</sup> Based on 2 fb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV. The top mass is obtained from the measurement of the invariant mass of the lepton ( $e$  or  $\mu$ ) from  $W$  decays and the soft  $\mu$  in  $b$ -jet. The result is insensitive to jet energy scaling.
- <sup>57</sup> Based on 1.9 fb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV. The first error is from statistics and jet energy scale uncertainty, and the latter is from the other systematics. Matrix element method with effective propagators.
- <sup>58</sup> Based on 943 pb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV. The first error is from statistical and jet-energy-scale uncertainties, and the latter is from other systematics. AALTONEN 09k selected 6 jet events with one or more vertex  $b$ -tags and used the tree-level matrix element to construct template models of signal and background.
- <sup>59</sup> Based on 1.9 fb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV. The first error is from statistical and jet-energy-scale (JES) uncertainties, and the second is from other systematics. Events with lepton + jets and those with dilepton + jets were simultaneously fit to constrain  $m_t$  and JES. Lepton + jets data only give  $m_t = 171.8 \pm 2.2$  GeV, and dilepton data only give  $m_t = 171.2^{+5.3}_{-5.1}$  GeV.
- <sup>60</sup> Based on 2 fb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV. Matrix Element method. Optimal selection criteria for candidate events with two high  $p_T$  leptons, high  $E_T$ , and two or more jets with and without  $b$ -tag are obtained by neural network with neuroevolution technique to minimize the statistical error of  $m_t$ .
- <sup>61</sup> Based on 2.9 fb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV. Mass  $m_t$  is estimated from the likelihood for the eight-fold kinematical solutions in the plane of the azimuthal angles of the two neutrino momenta.

- <sup>62</sup> Based on  $1 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . Events with two identified leptons, and those with one lepton plus one isolated track and a  $b$ -tag were used to constrain  $m_t$ . The result is a combination of the  $\nu$ WT ( $\nu$  Weighting Technique) result of  $176.2 \pm 4.8 \pm 2.1 \text{ GeV}$  and the MWT (Matrix-element Weighting Technique) result of  $173.2 \pm 4.9 \pm 2.0 \text{ GeV}$ .
- <sup>63</sup> Reports measurement of  $170.7^{+4.2}_{-3.9} \pm 2.6 \pm 2.4 \text{ GeV}$  based on  $1.2 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . The last error is due to the theoretical uncertainty on  $\sigma_{t\bar{t}}$ . Without the cross-section constraint a top mass of  $169.7^{+5.2}_{-4.9} \pm 3.1 \text{ GeV}$  is obtained.
- <sup>64</sup> Template method.
- <sup>65</sup> Result is based on  $1 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . The first error is from statistics and jet energy scale uncertainty, and the latter is from the other systematics.
- <sup>66</sup> Based on  $310 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ .
- <sup>67</sup> Ideogram method.
- <sup>68</sup> Based on  $311 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . Events with 4 or more jets with  $E_T > 15 \text{ GeV}$ , significant missing  $E_T$ , and secondary vertex  $b$ -tag are used in the fit. About 44% of the signal acceptance is from  $\tau\nu + 4$  jets. Events with identified  $e$  or  $\mu$  are vetoed to provide a statistically independent measurement.
- <sup>69</sup> Based on  $1.02 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . Superseded by AALTONEN 12G.
- <sup>70</sup> Based on  $955 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ .  $m_t$  and JES (Jet Energy Scale) are fitted simultaneously, and the first error contains the JES contribution of  $1.5 \text{ GeV}$ .
- <sup>71</sup> Matrix element method.
- <sup>72</sup> Based on  $425 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . The first error is a combination of statistics and JES (Jet Energy Scale) uncertainty, which has been measured simultaneously to give  $\text{JES} = 0.989 \pm 0.029(\text{stat})$ .
- <sup>73</sup> Based on  $370 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . Combined result of MWT (Matrix-element Weighting Technique) and  $\nu$ WT ( $\nu$  Weighting Technique) analyses is  $178.1 \pm 6.7 \pm 4.8 \text{ GeV}$ .
- <sup>74</sup> Based on  $1.0 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . ABULENCIA 07b improves the matrix element description by including the effects of initial-state radiation.
- <sup>75</sup> Based on  $695 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . The transverse decay length of the  $b$  hadron is used to determine  $m_t$ , and the result is free from the JES (jet energy scale) uncertainty.
- <sup>76</sup> Based on  $\sim 400 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . The first error includes statistical and systematic jet energy scale uncertainties, the second error is from the other systematics. The result is obtained with the  $b$ -tagging information. The result without  $b$ -tagging is  $169.2^{+5.0+1.5}_{-7.4-1.4} \text{ GeV}$ . Superseded by ABAZOV 08AH.
- <sup>77</sup> Based on  $318 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ .
- <sup>78</sup> Dynamical likelihood method.
- <sup>79</sup> Based on  $340 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ .
- <sup>80</sup> Based on  $360 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ .
- <sup>81</sup> Based on  $110.2 \pm 5.8 \text{ pb}^{-1}$  at  $\sqrt{s} = 1.8 \text{ TeV}$ .
- <sup>82</sup> Based on the all hadronic decays of  $t\bar{t}$  pairs. Single  $b$ -quark tagging via the decay chain  $b \rightarrow c \rightarrow \mu$  was used to select signal enriched multijet events. The result was obtained by the maximum likelihood method after bias correction.
- <sup>83</sup> Obtained by re-analysis of the lepton + jets candidate events that led to ABBOTT 98f. It is based upon the maximum likelihood method which makes use of the leading order matrix elements.
- <sup>84</sup> Based on  $125 \pm 7 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.8 \text{ TeV}$ .
- <sup>85</sup> Based on  $\sim 106 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.8 \text{ TeV}$ .
- <sup>86</sup> Obtained by combining the measurements in the lepton + jets [AFFOLDER 01], all-jets [ABE 97r, ABE 99b], and dilepton [ABE 99b] decay topologies.
- <sup>87</sup> Obtained by combining the D0 result  $m_t(\text{GeV}) = 168.4 \pm 12.3 \pm 3.6$  from 6 di-lepton events (see also ABBOTT 98b) and  $m_t(\text{GeV}) = 173.3 \pm 5.6 \pm 5.5$  from lepton+jet events (ABBOTT 98f).
- <sup>88</sup> Obtained by combining the CDF results of  $m_t(\text{GeV}) = 167.4 \pm 10.3 \pm 4.8$  from 8 dilepton events,  $m_t(\text{GeV}) = 175.9 \pm 4.8 \pm 5.3$  from lepton+jet events (ABE 98e), and  $m_t(\text{GeV}) = 186.0 \pm 10.0 \pm 5.7$  from all-jet events (ABE 97r). The systematic errors in the latter two measurements are changed in this paper.
- <sup>89</sup> See AFFOLDER 01 for details of systematic error re-evaluation.
- <sup>90</sup> Based on  $109 \pm 7 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.8 \text{ TeV}$ .
- <sup>91</sup> See ABAZOV 04G.
- <sup>92</sup> The updated systematic error is listed. See AFFOLDER 01, appendix C.
- <sup>93</sup> Obtained by combining the D0 results of  $m_t(\text{GeV}) = 168.4 \pm 12.3 \pm 3.6$  from 6 dilepton events and  $m_t(\text{GeV}) = 173.3 \pm 5.6 \pm 5.5$  from 77 lepton+jet events.
- <sup>94</sup> Obtained by combining the D0 results from dilepton and lepton+jet events, and the CDF results (ABE 99b) from dilepton, lepton+jet events, and all-jet events.
- <sup>95</sup> Based on the first observation of all hadronic decays of  $t\bar{t}$  pairs. Single  $b$ -quark tagging with jet-shape variable constraints was used to select signal enriched multi-jet events. The updated systematic error is listed. See AFFOLDER 01, appendix C.

### t-Quark Mass from Cross-Section Measurements

The top quark  $\overline{MS}$  or pole mass can be extracted from a measurement of  $\sigma(t\bar{t})$  by using theory calculations. We quote below the  $\overline{MS}$  mass. See the review "The Top Quark" and references therein for more information.

<sup>1</sup> AAD 19G based on $20.2 \text{ fb}^{-1}$ of data in $pp$ collisions at $\sqrt{s} = 8 \text{ TeV}$ . Normalized $t\bar{t} + 1$ -jet differential cross section as a function of $t\bar{t}$ invariant mass is measured in the $\ell + \text{jets}$ mode. The unfolded parton-level distribution is compared with the NLO QCD prediction. The three errors are from statistics, systematics, and theory.			
<sup>2</sup> Based on $5.3 \text{ fb}^{-1}$ in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ . ABAZOV 11s uses the measured $t\bar{t}$ production cross section of $8.13^{+1.02}_{-0.90} \text{ pb}$ [ABAZOV 11e] in the lepton plus jets channel to obtain the top quark $\overline{MS}$ mass by using an approximate NNLO computation (MOCH 08, LANGENFELD 09). The corresponding top quark pole mass is $167.5^{+5.4}_{-4.9} \text{ GeV}$ . A different theory calculation (AHRENS 10, AHRENS 10A) is also used and yields $m_t^{\overline{MS}} = 154.5^{+5.0}_{-4.3} \text{ GeV}$ .			
<sup>3</sup> Based on $1 \text{ fb}^{-1}$ of data at $\sqrt{s} = 1.96 \text{ TeV}$ . Uses the $\ell + \text{jets}$ , $\ell\ell$ , and $\ell\tau + \text{jets}$ channels. ABAZOV 09AG extract the pole mass of the top quark using two different calculations that yield $169.1^{+5.9}_{-5.2} \text{ GeV}$ (MOCH 08, LANGENFELD 09) and $168.2^{+5.4}_{-5.4} \text{ GeV}$ (KIDONAKIS 08).			
<sup>4</sup> Based on $1 \text{ fb}^{-1}$ of data at $\sqrt{s} = 1.96 \text{ TeV}$ . Uses the $\ell\ell$ and $\ell\tau + \text{jets}$ channels. ABAZOV 09R extract the pole mass of the top quark using two different calculations that yield $173.3^{+9.8}_{-8.6} \text{ GeV}$ (MOCH 08, LANGENFELD 09) and $171.5^{+9.9}_{-8.8} \text{ GeV}$ (CACIARI 08).

176.7 <sup>+3.0</sup> <sub>-2.8</sub>	12 CHATRCHYAN14	CMS	$pp$ at $\sqrt{s} = 7 \text{ TeV}$
<sup>1</sup> AAD 23AY based on $5 \text{ fb}^{-1}$ and $20 \text{ fb}^{-1}$ of $pp$ data at $\sqrt{s} = 7 \text{ TeV}$ and $8 \text{ TeV}$ , respectively. The result is obtained from the combined inclusive cross section measurements and the NNLO+NNLL predictions fixing $\alpha_s(m_Z) = 0.118$ .			
<sup>2</sup> TUMASYAN 23R based on $36.3 \text{ fb}^{-1}$ of data in $pp$ collisions at $\sqrt{s} = 13 \text{ TeV}$ . Normalized $t\bar{t} + 1$ -jet differential cross section as a function of $t\bar{t}$ invariant mass is measured in the dilepton mode. The unfolded parton-level distribution is compared with the NLO QCD prediction. The result depends on the PDF and ABMP16NNLO is used.			
<sup>3</sup> AAD 20Q based on $36.1 \text{ fb}^{-1}$ of $pp$ data at $\sqrt{s} = 13 \text{ TeV}$ . The result is obtained from the inclusive cross section measurement and the NNLO+NNLL prediction.			
<sup>4</sup> AAD 19G based on $20.2 \text{ fb}^{-1}$ of data in $pp$ collisions at $\sqrt{s} = 8 \text{ TeV}$ . Normalized $t\bar{t} + 1$ -jet differential cross section as a function of $t\bar{t}$ invariant mass is measured in the $\ell + \text{jets}$ mode. The unfolded parton-level distribution is compared with the NLO QCD prediction. The three errors are from statistics, systematics, and theory.			
<sup>5</sup> SIRUNYAN 17w based on $2.2 \text{ fb}^{-1}$ of $pp$ data at $\sqrt{s} = 13 \text{ TeV}$ . Events are categorized according to the jet multiplicity and the number of $b$ -tagged jets. The pole mass is obtained from the inclusive cross section measurement and the NNLO prediction.			
<sup>6</sup> ABAZOV 16F based on $9.7 \text{ fb}^{-1}$ of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ . The result is obtained from the inclusive cross section measurement and the NNLO+NNLL prediction.			
<sup>7</sup> AAD 15BW based on $4.6 \text{ fb}^{-1}$ of $pp$ data at $\sqrt{s} = 7 \text{ TeV}$ . Uses normalized differential cross section for $t\bar{t} + 1$ jet as a function of the inverse of the invariant mass of the $t\bar{t} + 1$ jet system. The measured cross section is corrected to the parton level. Then a fit to the data using NLO + parton shower prediction is performed.			
<sup>8</sup> SIRUNYAN 20BV based on $35.9 \text{ fb}^{-1}$ of $pp$ data at $\sqrt{s} = 13 \text{ TeV}$ . The error accounts for both experimental and theoretical uncertainties. Events containing two oppositely charged leptons are used. The pole mass is particularly sensitive to the $t\bar{t}$ invariant mass distribution close to the threshold. However, the Coulomb and soft gluon resummation effects are not taken into account, hence, an additional theoretical uncertainty of order $\pm 1 \text{ GeV}$ is assumed.			
<sup>9</sup> AABOUD 17BC based on $20.2 \text{ fb}^{-1}$ of $pp$ data at $\sqrt{s} = 8 \text{ TeV}$ . The pole mass is extracted from a fit of NLO predictions to eight single lepton and dilepton differential distributions, while simultaneously constraining uncertainties due to PDFs and QCD scales. The three reported uncertainties come from statistics, experimental systematics, and theoretical sources.			

## Quark Particle Listings

 $t$ 

- <sup>10</sup> KHACHATRYAN 16AW based on 5.0 fb<sup>-1</sup> of  $pp$  collisions at 7 TeV and 19.7 fb<sup>-1</sup> at 8 TeV. The 7 TeV data include those used in CHATRCHYAN 14. The result is obtained from the inclusive cross sections.
- <sup>11</sup> AAD 14AY used  $\sigma(t\bar{t})$  for  $e\mu$  events. The result is a combination of the measurements  $m_t = 171.4 \pm 2.6$  GeV based on 4.6 fb<sup>-1</sup> of data at 7 TeV and  $m_t = 174.1 \pm 2.6$  GeV based on 20.3 fb<sup>-1</sup> of data at 8 TeV.
- <sup>12</sup> CHATRCHYAN 14 used  $\sigma(t\bar{t})$  from  $pp$  collisions at  $\sqrt{s} = 7$  TeV measured in CHATRCHYAN 12AX to obtain  $m_t(\text{pole})$  for  $\alpha_s(m_Z) = 0.1184 \pm 0.0007$ . The errors have been corrected in KHACHATRYAN 14K.

 $m_t - m_{\bar{t}}$ 

Test of  $CPT$  conservation. OUR AVERAGE assumes that the systematic uncertainties are uncorrelated.

1.99 <sup>+0.69</sup> <sub>-0.55</sub>		<sup>5</sup> ABAZOV 11B	D0	Repl. by ABAZOV 12T
> 1.21	95	<sup>5</sup> ABAZOV 11B	D0	$\Gamma(t \rightarrow Wb)$
< 7.6	95	<sup>6</sup> AALTONEN 10AC	CDF	$\ell + \text{jets}$ , direct
< 13.1	95	<sup>7</sup> AALTONEN 09M	CDF	$m_t(\text{rec})$ distribution

- <sup>1</sup> Based on 20.2 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV.  $\Gamma_t$  is measured using a template fit to the reconstructed invariant mass of the  $b$ -jet of the semileptonically decaying top quark and the corresponding lepton, and the angular distance between  $j_b$  and  $j_j$  in hadronic top decay. Signal templates are generated by reweighting events at parton-level to Breit-Wigner distribution with different  $\Gamma_t$  hypotheses for  $m_t = 172.5$  GeV. The result is consistent with the NNLO SM prediction of 1.322 GeV.
- <sup>2</sup> Based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. The result is obtained by combining the measurement of  $R = \Gamma(t \rightarrow Wb)/\Gamma(t \rightarrow Wq (q=b,s,d))$  and a previous CMS measurement of the  $t$ -channel single top production cross section of CHATRCHYAN 12BQ, by using the theoretical calculation of  $\Gamma(t \rightarrow Wb)$  for  $m_t = 172.5$  GeV.
- <sup>3</sup> Based on 5.4 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at 1.96 TeV.  $\Gamma(t \rightarrow bW)$  is  $1.87^{+0.44}_{-0.40}$  GeV is obtained from the observed  $t$ -channel single top quark production cross section, whereas  $B(t \rightarrow bW) = 0.90 \pm 0.04$  is used assuming  $\sum_q B(t \rightarrow qW) = 1$ . The result is valid for  $m_t = 172.5$  GeV. See the paper for the values for  $m_t = 170$  or 175 GeV.
- <sup>4</sup> Based on 8.7 fb<sup>-1</sup> of data. The two sided 68% CL interval is 1.10 GeV <  $\Gamma_t$  < 4.05 GeV for  $m_t = 172.5$  GeV.
- <sup>5</sup> Based on 2.3 fb<sup>-1</sup> of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. ABAZOV 11B extracted  $\Gamma_t$  from the partial width  $\Gamma(t \rightarrow Wb) = 1.92^{+0.58}_{-0.51}$  GeV measured using the  $t$ -channel single top production cross section, and the branching fraction  $\text{br}(t \rightarrow Wb) = 0.962^{+0.068}_{-0.066}(\text{stat})^{+0.064}_{-0.052}(\text{syst})$ . The  $\Gamma(t \rightarrow Wb)$  measurement gives the 95% CL lowerbound of  $\Gamma(t \rightarrow Wb)$  and hence that of  $\Gamma_t$ .
- <sup>6</sup> Results are based on 4.3 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. The top quark mass and the hadronically decaying  $W$  boson mass are reconstructed for each candidate events and compared with templates of different top quark width. The two sided 68% CL interval is 0.3 GeV <  $\Gamma_t$  < 4.4 GeV for  $m_t = 172.5$  GeV.
- <sup>7</sup> Based on 955 pb<sup>-1</sup> of  $p\bar{p}$  collision data at  $\sqrt{s} = 1.96$  TeV. AALTONEN 09M selected  $t\bar{t}$  candidate events for the  $\ell + \cancel{E}_T + \text{jets}$  channel with one or two  $b$ -tags, and examine the decay width dependence of the reconstructed  $m_t$  distribution. The result is for  $m_t = 175$  GeV, whereas the upper limit is lower for smaller  $m_t$ .

WEIGHTED AVERAGE  
0.957 ± 0.034 (Error scaled by 1.5)

- <sup>1</sup> Based on 8.7 fb<sup>-1</sup> of data. This measurement gives  $|V_{tb}| = 0.93 \pm 0.04$  and  $|V_{cb}| > 0.85$  (95% CL) in the SM.
- <sup>2</sup> Based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. The result is obtained by counting the number of  $b$  jets per  $t\bar{t}$  signal events in the dilepton channel. The  $t\bar{t}$  production cross section is measured to be  $\sigma(t\bar{t}) = 238 \pm 1 \pm 15$  pb, in good agreement with the SM prediction and the latest CMS measurement of CHATRCHYAN 14F. The measurement gives  $R > 0.995$  (95% CL), or  $|V_{tb}| > 0.975$  (95% CL) in the SM, requiring  $R \leq 1$ .
- <sup>3</sup> Based on 8.7 fb<sup>-1</sup> of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. Measure the fraction of  $t \rightarrow Wb$  decays simultaneously with the  $t\bar{t}$  cross section. The correlation coefficient between those two measurements is  $-0.434$ . Assume unitarity of the  $3 \times 3$  CKM matrix and set  $|V_{tb}| > 0.89$  at 95% CL.
- <sup>4</sup> Based on 5.4 fb<sup>-1</sup> of data. The error is statistical and systematic combined. The result is a combination of  $0.95 \pm 0.07$  from  $\ell + \text{jets}$  channel and  $0.86 \pm 0.05$  from  $\ell\ell$  channel.  $|V_{tb}| = 0.95 \pm 0.02$  follows from the result by assuming unitarity of the  $3 \times 3$  CKM matrix.
- <sup>5</sup> Result is based on 0.9 fb<sup>-1</sup> of data. The 95% CL lower bound  $R > 0.79$  gives  $|V_{tb}| > 0.89$  (95% CL).

<sup>6</sup> ABAZOV 06k result is from the analysis of  $t\bar{t} \rightarrow \ell\nu + \geq 3$  jets with  $230 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . It gives  $R > 0.61$  and  $|V_{tb}| > 0.78$  at 95% CL. Superseded by ABAZOV 08m.

<sup>7</sup> ACOSTA 05A result is from the analysis of lepton + jets and di-lepton + jets final states of  $t\bar{t}$  candidate events with  $\sim 162 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ . The first error is statistical and the second systematic. It gives  $R > 0.61$ , or  $|V_{tb}| > 0.78$  at 95% CL.

<sup>8</sup> AFFOLDER 01c measures the top-quark decay width ratio  $R = \Gamma(Wb)/\Gamma(Wq)$ , where  $q$  is a  $d$ ,  $s$ , or  $b$  quark, by using the number of events with multiple  $b$  tags. The first error is statistical and the second systematic. A numerical integration of the likelihood function gives  $R > 0.61$  (0.56) at 90% (95%) CL. By assuming three generation unitarity,  $|V_{tb}| = 0.97 \pm_{-0.12}^{+0.16}$  or  $|V_{tb}| > 0.78$  (0.75) at 90% (95%) CL is obtained. The result is based on  $109 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 1.8 \text{ TeV}$ .

<b>0.111 ± 0.003</b>	<sup>1</sup> AAD	15cc ATLS	$\ell + \text{jets}, \ell\ell + \text{jets}, \ell\tau_h + \text{jets}$

<sup>1</sup> AAD 15cc based on  $4.6 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 7 \text{ TeV}$ . The original value is given by  $13.3 \pm 0.4 \pm 0.5\%$ , which includes electrons from the decay of  $\tau$  leptons. It is assumed that the top branching ratios to leptons and jets add up to one and that only SM processes contribute to the background. The event selection criteria are optimized for the  $\ell\tau_h + \text{jets}$  channel. We have converted the original value to eliminate contributions of electrons from  $\tau$ 's, by using the AAD 15cc measurements of the branching ratios to  $\mu$  and  $\tau$  channels, as well as the PDG values of  $\tau$  branching ratios into  $e$  and  $\mu$  channels.

<sup>4</sup> ABULENCIA 06R CDF  $\ell\tau + \text{jets}$

<sup>5</sup> ABE 97v CDF  $\ell\tau + \text{jets}$

<sup>1</sup> SIRUNYAN 20v based on  $35.9 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ .  $t\bar{t}$  events are selected in the  $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau\nu_\tau)b\bar{b}$  mode, where  $\tau_h$  refers to the hadronic decays of  $\tau$ . The branching ratio is determined with respect to the  $t\bar{t}$  inclusive cross section extrapolated from the light dilepton mode. The ratio of the  $t\bar{t}$  production cross sections in the  $\ell\tau_h$  and  $\ell\ell$  channels yields  $0.973 \pm 0.009 \pm 0.066$ , consistent with lepton universality.

<sup>2</sup> AAD 15cc based on  $4.6 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 7 \text{ TeV}$ . The original value is given by  $7.0 \pm 0.3 \pm 0.5\%$ , which includes only the hadronic decay of  $\tau$  leptons. It is assumed that the top branching ratios to leptons and jets add up to one and that only SM processes contribute to the background. The event selection criteria are optimized for the  $\ell\tau_h + \text{jets}$  channel. We have converted the original value to include leptonic decays of  $\tau$ 's, by using the AAD 15cc measurements of the branching ratios to  $e$  and  $\mu$  channels, as well as the PDG values of  $\tau$  branching ratios into  $e$  and  $\mu$  channels.

<sup>3</sup> Based on  $9 \text{ fb}^{-1}$  of data. The measurement is in the channel  $t\bar{t} \rightarrow (b\ell\nu)(b\tau\nu)$ , where  $\tau$  decays into hadrons ( $\tau_h$ ), and  $\ell$  ( $e$  or  $\mu$ ) include  $\ell$  from  $\tau$  decays ( $\tau_\ell$ ). The result is consistent with lepton universality.

<sup>4</sup> ABULENCIA 06R looked for  $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau\nu_\tau)b\bar{b}$  events in  $194 \text{ pb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$ . 2 events are found where  $1.00 \pm 0.17$  signal and  $1.29 \pm 0.25$  background events are expected, giving a 95% CL upper bound for the partial width ratio  $\Gamma(t \rightarrow \tau\nu q) / \Gamma_{SM}(t \rightarrow \tau\nu q) < 5.2$ .

<sup>5</sup> ABE 97v searched for  $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau\nu_\tau)b\bar{b}$  events in  $109 \text{ pb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.8 \text{ TeV}$ . They observed 4 candidate events where one expects  $\sim 1$  signal and  $\sim 2$  background events. Three of the four observed events have jets identified as  $b$  candidates.

<sup>1</sup> AAD 23 based on  $139 \text{ fb}^{-1}$  of data in  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$ . Anomalous FCNC left-handed and right-handed couplings are searched for through the single top production in association with a photon and in the decay of a top quark in the  $t\bar{t}$  production. The SM predictions of the corresponding branching ratios are of the order of  $10^{-14}$ .

<sup>2</sup> KHACHATRYAN 16AS based on  $19.8 \text{ fb}^{-1}$  of data in  $pp$  collisions at  $\sqrt{s} = 8 \text{ TeV}$ . FCNC through single top production in association with a photon is searched for in the mode  $\mu + \gamma + E_T + \geq 1j$  (0,1b). Bounds on the anomalous FCNC couplings are given by  $\kappa_{t u \gamma} < 0.025$  and  $\kappa_{t c \gamma} < 0.091$ .

<sup>3</sup> CHEKANOV 03 looked for single top production via FCNC in the reaction  $e^\pm p \rightarrow e^\pm (t \text{ or } \bar{t}) X$  in  $130.1 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 300\text{--}318 \text{ GeV}$ . No evidence for top production and its decay into  $bW$  was found. The result is obtained for  $m_t = 175 \text{ GeV}$  when  $B(\gamma c) = B(Z q) = 0$ , where  $q$  is a  $u$  or  $c$  quark. Bounds on the effective  $t\text{--}u\text{--}\gamma$  and  $t\text{--}u\text{--}Z$  couplings are found in their Fig. 4. The conversion to the constraint listed is from private communication, E. Gallo, January 2004.

<sup>4</sup> AAD 20B based on  $81 \text{ fb}^{-1}$  of data in  $pp$  collisions at  $\sqrt{s} = 13 \text{ TeV}$ . FCNC through single top production in association with a photon is searched for in the mode  $\ell\gamma + E_T + 1j$  ( $b$ -tag). Anomalous FCNC left-handed and right-handed couplings are searched for, which result in different kinematical properties of top decay such as the lepton distribution. Limits are set on the  $tq\gamma$  couplings in an effective field theory.

<sup>5</sup> AARON 09A looked for single top production via FCNC in  $e^\pm p$  collisions at HERA with  $474 \text{ pb}^{-1}$ . The upper bound of the cross section gives the bound on the FCNC coupling  $\kappa_{t u \gamma} / \Lambda < 1.03 \text{ TeV}^{-1}$ , which corresponds to the result for  $m_t = 175 \text{ GeV}$ .

<sup>6</sup> ABDALLAH 04c looked for single top production via FCNC in the reaction  $e^+e^- \rightarrow \bar{t}c \text{ or } \bar{t}u$  in  $541 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 189\text{--}208 \text{ GeV}$ . No deviation from the SM is found, which leads to the bound on  $B(t \rightarrow \gamma q)$ , where  $q$  is a  $u$  or a  $c$  quark, for  $m_t = 175 \text{ GeV}$  when  $B(t \rightarrow Z q) = 0$  is assumed. The conversion to the listed bound is from private communication, O. Yushchenko, April 2005. The bounds on the effective  $t\text{--}q\text{--}\gamma$  and  $t\text{--}q\text{--}Z$  couplings are given in their Fig. 7 and Table 4, for  $m_t = 170\text{--}180 \text{ GeV}$ , where most conservative bounds are found by choosing the chiral couplings to maximize the negative interference between the virtual  $\gamma$  and  $Z$  exchange amplitudes.

<sup>7</sup> AKTAS 04 looked for single top production via FCNC in  $e^\pm$  collisions at HERA with  $118.3 \text{ pb}^{-1}$ , and found 5 events in the  $e$  or  $\mu$  channels. By assuming that they are due to statistical fluctuation, the upper bound on the  $t u \gamma$  coupling  $\kappa_{t u \gamma} < 0.27$  (95% CL) is obtained. The conversion to the partial width limit, when  $B(\gamma c) = B(Z u) = B(Z c) = 0$ , is from private communication, E. Perez, May 2005.

<sup>8</sup> ACHARD 02i looked for single top production via FCNC in the reaction  $e^+e^- \rightarrow \bar{t}c \text{ or } \bar{t}u$  in  $634 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 189\text{--}209 \text{ GeV}$ . No deviation from the SM is found, which leads to a bound on the top-quark decay branching fraction  $B(\gamma q)$ , where  $q$  is a  $u$  or  $c$  quark. The bound assumes  $B(Z q) = 0$  and is for  $m_t = 175 \text{ GeV}$ ; bounds for  $m_t = 170 \text{ GeV}$  and  $180 \text{ GeV}$  and  $B(Z q) \neq 0$  are given in Fig. 5 and Table 7.

<sup>9</sup> ABE 98G looked for  $t\bar{t}$  events where one  $t$  decays into  $q\gamma$  while the other decays into  $bW$ . The quoted bound is for  $\Gamma(\gamma q)/\Gamma(Wb)$ .

$\Gamma(H^+ b, H^+ \rightarrow \tau\nu_\tau)/\Gamma_{\text{total}}$		$\Gamma_8/\Gamma$

- <sup>1</sup> AAD 23As based on 139 fb<sup>-1</sup> of data in  $pp$  collisions at  $\sqrt{s} = 13$  TeV. Anomalous FCNC left-handed and right-handed couplings are searched for through the single top production in association with a Z boson and in the decay of a top quark in the  $t\bar{t}$  production. Events with  $3\ell + \geq 1$  jet(s) (1b-tagged) +  $\cancel{E}_T$  are used. The SM predictions of the corresponding branching ratios are of the order of  $10^{-14}$ .
- <sup>2</sup> SIRUNYAN 17E based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. The final states  $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu + \text{jets}$  ( $\ell, \ell' = e, \mu$ ) are investigated and the cross section  $\sigma(pp \rightarrow tZq \rightarrow \ell\nu b\ell^+ \ell^- q) = 10^{+8}_{-7}$  fb is measured, giving no sign of FCNC decays of the top quark.
- <sup>3</sup> AAD 16D based on 20.3 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. The FCNC decay is searched for in  $t\bar{t}$  events in the final state  $(bW)(qZ)$  when both W and Z decay leptonically, giving 3 charged leptons.
- <sup>4</sup> Based on 36.1 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. The final states  $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu + \text{jets}$  ( $\ell, \ell' = e, \mu$ ) are investigated and no significant excess over the SM background contributions is observed.
- <sup>5</sup> Based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. The flavor changing decay is searched for in  $t\bar{t}$  events in the final state  $(bW)(qZ)$  when both W and Z decay leptonically, giving 3 charged leptons.
- <sup>6</sup> CHATRCHYAN 14s combined search limit from this and CHATRCHYAN 13F data.
- <sup>7</sup> Based on 5.0 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. Search for FCNC decays of the top quark in  $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu + \text{jets}$  ( $\ell, \ell' = e, \mu$ ) final states found no excess of signal events.
- <sup>8</sup> Based on 2.1 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV.
- <sup>9</sup> Based on 4.1 fb<sup>-1</sup> of data. ABAZOV 11M searched for FCNC decays of the top quark in  $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu + \text{jets}$  ( $\ell, \ell' = e, \mu$ ) final states, and absence of the signal gives the bound.
- <sup>10</sup> Based on  $p\bar{p}$  data of 1.52 fb<sup>-1</sup>. AALTONEN 09AL compared  $t\bar{t} \rightarrow WbWb \rightarrow \ell\nu bjjb$  and  $t\bar{t} \rightarrow ZcWb \rightarrow \ell\ell cjjb$  decay chains, and absence of the latter signal gives the bound. The result is for 100% longitudinally polarized Z boson and the theoretical  $t\bar{t}$  production cross section The results for different Z polarizations and those without the cross section assumption are given in their Table XII.
- <sup>11</sup> Result is based on 1.9 fb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV.  $t\bar{t} \rightarrow WbZq$  or  $ZqZq$  processes have been looked for in  $Z + \geq 4$  jet events with and without b-tag. No signal leads to the bound  $B(t \rightarrow Zq) < 0.037 (0.041)$  for  $m_t = 175 (170)$  GeV.
- <sup>12</sup> ABDALLAH 04C looked for single top production via FCNC in the reaction  $e^+e^- \rightarrow \bar{t}c \text{ or } \bar{t}u$  in 541 pb<sup>-1</sup> of data at  $\sqrt{s}=189-208$  GeV. No deviation from the SM is found, which leads to the bound on  $B(t \rightarrow Zq)$ , where  $q$  is a  $u$  or a  $c$  quark, for  $m_t = 175$  GeV when  $B(t \rightarrow \gamma q)=0$  is assumed. The conversion to the listed bound is from private communication, O. Yushchenko, April 2005. The bounds on the effective  $t$ - $q$ - $\gamma$  and  $t$ - $q$ - $Z$  couplings are given in their Fig. 7 and Table 4, for  $m_t = 170-180$  GeV, where most conservative bounds are found by choosing the chiral couplings to maximize the negative interference between the virtual  $\gamma$  and Z exchange amplitudes.
- <sup>13</sup> ACHARD 02J looked for single top production via FCNC in the reaction  $e^+e^- \rightarrow \bar{t}c$  or  $\bar{t}u$  in 634 pb<sup>-1</sup> of data at  $\sqrt{s} = 189-209$  GeV. No deviation from the SM is found, which leads to a bound on the top-quark decay branching fraction  $B(Zq)$ , where  $q$  is a  $u$  or  $c$  quark. The bound assumes  $B(\gamma q)=0$  and is for  $m_t = 175$  GeV; bounds for  $m_t=170$  GeV and 180 GeV and  $B(\gamma q) \neq 0$  are given in Fig. 5 and Table 7. Table 6 gives constraints on  $t$ - $c$ - $e$ - $e$  four-fermi contact interactions.
- <sup>14</sup> HEISTER 02Q looked for single top production via FCNC in the reaction  $e^+e^- \rightarrow \bar{t}c$  or  $\bar{t}u$  in 214 pb<sup>-1</sup> of data at  $\sqrt{s}=204-209$  GeV. No deviation from the SM is found, which leads to a bound on the branching fraction  $B(Zq)$ , where  $q$  is a  $u$  or  $c$  quark. The bound assumes  $B(\gamma q)=0$  and is for  $m_t = 174$  GeV. Bounds on the effective  $t$ - $(c \text{ or } u)$ - $\gamma$  and  $t$ - $(c \text{ or } u)$ - $Z$  couplings are given in their Fig. 2.
- <sup>15</sup> ABBIENDI 01T looked for single top production via FCNC in the reaction  $e^+e^- \rightarrow \bar{t}c$  or  $\bar{t}u$  in 600 pb<sup>-1</sup> of data at  $\sqrt{s}=189-209$  GeV. No deviation from the SM is found, which leads to bounds on the branching fractions  $B(Zq)$  and  $B(\gamma q)$ , where  $q$  is a  $u$  or  $c$  quark. The result is obtained for  $m_t = 174$  GeV. The upper bound becomes 9.7% (20.6%) for  $m_t = 169 (179)$  GeV. Bounds on the effective  $t$ - $(c \text{ or } u)$ - $\gamma$  and  $t$ - $(c \text{ or } u)$ - $Z$  couplings are given in their Fig. 4.
- <sup>16</sup> BARATE 00s looked for single top production via FCNC in the reaction  $e^+e^- \rightarrow \bar{t}c$  or  $\bar{t}u$  in 411 pb<sup>-1</sup> of data at c.m. energies between 189 and 202 GeV. No deviation from the SM is found, which leads to a bound on the branching fraction. The bound assumes  $B(\gamma q)=0$ . Bounds on the effective  $t$ - $(c \text{ or } u)$ - $\gamma$  and  $t$ - $(c \text{ or } u)$ - $Z$  couplings are given in their Fig. 4.
- <sup>17</sup> ABE 98G looked for  $t\bar{t}$  events where one  $t$  decays into three jets and the other decays into  $qZ$  with  $Z \rightarrow \ell\ell$ . The quoted bound is for  $\Gamma(Zq)/\Gamma(Wb)$ .

- <sup>1</sup> TUMASYAN 22A based on 137 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data. The processes considered include both the associated production of a single top quark with a Higgs boson and the decay  $t \rightarrow Hu$  in  $t\bar{t}$  production using  $H \rightarrow \gamma\gamma$ .
- <sup>2</sup> AAD 23CJ based on 139 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data. The processes considered include both the associated production of a single top quark with a Higgs boson and the decay  $t \rightarrow Hu$  in  $t\bar{t}$  production using  $H \rightarrow \gamma\gamma$ . Limits on the SMEFT Wilson coefficients are derived.
- <sup>3</sup> AAD 23CJ based on 139 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data. The results are combined with searches in the  $H \rightarrow \gamma\gamma, H \rightarrow bb$ , and  $H \rightarrow \tau\tau$  final states. Limits on the SMEFT Wilson coefficients are also derived.
- <sup>4</sup> AAD 23H based on 139 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data. Uses events with one or two hadronically decaying  $\tau$  and multiple jets. The limit corresponds to  $(3.5^{+1.5}_{-1.0}) \times 10^{-4}$  measurement.
- <sup>5</sup> TUMASYAN 22K based on 137 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data. Uses events with one isolated lepton and multiple jets (including  $\geq 2b$ -jets). Deep neural networks are used for kinematical event reconstruction.
- <sup>6</sup> AABOUD 19s based on 36.1 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data. Uses events with one isolated lepton and multiple jets (several of them b-tagged with high purity). A multivariate analysis is performed to distinguish the signal from backgrounds.
- <sup>7</sup> AABOUD 19s based on 36.1 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data. Uses events with one or two hadronically decaying  $\tau$  and multiple jets. A multivariate analysis is performed to distinguish the signal from backgrounds.
- <sup>8</sup> AABOUD 19s based on 36.1 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data. The searches using  $H \rightarrow bb$  and  $H \rightarrow \tau\tau$  are combined with searches in diphoton and multilepton final states. The upper limit on the Yukawa coupling  $|Y_{tH}| < 0.066$  (95% CL) is obtained.
- <sup>9</sup> AABOUD 18x based on 36.1 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data.  $\ell\ell$  (same sign) +  $\geq 4j$  mode and  $\ell\ell\ell + \geq 2j$  mode are targeted and specialized boosted decision trees are used to distinguish signals from backgrounds.
- <sup>10</sup> SIRUNYAN 18Bc based on 35.9 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data. Two channels  $pp \rightarrow tH$  and  $pp \rightarrow t\bar{t}$  in final states with one isolated lepton and  $\geq 3$  jets with  $\geq 2b$  jets are considered assuming a single  $tHu$  FCNC coupling. Reconstructed kinematical variables are fed into a multivariate analysis and no significant deviation is observed from the predicted background.
- <sup>11</sup> AABOUD 17AV based on 36.1 fb<sup>-1</sup> at  $\sqrt{s} = 13$  TeV of  $pp$  data. Search for  $t\bar{t}$  events, where the other top quark decays hadronically or semi-leptonically.
- <sup>12</sup> KHACHATRYAN 17I based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV, using the topologies  $t\bar{t} \rightarrow Hq+Wb$ , where  $q=u, c$ .
- <sup>13</sup> AAD 15C0 based on 20.3 fb<sup>-1</sup> at  $\sqrt{s} = 8$  TeV of  $pp$  data. Searches for  $t\bar{t}$  events, where the other top quark decays semi-leptonically. Exploits high multiplicity of b-jets and uses a likelihood discriminant. Combining with other ATLAS searches for different Higgs decay modes,  $B(t \rightarrow Hc) < 0.46\%$  and  $B(t \rightarrow Hu) < 0.45\%$  are obtained.
- <sup>14</sup> AAD 14AA based on 4.7 fb<sup>-1</sup> at  $\sqrt{s} = 7$  TeV and 20.3 fb<sup>-1</sup> at  $\sqrt{s} = 8$  TeV of  $pp$  data. The upper-bound is for the sum of  $B(t \rightarrow Hc)$  and  $B(t \rightarrow Hu)$ . Search for  $t\bar{t}$  events, where the other top quark decays hadronically or semi-leptonically. The upper bound constrains the  $H$ - $t$ - $c$  Yukawa couplings  $\sqrt{|Y_{tL}^H|^2 + |Y_{tR}^H|^2} < 0.17$  (95% CL).

Two channels  $pp \rightarrow tH$  and  $pp \rightarrow t\bar{t}$  in final states with one isolated lepton and  $\geq 3$  jets with  $\geq 2$   $b$  jets are considered assuming a single  $tHc$  FCNC coupling. Reconstructed kinematical variables are fed into a multivariate analysis and no significant deviation is observed from the predicted background.
- 11 AABOUD 17AV based on  $36.1 \text{ fb}^{-1}$  at  $\sqrt{s} = 13 \text{ TeV}$  of  $pp$  data. Search for  $t\bar{t}$  events, where the other top quark decays hadronically or semi-leptonically. The upper bound on the  $H$ - $t$ - $c$  Yukawa couplings is  $0.090$  (95% CL).
- 12 KHACHATRYAN 17I based on  $19.7 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ , using the topologies  $t\bar{t} \rightarrow Hq + Wb$ , where  $q = u, c$ .
- 13 AAD 15CO based on  $20.3 \text{ fb}^{-1}$  at  $\sqrt{s} = 8 \text{ TeV}$  of  $pp$  data. Searches for  $t\bar{t}$  events, where the other top quark decays semi-leptonically. Exploits high multiplicity of  $b$ -jets and uses a likelihood discriminant. Combining with other ATLAS searches for different Higgs decay modes,  $B(t \rightarrow Hc) < 0.46\%$  and  $B(t \rightarrow Hu) < 0.45\%$  are obtained.
- 14 AAD 14AA based on  $4.7 \text{ fb}^{-1}$  at  $\sqrt{s} = 7 \text{ TeV}$  and  $20.3 \text{ fb}^{-1}$  at  $\sqrt{s} = 8 \text{ TeV}$  of  $pp$  data. The upper-bound is for the sum of  $B(t \rightarrow Hc)$  and  $B(t \rightarrow Hu)$ . Search for  $t\bar{t}$  events, where the other top quark decays hadronically or semi-leptonically. The upper bound constrains the  $H$ - $t$ - $c$  Yukawa couplings  $\sqrt{|Y_{tCL}^H|^2 + |Y_{tCR}^H|^2} < 0.17$  (95% CL).
- 15 Based on  $19.5 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ . Search for final states with 3 or more isolated high  $E_T$  charged leptons ( $\ell = e, \mu$ ) bounds the  $t \rightarrow Hc$  decay in  $t\bar{t}$  events when  $H$  decays contain a pair of leptons. The upper bound constrains the  $H$ - $t$ - $c$  Yukawa couplings  $\sqrt{|Y_{tCL}^H|^2 + |Y_{tCR}^H|^2} < 0.21$  (95% CL).
- 16 KHACHATRYAN 14Q based on  $19.5 \text{ fb}^{-1}$  at  $\sqrt{s} = 8 \text{ TeV}$  of  $pp$  data. Search for final states with  $\geq 3$  isolated charged leptons or with a photon pair accompanied by  $\geq 1$  lepton(s).

- 1 TUMASYAN 22Z analysis includes both the production ( $u \rightarrow e\mu t$ ) and decay ( $t \rightarrow e\mu u$ ) modes of the top quark through CFLV interactions. With no significant excess over the standard model expectation, the limits are set at 95% CL on the  $B(t \rightarrow e\mu u)$  of  $0.13 \times 10^{-6}$ ,  $0.07 \times 10^{-6}$ ,  $0.25 \times 10^{-6}$  for vector-, scalar-, and tensor-like CLFV four-fermion effective interactions, respectively.

### t-quark EW Couplings

$W$  helicity fractions in top decays.  $F_0$  is the fraction of longitudinal and  $F_{\pm}$  the fraction of right-handed  $W$  bosons.  $F_{V+A}$  is the fraction of  $V+A$  current in top decays. The effective Lagrangian (cited by ABAZOV 08AI) has terms  $f_L^V$  and  $f_L^A$  for  $V-A$  and  $V+A$  couplings,  $f_2^V$  and  $f_2^A$  for tensor couplings with  $b_R$  and  $b_L$  respectively.

- 1 AAD 20Y based on about  $20 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$  for each experiment. The first error stands for the sum of the statistical and background uncertainties, and the second error for the remaining systematic uncertainties. The measurements used events with one lepton and different jet multiplicities in the final state. The result is consistent with the NNLO SM prediction of  $0.687 \pm 0.005$  for  $m_t = 172.8 \pm 1.3 \text{ GeV}$ .
- 2 Based on  $8.7 \text{ fb}^{-1}$  of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$  using  $t\bar{t}$  events with  $\ell + \cancel{E}_T + \geq 4$  jets ( $\geq 1 b$ ), and under the constraint  $F_0 + F_{\pm} + F_{\mp} = 1$ . The statistical errors of  $F_0$  and  $F_{\pm}$  are correlated with correlation coefficient  $\rho(F_0, F_{\pm}) = -0.69$ .
- 3 Based on  $5.0 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 7 \text{ TeV}$ . CHATRCHYAN 13BH studied  $tt$  events with large  $\cancel{E}_T$  and  $\ell + \geq 4$  jets using a constrained kinematic fit.
- 4 Based on  $1.04 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 7 \text{ TeV}$ . AAD 12BG studied  $tt$  events with large  $\cancel{E}_T$  and either  $\ell + \geq 4j$  or  $\ell\ell + \geq 2j$ . The uncertainties are not independent,  $\rho(F_0, F_{\pm}) = -0.96$ .
- 5 Based on 2.7 and 5.1  $\text{fb}^{-1}$  of CDF data in  $\ell +$  jets and dilepton channels, and 5.4  $\text{fb}^{-1}$  of D0 data in  $\ell +$  jets and dilepton channels.  $F_0 = 0.682 \pm 0.035 \pm 0.046$  if  $F_{\pm} = 0.0017(1)$ , while  $F_{\pm} = -0.015 \pm 0.018 \pm 0.030$  if  $F_0 = 0.688(4)$ , where the assumed fixed values are the SM prediction for  $m_t = 173.3 \pm 1.1 \text{ GeV}$  and  $m_W = 80.399 \pm 0.023 \text{ GeV}$ .
- 6 Results are based on 5.4  $\text{fb}^{-1}$  of data in  $p\bar{p}$  collisions at 1.96 TeV, including those of ABAZOV 08B. Under the SM constraint of  $f_0 = 0.698$  (for  $m_t = 173.3 \text{ GeV}$ ,  $m_W = 80.399 \text{ GeV}$ ),  $f_{\pm} = 0.010 \pm 0.022 \pm 0.030$  is obtained.
- 7 AFFOLDER 00b studied the angular distribution of leptonic decays of  $W$  bosons in  $t \rightarrow Wb$  events. The ratio  $F_0$  is the fraction of the helicity zero (longitudinal)  $W$  bosons in the decaying top quark rest frame.  $B(t \rightarrow W_{\pm} b)$  is the fraction of positive helicity (right-handed) positive charge  $W$  bosons in the top quark decays. It is obtained by assuming the Standard Model value of  $F_0$ .
- 8 AABOUD 17BB based on  $20.2 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ . Triple-differential decay rate of top quark in the  $t$ -channel single-top production is used to simultaneously determine five generalized  $Wtb$  couplings as well as the top polarization. No assumption is made for the other couplings. See this paper for constraints on other couplings not included here. The paper reported  $f_1$  and we converted it to  $F_0$ .
- 9 KHACHATRYAN 16BU based on  $19.8 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$  using  $t\bar{t}$  events with  $\ell + \cancel{E}_T + \geq 4$  jets ( $\geq 2 b$ ). The errors of  $F_0$  and  $F_{\pm}$  are correlated with a correlation coefficient  $\rho(F_0, F_{\pm}) = -0.87$ . The result is consistent with the NNLO SM prediction of  $0.687 \pm 0.005$  for  $m_t = 172.8 \pm 1.3 \text{ GeV}$ .
- 10 Results are based on 2.7  $\text{fb}^{-1}$  of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$ .  $F_0$  result is obtained by assuming  $F_{\pm} = 0$ , while  $F_{\pm}$  result is obtained for  $F_0 = 0.70$ , the SM value. Model independent fits for the two fractions give  $F_0 = 0.88 \pm 0.11 \pm 0.06$  and  $F_{\pm} = -0.15 \pm 0.07 \pm 0.06$  with correlation coefficient of  $-0.59$ . The results are for  $m_t = 175 \text{ GeV}$ .
- 11 Results are based on 1.9  $\text{fb}^{-1}$  of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$ .  $F_0$  result is obtained assuming  $F_{\pm} = 0$ , while  $F_{\pm}$  result is obtained for  $F_0 = 0.70$ , the SM values. Model independent fits for the two fractions give  $F_0 = 0.66 \pm 0.16 \pm 0.05$  and  $F_{\pm} = -0.03 \pm 0.06 \pm 0.03$ .
- 12 Based on 1  $\text{fb}^{-1}$  at  $\sqrt{s} = 1.96 \text{ TeV}$ .
- 13 Based on 318  $\text{pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ .
- 14 Based on 200  $\text{pb}^{-1}$  of data at  $\sqrt{s} = 1.96 \text{ TeV}$ .  $t \rightarrow Wb \rightarrow \ell\nu b$  ( $\ell = e$  or  $\mu$ ). The errors are stat + syst.
- 15 ABAZOV 05G studied the angular distribution of leptonic decays of  $W$  bosons in  $t\bar{t}$  candidate events with lepton + jets final states, and obtained the fraction of longitudinally polarized  $W$  under the constraint of no right-handed current,  $F_{\pm} = 0$ . Based on 125  $\text{pb}^{-1}$  of data at  $\sqrt{s} = 1.8 \text{ TeV}$ .

<sup>1</sup> AAD 20Y based on about 20 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 8$  TeV for each experiment. The first error stands for the sum of the statistical and background uncertainties, and the second error for the remaining systematic uncertainties. The measurements used events with one lepton and different jet multiplicities in the final state. The result is estimated from the measurements of  $F_0$  and  $F_-$  assuming unitarity. The value is consistent with the NNLO SM prediction of  $0.0017 \pm 0.0001$  for  $m_t = 172.8 \pm 1.3$  GeV.

<sup>2</sup> Based on 8.7 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV using  $t\bar{t}$  events with  $\ell + \cancel{E}_T + \geq 4$  jets ( $\geq 1$  b), and under the constraint  $F_0 + F_+ + F_- = 1$ . The statistical errors of  $F_0$  and  $F_+$  are correlated with correlation coefficient  $\rho(F_0, F_+) = -0.69$ .

<sup>3</sup> Based on 5.0 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 7$  TeV. CHATRCHYAN 13BH studied  $tt$  events with large  $\cancel{E}_T$  and  $\ell + \geq 4$  jets using a constrained kinematic fit.

<sup>4</sup> Based on 1.04 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 7$  TeV. AAD 12BG studied  $tt$  events with large  $\cancel{E}_T$  and either  $\ell + \geq 4$  or  $\ell\ell + \geq 2$ .

<sup>5</sup> Results are based on 5.4 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at 1.96 TeV, including those of ABAZOV 08B. Under the SM constraint of  $f_0 = 0.698$  (for  $m_t = 173.3$  GeV,  $m_W = 80.399$  GeV),  $f_+ = 0.010 \pm 0.022 \pm 0.030$  is obtained.

<sup>6</sup> AFFOLDER 00B studied the angular distribution of leptonic decays of W bosons in  $t \rightarrow Wb$  events. The ratio  $F_0$  is the fraction of the helicity zero (longitudinal) W bosons in the decaying top quark rest frame.  $B(t \rightarrow W_+ b)$  is the fraction of positive helicity (right-handed) positive charge W bosons in the top quark decays. It is obtained by assuming the Standard Model value of  $F_0$ .

<sup>7</sup> AABOUD 17BB based on 20.2 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 8$  TeV. Triple-differential decay rate of top quark in the t-channel single-top production is used to simultaneously determine five generalized  $Wtb$  couplings as well as the top polarization. No assumption is made for the other couplings. The authors reported  $f_1 = 0.30 \pm 0.05$  and  $f_1^+ < 0.120$  which we converted to  $F_+ = f_1 f_1^+$ . See this paper for constraints on other couplings not included here.

<sup>8</sup> KHACHATRYAN 16BU based on 19.8 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 8$  TeV using  $t\bar{t}$  events with  $\ell + \cancel{E}_T + \geq 4$  jets ( $\geq 2$  b). The result is consistent with the NNLO SM prediction of  $0.0017 \pm 0.0001$  for  $m_t = 172.8 \pm 1.3$  GeV.

<sup>9</sup> Based on 2.7 and 5.1 fb<sup>-1</sup> of CDF data in  $\ell +$  jets and dilepton channels, and 5.4 fb<sup>-1</sup> of D0 data in  $\ell +$  jets and dilepton channels.  $F_0 = 0.682 \pm 0.035 \pm 0.046$  if  $F_+ = 0.0017(1)$ , while  $F_+ = -0.015 \pm 0.018 \pm 0.030$  if  $F_0 = 0.688(4)$ , where the assumed fixed values are the SM prediction for  $m_t = 173.3 \pm 1.1$  GeV and  $m_W = 80.399 \pm 0.023$  GeV.

<sup>10</sup> Results are based on 2.7 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV.  $F_0$  result is obtained by assuming  $F_+ = 0$ , while  $F_+$  result is obtained for  $F_0 = 0.70$ , the SM value. Model independent fits for the two fractions give  $F_0 = 0.88 \pm 0.11 \pm 0.06$  and  $F_+ = -0.15 \pm 0.07 \pm 0.06$  with correlation coefficient of  $-0.59$ . The results are for  $m_t = 175$  GeV.

<sup>11</sup> Results are based on 1.9 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV.  $F_0$  result is obtained assuming  $F_+ = 0$ , while  $F_+$  result is obtained for  $F_0 = 0.70$ , the SM values. Model independent fits for the two fractions give  $F_0 = 0.66 \pm 0.16 \pm 0.05$  and  $F_+ = -0.03 \pm 0.06 \pm 0.03$ .

<sup>12</sup> Based on 1 fb<sup>-1</sup> at  $\sqrt{s} = 1.96$  TeV.

<sup>13</sup> Based on 370 pb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV, using the  $\ell +$  jets and dilepton decay channels. The result assumes  $F_0 = 0.70$ , and it gives  $F_+ < 0.23$  at 95% CL.

<sup>14</sup> Based on 318 pb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV.

<sup>15</sup> Based on 200 pb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV.  $t \rightarrow Wb \rightarrow \ell\nu b$  ( $\ell = e$  or  $\mu$ ). The errors are stat + syst.

<sup>16</sup> ABAZOV 05L studied the angular distribution of leptonic decays of W bosons in  $t\bar{t}$  events, where one of the W's from  $t$  or  $\bar{t}$  decays into  $e$  or  $\mu$  and the other decays hadronically. The fraction of the "+" helicity W boson is obtained by assuming  $F_0$

$= 0.7$ , which is the generic prediction for any linear combination of V and A currents. Based on  $230 \pm 15$  pb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV.

<sup>17</sup> ACOSTA 05D measures the  $m_{\ell^+ b}$  distribution in  $t\bar{t}$  production events where one or both W's decay leptonically to  $\ell = e$  or  $\mu$ , and finds a bound on the V+A coupling of the  $t b W$  vertex. By assuming the SM value of the longitudinal W fraction  $F_0 = B(t \rightarrow W_0 b) = 0.70$ , the bound on  $F_+$  is obtained. If the results are combined with those of AFFOLDER 00B, the bounds become  $F_{V+A} < 0.61$  (95% CL) and  $F_+ < 0.18$  (95% CL), respectively. Based on  $109 \pm 7$  pb<sup>-1</sup> of data at  $\sqrt{s} = 1.8$  TeV (run I).

<sup>1</sup> AAD 20Y based on about 20 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 8$  TeV for each experiment. The measurements used events with one lepton and different jet multiplicities in the final state. The measurements of  $F_0$  and  $F_-$  are used to set the limit. The limit is obtained by assuming the other couplings to have their SM values.

<sup>2</sup> AABOUD 17BB based on 20.2 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 8$  TeV. Triple-differential decay rate of top quark is used to simultaneously determine five generalized  $Wtb$  couplings as well as the top polarization. No assumption is made for the other couplings. See this paper for constraints on other couplings not included here.

<sup>3</sup> KHACHATRYAN 17G based on 5.0 and 19.7 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 7$  and 8 TeV, respectively. A Bayesian neural network technique is used to discriminate between signal and backgrounds. This is a 95% CL exclusion limit obtained by a three-dimensional fit with simultaneous variation of  $(f_1^L, f_1^R, f_1^R)$ .

<sup>4</sup> Based on 1.04 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 7$  TeV. AAD 12BG studied  $tt$  events with large  $\cancel{E}_T$  and either  $\ell + \geq 4$  or  $\ell\ell + \geq 2$ .

<sup>5</sup> Based on 5.4 fb<sup>-1</sup> of data. For each value of the form factor quoted the other two are assumed to have their SM value. Their Fig. 4 shows two-dimensional posterior probability density distributions for the anomalous couplings.

<sup>6</sup> Based on 5.4 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at 1.96 TeV. Results are obtained by combining the limits from the W helicity measurements and those from the single top quark production.

<sup>7</sup> Based on 1 fb<sup>-1</sup> of data at  $p\bar{p}$  collisions  $\sqrt{s} = 1.96$  TeV. Combined result of the W helicity measurement in  $t\bar{t}$  events (ABAZOV 08B) and the search for anomalous  $tbW$  couplings in the single top production (ABAZOV 08AI). Constraints when  $f_1^L$  and one of the anomalous couplings are simultaneously allowed to vary are given in their Fig. 1 and Table 1.

<sup>8</sup> Result is based on 0.9 fb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV. Single top quark production events are used to measure the Lorentz structure of the  $tbW$  coupling. The upper bounds on the non-standard couplings are obtained when only one non-standard coupling is allowed to be present together with the SM one,  $f_1^L = V_{tb}^*$ .

<sup>3</sup> Based on 5.3 fb<sup>-1</sup> of data. The error is statistical and systematic combined. A matrix element method is used.

<sup>4</sup> Based on 4.3 fb<sup>-1</sup> of data. The measurement is based on the angular study of the top quark decay products in the helicity basis. The theory prediction is  $\kappa \approx 0.40$ .

<sup>5</sup> Based on 5.4 fb<sup>-1</sup> of data using a matrix element method. The error is statistical and systematic combined. The no-correlation hypothesis is excluded at the 97.7% CL.

<sup>6</sup> Based on 5.4 fb<sup>-1</sup> of data. The error is statistical and systematic combined. The NLO QCD prediction is  $C = 0.78 \pm 0.03$ . The neutrino weighting method is used for reconstruction of kinematics.

## Spin Correlation in $t\bar{t}$ Production in $p\bar{p}$ Collisions

Spin correlation,  $f_{SM}$ , measures the strength of the correlation between the spins of the pair produced  $t\bar{t}$ .  $f_{SM} = 1$  for the SM, while  $f_{SM} = 0$  for no spin correlation.

<sup>1</sup> SIRUNYAN 19BX based on 35.9 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 13$  TeV. A set of parton-level normalized differential cross sections sensitive to coefficients of the spin-dependent  $t\bar{t}$  production density matrix is measured. The distributions and coefficients are compared with the NLO MC simulations and with the NLO QCD calculation including EW corrections. Three errors are from statistics, experimental systematics, and theory.

<sup>2</sup> KHACHATRYAN 16AI based on 19.5 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 8$  TeV, using lepton angular distributions as a function of the  $t\bar{t}$ -system kinematical variables.

<sup>3</sup> KHACHATRYAN 16X based on 19.7 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 8$  TeV. Uses a template fit method. Spin correlation strength in the helicity basis is given by  $A_{hel} = 0.23 \pm 0.03^{+0.05}_{-0.04}$ .

<sup>4</sup> AAD 15J based on 20.3 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 8$  TeV. Uses a fit including a linear superposition of  $\Delta\phi$  distribution from the SM NLO simulation with coefficient  $f_{SM}$  and from  $t\bar{t}$  simulation without spin correlation with coefficient  $(1 - f_{SM})$ .

<sup>5</sup> Based on 4.6 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 7$  TeV. The results are for  $m_t = 172.5$  GeV.

<sup>6</sup> The S-ratio is defined as the SM spin correlation in the like-helicity gluon-gluon collisions normalized to the no spin correlation case; see eq. (6) for the LO expression.

<sup>7</sup> The polar angle correlation along the helicity axis.

<sup>8</sup> The polar angle correlation along the direction which maximizes the correlation.

## t-quark FCNC Couplings $\kappa^{utg}/\Lambda$ and $\kappa^{ctg}/\Lambda$

<sup>1</sup> AAD 22T based on 139 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 13$  TeV. The results are obtained from the 95% CL upper limits on the single top-quark productions  $\sigma(qg \rightarrow t) \cdot B(t \rightarrow bW) \cdot B(W \rightarrow \ell\nu) < 3.0$  pb and  $\sigma(cg \rightarrow t) \cdot B(t \rightarrow bW) \cdot B(W \rightarrow \ell\nu) < 4.7$  pb. These are interpreted as limits on couplings in an EFT  $|C_{uG}^{ct}|/\Lambda^2 < 0.057$  TeV<sup>-2</sup> and  $|C_{uG}^{ct}|/\Lambda^2 < 0.14$  TeV<sup>-2</sup>. The results also correspond to  $B(t \rightarrow ug) < 6.1 \times 10^{-5}$  and  $B(t \rightarrow cg) < 3.7 \times 10^{-4}$ .

<sup>2</sup> KHACHATRYAN 17G based on 5.0 and 19.7 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 7$  and 8 TeV, respectively.  $t$ -channel single top production is used. The result corresponds to  $B(t \rightarrow ug) < 2.0 \times 10^{-5}$  or  $B(t \rightarrow cg) < 4.1 \times 10^{-4}$ .

<sup>3</sup> AAD 16AS based on 20.3 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 8$  TeV. The results are obtained from the 95% CL upper limit on the single top-quark production  $\sigma(qg \rightarrow t) \cdot B(t \rightarrow bW) \cdot B(W \rightarrow \ell\nu) < 2.9$  pb,  $B(t \rightarrow ug) < 4.0 \times 10^{-5}$  and  $B(t \rightarrow cg) < 20 \times 10^{-5}$ .

<sup>4</sup> Based on 2.05 fb<sup>-1</sup> of  $p\bar{p}$  data at  $\sqrt{s} = 7$  TeV. The results are obtained from the 95% CL upper limit on the single top-quark production  $\sigma(qg \rightarrow t) \cdot B(t \rightarrow bW) < 3.9$  pb, for  $q=u$  or  $q=c$ ,  $B(t \rightarrow ug) < 5.7 \times 10^{-5}$  and  $B(t \rightarrow ug) < 2.7 \times 10^{-4}$ .

<sup>5</sup> Based on 2.3 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. Upper limit of single top quark production cross section 0.20 pb and 0.27 pb via FCNC  $t$ - $u$ - $g$  and  $t$ - $c$ - $g$  couplings, respectively, lead to the bounds without assuming the absence of the other coupling.  $B(t \rightarrow u + g) < 2.0 \times 10^{-4}$  and  $B(t \rightarrow c + g) < 3.9 \times 10^{-3}$  follow.

<sup>6</sup> Based on 2.2 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. Upper limit of single top quark production cross section  $\sigma(u(c) + g \rightarrow t) < 1.8$  pb (95% CL) via FCNC  $t$ - $u$ - $g$  and  $t$ - $c$ - $g$  couplings lead to the bounds.  $B(t \rightarrow u + g) < 3.9 \times 10^{-4}$  and  $B(t \rightarrow c + g) < 5.7 \times 10^{-3}$  follow.

<sup>7</sup> Result is based on 230 pb<sup>-1</sup> of data at  $\sqrt{s} = 1.96$  TeV. Absence of single top quark production events via FCNC  $t$ - $u$ - $g$  and  $t$ - $c$ - $g$  couplings lead to the upper bounds on the dimensioned couplings,  $\kappa^{utg}/\Lambda$  and  $\kappa^{ctg}/\Lambda$ , respectively.

## t-Quark Yukawa Coupling from $t\bar{t}$ Kinematic Distributions in $p\bar{p}$ Collisions

The ratio of  $t$ -quark Yukawa coupling to its standard model predicted value.

VALUE	DOCUMENT ID	TECN	COMMENT
•••	We do not use the following data for averages, fits, limits, etc. •••		
$1.16^{+0.24}_{-0.35}$	<sup>1</sup> SIRUNYAN 20BH CMS	$\ell\ell (\ell=e,\mu) + \text{jets} (\geq 2b_j) + \cancel{E}_T$	
$1.07^{+0.34}_{-0.43}$	<sup>2</sup> SIRUNYAN 19BY CMS	$\ell$ -jets, $t\bar{t}$ threshold	

<sup>1</sup> SIRUNYAN 20BH based on 137 fb<sup>-1</sup> of data at  $\sqrt{s} = 13$  TeV. Kinematic distributions of  $t\bar{t}$  are compared with predictions by different values of the top Yukawa coupling in loop corrections, where the scaling of the SM coupling is used within the  $\kappa$ -framework. The  $\cancel{E}_T$  cut applies only to the same-flavor dilepton, not  $e\mu$  events.

<sup>2</sup> SIRUNYAN 19BY based on 35.8 fb<sup>-1</sup> of data at  $\sqrt{s} = 13$  TeV. Experimental sensitivity is enhanced in the low  $M_{t\bar{t}}$  region. The distributions of  $M_{t\bar{t}}$ ,  $|y_t - y_{\bar{t}}|$ , and the number of reconstructed jets are compared with predictions by different Yukawa couplings which include NNLO QCD and NLO EW corrections.

<sup>1</sup> AAD 20Z based on 139 fb<sup>-1</sup> of  $p\bar{p}$  data at 13 TeV. Assuming a  $CP$ -even coupling the  $t\bar{t}H$  process is observed with a significance of 5.2  $\sigma$ , and the measured  $\sigma_{t\bar{t}H} \cdot B_{\gamma\gamma} = 1.64^{+0.38+0.17}_{-0.36-0.14}$  fb. A  $CP$ -mixing angle  $|\alpha| > 43^\circ$  is excluded at 95% CL.

<sup>2</sup> SIRUNYAN 20AS based on 137 fb<sup>-1</sup> of  $p\bar{p}$  data at 13 TeV. The  $t\bar{t}H$  process is observed with a significance of 6.6  $\sigma$ , and the measured  $\sigma_{t\bar{t}H} \cdot B_{\gamma\gamma} = 1.56^{+0.33+0.09}_{-0.30-0.08}$  fb. The fractional contribution of the  $CP$ -odd component is measured to be  $f_{CP}^{t\bar{t}H} = 0.00 \pm 0.33$ .

<sup>3</sup> SIRUNYAN 19R based on 35.9 fb<sup>-1</sup> of  $p\bar{p}$  data at 13 TeV. Multivariate techniques are employed to separate the signal from the dominant  $t\bar{t}$ -jets background. The result is for  $m_H = 125$  GeV. The measured ratio corresponds to a signal significance of 1.6 $\sigma$  above the background-only hypothesis.

<sup>4</sup> SIRUNYAN 18BD based on 35.9 fb<sup>-1</sup> of  $p\bar{p}$  data at 13 TeV. A combined fit of signal and background templates to data is performed in six event categories separated by jet and  $b$ -jet multiplicities. An upper limit of 3.8 is obtained for the cross section ratio.

<sup>5</sup> SIRUNYAN 18L based on up to 5.1, 19.7, and 35.9 fb<sup>-1</sup> of  $p\bar{p}$  data at 7, 8, and 13 TeV, respectively. An excess of events is observed, with a significance of 5.2 standard deviations, over the expectation from the background-only hypothesis. The result is for the Higgs boson mass of 125.09 GeV.

<sup>6</sup> Based on 4.5 fb<sup>-1</sup> of data at 7 TeV and 20.3 fb<sup>-1</sup> at 8 TeV. The result is for  $m_H = 125.4$  GeV. The measurement constrains the top quark Yukawa coupling strength parameter  $\kappa_t = Y_t/Y_t^{SM}$  to be  $-1.3 < \kappa_t < 8.0$  (95% CL).

<sup>7</sup> Based on 5.1 fb<sup>-1</sup> of  $p\bar{p}$  data at 7 TeV and 19.7 fb<sup>-1</sup> at 8 TeV. The results are obtained by assuming the SM decay branching fractions for the Higgs boson of mass 125.6 GeV. The signal strength for individual Higgs decay channels are given in Fig. 13, and the preferred region in the  $(\kappa_V, \kappa_f)$  space is given in Fig. 14.

## Single t-Quark Production Cross Section in $p\bar{p}$ Collisions at $\sqrt{s} = 1.8$ TeV

Direct probe of the  $tbW$  coupling and possible new physics at  $\sqrt{s} = 1.8$  TeV.

1 AALTONEN 16 based on  $9.5 \text{ fb}^{-1}$  of data. This includes, as a part, the result of AALTONEN 14k. Combination of this result with that of AALTONEN 14o gives a s + t cross section of  $3.02^{+0.49}_{-0.48} \text{ pb}$  and  $|V_{tb}| > 0.84$  (95% CL).

2 AALTONEN 15H based on  $9.7 \text{ fb}^{-1}$  of data per experiment. The result is for  $m_t = 172.5 \text{ GeV}$ , and is a combination of the CDF measurements (AALTONEN 16) and the D0 measurements (ABAZOV 13o) on the t-channel single t-quark production cross section. The result is consistent with the NLO+NNLL SM prediction and gives  $|V_{tb}| = 1.02^{+0.06}_{-0.05}$  and  $|V_{tb}| > 0.92$  (95% CL).

3 AALTONEN 15H is a combined measurement of s-channel single top cross section by CDF + D0. AALTONEN 14M is not included.

4 Based on  $9.45 \text{ fb}^{-1}$  of data, using neural networks to separate signal from backgrounds. The result is for  $m_t = 172.5 \text{ GeV}$ . Combination of this result with the CDF measurement in the 1 lepton channel AALTONEN 14L gives  $1.36^{+0.37}_{-0.32} \text{ pb}$ , consistent with the SM prediction, and is 4.2 sigma away from the background only hypothesis.

5 Based on  $9.4 \text{ fb}^{-1}$  of data, using neural networks to separate signal from backgrounds. The result is for  $m_t = 172.5 \text{ GeV}$ . The result is 3.8 sigma away from the background only hypothesis.

6 Based on  $9.7 \text{ fb}^{-1}$  of data per experiment. The result is for  $m_t = 172.5 \text{ GeV}$ , and is a combination of the CDF measurements AALTONEN 14L, AALTONEN 14K and the D0 measurement ABAZOV 13o on the s-channel single t-quark production cross section. The result is consistent with the SM prediction of  $1.05 \pm 0.06 \text{ pb}$  and the significance of the observation is of 6.3 standard deviations.

7 Based on  $7.5 \text{ fb}^{-1}$  of data. Neural network is used to discriminate signals (s-, t- and  $Wt$ -channel single top production) from backgrounds. The result is consistent with the SM prediction, and gives  $|V_{tb}| = 0.95 \pm 0.09(\text{stat} + \text{syst}) \pm 0.05(\text{theory})$  and  $|V_{tb}| > 0.78$  (95% CL). The result is for  $m_t = 172.5 \text{ GeV}$ .

8 Based on  $9.7 \text{ fb}^{-1}$  of data. Events with  $\ell + \cancel{E}_T + 2$  or 3 jets (1 or 2 b-tag) are analysed, assuming  $m_t = 172.5 \text{ GeV}$ . The combined s- + t-channel cross section gives  $|V_{tb}| = 1.12^{+0.09}_{-0.08}$ , or  $|V_{tb}| > 0.92$  at 95% CL for  $r_1^t = 1$  and a flat prior within  $0 \leq |V_{tb}|^2 \leq 1$ .

9 Based on  $5.4 \text{ fb}^{-1}$  of data. The result is statistical + systematic combined. The results are for  $m_t = 172.5 \text{ GeV}$ . Results for other  $m_t$  values are given in Table 2 of ABAZOV 11AA.

10 Based on  $5.4 \text{ fb}^{-1}$  of data and for  $m_t = 172.5 \text{ GeV}$ . The error is statistical + systematic combined. Results for other  $m_t$  values are given in Table III of ABAZOV 11AD. The result is obtained by assuming the SM ratio between  $tb$  (s-channel) and  $tqb$  (t-channel) productions, and gives  $|V_{tb}| = 1.02^{+0.10}_{-0.11}$ , or  $|V_{tb}| > 0.79$  at 95% CL for a flat prior within  $0 < |V_{tb}|^2 < 1$ .

11 Based on  $3.2 \text{ fb}^{-1}$  of data. For combined s- + t-channel result see AALTONEN 09AT.

12 Result is based on  $2.1 \text{ fb}^{-1}$  of data. Events with large missing  $E_T$  and jets with at least one b-jet without identified electron or muon are selected. Result is obtained when observed  $2.1 \sigma$  excess over the background originates from the signal for  $m_t = 175 \text{ GeV}$ , giving  $|V_{tb}| = 1.24^{+0.34}_{-0.29} \pm 0.07(\text{theory})$ .

13 Result is based on  $2.3 \text{ fb}^{-1}$  of data. Events with isolated  $\ell + \cancel{E}_T + 2, 3, 4$  jets with one or two b-tags are selected. The analysis assumes  $m_t = 170 \text{ GeV}$ .

14 Result is based on  $4.8 \text{ fb}^{-1}$  of data. Events with an isolated reconstructed tau lepton, missing  $E_T + 2, 3$  jets with one or two b-tags are selected. When combined with ABAZOV 09Z result for e +  $\mu$  channels, the s- and t-channels combined cross section is  $3.84^{+0.89}_{-0.83} \text{ pb}$ .

15 Based on  $3.2 \text{ fb}^{-1}$  of data. Events with isolated  $\ell + \cancel{E}_T$  + jets with at least one b-tag are analyzed and s- and t-channel single top events are selected by using the likelihood function, matrix element, neural-network, boosted decision tree, likelihood function optimized for s-channel process, and neural-networked based analysis of events with  $\cancel{E}_T$  that has sensitivity for  $W \rightarrow \tau\nu$  decays. The result is for  $m_t = 175 \text{ GeV}$ , and the mean value decreases by  $0.02 \text{ pb/GeV}$  for smaller  $m_t$ . The signal has 5.0 sigma significance. The result gives  $|V_{tb}| = 0.91 \pm 0.11(\text{stat} + \text{syst}) \pm 0.07(\text{theory})$ , or  $|V_{tb}| > 0.71$  at 95% CL.

16 Based on  $2.3 \text{ fb}^{-1}$  of data. Events with isolated  $\ell + \cancel{E}_T + \geq 2$  jets with 1 or 2 b-tags are analyzed and s- and t-channel single top events are selected by using boosted decision tree, Bayesian neural networks and the matrix element method. The signal has 5.0 sigma significance. The result gives  $|V_{tb}| = 1.07 \pm 0.12$ , or  $|V_{tb}| > 0.78$  at 95% CL. The analysis assumes  $m_t = 170 \text{ GeV}$ .

17 Result is based on  $2.2 \text{ fb}^{-1}$  of data. Events with isolated  $\ell + \cancel{E}_T + 2, 3$  jets with at least one b-tag are selected, and s- and t-channel single top events are selected by using likelihood, matrix element, and neural network discriminants. The result can be interpreted as  $|V_{tb}| = 0.88^{+0.13}_{-0.12}(\text{stat} + \text{syst}) \pm 0.07(\text{theory})$ , and  $|V_{tb}| > 0.66$  (95% CL) under the  $|V_{tb}| < 1$  constraint.

18 Result is based on  $0.9 \text{ fb}^{-1}$  of data. Events with isolated  $\ell + \cancel{E}_T + 2, 3, 4$  jets with one or two b-vertex-tag are selected, and contributions from  $W$  + jets,  $t\bar{t}$ , s- and t-channel single top events are identified by using boosted decision trees, Bayesian neural networks, and matrix element analysis. The result can be interpreted as the measurement of the CKM matrix element  $|V_{tb}| = 1.31^{+0.25}_{-0.21}$ , or  $|V_{tb}| > 0.68$  (95% CL) under the  $|V_{tb}| < 1$  constraint.

19 Result is based on  $0.9 \text{ fb}^{-1}$  of data. This result constrains  $V_{tb}$  to  $0.68 < |V_{tb}| \leq 1$  at 95% CL.

20 ABAZOV 05P bounds single top-quark production from either the s-channel  $W$ -exchange process,  $q'\bar{q} \rightarrow t\bar{b}$ , or the t-channel  $W$ -exchange process,  $q'g \rightarrow qt\bar{b}$ , based on  $\sim 230 \text{ pb}^{-1}$  of data.

21 ACOSTA 05N bounds single top-quark production from the t-channel  $W$ -exchange process ( $q'g \rightarrow qt\bar{b}$ ), the s-channel  $W$ -exchange process ( $q'\bar{q} \rightarrow t\bar{b}$ ), and from the combined cross section of t- and s-channel. Based on  $\sim 162 \text{ pb}^{-1}$  of data.

**t-channel Single t Production Cross Section in pp Collisions at  $\sqrt{s} = 7$  TeV**Direct probe of the  $tbW$  coupling and possible new physics at  $\sqrt{s} = 7$  TeV.

VALUE (pb)	DOCUMENT ID	TECN	COMMENT
$67.5 \pm 5.7$	1 AABOUD	19R LHC	combination of ATLAS+CMS
$68 \pm 2 \pm 8$	2 AAD	14BI ATLS	$\ell + \cancel{E}_T + 2j$ or $3j$
$83 \pm 4^{+20}_{-19}$	3 AAD	12CH ATLS	t-channel $\ell + \cancel{E}_T + (2,3)j$ (1b)
$67.2 \pm 6.1$	4 CHATRCHYAN12BQ CMS		t-channel $\ell + \cancel{E}_T + \geq 2j$ (1b)
$83.6 \pm 29.8 \pm 3.3$	5 CHATRCHYAN11R CMS		t-channel

1 AABOUD 19R based on  $1.17$  to  $5.1 \text{ fb}^{-1}$  of data from ATLAS and CMS at  $7 \text{ TeV}$ .

2 Based on  $4.59 \text{ fb}^{-1}$  of data, using neural networks for signal and background separation.  $\sigma(tq) = 46 \pm 1 \pm 6 \text{ pb}$  and  $\sigma(\bar{t}q) = 23 \pm 1 \pm 3 \text{ pb}$  are separately measured, as well as their ratio  $R = \sigma(tq)/\sigma(\bar{t}q) = 2.04 \pm 0.13 \pm 0.12$ . The results are for  $m_t = 172.5 \text{ GeV}$ , and those for other  $m_t$  values are given by eq.(4) and Table IV. The measurements give  $|V_{tb}| = 1.02 \pm 0.07$  or  $|V_{tb}| > 0.88$  (95% CL).

3 Based on  $1.04 \text{ fb}^{-1}$  of data. The result gives  $|V_{tb}| = 1.13^{+0.14}_{-0.13}$  from the ratio  $\sigma(\text{exp})/\sigma(\text{th})$ , where  $\sigma(\text{th})$  is the SM prediction for  $|V_{tb}| = 1$ . The 95% CL lower bound of  $|V_{tb}| > 0.75$  is found if  $|V_{tb}| < 1$  is assumed.  $\sigma(t) = 59^{+18}_{-16} \text{ pb}$  and  $\sigma(\bar{t}) = 33^{+13}_{-12} \text{ pb}$  are found for the separate single t and  $\bar{t}$  production cross sections, respectively. The results assume  $m_t = 172.5 \text{ GeV}$  for the acceptance.

4 Based on  $1.17 \text{ fb}^{-1}$  of data for  $\ell = \mu, 1.56 \text{ fb}^{-1}$  of data for  $\ell = e$  at  $7 \text{ TeV}$  collected during 2011. The result gives  $|V_{tb}| = 1.020 \pm 0.046(\text{meas}) \pm 0.017(\text{th})$ . The 95% CL lower bound of  $|V_{tb}| > 0.92$  is found if  $|V_{tb}| < 1$  is assumed. The results assume  $m_t = 172.5 \text{ GeV}$  for the acceptance.

5 Based on  $36 \text{ pb}^{-1}$  of data. The first error is statistical + systematic combined, the second is luminosity. The result gives  $|V_{tb}| = 1.114 \pm 0.22(\text{exp}) \pm 0.02(\text{th})$  from the ratio  $\sigma(\text{exp})/\sigma(\text{th})$ , where  $\sigma(\text{th})$  is the SM prediction for  $|V_{tb}| = 1$ . The 95% CL lower bound of  $|V_{tb}| > 0.62$  (0.68) is found from the 2D (BDT) analysis under the constraint  $0 < |V_{tb}|^2 < 1$ .

- <sup>1</sup>AAD 23BN measured fiducial cross section for  $pp \rightarrow t\gamma \rightarrow t\gamma$  at 13 TeV with 139 fb<sup>-1</sup> of data. The measured cross section is 688 ± 23<sup>+75</sup><sub>-71</sub> fb, to be compared with the NLO SM prediction of 515 ± 36 fb.

Single  $t$ -Quark Production Cross Section in  $e\bar{p}$  Collisions

VALUE (pb)	CL%	DOCUMENT ID	TECN	COMMENT
<0.25	95	1 AARON	09A H1	$e^\pm p \rightarrow e^\pm tX$
<0.55	95	2 AKTAS	04 H1	$e^\pm p \rightarrow e^\pm tX$
<0.225	95	3 CHEKANOV	03 ZEUS	$e^\pm p \rightarrow e^\pm tX$

1 AARON 09A looked for single top production via FCNC in  $e^\pm p$  collisions at HERA with  $474 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 301\text{--}319 \text{ GeV}$ . The result supersedes that of AKTAS 04.

2 AKTAS 04 looked for single top production via FCNC in  $e^\pm$  collisions at HERA with  $118.3 \text{ pb}^{-1}$ , and found 5 events in the  $e$  or  $\mu$  channels while  $1.31 \pm 0.22$  events are expected from the Standard Model background. No excess was found for the hadronic channel. The observed cross section of  $\sigma(ep \rightarrow etX) = 0.29^{+0.15}_{-0.14} \text{ pb}$  at  $\sqrt{s} = 319 \text{ GeV}$  gives the quoted upper bound if the observed events are due to statistical fluctuation.

3 CHEKANOV 03 looked in  $130.1 \text{ pb}^{-1}$  of data at  $\sqrt{s} = 301$  and  $318 \text{ GeV}$ . The limit is for  $\sqrt{s} = 318 \text{ GeV}$  and assumes  $m_t = 175 \text{ GeV}$ .

 $t\bar{t}$  Production Cross Section in  $p\bar{p}$  Collisions at  $\sqrt{s} = 1.8 \text{ TeV}$ 

Only the final combined  $t\bar{t}$  production cross sections obtained from Tevatron Run I by the CDF and D0 experiments are quoted below.

VALUE (pb)	DOCUMENT ID	TECN	COMMENT
$5.69 \pm 1.21 \pm 1.04$	1 ABAZOV	03A D0	Combined Run I data
$6.5^{+1.7}_{-1.4}$	2 AFFOLDER	01A CDF	Combined Run I data

1 Combined result from  $110 \text{ pb}^{-1}$  of Tevatron Run I data. Assume  $m_t = 172.1 \text{ GeV}$ .

2 Combined result from  $105 \text{ pb}^{-1}$  of Tevatron Run I data. Assume  $m_t = 175 \text{ GeV}$ .

 $t\bar{t}$  Production Cross Section in  $p\bar{p}$  Collisions at  $\sqrt{s} = 1.96 \text{ TeV}$ 

Unless otherwise noted the first quoted error is from statistics, the second from systematic uncertainties, and the third from luminosity. If only two errors are quoted the luminosity is included in the systematic uncertainties.

1 ABAZOV 16F based on  $9.7 \text{ fb}^{-1}$  of data. The result is for  $m_t = 172.5 \text{ GeV}$ , and the  $m_t$  dependence is shown in Table V and Fig. 9. The result agrees with the NNLO+NNLL SM prediction of  $7.35^{+0.23}_{-0.27} \text{ pb}$ .

2 Based on  $9 \text{ fb}^{-1}$  of data. The measurement is in the channel  $t\bar{t} \rightarrow (b\ell\nu)(b\tau\nu)$ , where  $\tau$  decays into hadrons ( $\tau_h$ ), and  $\ell$  ( $e$  or  $\mu$ ) include  $\ell$  from  $\tau$  decays ( $\tau_\ell$ ). The result is for  $m_t = 173 \text{ GeV}$ .

3 Based on  $8.8 \text{ fb}^{-1}$  of data. Combination of CDF and D0 measurements given, respectively, by  $\sigma(t\bar{t}; \text{CDF}) = 7.63 \pm 0.31 \pm 0.36 \pm 0.16 \text{ pb}$ ,  $\sigma(t\bar{t}; \text{D0}) = 7.56 \pm 0.20 \pm 0.32 \pm 0.46 \text{ pb}$ . All the results are for  $m_t = 172.5 \text{ GeV}$ . The  $m_t$  dependence of the mean value is parametrized in eq. (1) and shown in Fig. 2.

4 Based on  $9.7 \text{ fb}^{-1}$  of data. Differential cross sections with respect to  $m_{t\bar{t}}$ ,  $|y(\text{top})|$ ,  $E_T(\text{top})$  are shown in Figs. 9, 10, 11, respectively, and are compared to the predictions of MC models.

5 Based on  $8.8 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$ .

6 Based on  $8.7 \text{ fb}^{-1}$  of  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96 \text{ TeV}$ . Measure the  $t\bar{t}$  cross section simultaneously with the fraction of  $t \rightarrow Wb$  decays. The correlation coefficient between those two measurements is  $-0.434$ . Assume unitarity of the  $3 \times 3$  CKM matrix and set  $|V_{tb}| > 0.89$  at 95% CL.

7 Based on  $2.2 \text{ fb}^{-1}$  of data in  $p\bar{p}$  collisions at  $1.96 \text{ TeV}$ . The result assumes the acceptance for  $m_t = 172.5 \text{ GeV}$ .

8 Based on  $1.12 \text{ fb}^{-1}$  and assumes  $m_t = 175 \text{ GeV}$ , where the cross section changes by  $\pm 0.1 \text{ pb}$  for every  $\pm 1 \text{ GeV}$  shift in  $m_t$ . AALTONEN 11D fits simultaneously the  $t\bar{t}$  production cross section and the  $b$ -tagging efficiency and find improvements in both measurements.

9 Based on  $2.7 \text{ fb}^{-1}$ . The first error is from statistics and systematics, the second is from luminosity. The result is for  $m_t = 175 \text{ GeV}$ . AALTONEN 11W fits simultaneously a jet flavor discriminator between  $b$ -,  $c$ -, and light-quarks, and find significant reduction in the systematic error.

10 Based on  $2.2 \text{ fb}^{-1}$ . The result is for  $m_t = 172.5 \text{ GeV}$ . AALTONEN 11Y selects multi-jet events with large  $\cancel{E}_T$ , and vetoes identified electrons and muons.

11 Based on  $5.3 \text{ fb}^{-1}$ . The error is statistical + systematic + luminosity combined. The result is for  $m_t = 172.5 \text{ GeV}$ . The results for other  $m_t$  values are given in Table XII and eq.(10) of ABAZOV 11E.

12 Combination of a dilepton measurement presented in ABAZOV 11Z (based on  $5.4 \text{ fb}^{-1}$ ), which yields  $7.36^{+0.90}_{-0.79}$  (stat+syst) pb, and the lepton + jets measurement of ABAZOV 11E. The result is for  $m_t = 172.5 \text{ GeV}$ . The results for other  $m_t$  values is given by eq.(5) of ABAZOV 11A.

13 Based on  $2.8 \text{ fb}^{-1}$ . The result is for  $m_t = 175 \text{ GeV}$ .

14 Based on  $2.9 \text{ fb}^{-1}$ . Result is obtained from the fraction of signal events in the top quark mass measurement in the all hadronic decay channel.

15 Based on  $1.7 \text{ fb}^{-1}$ . The result is for  $m_t = 175 \text{ GeV}$ . AALTONEN 10V uses soft electrons from  $b$ -hadron decays to suppress  $W$ +jets background events.

16 Based on  $4.6 \text{ fb}^{-1}$ . The result is for  $m_t = 172.5 \text{ GeV}$ . The ratio  $\sigma(t\bar{t} \rightarrow \ell + \text{jets}) / \sigma(Z/\gamma^* \rightarrow \ell\ell)$  is measured and then multiplied by the theoretical  $Z/\gamma^* \rightarrow \ell\ell$  cross section of  $\sigma(Z/\gamma^* \rightarrow \ell\ell) = 251.3 \pm 5.0 \text{ pb}$ , which is free from the luminosity error.

17 Based on  $1 \text{ fb}^{-1}$ . The result is for  $m_t = 175 \text{ GeV}$ .  $7.9 \pm 2.3 \text{ pb}$  is found for  $m_t = 170 \text{ GeV}$ . ABAZOV 10I uses a likelihood discriminant to separate signal from background, where the background model was created from lower jet-multiplicity data.

18 Based on  $1 \text{ fb}^{-1}$ . The result is for  $m_t = 170 \text{ GeV}$ . For  $m_t = 175 \text{ GeV}$ , the result is  $6.3^{+1.2}_{-1.1}(\text{stat}) \pm 0.7(\text{syst}) \pm 0.4(\text{lumi}) \text{ pb}$ . Cross section of  $t\bar{t}$  production has been measured in the  $t\bar{t} \rightarrow \tau_h + \text{jets}$  topology, where  $\tau_h$  denotes hadronically decaying  $\tau$  leptons. The result for the cross section times the branching ratio is  $\sigma(t\bar{t}) \cdot B(t\bar{t} \rightarrow \tau_h + \text{jets}) = 0.60^{+0.23}_{-0.22} \pm 0.15 \pm 0.04 \text{ pb}$  for  $m_t = 170 \text{ GeV}$ .

19 Based on  $1.1 \text{ fb}^{-1}$ . The result is for  $B(W \rightarrow \ell\nu) = 10.8\%$  and  $m_t = 175 \text{ GeV}$ ; the mean value is  $9.8$  for  $m_t = 172.5 \text{ GeV}$  and  $10.1$  for  $m_t = 170 \text{ GeV}$ . AALTONEN 09AD used high  $p_T$   $e$  or  $\mu$  with an isolated track to select  $t\bar{t}$  decays into dileptons including  $\ell = \tau$ . The result is based on the candidate event samples with and without vertex  $b$ -tag.

20 Based on  $2 \text{ fb}^{-1}$ . The result is for  $m_t = 175 \text{ GeV}$ ; the mean value is 3% higher for  $m_t = 170 \text{ GeV}$  and 4% lower for  $m_t = 180 \text{ GeV}$ .

21 Result is based on  $1 \text{ fb}^{-1}$  of data. The result is for  $m_t = 170 \text{ GeV}$ , and the mean value decreases with increasing  $m_t$ ; see their Fig. 2. The result is obtained after combining  $\ell + \text{jets}$ ,  $\ell\ell$ , and  $\ell\tau$  final states, and the ratios of the extracted cross sections are  $R^{\ell\ell/\ell j} = 0.86^{+0.19}_{-0.17}$  and  $R^{\ell\tau/\ell\ell - \ell j} = 0.97^{+0.32}_{-0.29}$ , consistent with the SM expectation of  $R = 1$ . This leads to the upper bound of  $B(t \rightarrow bH^+)$  as a function of  $m_{H^+}$ . Results are shown in their Fig. 1 for  $B(H^+ \rightarrow \tau\nu) = 1$  and  $B(H^+ \rightarrow c\bar{s}) = 1$  cases. Comparison of the  $m_t$  dependence of the extracted cross section and a partial NNLO prediction gives  $m_t = 169.1^{+5.9}_{-5.2} \text{ GeV}$ .

22 Result is based on  $1 \text{ fb}^{-1}$  of data. The result is for  $m_t = 170 \text{ GeV}$ , and the mean value changes by  $-0.07 [m_t(\text{GeV}) - 170] \text{ pb}$  near the reference  $m_t$  value. Comparison of the  $m_t$  dependence of the extracted cross section and a partial NNLO QCD prediction gives  $m_t = 171.5^{+9.9}_{-8.8} \text{ GeV}$ . The  $\ell\tau$  channel alone gives  $7.6^{+4.9}_{-4.3} \pm 3.5 \pm 1.4 \text{ pb}$  and the  $\ell\ell$  channel gives  $7.5^{+1.2}_{-1.1} \pm 0.7 \pm 0.5 \text{ pb}$ .

23 Result is based on  $0.9 \text{ fb}^{-1}$  of data. The first error is from stat + syst, while the latter error is from luminosity. The result is for  $m_t = 175 \text{ GeV}$ , and the mean value changes by  $-0.09 \text{ pb} \cdot [m_t(\text{GeV}) - 175]$ .

24 Result is based on  $0.9 \text{ fb}^{-1}$  of data. The cross section is obtained from the  $\ell + \geq 3$  jet event rates with 1 or 2  $b$ -tag, and also from the kinematical likelihood analysis of the  $\ell + 3, 4$  jet events. The result is for  $m_t = 172.6 \text{ GeV}$ , and its  $m_t$  dependence shown in Fig. 3 leads to the constraint  $m_t = 170 \pm 7 \text{ GeV}$  when compared to the SM prediction.

# Quark Particle Listings

*t*

- <sup>25</sup> Result is based on 360 pb<sup>-1</sup> of data. Events with high  $p_T$  oppositely charged dileptons  $\ell^+ \ell^-$  ( $\ell = e, \mu$ ) are used to obtain cross sections for  $t\bar{t}$ ,  $W^+W^-$ , and  $Z \rightarrow \tau^+\tau^-$  production processes simultaneously. The other cross sections are given in Table IV.
- <sup>26</sup> Based on 1.02 fb<sup>-1</sup> of data. Result is for  $m_t = 175$  GeV. Secondary vertex  $b$ -tag and neural network selections are used to achieve a signal-to-background ratio of about 1/2.
- <sup>27</sup> Based on 425 pb<sup>-1</sup> of data. Result is for  $m_t = 175$  GeV. For  $m_t = 170.9$  GeV,  $7.8 \pm 1.8(\text{stat} + \text{syst})$  pb is obtained.
- <sup>28</sup> Based on 405  $\pm 25$  pb<sup>-1</sup> of data. Result is for  $m_t = 175$  GeV. The last error is for luminosity. Secondary vertex  $b$ -tag and neural network are used to separate the signal events from the background.
- <sup>29</sup> Based on 425 pb<sup>-1</sup> of data. Assumes  $m_t = 175$  GeV.
- <sup>30</sup> Based on  $\sim 425$  pb<sup>-1</sup>. Assuming  $m_t = 175$  GeV. The first error is combined statistical and systematic, the second one is luminosity.
- <sup>31</sup> Based on  $\sim 318$  pb<sup>-1</sup>. Assuming  $m_t = 178$  GeV. The cross section changes by  $\pm 0.08$  pb for each  $\mp$  GeV change in the assumed  $m_t$ . Result is for at least one  $b$ -tag. For at least two  $b$ -tagged jets,  $t\bar{t}$  signal of significance greater than  $5\sigma$  is found, and the cross section is  $10.1^{+1.6+2.0}_{-1.4-1.3}$  pb for  $m_t = 178$  GeV.
- <sup>32</sup> Based on  $\sim 311$  pb<sup>-1</sup>. Assuming  $m_t = 178$  GeV. For  $m_t = 175$  GeV, the result is  $6.0 \pm 1.2^{+0.9}_{-0.7}$ . This is the first CDF measurement without lepton identification, and hence it has sensitivity to the  $W \rightarrow \tau\nu$  mode.
- <sup>33</sup> ABULENCIA, A 06E measures the  $t\bar{t}$  production cross section in the all hadronic decay mode by selecting events with 6 to 8 jets and at least one  $b$ -jet.  $S/B = 1/5$  has been achieved. Based on 311 pb<sup>-1</sup>. Assuming  $m_t = 178$  GeV.
- <sup>34</sup> Based on  $\sim 318$  pb<sup>-1</sup>. Assuming  $m_t = 178$  GeV. Result is for at least one  $b$ -tag. For at least two  $b$ -tagged jets, the cross section is  $11.1^{+2.3+2.5}_{-1.9-1.9}$  pb.
- <sup>35</sup> ABAZOV 05Q measures the top-quark pair production cross section with  $\sim 230$  pb<sup>-1</sup> of data, based on the analysis of  $W$  plus  $n$ -jet events where  $W$  decays into  $e$  or  $\mu$  plus neutrino, and at least one of the jets is  $b$ -jet like. The first error is statistical and systematic, and the second accounts for the luminosity uncertainty. The result assumes  $m_t = 175$  GeV; the mean value changes by  $(175 - m_t(\text{GeV})) \times 0.06$  pb in the mass range 160 to 190 GeV.
- <sup>36</sup> ABAZOV 05R measures the top-quark pair production cross section with 224–243 pb<sup>-1</sup> of data, based on the analysis of events with two charged leptons in the final state. The result assumes  $m_t = 175$  GeV; the mean value changes by  $(175 - m_t(\text{GeV})) \times 0.08$  pb in the mass range 160 to 190 GeV.
- <sup>37</sup> Based on 230 pb<sup>-1</sup>. Assuming  $m_t = 175$  GeV.
- <sup>38</sup> Based on 194 pb<sup>-1</sup>. Assuming  $m_t = 175$  GeV.
- <sup>39</sup> Based on 194  $\pm 11$  pb<sup>-1</sup>. Assuming  $m_t = 175$  GeV.
- <sup>40</sup> Based on 162  $\pm 10$  pb<sup>-1</sup>. Assuming  $m_t = 175$  GeV.
- <sup>41</sup> ACOSTA 05V measures the top-quark pair production cross section with  $\sim 162$  pb<sup>-1</sup> data, based on the analysis of  $W$  plus  $n$ -jet events where  $W$  decays into  $e$  or  $\mu$  plus neutrino, and at least one of the jets is  $b$ -jet like. Assumes  $m_t = 175$  GeV.
- <sup>42</sup> ACOSTA 04I measures the top-quark pair production cross section with 197  $\pm 12$  pb<sup>-1</sup> data, based on the analysis of events with two charged leptons in the final state. Assumes  $m_t = 175$  GeV.

## Ratio of the Production Cross Sections of $t\bar{t}\gamma$ to $t\bar{t}$ at $\sqrt{s} = 1.96$ TeV

VALUE	DOCUMENT ID	TECN	COMMENT
0.024 $\pm$ 0.009	1 AALTONEN 11Z CDF		$E_{T}(\gamma) > 10$ GeV, $ \eta(\gamma)  < 1.0$

- • • We do not use the following data for averages, fits, limits, etc. • • •
- <sup>1</sup> Based on 6.0 fb<sup>-1</sup> of data. The error is statistical and systematic combined. Events with lepton +  $E_T + \geq 3$  jets ( $\geq 1b$ ) with and without central, high  $E_T$  photon are measured. The result is consistent with the SM prediction of  $0.024 \pm 0.005$ . The absolute production cross section is measured to be  $0.18 \pm 0.08$  fb. The statistical significance is 3.0 standard deviations.

## $t\bar{t}$ Production Cross Section in $pp$ Collisions at $\sqrt{s} = 7$ TeV

VALUE (pb)	CL%	DOCUMENT ID	TECN	COMMENT
<1.7	95	1 AAD	12BE ATLS	$\ell^+ \ell^+ + E_T + \geq 2j$ + HT

- <sup>1</sup> Based on 1.04 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. The upper bounds are the same for LL, LR and RR chiral components of the two top quarks.

## $t\bar{t}$ Production Cross Section in $pp$ Collisions at $\sqrt{s} = 5.02$ TeV

Unless otherwise noted the first quoted error is from statistics, the second from systematic uncertainties, and the third from luminosity. If only two errors are quoted the luminosity is included in the systematic uncertainties.

69.5 $\pm$ 6.1 $\pm$ 5.6 $\pm$ 1.6	4 SIRUNYAN 18AQ CMS		$\ell +$ jets, $\ell\ell +$ jets

- <sup>1</sup> AAD 23J based on 257 pb<sup>-1</sup> of data from  $pp$  collisions. The second error is the sum of systematics ( $\pm 2.3$ ), luminosity ( $\pm 1.1$ ) and beam energy ( $\pm 0.2$ ) uncertainties. The result agrees with the NNLO+NNLL SM prediction of  $68.2^{+5.2}_{-5.3}$  pb.
- <sup>2</sup> TUMASYAN 22T based on 302 pb<sup>-1</sup> of data from  $pp$  collisions at  $\sqrt{s} = 5.02$  TeV. The errors are from statistics, systematics and luminosity.
- <sup>3</sup> Combination of the measurement by TUMASYAN 22T and the measurement in the  $\ell +$  jets channel by SIRUNYAN 18AQ. The errors are from statistics and systematics + luminosity. The result is in agreement with the NNLO+NNLL SM prediction  $66.8^{+2.9}_{-3.1}$  pb.
- <sup>4</sup> SIRUNYAN 18AQ based on 27.4 pb<sup>-1</sup> of data from  $pp$  collisions at  $\sqrt{s} = 5.02$  TeV. The result is in agreement with the NNLO SM prediction  $68.9^{+1.9}_{-2.3}(\text{scale}) \pm 2.3(\text{PDF}) \pm 1.4(\alpha_s)$  pb.

## $t\bar{t}$ Production Cross Section in $pp$ Collisions at $\sqrt{s} = 7$ TeV

Unless otherwise noted the first quoted error is from statistics, the second from systematic uncertainties, and the third from luminosity. If only two errors are quoted the luminosity is included in the systematic uncertainties.

- <sup>1</sup> AABOUD 23 based on 4.6 fb<sup>-1</sup> of data. The measurement is performed using a multivariate event classifier based on a binary learning algorithm which differentiates  $t\bar{t}$  events from backgrounds in a three-dimensional space. The result is in agreement with the NNLO+NNLL SM prediction of  $177^{+5}(\text{scale}) \pm 9(\text{PDF} + \alpha_s)$  pb for  $m_t = 172.5$  GeV. Compared to the measured cross section using the dilepton mode of AAD 14AY, significance of discrepancy is between 1.9 $\sigma$  to 2.1 $\sigma$ .
- <sup>2</sup> AAD 23AY based on 5 fb<sup>-1</sup> of data using  $m_t = 172.5$  GeV. The ratio of the combined cross section at  $\sqrt{s} = 8$  TeV to this one at  $\sqrt{s} = 7$  TeV is determined as  $1.363 \pm 0.032$ . The values of the cross sections as well as the ratio are consistent with the NNLO+NNLL SM predictions.
- <sup>3</sup> KHACHATRYAN 17B based on 5.0 fb<sup>-1</sup> of data, using a binned likelihood fit of templates to the data. Also the ratio  $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.43 \pm 0.04 \pm 0.07 \pm 0.05$  is reported. The results are in agreement with NNLO SM predictions.
- <sup>4</sup> KHACHATRYAN 16AW based on 5.0 fb<sup>-1</sup> of data, using a binned likelihood fit to differential distributions of  $b$ -tagged and non- $b$ -tagged jets. The result is in good agreement with NNLO SM predictions.
- <sup>5</sup> Based on 4.6 fb<sup>-1</sup> of data. Uses a template fit to distributions of  $E_T$  and jet multiplicities to measure simultaneously  $t\bar{t}$ ,  $WW$ , and  $Z/\gamma^* \rightarrow \tau\tau$  cross sections, assuming  $m_t = 172.5$  GeV.
- <sup>6</sup> AAD 15CC based on 4.6 fb<sup>-1</sup> of data. The event selection criteria are optimized for the  $\ell\tau_h +$  jets channel. Using only this channel  $183 \pm 9 \pm 23 \pm 3$  pb is derived for the cross section.
- <sup>7</sup> AAIJ 15R, based on 1.0 fb<sup>-1</sup> of data, reports  $0.239 \pm 0.053 \pm 0.033 \pm 0.024$  pb cross section for the forward fiducial region  $p_T(\mu) > 25$  GeV,  $2.0 < \eta(\mu) < 4.5$ ,  $50 \text{ GeV} < p_T(b) < 100$  GeV,  $2.2 < \eta(b) < 4.2$ ,  $\Delta R(\mu, b) > 0.5$ , and  $p_T(\mu+b) > 20$  GeV. The three errors are from statistics, systematics, and theory. The result agrees with the SM NLO prediction.
- <sup>8</sup> AAD 14AY reports  $182.9 \pm 3.1 \pm 4.2 \pm 3.6 \pm 3.3$  pb value based on 4.6 fb<sup>-1</sup> of data. The four errors are from statistics, systematic, luminosity, and the 0.66% beam energy uncertainty. We have combined the systematic uncertainties in quadrature. The result is for  $m_t = 172.5$  GeV; for other  $m_t$ ,  $\sigma(m_t) = \sigma(172.5 \text{ GeV}) \times [1 - 0.0028 \times (m_t - 172.5 \text{ GeV})]$ . The result is consistent with the SM prediction at NNLO.
- <sup>9</sup> Based on 1.67 fb<sup>-1</sup> of data. The result uses the acceptance for  $m_t = 172.5$  GeV.
- <sup>10</sup> Based on 3.54 fb<sup>-1</sup> of data.
- <sup>11</sup> Based on 2.3 fb<sup>-1</sup> of data.
- <sup>12</sup> Based on 3.9 fb<sup>-1</sup> of data.
- <sup>13</sup> Based on 35 pb<sup>-1</sup> of data for an assumed top quark mass of  $m_t = 172.5$  GeV.
- <sup>14</sup> Based on 0.70 fb<sup>-1</sup> of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for  $m_t = 172.5$  GeV.
- <sup>15</sup> Based on 35 pb<sup>-1</sup> of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for  $m_t = 172.5$  GeV and  $173 \pm 17^{+18}_{-16} \pm 6$  pb is found without the  $b$ -tag.
- <sup>16</sup> Based on 2.05 fb<sup>-1</sup> of data. The hadronic  $\tau$  candidates are selected using a BDT technique. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for  $m_t = 172.5$  GeV.
- <sup>17</sup> Based on 2.0 fb<sup>-1</sup> and 2.2 fb<sup>-1</sup> of data for  $\ell = e$  and  $\ell = \mu$ , respectively. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for  $m_t = 172.5$  GeV.
- <sup>18</sup> Based on 2.3 fb<sup>-1</sup> of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the profile likelihood-ratio (PLB) method and an assumed  $m_t$  of 172.5 GeV.
- <sup>19</sup> Based on 2.9 pb<sup>-1</sup> of data. The result for single lepton channels is  $142 \pm 34^{+50}_{-31}$  pb, while for the dilepton channels is  $151 \pm 78 \pm 37$   
 $-62 - 24$  pb.

<sup>20</sup> Result is based on 36 pb<sup>-1</sup> of data. The first uncertainty corresponds to the statistical and systematic uncertainties, and the second corresponds to the luminosity.

<sup>21</sup> Based on 36 pb<sup>-1</sup> of data. The ratio of  $t\bar{t}$  and  $Z/\gamma^*$  cross sections is measured as  $\sigma(pp \rightarrow t\bar{t})/\sigma(pp \rightarrow Z/\gamma^* \rightarrow e^+e^-/\mu^+\mu^-) = 0.175 \pm 0.018(\text{stat}) \pm 0.015(\text{syst})$  for  $60 < m_{\ell\ell} < 120$  GeV, for which they use an NNLO prediction for the denominator cross section of  $972 \pm 42$  pb.

<sup>22</sup> Result is based on 36 pb<sup>-1</sup> of data. The first error is from statistical and systematic uncertainties, and the second from luminosity. This is a combination of a measurement in the dilepton channel (CHATRCHYAN 11F) and the measurement in the  $\ell + \text{jets}$  channel (CHATRCHYAN 11Z) which yields  $150 \pm 9 \pm 17 \pm 6$  pb.

<sup>23</sup> Result is based on  $3.1 \pm 0.3$  pb<sup>-1</sup> of data.

### $t\bar{t}$ Production Cross Section in $pp$ Collisions at $\sqrt{s} = 8$ TeV

Unless otherwise noted the first quoted error is from statistics, the second from systematic uncertainties, and the third from luminosity. If only two errors are quoted the luminosity is included in the systematic uncertainties.

<sup>1</sup> AAD 23AY based on 20 fb<sup>-1</sup> of data using  $m_t = 172.5$  GeV. The ratio of this cross section at  $\sqrt{s} = 8$  TeV to the combined cross section at  $\sqrt{s} = 7$  TeV is determined as  $1.363 \pm 0.032$ . The values of cross sections as well as their ratio are consistent with the NNLO+NNLL SM predictions.

<sup>2</sup> AABOUD 18BH based on 20.2 fb<sup>-1</sup> of data. The result is for  $m_t = 172.5$  GeV. To reduce effects of uncertainties in the jet energy scale and  $b$ -tagging efficiency, they are included as nuisance parameters in the fit of discriminant distributions, after separating selected events into three regions. Furthermore the  $W$ +jets background distribution is modelled using  $Z$ +jets event data.

<sup>3</sup> AABOUD 17Z based on 20.2 fb<sup>-1</sup> of data, using the mode  $t\bar{t} \rightarrow \tau\nu q^i \bar{q} b \bar{b}$  with  $\tau$  decaying hadronically. Single prong and 3 prong decays of  $\tau$  are separately analyzed. The result is consistent with the SM. The third quoted uncertainty is due to luminosity.

<sup>4</sup> KHACHATRYAN 17B based on 19.6 fb<sup>-1</sup> of data, using a binned likelihood fit of templates to the data. Also the ratio  $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.43 \pm 0.04 \pm 0.07 \pm 0.05$  is reported. The results are in agreement with NNLO SM predictions.

<sup>5</sup> AAD 16BK is an update of the value from AAD 14AY using the improved luminosity calibration. The value  $242.9 \pm 1.7 \pm 5.5 \pm 5.1 \pm 4.2$  pb is reported, where we have combined the systematic uncertainties in quadrature. Also the ratio  $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.328 \pm 0.024 \pm 0.015 \pm 0.038 \pm 0.001$  has been updated. The former result is consistent with the SM predictions at NNLO, while the latter result is 2.1  $\sigma$  below the expectation.

<sup>6</sup> KHACHATRYAN 16AW based on 19.7 fb<sup>-1</sup> of data, using a binned likelihood fit to differential distributions of  $b$ -tagged and non- $b$ -tagged jets. The result is in good agreement with NNLO SM predictions.

<sup>7</sup> KHACHATRYAN 16BC based on 18.4 fb<sup>-1</sup> of data. The last uncertainty is due to luminosity. Cuts on kinematical fit probability and  $\Delta R(b, b)$  are imposed. The major QCD background is determined from the data. The result is for  $m_t = 172.5$  GeV and in agreement with the SM prediction. The top quark  $p_T$  spectra, also measured, are significantly softer than theoretical predictions.

<sup>8</sup> AAD 15BP based on 20.3 fb<sup>-1</sup> of data. The result is for  $m_t = 172.5$  GeV and in agreement with the SM prediction  $253 \pm 13 \pm 15$  pb at NNLO+NNLL. Superseded by AABOUD 18BH.

<sup>9</sup> AAIJ 15R, based on 2.0 fb<sup>-1</sup> of data, reports  $0.289 \pm 0.043 \pm 0.040 \pm 0.029$  pb cross section for the forward fiducial region  $p_T(\mu) > 25$  GeV,  $2.0 < \eta(\mu) < 4.5$ ,  $50 \text{ GeV} < p_T(b) < 100$  GeV,  $2.2 < \eta(b) < 4.2$ ,  $\Delta R(\mu, b) > 0.5$ , and  $p_T(\mu+b) > 20$  GeV. The three errors are from statistics, systematics, and theory. The result agrees with the SM NLO prediction.

<sup>10</sup> AAD 14AY reports  $242.4 \pm 1.7 \pm 5.5 \pm 7.5 \pm 4.2$  pb value based on 20.3 fb<sup>-1</sup> of data. The four errors are from statistics, systematic, luminosity, and the 0.66% beam energy uncertainty. We have combined the systematic uncertainties in quadrature. The result is for  $m_t = 172.5$  GeV; for other  $m_t$ ,  $\sigma(m_t) = \sigma(172.5 \text{ GeV}) \times [1 - 0.0028 \times (m_t - 172.5 \text{ GeV})]$ . Also measured is the ratio  $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.326 \pm 0.024 \pm 0.015 \pm 0.049 \pm 0.001$ . The results are consistent with the SM predictions at NNLO.

<sup>11</sup> Based on 5.3 fb<sup>-1</sup> of data. The result is for  $m_t = 172.5$  GeV, and a parametrization is given in eq.(6.1) for the mean value at other  $m_t$  values. The result is in agreement with the SM prediction  $252.9 \pm 6.4 \pm 8.6$  pb at NNLO.

<sup>12</sup> Based on 19.6 fb<sup>-1</sup> of data. The measurement is in the channel  $t\bar{t} \rightarrow (b\ell\nu)(b\tau\nu)$ , where  $\tau$  decays into hadrons ( $\tau_h$ ). The result is for  $m_t = 172.5$  GeV. For  $m_t = 173.3$  GeV, the cross section is lower by 3.1 pb.

### $t\bar{t}$ Production Cross Section in $pp$ Collisions at $\sqrt{s} = 13$ TeV

<sup>1</sup> AAD 23S based on 140 fb<sup>-1</sup> of data at 13 TeV. The second error is the sum of systematic effects ( $\pm 13$ ), luminosity ( $\pm 8$ ), and beam energy ( $\pm 2$ ) uncertainties. This measurement supersedes that of AAD 20Q. The result is in good agreement with the NNLO+NNLL SM prediction.

<sup>2</sup> TUMASYAN 21J result is based on 137 fb<sup>-1</sup> of data. The last uncertainty is due to the beam luminosity. The result is in agreement with the SM prediction of  $832 \pm 40 \pm 46$  pb at NNLO+NNLL. Measurements of differential and double-differential cross sections are also presented.

<sup>3</sup> AAD 20AH based on 139 fb<sup>-1</sup> of data. The last quoted uncertainty is due to the beam luminosity. The result is for  $m_t = 172.5$  GeV and in agreement with the SM prediction of  $832 \pm 20$  (scale)  $\pm 35$  (PDF+ $\alpha_s$ ) pb at NNLO+NNLL.

<sup>4</sup> AAD 20Q reports  $826.4 \pm 3.6 \pm 11.5 \pm 15.7 \pm 1.9$  pb based on 36.1 fb<sup>-1</sup> of data at 13 TeV. The four errors stem from statistics, systematic effects, luminosity, and beam energy, respectively. We have combined luminosity and beam energy uncertainties in quadrature. The result is in agreement with the SM prediction  $832 \pm 20$  (scale)  $\pm 35$  (PDF+ $\alpha_s$ ) pb at NNLO+NNLL for  $m_t = 172.5$  GeV.

<sup>5</sup> SIRUNYAN 20V based on 35.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. The last uncertainty is due to beam luminosity. The  $t\bar{t}$  production cross section is measured in the  $t\bar{t} \rightarrow (\ell\nu\ell)(\tau_h\nu\tau) b\bar{b}$  final state, where  $\tau_h$  refers to the hadronic decays of  $\tau$ . The result is for  $m_t = 172.5$  GeV and in agreement with the SM prediction at NNLO+NNLL.

<sup>6</sup> SIRUNYAN 19AR based on 35.9 fb<sup>-1</sup> of data. Obtained from the visible cross section measured using a template fit to multidifferential distributions categorized according to the  $b$ -tagged jet multiplicity. The result is for  $m_t = 172.5$  GeV and in agreement with the SM prediction at NNLO+NNLL.

<sup>7</sup> SIRUNYAN 19P reports differential  $t\bar{t}$  cross sections measured using dilepton events at 13 TeV with 35.9 fb<sup>-1</sup> and compared to NLO predictions.

<sup>8</sup> KHACHATRYAN 17N based on 2.2 fb<sup>-1</sup> of data. The last quoted uncertainty is due to the beam luminosity. This measurement supersedes that of KHACHATRYAN 16J.

<sup>9</sup> SIRUNYAN 17W based on 2.2 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. Events are categorized according to the jet multiplicity and the number of  $b$ -tagged jets. A likelihood fit is performed to the event distributions to compare to the NNLO+NNLL prediction.

<sup>10</sup> AABOUD 16R reported value  $818 \pm 8 \pm 27 \pm 19 \pm 12$  pb based on 3.2 fb<sup>-1</sup> of data. The four errors are from statistics, systematic, luminosity, and beam energy. We have combined the systematic uncertainties in quadrature. The result is in agreement with the SM prediction  $832 \pm 20$  (scale)  $\pm 35$  (PDF+ $\alpha_s$ ) pb at NNLO+NNLL for  $m_t = 172.5$  GeV.

<sup>11</sup> KHACHATRYAN 16J based on 43 pb<sup>-1</sup> of data. The last uncertainty is due to luminosity. The result is for  $m_t = 172.5$  GeV and in agreement with the SM prediction  $832 \pm 20$  (scale)  $\pm 35$  (PDF+ $\alpha_s$ ) pb at NNLO+NNLL.

### $t\bar{t}$ Production Cross Section in $pp$ Collisions at $\sqrt{s} = 13.6$ TeV

850 $\pm 3 \pm 27$	<sup>1</sup> AAD	24 ATLS	$e^\pm\mu^\mp + 1$ or $2$ $b$ -jets

<sup>1</sup> AAD 24 based on 29 fb<sup>-1</sup> of data. The last error includes the luminosity uncertainty of  $\pm 20$  pb. The result is for  $m_t = 172.5$  GeV and in agreement with the SM prediction of  $924 \pm 32$  (scale+PDF+ $\alpha_s$ ) pb. The ratio of the  $t\bar{t}$  to the  $Z$  production cross section is also measured as  $1.145 \pm 0.003 \pm 0.021 \pm 0.002$ , which is consistent with the SM prediction of  $1.238 \pm 0.063 \pm 0.071$  (scale+PDF+ $\alpha_s$ ). The uncertainties of luminosity and lepton efficiency largely cancel in the ratio.

1 AAD 23bc result is based on  $140 \text{ fb}^{-1}$  of data. The result corresponds to observed significance of  $6.1 \sigma$ .

2 HAYRAPETYAN 23b based on  $138 \text{ fb}^{-1}$  of data. Improvements include the identification of leptons and jets from  $b$  hadrons, and from the revised analysis strategy for the signal-background separation by application of machine learning techniques. The result corresponds to the observed significance of  $5.6 \sigma$  and is in agreement with the NLO (QCD+EW) SM prediction of  $13.4^{+1.0}_{-1.8} \text{ fb}$  including soft-gluon emission corrections at the next-to-leading logarithmic accuracy.

3 TUMASYAN 23AQ based on up to  $138 \text{ fb}^{-1}$  of data. The all-hadronic final state is included for the first time.

4 TUMASYAN 23AQ based on up to  $138 \text{ fb}^{-1}$  of data. It combines earlier CMS results, giving the observed significance of  $4.0\sigma$ .

5 AAD 21bc result is based on  $139 \text{ fb}^{-1}$  of data. The events are categorized according to the number of jets and how likely to contain  $b$ -hadrons and a multivariate analysis is used to discriminate the signal from backgrounds. The result corresponds to observed significance of  $1.9 \sigma$ .

6 AAD 21bc combines the results of the four-top-quark production cross section measured from the  $1\ell/\text{opposite-sign } 2\ell$  channel with that from the same-sign  $2\ell/3\ell$  channel (AAD 20AR). The result corresponds to observed significance of  $4.7 \sigma$  and is consistent within  $2.0 \sigma$  with the NLO (QCD+EW) SM prediction of  $12.0 \pm 2.4 \text{ fb}$ .

7 AAD 20AR based on  $139 \text{ fb}^{-1}$  of data. Jet multiplicity, jet flavor and event kinematics are used in a multivariate analysis to discriminate the signal from backgrounds. The result corresponds to observed significance of  $4.3\sigma$  and is consistent within  $1.7\sigma$  with the NLO (QCD+EW) SM prediction of  $12.0 \pm 2.4 \text{ fb}$ .

8 SIRUNYAN 20c based on  $137 \text{ fb}^{-1}$  of data. Both cut-based and multivariate approaches are taken to discriminate the signal from backgrounds. The result is in agreement with the NLO (QCD+EW) SM prediction of  $12.0^{+2.2}_{-2.5} \text{ fb}$ . The measurement constrains the top quark Yukawa coupling strength parameter to be  $|Y_t/Y_t^{\text{SM}}| < 1.7$  (95% CL). It is also used to constrain an oblique parameter of the Higgs boson. Superseded by HAYRAPETYAN 23b.

9 AABOUD 19AP based on  $36.1 \text{ fb}^{-1}$  of data. The upper limit corresponds to 5.1 times the NLO SM cross section.

10 AABOUD 19AP limit from data combined with AABOUD 18CE. The upper limit corresponds to 5.3 times the NLO SM cross section. Also a limit on the four-top-quark contact interaction of  $|C_{4t}|/\Lambda^2 < 1.9 \text{ TeV}^{-2}$  (95% CL) is obtained in an EFT model.

11 SIRUNYAN 19CN based on  $35.8 \text{ fb}^{-1}$  of data, combined with SIRUNYAN 18BU. The results are also interpreted in the effective field theory framework.

12 SIRUNYAN 19CN based on  $35.8 \text{ fb}^{-1}$  of data. A multivariate analysis using global event and jet properties is performed to discriminate from  $t\bar{t}$  background.

13 AABOUD 18CE based on  $36.1 \text{ fb}^{-1}$  of proton-proton data taken at  $\sqrt{s} = 13 \text{ TeV}$ . Events including a same-sign lepton pair are used. The result is consistent with the NLO SM cross section of  $9.2 \text{ fb}$ .

14 SIRUNYAN 18BU based on  $35.9 \text{ fb}^{-1}$  of proton-proton data taken at  $\sqrt{s} = 13 \text{ TeV}$ . Yields from signal regions and control regions defined based on  $N_{\text{jets}}$ ,  $N_b$  and  $N_j$  are combined in a maximum-likelihood fit. The result is in agreement with the NLO SM prediction  $9.2^{+2.9}_{-2.4} \text{ fb}$ . The measurement constrains the top quark Yukawa coupling strength parameter to be  $|Y_t/Y_t^{\text{SM}}| < 2.1$  (95% CL).

15 SIRUNYAN 17AB based on  $2.6 \text{ fb}^{-1}$  of data. A multivariate analysis is used to discriminate between  $t\bar{t}t\bar{t}$  signal and  $t\bar{t}$  background. A combination with a previous search (CMS, KHACHATRYAN 16bJ) in the same-sign dilepton channel gives an upper limit of  $69 \text{ fb}$  (95% CL), corresponding to  $7.4 \times$  (SM prediction).

16 SIRUNYAN 17s based on  $35.9 \text{ fb}^{-1}$ . The limit is in agreement with the NLO SM prediction  $9.2^{+2.9}_{-2.4} \text{ fb}$ . Superseded by SIRUNYAN 18BU. The signal events are also used to constrain various new physics models.

1 TUMASYAN 23AN result is based on  $138 \text{ fb}^{-1}$  of proton-proton data. The  $t\bar{t}W^+$  and  $t\bar{t}W^-$  production cross sections, respectively, are measured as  $0.553 \pm 0.030 \pm 0.030 \text{ pb}$  and  $0.343 \pm 0.026 \pm 0.025 \text{ pb}$ . The results are within  $2\sigma$  deviations from the NLO FxFx SM predictions,  $0.592^{+0.155}_{-0.097} \text{ pb}$  ( $t\bar{t}W$ ),  $0.384^{+0.053}_{-0.033} \text{ pb}$  ( $t\bar{t}W^+$ ) and  $0.198^{+0.026}_{-0.017} \text{ pb}$  ( $t\bar{t}W^-$ ).

2 AABOUD 19AR result is based on  $35.9 \text{ fb}^{-1}$  of data.  $t\bar{t}W$  and  $t\bar{t}Z$  cross sections are simultaneously measured using a combined fit to the events divided into multiple regions. The result is consistent with the SM prediction at NLO  $0.60^{+0.08}_{-0.07} \text{ pb}$ . It is also used to constrain the Wilson coefficients for dimension-six operators which modify the  $t\bar{t}Z$  vertex.

3 SIRUNYAN 18Bs result is based on  $35.9 \text{ fb}^{-1}$  of proton-proton data taken at  $\sqrt{s} = 13 \text{ TeV}$ . The result is consistent with the SM prediction and is used to constrain the Wilson coefficients for dimension-six operators describing new interactions. The result is consistent with the SM prediction at NLO  $0.628 \pm 0.082 \text{ pb}$ .

2 Based on  $2.05 \text{ fb}^{-1}$  of data. The  $t\bar{t}$  events are selected in the dilepton decay channel with two identified  $b$ -jets.

**Fraction of  $t\bar{t}$  + multi-jet Events in  $pp$  Collisions at  $\sqrt{s} = 7$  TeV**

VALUE	DOCUMENT ID	TECN	COMMENT
0.332±0.090	<sup>1</sup> AAD	15D ATLS	$\ell + \cancel{E}_T + n_j$ ( $n=3$ to 8)
0.436±0.098	<sup>2</sup> CHATRCHYAN14AE	CMS	$t\bar{t}(\ell\ell) + 0$ jet ( $E_T > 30$ GeV)
0.232±0.125	<sup>2</sup> CHATRCHYAN14AE	CMS	$t\bar{t}(\ell\ell) + 1$ jet ( $E_T > 30$ GeV)
	<sup>2</sup> CHATRCHYAN14AE	CMS	$t\bar{t}(\ell\ell) + \geq 2$ jet ( $E_T > 30$ GeV)

- <sup>1</sup> Based on 4.6 fb<sup>-1</sup> of data. Fiducial  $t\bar{t}$  production cross section is presented as a function of the jet multiplicity for up to eight jets with the jet  $p_T$  threshold of 25, 40, 60, and 80 GeV, and as a function of jet  $p_T$  up to the 5th jet. MC models can be discriminated by using data for high jet multiplicity and by  $p_T$  distributions of the leading and 5th jet.
- <sup>2</sup> Based on 5.0 fb<sup>-1</sup> of data. Events with two oppositely charged leptons, large  $\cancel{E}_T$  and jets with at least 1  $b$ -tag are used to measure the fraction of  $t\bar{t}$  plus additional jets. The gap fraction ( $n=0$  jet rate) as a function of the jet  $p_T$  and that of  $H_T$ , the scalar sum of the  $p_T$ 's of additional jets, is shown in Fig. 8.

 **$t\bar{t}$  Charge Asymmetry ( $A_C$ ) in  $pp$  Collisions at  $\sqrt{s} = 7$  TeV**

$A_C = (N(\Delta|y| > 0) - N(\Delta|y| < 0)) / (N(\Delta|y| > 0) + N(\Delta|y| < 0))$  where  $\Delta|y| = |y_t| - |y_{\bar{t}}|$  is the difference between the absolute values of the top and antitop rapidities and  $N$  is the number of events with  $\Delta|y|$  positive or negative.

- <sup>1</sup> ATLAS and CMS combination based on the data of AAD 14I and CHATRCHYAN 12BB. It takes into account the correlations of the measurements and systematic errors. The result is in agreement with the SM prediction (NLO QCD + NLO EW).
- <sup>2</sup> AAD 15AJ based on 4.6 fb<sup>-1</sup> of data. After kinematic reconstruction the top quark momenta are corrected for detector resolution and acceptance effects by unfolding, using parton level information of the MC generators. The lepton charge asymmetry is measured as  $A_C = 0.024 \pm 0.015 \pm 0.009$ . All the measurements are consistent with the SM predictions.
- <sup>3</sup> Based on 4.7 fb<sup>-1</sup> of data. The result is consistent with the SM prediction of  $A_C = 0.0123 \pm 0.0005$ . The asymmetry is  $0.011 \pm 0.018$  if restricted to those events where  $\beta_Z(t\bar{t}) > 0.6$ , which is also consistent with the SM prediction of  $0.020^{+0.006}_{-0.007}$ .
- <sup>4</sup> Based on 5.0 fb<sup>-1</sup> of data. The lepton charge asymmetry is measured as  $A_C = 0.009 \pm 0.0010 \pm 0.006$ .  $A_C$  dependences on  $m_{T\bar{T}}$ ,  $|y(t\bar{t})|$ , and  $p_T(t\bar{t})$  are given in Fig. 5. All measurements are consistent with the SM predictions.
- <sup>5</sup> Based on 1.04 fb<sup>-1</sup> of data. The result is consistent with  $A_C = 0.006 \pm 0.002$  (MC at NLO). No significant dependence of  $A_C$  on  $m_{t\bar{t}}$  is observed.
- <sup>6</sup> Based on 5.0 fb<sup>-1</sup> of data at 7 TeV.
- <sup>7</sup> Based on 1.09 fb<sup>-1</sup> of data. The result is consistent with the SM predictions.

- <sup>1</sup> ATLAS and CMS combination based on the data of AAD 16AZ and KHACHATRYAN 16AH. It takes into account the correlations of the measurements and systematic errors. A combination of the differential measurements of the charge asymmetry is also presented. The results are in agreement with the SM prediction (NNLO QCD + NLO EW).
- <sup>2</sup> AAD 16AE is based on 20.3 fb<sup>-1</sup> of data. After kinematic reconstruction, the top quark momenta are corrected for detector resolution and acceptance effects by unfolding, using parton level information of the MC generators. The lepton charge asymmetry is measured as  $A_C = 0.008 \pm 0.006$ . All the measurements are consistent with the SM predictions.
- <sup>3</sup> AAD 16AZ based on 20.3 fb<sup>-1</sup> of data. All the differential and inclusive measurements are statistically limited and consistent with the SM predictions.
- <sup>4</sup> AAD 16T based on 20.3 fb<sup>-1</sup> of data. Uses reconstruction techniques for the decay topology of highly boosted top quarks. The observed asymmetry is transformed by unfolding to a parton-level result in the shown fiducial region. The result is consistent with the NLO SM prediction.
- <sup>5</sup> KHACHATRYAN 16AD based on 19.5 fb<sup>-1</sup> of data. The lepton charge asymmetry is measured as  $A_C = 0.003 \pm 0.006 \pm 0.003$ . All the measurements are consistent with the SM predictions.
- <sup>6</sup> KHACHATRYAN 16AH based on 19.6 fb<sup>-1</sup> of data. The same data set as in KHACHATRYAN 16T is used. A template technique is used, which is sensitive to the charge anti-symmetric component of the  $t\bar{t}$  rapidity distributions and statistically advantageous. The result is consistent with the SM predictions.
- <sup>7</sup> KHACHATRYAN 16T based on 19.7 fb<sup>-1</sup> of data. The same data set as in KHACHATRYAN 16AH is used. After kinematic reconstruction the top quark momenta are corrected for detector resolution and acceptance effects by unfolding, using parton level information of the MC generators. All the measurements are consistent with the SM predictions.

 **$t\bar{t}$  Charge Asymmetry ( $A_C$ ) in  $pp$  Collisions at  $\sqrt{s} = 13$  TeV**

Combination with the result of ABAZOV 15K yields 0.081 ± 0.048. This result together with the helicity polarization is shown in a 2-dimensional plot in Fig.4. These results are consistent with the SM prediction.
- <sup>2</sup> ABAZOV 17 based on 9.7 fb<sup>-1</sup> of data. The value is top quark polarization times spin analyzing power in the helicity basis. The result is consistent with the SM prediction. This result together with the beam polarization is shown in a 2-dimensional plot in Fig.4.
- <sup>3</sup> ABAZOV 17 based on 9.7 fb<sup>-1</sup> of data. The value is top quark polarization times spin analyzing power in the transverse basis. The result is consistent with the SM prediction.
- <sup>4</sup> ABAZOV 15K based on 9.7 fb<sup>-1</sup> of data. The value is top quark polarization times spin analyzing power in the beam basis. The result is consistent with the SM prediction of  $-0.0019 \pm 0.0005$ .

 **$t$ -quark Polarization in  $t\bar{t}$  Events in  $pp$  Collisions at  $\sqrt{s} = 7$  TeV**

The double differential distribution in polar angles,  $\theta_1$  ( $\theta_2$ ) of the decay particle of the top (anti-top) decay products, is parametrized as  $(1/\sigma)d\sigma/(d\cos\theta_1 d\cos\theta_2) = (1/4) (1 + A_t \cos\theta_1 + A_{\bar{t}} \cos\theta_2 - C \cos\theta_1 \cos\theta_2)$ . The charged lepton is used to tag  $t$  or  $\bar{t}$ . The coefficient  $A_t$  and  $A_{\bar{t}}$  measure the average helicity of  $t$  and  $\bar{t}$ , respectively.  $A_{CP} = A_t = A_{\bar{t}}$  assumes  $CP$  conservation, whereas  $A_{CPV} = A_t = -A_{\bar{t}}$  corresponds to maximal  $CP$  violation.

$0.26 \pm 0.03 \pm 0.10$		4 KHACHATRYAN 16Bo CMS	$(\alpha_\mu P)/2$ ; t-channel	

1 AABOUD 17BB based on 20.2 fb<sup>-1</sup> of pp data. Triple-differential decay rate of top quark is used to simultaneously determine five generalized  $Wtb$  couplings as well as the top polarization.  $\alpha_\ell$  denotes the spin analyzing power of charged lepton, and the spin axis of the top polarization  $P$  is taken along the spectator-quark momentum in the top rest frame. The value is compatible with the SM prediction of about 0.9.

2 AABOUD 17i based on 20.2 fb<sup>-1</sup> of pp data. A cut-based analysis is used to discriminate between signal and backgrounds.  $\alpha_\ell$  denotes the spin analyzing power of charged lepton, and the spin axis of the top polarization  $P$  is taken along the spectator-quark momentum in the top rest frame. See this paper for a number of other asymmetries and measurements that are not included here.

3 AABOUD 17i based on 20.2 fb<sup>-1</sup> of pp data. A cut-based analysis is used to discriminate between signal and backgrounds.  $F_\pm$  denotes  $W$  helicity fraction, and the spin axis of the top polarization  $P$  is taken along the spectator-quark momentum in the top rest frame. See this paper for a number of other asymmetries and measurements that are not included here.

4 KHACHATRYAN 16Bo based on 19.7 fb<sup>-1</sup> of data. A high-purity sample with a muon is selected by a multivariate analysis. The value is the top spin asymmetry, given by one half of the spin analyzing power  $\alpha_\mu$  (=1 at LO of SM) times the top polarization,  $P$ , where the spin axis is defined as the direction of the untagged jet in the top rest frame. The value is compatible with the SM prediction of 0.44 with a 2.0 $\sigma$  deviation.

t-quark Polarization in Single Top Events in pp Collisions at  $\sqrt{s} = 13$  TeV

$0.440 \pm 0.070$	2 SIRUNYAN 20R CMS	$(\alpha_\ell P)/2$ ; t-channel	

1 AAD 22Z based on 139 fb<sup>-1</sup> of data. Three components of  $t$  or  $\bar{t}$  polarization vector (defined in the  $t$  or  $\bar{t}$  rest frame) are measured in t-channel single top production using  $\ell$  momentum distribution in the  $\ell + \cancel{E}_T + 2j$  (with 1 of them b-jet) channel. The measured values are in agreement with NNLO SM prediction. Constraints on the Wilson coefficients of SMEFT are obtained as  $-0.9 < C_{tW} < 1.4$  and  $-0.8 < C_{tW} < 0.2$ .

2 SIRUNYAN 20R based on 36.1 fb<sup>-1</sup> of data. Differential cross sections for t-channel single top production are measured using  $1\ell + 2,3\text{-jet}$  mode and found to be in good agreement with SM predictions. The value is the top spin asymmetry, given by 1/2 of the spin analyzing power  $\alpha_\ell$  (=1 at LO of SM) times the top polarization  $P$ , where the spin axis is defined as the direction of the spectator quark in the top rest frame at the parton level. It is in good agreement with the NLO SM prediction of 0.436.

gg  $\rightarrow$  t $\bar{t}$  Fraction in p $\bar{p}$  Collisions at  $\sqrt{s} = 1.96$  TeV

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
•••				We do not use the following data for averages, fits, limits, etc. •••
<0.33	68	1 AALTONEN 09F CDF	t $\bar{t}$ correlations	
$0.07 \pm 0.14 \pm 0.07$		2 AALTONEN 08AG CDF	low $p_T$ number of tracks	

1 Based on 955 pb<sup>-1</sup>. AALTONEN 09F used differences in the t $\bar{t}$  production angular distribution and polarization correlation to discriminate between  $gg \rightarrow t\bar{t}$  and  $q\bar{q} \rightarrow t\bar{t}$  subprocesses. The combination with the result of AALTONEN 08AG gives  $0.07^{+0.15}_{-0.07}$ .

2 Result is based on 0.96 fb<sup>-1</sup> of data. The contribution of the subprocesses  $gg \rightarrow t\bar{t}$  and  $q\bar{q} \rightarrow t\bar{t}$  is distinguished by using the difference between quark and gluon initiated jets in the number of small  $p_T$  ( $0.3 \text{ GeV} < p_T < 3 \text{ GeV}$ ) charged particles in the central region ( $|\eta| < 1.1$ ).

 $A_{FB}^t$  of t $\bar{t}$  in p $\bar{p}$  Collisions at  $\sqrt{s} = 1.96$  TeV

$A_{FB}^t$  = Forward-backward asymmetry.

1 AALTONEN 18 based on 9–10 fb<sup>-1</sup> of p $\bar{p}$  data at  $\sqrt{s} = 1.96$  TeV. The value is the asymmetry in the number of reconstructed t $\bar{t}$  events with rapidity  $y_\ell > y_{\bar{t}}$  and those with  $y_\ell < y_{\bar{t}}$ . The combined fits to CDF and D0 single lepton and  $\ell\ell$  asymmetries give  $A_{FB}^t = 0.073 \pm 0.016 \pm 0.012$  and  $A_{FB}^{\ell\ell} = 0.108 \pm 0.043 \pm 0.016$ , respectively. The results are consistent with the SM predictions.

2 ABZOV 15K based on 9.7 fb<sup>-1</sup> of data. The result is consistent with the SM predictions. By combining with the previous D0 measurement in the  $\ell + \text{jet}$  channel ABZOV 14H,  $A_{FB}^t = 0.118 \pm 0.025 \pm 0.013$  is obtained.

3 AALTONEN 14F based on 9.1 fb<sup>-1</sup> of data.  $A_{FB}^t$  and  $A_{FB}^{\ell\ell}$  denote, respectively, the asymmetries  $(N(x>0) - N(x<0))/N_{\text{tot}}$  for  $x = q\ell\eta_\ell$  ( $q_\ell$  is the charge of  $\ell$ ) and  $x = \eta_{\ell^+} - \eta_{\ell^-}$ . Both results are consistent with the SM predictions. By combining with the previous CDF measurement in the  $\ell + \text{jet}$  channel AALTONEN 13X,  $A_{FB}^t = 0.098^{+0.028}_{-0.026}$  is obtained. The combined result is about two sigma larger than the SM prediction of  $A_{FB}^t = 0.038 \pm 0.003$ .

4 Based on 9.7 fb<sup>-1</sup> of p $\bar{p}$  data at  $\sqrt{s} = 1.96$  TeV. The asymmetry is corrected for the production level for events with  $|y_\ell| < 1.5$ . Asymmetry as functions of  $E_T(\ell)$  and  $|y_\ell|$  are given in Figs. 7 and 8, respectively. Combination with the asymmetry measured in the dilepton channel [ABZOV 13P] gives  $A_{FB}^t = 4.2 \pm 2.0 \pm 1.4\%$ , in agreement with the SM prediction of 2.0%.

5 Based on 9.7 fb<sup>-1</sup> of data of p $\bar{p}$  data at  $\sqrt{s} = 1.96$  TeV. The measured asymmetry is in agreement with the SM predictions of  $8.8 \pm 0.9\%$  [BERNREUTHER 12], which includes the EW effects. The dependences of the asymmetry on  $|y(t) - y(\bar{t})|$  and  $m_{t\bar{t}}$  are shown in Figs. 9 and 10, respectively.

6 Based on 9.4 fb<sup>-1</sup> of data. Reported  $A_{FB}^t$  values come from the determination of  $a_j$  coefficients of  $d\sigma/d(\cos\theta_\ell) = \sum_i a_i P_i(\cos\theta_\ell)$  measurement. The result of  $a_1/a_0 = (40 \pm 12)\%$  seems higher than the NLO SM prediction of  $(15^{+7}_{-3})\%$ .

7 Based on 9.4 fb<sup>-1</sup> of data. The quoted result is the asymmetry at the parton level.

8 Based on 9.4 fb<sup>-1</sup> of data. The observed asymmetry is to be compared with the SM prediction of  $A_{FB}^t = 0.038 \pm 0.003$ .

9 Based on 5.4 fb<sup>-1</sup> of data. ABZOV 13A studied the dilepton channel of the t $\bar{t}$  events and measured the leptonic forward-backward asymmetry to be  $A_{FB}^t = 5.8 \pm 5.1 \pm 1.3\%$ , which is consistent with the SM (QCD+EW) prediction of  $4.7 \pm 0.1\%$ . The result is obtained after combining the measurement ( $15.2 \pm 4.0\%$ ) in the  $\ell + \text{jets}$  channel ABZOV 11AH. The top quark helicity is measured by using the neutrino weighting method to be consistent with zero in both dilepton and  $\ell + \text{jets}$  channels.

10 Based on 5.3 fb<sup>-1</sup> of data. The error is statistical and systematic combined. Events with lepton +  $\cancel{E}_T + \geq 4\text{jets}(\geq 1b)$  are used. AALTONEN 11F also measures the asymmetry as a function of the rapidity difference  $|y_\ell - y_{\bar{t}}|$ . The NLO QCD predictions [MCFM] are  $(4.0 \pm 0.6)\%$  and  $(8.8 \pm 1.3)\%$  for  $m_{t\bar{t}} < 450$  and  $> 450$  GeV, respectively.

11 Based on 5.4 fb<sup>-1</sup> of data. The error is statistical and systematic combined. The quoted asymmetry is obtained after unfolding to be compared with the MC@NLO prediction of  $(5.0 \pm 0.1)\%$ . No significant difference between the  $m_{t\bar{t}} < 450$  and  $> 450$  GeV data samples is found. A corrected asymmetry based on the lepton from a top quark decay of  $(15.2 \pm 4.0)\%$  is measured to be compared to the MC@NLO prediction of  $(2.1 \pm 0.1)\%$ .

12 Result is based on 1.9 fb<sup>-1</sup> of data. The FB asymmetry in the t $\bar{t}$  events has been measured in the  $\ell + \text{jets}$  mode, where the lepton charge is used as the flavor tag. The asymmetry in the p $\bar{p}$  frame is defined in terms of  $\cos(\theta)$  of hadronically decaying t-quark momentum, whereas that in the t $\bar{t}$  frame is defined in terms of the  $t$  and  $\bar{t}$  rapidity difference. The results are consistent ( $\leq 2\sigma$ ) with the SM predictions.

13 Result is based on 0.9 fb<sup>-1</sup> of data. The asymmetry in the number of t $\bar{t}$  events with  $y_\ell > y_{\bar{t}}$  and those with  $y_\ell < y_{\bar{t}}$  has been measured in the lepton + jets final state. The observed value is consistent with the SM prediction of 0.8% by MC@NLO, and an upper bound on the  $Z' \rightarrow t\bar{t}$  contribution for the SM Z-like couplings is given in Fig. 2 for  $350 \text{ GeV} < m_{Z'} < 1 \text{ TeV}$ .

## t-Quark Electric Charge

VALUE	DOCUMENT ID	TECN	COMMENT
$0.64 \pm 0.02 \pm 0.08$	1 AAD 13AY ATLS	$\ell + \cancel{E}_T + \geq 4 \text{ jets}(\geq 1b)$	
•••			We do not use the following data for averages, fits, limits, etc. •••
	2 ABZOV 14D D0	$\ell + \cancel{E}_T + \geq 4 \text{ jets}(\geq 2b)$	
	3 AALTONEN 13J CDF	p $\bar{p}$ at 1.96 TeV	
	4 AALTONEN 10S CDF	Repl. by AALTONEN 13J	
	5 ABZOV 07c D0	fraction of $ q =4e/3$ pair	

1 AAD 13AY result is based on 2.05 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 7$  TeV, the result is obtained by reconstructing t $\bar{t}$  events in the lepton + jets final state, where b-jet charges are tagged by the jet-charge algorithm. This measurement excludes the charge -4/3 assignment to the top quark at more than 8 standard deviations.

2 ABZOV 14D result is based on 5.3 fb<sup>-1</sup> of p $\bar{p}$  data at  $\sqrt{s} = 1.96$  TeV. The electric charge of  $b + W$  system in t $\bar{t}$  candidate events is measured from the charges of the leptons from  $W$  decay and in  $b$  jets. Under the assumption that the  $b + W$  system consists of the sum of the top quark and the charge -4/3 quark  $b'(-4/3)$  of the same mass, the top quark fraction is found to be  $f = 0.88 \pm 0.13$  (stat)  $\pm 0.11$  (syst), or the upper bound for the  $b'(-4/3)$  contamination of  $1 - f < 0.46$  (95% CL).

3 AALTONEN 13J excludes the charge -4/3 assignment to the top quark at 99% CL, using 5.6 fb<sup>-1</sup> of data in p $\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. Result is obtained by reconstructing t $\bar{t}$  events in the lepton + jets final state, where b-jet charges are tagged by the jet-charge algorithm.

4 AALTONEN 10S excludes the charge -4/3 assignment for the top quark [CHANG 99] at 95% CL, using 2.7 fb<sup>-1</sup> of data in p $\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. Result is obtained by reconstructing t $\bar{t}$  events in the lepton + jets final state, where b-jet charges are tagged by the SLT (soft lepton tag) algorithm.

5 ABZOV 07c reports an upper limit  $\rho < 0.80$  (90% CL) on the fraction  $\rho$  of exotic quark pairs  $Q\bar{Q}$  with electric charge  $|q| = 4e/3$  in t $\bar{t}$  candidate events with high  $p_T$  lepton, missing  $E_T$  and  $\geq 4$  jets. The result is obtained by measuring the fraction of

- AAD 23Ag based on 139 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. Pair production of vector-like  $b'$  is searched for in the mode  $\ell^{\pm}\ell^{\mp} + \geq 2j$  ( $\geq 1b$ -tagged) +  $E_T$  or with  $3\ell$ . The data are consistent with the SM background predictions and limits are obtained for different branching ratios.
- TUMASYAN 23v based on 138 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. Pair production of vector-like  $b'$  is searched for in the single-lepton, same-sign charge dilepton and multi-lepton channels. The data are consistent with the SM background predictions and limits are obtained for different branching ratios.
- SIRUNYAN 20Bi based on 137 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. Pair production of vector-like  $b'$  is searched for with each  $b'$  decaying into  $Zb$  or  $hb$ . Analysis focuses on final states consisting of jets from six quarks. Mass limits are obtained for a variety of branching ratios of  $b'$  decays.
- AABOUD 18Ce based on 36.1 fb<sup>-1</sup> of proton-proton data taken at  $\sqrt{s} = 13$  TeV. Events including a same-sign lepton pair are used. The limit is for a singlet model, assuming the branching ratios of  $b'$  into  $Zb, Wt$  and  $Hb$  as predicted by the model.
- AABOUD 18cL, AABOUD 18cP based on 36.1 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. The limit is for the pair-produced vector-like  $b'$  using all-hadronic final state. The analysis is particularly powerful for the  $b' \rightarrow hb$  mode. Assuming the pure decay only in this mode sets a limit  $m_{b'} > 1010$  GeV.
- AABOUD 18cP based on 36.1 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. Pair and single production of vector-like  $b'$  are searched for with at least one  $b'$  decaying into  $Zb$ . In the case of  $B(b' \rightarrow Zb) = 1$ , the limit is  $m_{b'} > 1220$  GeV.
- The limit is for the singlet model, assuming that the branching ratios into  $Wt, Zb, hb$  add up to one.
- The limit is for the doublet model, assuming that the branching ratios into  $Wt, Zb, hb$  add up to one.
- AABOUD 18cR based on 36.1 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. A combination of searches for the pair-produced vector-like  $b'$  in various decay channels ( $b' \rightarrow Wt, Zb, hb$ ). Also a model-independent limit is obtained as  $m_{b'} > 1.03$  TeV, assuming that the branching ratios into  $Zb, Wt$ , and  $hb$  add up to one.
- The limit is for the singlet  $b'$ .
- The limit is for  $b'$  in a weak isospin doublet ( $t', b'$ ) and  $|V_{t'b}| \ll |V_{tb}|$ . For a  $b'$  in a doublet with a charge  $-4/3$  vector-like quark, the limit  $m_{b'} > 1.14$  TeV is obtained.
- SIRUNYAN 18g based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. The limit is for the pair-produced vector-like  $b'$  that couple only to light quarks. Upper cross section limits on the single production of a  $b'$  and constraints for other decay channels ( $Zq$  and  $Hq$ ) are also given in the paper.
- SIRUNYAN 17AU based on 2.3–2.6 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. Limit on pair-produced singlet vector-like  $b'$  using one lepton and several jets. The mass bound is given for a  $b'$  transforming as a singlet under the electroweak symmetry group, assumed to decay through  $W, Z$  or Higgs boson (which decays to jets) and to a third generation quark.
- AAD 15z based on 20.3 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. Used events with  $\ell + E_T + \geq 6j$  ( $\geq 1b$ ) and at least one pair of jets from weak boson decay, primarily designed to select the signature  $b'b' \rightarrow WWt\bar{t} \rightarrow JWWWWb\bar{b}$ . This is a limit on pair-produced vector-like  $b'$ . The lower mass limit is 640 GeV for a vector-like singlet  $b'$ .
- Result is based on 1.1 fb<sup>-1</sup> of data. No signal is found for the search of long-lived particles which decay into final states with two electrons or photons, and upper bound on the cross section times branching fraction is obtained for  $2 < cr < 7000$  mm; see Fig. 3. 95% CL excluded region of  $b'$  lifetime and mass is shown in Fig. 4.

- ACOSTA 03 looked for long-lived fourth generation quarks in the data sample of 90 pb<sup>-1</sup> of  $\sqrt{s} = 1.8$  TeV  $p\bar{p}$  collisions by using the muon-like penetration and anomalously high ionization energy loss signature. The corresponding lower mass bound for the charge  $(2/3)e$  quark ( $t'$ ) is 220 GeV. The  $t'$  bound is higher than the  $b'$  bound because  $t'$  is more likely to produce charged hadrons than  $b'$ . The 95% CL upper bounds for the production cross sections are given in their Fig. 3.
- AAD 23Ag based on 139 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. Pair production of vector-like top or  $b_s$  is searched for in the mode  $1\ell + \geq 4j$  ( $\geq 1b$ -tagged) +  $E_T$ . The data are consistent with the SM background predictions and limits are obtained for different branching ratios. Masses below 1.59 TeV are excluded assuming a mass-degenerate vector-like doublet ( $t', b'$ ) model.
- SIRUNYAN 19AQ based on 35.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. Pair production of vector-like  $b'$  is searched for with one  $b'$  decaying into  $Zb$  and the other  $b'$  decaying into  $Wt, Zb, hb$ . Events with an opposite-sign lepton pair consistent with coming from  $Z$  and jets are used. Mass limits are obtained for a variety of branching ratios of  $b'$ .
- SIRUNYAN 19BW based on 35.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. The limit is for the pair-produced vector-like  $b'$  using all-hadronic final state. The analysis is made for the  $Zb, Wt, hb$  modes and mass limits are obtained for a variety of branching ratios.
- AABOUD 18AW based on 36.1 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. The limit is for the pair-produced vector-like  $b'$  using lepton-plus-jets final state. The search is also sensitive to the decays into  $Zb$  and  $Hb$  final states.
- SIRUNYAN 18BM based on 35.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 13$  TeV. The limit is for the pair-produced vector-like  $b'$ . Three channels (single lepton, same-charge 2 leptons, or at least 3 leptons) are considered for various branching fraction combinations. Assuming  $B(tW) = 1$ , the limit is 1240 GeV and for  $B(bZ) = 1$  it is 960 GeV.
- KHACHATRYAN 16AN based on 19.7 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. Limit on pair-produced vector-like  $b'$  using 1, 2, and  $>2$  leptons as well as fully hadronic final states. Other limits depending on the branching fractions to  $tW, bZ$ , and  $bH$  are given in Table IX.
- AAD 15AR based on 20.3 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. Used lepton-plus-jets final state. See Fig. 24 for mass limits in the plane of  $B(b' \rightarrow Wt)$  vs.  $B(b' \rightarrow Hb)$  from  $b'b' \rightarrow Hb + X$  searches.
- AAD 15BY based on 20.3 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. Limit on pair-produced vector-like  $b'$  assuming the branching fractions to  $W, Z$ , and  $h$  modes of the singlet model. Used events containing  $\geq 2\ell + E_T + \geq 2j$  ( $\geq 1b$ ) and including a same-sign lepton pair.
- AAD 15BY based on 20.3 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. Limit on pair-produced chiral  $b'$ -quark. Used events containing  $\geq 2\ell + E_T + \geq 2j$  ( $\geq 1b$ ) and including a same-sign lepton pair.
- AAD 15CN based on 20.3 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. Limit on pair-production of chiral  $b'$ -quark. Used events with  $\ell + E_T + \geq 4j$  (non- $b$ -tagged). Limits on a heavy vector-like quark, which decays into  $Wq, Zq, hq$ , are presented in the plane  $B(Q \rightarrow Wq)$  vs.  $B(Q \rightarrow hq)$  in Fig. 12.
- Based on 20.3 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 8$  TeV. No significant excess over SM expectation is found in the search for pair production or single production of  $b'$  in the events with dilepton from a high  $p_T Z$  and additional jets ( $\geq 1b$ -tag). If instead of  $B(b' \rightarrow Wt) = 1$  an electroweak singlet with  $B(b' \rightarrow Wt) \sim 0.45$  is assumed, the limit reduces to 685 GeV.
- Based on 5.0 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. CHATRCHYAN 13i looked for events with one isolated electron or muon, large  $E_T$ , and at least four jets with large transverse momenta, where one jet is likely to originate from the decay of a bottom quark.
- Based on 1.04 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. No signal is found for the search of heavy quark pair production that decay into  $W$  and a  $t$  quark in the events with a high  $p_T$  isolated lepton, large  $E_T$ , and at least 6 jets in which one, two or more dijets are from  $W$ .
- Based on 2.0 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. No  $b' \rightarrow Zb$  invariant mass peak is found in the search of heavy quark pair production that decay into  $Z$  and a  $b$  quark in events with  $Z \rightarrow e^+e^-$  and at least one  $b$ -jet. The lower mass limit is 358 GeV for a vector-like singlet  $b'$  mixing solely with the third SM generation.
- Based on 1.04 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. No signal is found for the search of heavy quark pair production that decay into  $W$  and a quark in the events with dileptons, large  $E_T$ , and  $\geq 2$  jets.
- Based on 1.04 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. AAD 12bE looked for events with two isolated like-sign leptons and at least 2 jets, large  $E_T$  and  $H_T > 350$  GeV.
- Based on 5 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. CHATRCHYAN 12bH searched for QCD and EW production of single and pair of degenerate 4th generation quarks that decay to  $bW$  or  $tW$ . Absence of signal in events with one lepton, same-sign dileptons or tripletons gives the bound. With a mass difference of 25 GeV/ $c^2$  between  $m_{t'}$  and  $m_{b'}$ , the corresponding limit shifts by about  $\pm 20$  GeV/ $c^2$ .
- Based on 4.9 fb<sup>-1</sup> of  $pp$  data at  $\sqrt{s} = 7$  TeV. CHATRCHYAN 12X looked for events with trileptons or same-sign dileptons and at least one  $b$  jet.
- Based on 4.8 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at 1.96 TeV. AALTONEN 11J looked for events with  $\ell + E_T + \geq 5j$  ( $\geq 1b$  or  $c$ ). No signal is observed and the bound  $\sigma(b'b')$  < 30 fb for  $m_{b'} > 375$  GeV is found for  $B(b' \rightarrow Wt) = 1$ .
- Based on 34 pb<sup>-1</sup> of data in  $pp$  collisions at 7 TeV. CHATRCHYAN 11L looked for multi-jet events with trileptons or same-sign dileptons. No excess above the SM background excludes  $m_{b'}$  between 255 and 361 GeV at 95% CL for  $B(b' \rightarrow Wt) = 1$ .
- Based on 2.7 fb<sup>-1</sup> of data in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV. AALTONEN 10H looked for pair production of heavy quarks which decay into  $tW^-$  or  $tW^+$ , in events with same sign dileptons ( $e$  or  $\mu$ ), several jets and large missing  $E_T$ . The result is obtained for  $b'$  which decays into  $tW^-$ . For the charge 5/3 quark ( $T_{5/3}$ ) which decays into  $tW^+$ ,  $m_{T_{5/3}} > 365$  GeV (95% CL) is found when it has the charge  $-1/3$  partner  $B$  of the same mass.
- FLACCO 10 result is obtained from AALTONEN 10H result of  $m_{b'} > 338$  GeV, by relaxing the condition  $B(b' \rightarrow Wt) = 100\%$  when  $m_{b'} > m_{t'}$ .
- Result is based on 1.06 fb<sup>-1</sup> of data. No excess from the SM  $Z$ +jet events is found when  $Z$  decays into  $ee$  or  $\mu\mu$ . The  $m_{b'}$  bound is found by comparing the resulting upper

# Quark Particle Listings

## $b'$ (Fourth Generation) Quark

bound on  $\sigma(b'\bar{b}') [1 - (1 - B(b' \rightarrow Zb))^2]$  and the LO estimate of the  $b'$  pair production cross section shown in Fig. 38 of the article.

<sup>40</sup> HUANG 08 reexamined the  $b'$  mass lower bound of 268 GeV obtained in AALTONEN 07c that assumes  $B(b' \rightarrow Zb) = 1$ , which does not hold for  $m_{b'} > 255$  GeV. The lower mass bound is given in the plane of  $\sin^2(\theta_{tb'})$  and  $m_{b'}$ .

<sup>41</sup> AFFOLDER 00 looked for  $b'$  that decays in to  $b+Z$ . The signal searched for is  $bbZ$  events where one  $Z$  decays into  $e^+e^-$  or  $\mu^+\mu^-$  and the other  $Z$  decays hadronically. The bound assumes  $B(b' \rightarrow Zb) = 100\%$ . Between 100 GeV and 199 GeV, the 95%CL upper bound on  $\sigma(b' \rightarrow \bar{b}') \times B^2(b' \rightarrow Zb)$  is also given (see their Fig. 2).

<sup>42</sup> ABE 98n looked for  $Z \rightarrow e^+e^-$  decays with displaced vertices. Quoted limit assumes  $B(b' \rightarrow Zb) = 1$  and  $c\tau_{b'} = 1$  cm. The limit is lower than  $m_{Z+m_b}$  ( $\sim 96$  GeV) if  $c\tau > 22$  cm or  $c\tau < 0.009$  cm. See their Fig. 4.

<sup>43</sup> ABACHI 97D searched for  $b'$  that decays mainly via FCNC. They obtained 95%CL upper bounds on  $B(b'\bar{b}' \rightarrow \gamma + 3 \text{ jets})$  and  $B(b'\bar{b}' \rightarrow 2\gamma + 2 \text{ jets})$ , which can be interpreted as the lower mass bound  $m_{b'} > m_{Z+m_b}$ .

<sup>44</sup> ABACHI 95F bound on the top-quark also applies to  $b'$  and  $t'$  quarks that decay predominantly into  $W$ . See FROGGATT 97.

<sup>45</sup> MUKHOPADHYAYA 93 analyze CDF dilepton data of ABE 92G in terms of a new quark decaying via flavor-changing neutral current. The above limit assumes  $B(b' \rightarrow b\ell^+\ell^-) = 1\%$ . For an exotic quark decaying only via virtual  $Z$  [ $B(b\ell^+\ell^-) = 3\%$ ], the limit is 85 GeV.

<sup>46</sup> ABE 92 dilepton analysis limit of  $>85$  GeV at CL=95% also applies to  $b'$  quarks, as discussed in ABE 90b.

<sup>47</sup> ABE 90b exclude the region 28–72 GeV.

<sup>48</sup> AKESSON 90 searched for events having an electron with  $p_T > 12$  GeV, missing momentum  $> 15$  GeV, and a jet with  $E_T > 10$  GeV,  $|\eta| < 2.2$ , and excluded  $m_{b'}$  between 30 and 69 GeV.

<sup>49</sup> For the reduction of the limit due to non-charged-current decay modes, see Fig. 19 of ALBAJAR 90b.

<sup>50</sup> ALBAJAR 88 study events at  $E_{cm} = 546$  and 630 GeV with a muon or isolated electron, accompanied by one or more jets and find agreement with Monte Carlo predictions for the production of charm and bottom, without the need for a new quark. The lower mass limit is obtained by using a conservative estimate for the  $b'\bar{b}'$  production cross section and by assuming that it cannot be produced in  $W$  decays. The value quoted here is revised using the full  $O(\alpha_s^2)$  cross section of ALTARELLI 88.

<sup>1</sup> TUMASYAN 220 based on  $138 \text{ fb}^{-1}$  of data in  $pp$  collisions at 13 TeV. No significant excess over SM expectation is found in the search for a left-handed  $b'$  assuming 100% decay to  $tW$  using a  $t$ -tagged jet and a lepton from  $W$ . The model assumes that the  $b'$  has the excited quark couplings. The bound is from a statistical combination with an earlier analysis by SIRUNYAN 21AG. The 95% CL bounds are also set as 3.0, 3.0, and 3.2 TeV, respectively, for left-handed, right-handed, and vector-like couplings.

<sup>2</sup> ABAZOV 11F based on  $5.4 \text{ fb}^{-1}$  of data in  $p\bar{p}$  collisions at 1.96 TeV. ABAZOV 11F looked for single production of  $b'$  via the  $W$  or  $Z$  coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes  $p\bar{p} \rightarrow b'q \rightarrow Wuq$ , and  $p\bar{p} \rightarrow b'q \rightarrow Zdq$  are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks.

<sup>3</sup> AAD 23CQ based on  $139 \text{ fb}^{-1}$  of data in  $pp$  collisions at 13 TeV. No significant excess over SM expectation is found. Limits on mass and production cross section of a vector-like  $b'$  are obtained in several theoretical scenarios determined by the couplings between  $b'$  and  $W, Z, h$ .

<sup>4</sup> SIRUNYAN 21AG based on  $137 \text{ fb}^{-1}$  of data in  $pp$  collisions at 13 TeV. No significant excess over SM expectation is found in the search for a left-handed  $b'$  assuming 100% decay to  $tW$  using all hadronic final states, where  $t$  and  $W$  are tagged as single jets, respectively. The model assumes that the  $b'$  has the excited quark couplings. The 95% CL bounds are also set as 2.8 and 3.1 TeV, respectively, for the right-handed and vector-like couplings.

<sup>5</sup> SIRUNYAN 19AI based on  $35.9 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13$  TeV. Exclusion limits are set on the product of the production cross section and branching fraction for the  $b'(-1/3) + b$  and  $b'(-1/3) + t$  modes as a function of the vector-like quark mass in Figs. 7 and 8 and in Tab. 2 for relative vector-like quark widths between 1 and 30% for left- and right-handed vector-like quark couplings. No significant deviation from the SM prediction is observed.

<sup>6</sup> AAD 16AH based on  $20.3 \text{ fb}^{-1}$  of data in  $pp$  collisions at 8 TeV. No significant excess over SM expectation is found in the search for a vector-like  $b'$  in the single-lepton and dilepton channels ( $\ell$  or  $\ell\ell$ ) +  $1,2,3 j$  ( $\geq 1b$ ). The model assumes that the  $b'$  has the excited quark couplings.

<sup>7</sup> Based on  $19.7 \text{ fb}^{-1}$  of data in  $pp$  collisions at 8 TeV. Limit on left-handed  $b'$  assuming 100% decay to  $tW$  and using all-hadronic, lepton + jets, and dilepton final states.

<sup>8</sup> Based on  $19.7 \text{ fb}^{-1}$  of data in  $pp$  collisions at 8 TeV. Limit on right-handed  $b'$  assuming 100% decay to  $tW$  and using all-hadronic, lepton + jets, and dilepton final states.

<sup>9</sup> Based on  $19.7 \text{ fb}^{-1}$  of data in  $pp$  collisions at 8 TeV. Limit on vector-like  $b'$  assuming 100% decay to  $tW$  and using all-hadronic, lepton+jets, and dilepton final states.

### MASS LIMITS for $b'$ (4<sup>th</sup> Generation) Quark or Hadron in $e^+e^-$ Collisions

Search for hadrons containing a fourth-generation  $-1/3$  quark denoted  $b'$ .

The last column specifies the assumption for the decay mode ( $CC$  denotes the conventional charged-current decay) and the event signature which is looked for.

<sup>1</sup> DECAMP 90F looked for isolated charged particles, for isolated photons, and for four-jet final states. The modes  $b' \rightarrow bg$  for  $B(b' \rightarrow bg) > 65\%$  or  $b' \rightarrow b\gamma$  for  $B(b' \rightarrow b\gamma) > 5\%$  are excluded. Charged Higgs decays were not discussed.

<sup>2</sup> ABDALLAH 07 searched for  $b'$  pair production at  $E_{cm} = 196\text{--}209$  GeV, with  $420 \text{ pb}^{-1}$ . No signal leads to the 95% CL upper limits on  $B(b' \rightarrow bZ)$  and  $B(b' \rightarrow cW)$  for  $m_{b'} = 96$  to 103 GeV.

<sup>3</sup> ADRIANI 93G search for vector quarkonium states near  $Z$  and give limit on quarkonium- $Z$  mixing parameter  $\delta m^2 < (10\text{--}30) \text{ GeV}^2$  (95%CL) for the mass 88–94.5 GeV. Using Richardson potential, a  $1S(b'\bar{b}')$  state is excluded for the mass range 87.7–94.7 GeV. This range depends on the potential choice.

<sup>4</sup> ABREU 90D assumed  $m_{H^\pm} < m_{b'} - 3 \text{ GeV}$ .

<sup>5</sup> Superseded by ABREU 91F.

<sup>6</sup> AKRAWY 90B search was restricted to data near the  $Z$  peak at  $E_{cm} = 91.26$  GeV at LEP. The excluded region is between 23.6 and 41.4 GeV if no  $H^\pm$  decays exist. For charged Higgs decays the excluded regions are between  $(m_{H^\pm} + 1.5 \text{ GeV})$  and 45.5 GeV.

<sup>7</sup> AKRAWY 90I search for isolated photons in hadronic  $Z$  decay and derive

$B(Z \rightarrow b'\bar{b}') \cdot B(b' \rightarrow \gamma X) / B(Z \rightarrow \text{hadrons}) < 2.2 \times 10^{-3}$ . Mass limit assumes

$B(b' \rightarrow \gamma X) > 10\%$ .

<sup>8</sup> ABE 89E search at  $E_{cm} = 56\text{--}57$  GeV at TRISTAN for multihadron events with a spherical shape (using thrust and acoplanarity) or containing isolated leptons.

<sup>9</sup> ABE 89G search was at  $E_{cm} = 55\text{--}60.8$  GeV at TRISTAN.

<sup>10</sup> If the photonic decay mode is large ( $B(b' \rightarrow b\gamma) > 25\%$ ), the ABRAMS 89C limit is 45.4 GeV. The limit for Higgs decay ( $b' \rightarrow cH^-, H^- \rightarrow \bar{c}s$ ) is 45.2 GeV.

<sup>11</sup> ADACHI 89C search was at  $E_{cm} = 56.5\text{--}60.8$  GeV at TRISTAN using multi-hadron events accompanying muons.

<sup>12</sup> ADACHI 89C also gives limits for any mixture of  $CC$  and  $bg$  decays.

<sup>13</sup> ENO 89 search at  $E_{cm} = 50\text{--}60.8$  at TRISTAN.

<sup>14</sup> ENO 89 considers arbitrary mixture of the charged current,  $bg$ , and  $b\gamma$  decays.

<sup>15</sup> IGARASHI 88 searches for leptons in low-thrust events and gives  $\Delta R(b') < 0.26$  (95% CL) assuming charged current decay, which translates to  $m_{b'} > 24.4$  GeV.

<sup>16</sup> SAGAWA 88 set limit  $\sigma(\text{top}) < 6.1 \text{ pb}$  at CL=95% for top-flavored hadron production from event shape analyses at  $E_{cm} = 52$  GeV. By using the quark parton model cross-section formula near threshold, the above limit leads to lower mass bounds of 23.8 GeV for charge  $-1/3$  quarks.

<sup>17</sup> ADEVA 86 give 95%CL upper bound on an excess of the normalized cross section,  $\Delta R$ , as a function of the minimum c.m. energy (see their figure 3). Production of a pair of  $1/3$  charge quarks is excluded up to  $E_{cm} = 45.4$  GeV.

<sup>18</sup> ALTHOFF 84C narrow state search sets limit  $\Gamma(e^+e^-) / B(\text{hadrons}) < 2.4 \text{ keV}$  CL = 95% and heavy charge  $1/3$  quark pair production  $m > 21$  GeV, CL = 95%.

<sup>19</sup> ALTHOFF 84I exclude heavy quark pair production for  $7 < m < 19$  GeV ( $1/3$  charge) using aplanarity distributions (CL = 95%).

See key on page 1171

- AAD 23av based on 139 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 13$  TeV. Pair production of vector-like  $t'$  is searched for in the mode  $\ell^\pm \ell'^\mp + \geq 2j$  ( $\geq 1b$ -tagged) +  $E_T$  or with  $3\ell$ . The data are consistent with the SM background predictions and limits are obtained for different branching ratios.
- TUMASYAN 23AX based on 138 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 13$  TeV. A vector-like  $t'$  is searched for in the  $t + H (H \rightarrow \gamma\gamma)$  decay channel. EW production via a coupling to third-generation quarks of  $\kappa_T = 0.25$  is assumed. The branching fractions are assumed to be 50, 25, and 25%, respectively, for  $bW$ ,  $tZ$ , and  $tH$  decays.
- TUMASYAN 23v based on 138 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 13$  TeV. Pair production of vector-like  $t'$  is searched for in the single-lepton, same-sign charge dilepton and multi-lepton channels. The data are consistent with the SM background predictions and limits are obtained for different branching ratios. Masses below 1.48 TeV are excluded for all decays to third generation quarks.
- AABOUD 18CE based on 36.1 fb<sup>-1</sup> of proton-proton data taken at  $\sqrt{s} = 13$  TeV. Events including a same-sign lepton pair are used. The limit is for a singlet model, assuming the branching ratios of  $t'$  into  $Zt$ ,  $Wb$  and  $Ht$  as predicted by the model.
- AABOUD 18CP based on 36.1 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 13$  TeV. Pair and single production of vector-like  $t'$  are searched for with at least one  $t'$  decaying into  $Zt$ . In the case of  $B(t' \rightarrow Zt) = 1$ , the limit is  $m_{t'} > 1340$  GeV.
- The limit is for the singlet model, assuming that the branching ratios into  $Zt$ ,  $Wb$ , and  $Ht$  add up to one.
- The limit is for the doublet model, assuming that the branching ratios into  $Zt$ ,  $Wb$ , and  $Ht$  add up to one.
- AABOUD 18CR based on 36.1 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 13$  TeV. A combination of searches for the pair-produced vector-like  $t'$  in various decay channels ( $t' \rightarrow Wb, Zt, ht$ ). Also a model-independent limit is obtained as  $m_{t'} > 1.31$  TeV, assuming that the branching ratios into  $Zt$ ,  $Wb$  and  $ht$  add up to one.
- The limit is for the singlet  $t'$ .
- The limit is for  $t'$  in a weak isospin doublet ( $t', b'$ ) and  $|V_{t'b}| \ll |V_{t'c}|$ .
- SIRUNYAN 18BM based on 35.9 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 13$  TeV. The limit is for the pair-produced vector-like  $t'$ . Three channels (single lepton, same-charge 2 leptons, or at least 3 leptons) are considered for various branching fraction combinations. Assuming  $B(tH) = 1$ , the limit is 1270 GeV and for  $B(tZ) = 1$  it is 1300 GeV.
- SIRUNYAN 18Q based on 19.7 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 8$  TeV. The limit is for the pair-produced vector-like  $t'$  that couple only to light quarks. Constraints for other decay channels ( $Zq$  and  $Hq$ ) are also given in the paper.
- SIRUNYAN 18W based on 35.8 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 13$  TeV. The limit is for the vector-like  $t'$  pair-produced by strong interaction using lepton-plus-jets mode and assuming that  $B(t' \rightarrow Wb)$  is 100% of the production cross section and branching fraction to  $Wb$  for any new pair-produced heavy quark decaying to this channel as a narrow resonance.
- SIRUNYAN 17AU based on 2.3-2.6 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 13$  TeV. Limit on pair-produced singlet vector-like  $t'$  using one lepton and several jets. The mass bound is given for a  $t'$  transforming as a singlet under the electroweak symmetry group, assumed to decay through  $W, Z$  or Higgs boson (which decays to jets) and to a third generation quark. For a doublet, the limit is  $>830$  GeV. Other limits are also given in the paper.
- Based on 20.3 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 8$  TeV. No significant excess over SM expectation is found in the search for pair production or single production of  $t'$  in the events with dilepton from a high  $P_T Z$  and additional jets ( $\geq 1 b$ -tag). If instead of  $B(b' \rightarrow Wt) = 1$  an electroweak singlet with  $B(b' \rightarrow Wt) \sim 0.45$  is assumed, the limit reduces to 685 GeV.
- Based on 1.04 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 7$  TeV. No signal is found for the search of heavy quark pair production that decay into  $W$  and a quark in the events with dileptons, large  $E_T$ , and  $\geq 2$  jets.
- Based on 1.04 fb<sup>-1</sup> of data in pp collisions at 7 TeV. AAD 12c looked for  $t'\bar{t}'$  production followed by  $t'$  decaying into a top quark and  $X$ , an invisible particle, in a final state with an isolated high- $P_T$  lepton, four or more jets, and a large missing transverse energy. No excess over the SM  $t\bar{t}$  production gives the upper limit on  $t'\bar{t}'$  production cross section as a function of  $m_{t'}$  and  $m_X$ . The result is obtained for  $B(t' \rightarrow Wt) = 1$ .
- Based on 5 fb<sup>-1</sup> of pp data at  $\sqrt{s} = 7$  TeV. CHATRCHYAN 12BH searched for QCD and EW production of single and pair of degenerate 4th generation quarks that decay to  $Wb$  or  $Wt$ . Absence of signal in events with one lepton, same-sign dileptons or tripletons gives the bound. With a mass difference of 25 GeV/c<sup>2</sup> between  $m_{t'}$  and  $m_{b'}$ , the corresponding limit shifts by about  $\pm 20$  GeV/c<sup>2</sup>.

# Quark Particle Listings

## $t'$ (Fourth Generation) Quark

- <sup>19</sup>Based on  $5.0 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 7 \text{ TeV}$ . CHATRCHYAN 12P looked for  $t'\bar{t}'$  production events with two isolated high  $p_T$  leptons, large  $E_T$ , and 2 high  $p_T$  jets with  $b$ -tag. The absence of signal above the SM background gives the limit for  $B(t' \rightarrow Wb) = 1$ .
- <sup>20</sup>AAD 23AG based on  $139 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . Pair production of vector-like top or  $b_s$  is searched for in the mode  $1\ell + \geq 4j$  ( $\geq 1b$ -tagged) +  $E_T$ . The data are consistent with the SM background predictions and limits are obtained for different branching ratios. Masses below  $1.59 \text{ TeV}$  are excluded assuming a mass-degenerate vector-like doublet ( $t', b'$ ) model.
- <sup>21</sup>SIRUNYAN 19AQ based on  $35.9 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . Pair production of vector-like  $t'$  is searched for with one  $t'$  decaying into  $Zt$  and the other  $t'$  decaying into  $Wb, Zt, ht$ . Events with an opposite-sign lepton pair consistent with coming from  $Z$  and jets are used. Mass limits are obtained for a variety of branching ratios of  $t'$ .
- <sup>22</sup>SIRUNYAN 19BW based on  $35.9 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . The limit is for the pair-produced vector-like  $t'$  using all-hadronic final state. The analysis is made for the  $Wb, Zt, ht$  modes and mass limits are obtained for a variety of branching ratios.
- <sup>23</sup>AABOUD 18CL based on  $36.1 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . The limit is for the pair-produced vector-like  $t'$  using all-hadronic final state. The analysis is also made for the  $Wb, Zt, ht$  modes and mass limits are obtained for a variety of branching ratios.
- <sup>24</sup>AABOUD 17L based on  $36.1 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . No signal is found in the search for heavy quark pair production that decay into  $Zt$  followed by  $Z \rightarrow \nu\nu$  in the events with one lepton, large  $E_T$ , and  $\geq 4$  jets. The lower mass limit  $0.87 (1.05) \text{ TeV}$  is obtained for the singlet (doublet) model with other possible decay modes.
- <sup>25</sup>AAD 15AR based on  $20.3 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ . Used lepton-plus-jets final state. See Fig. 20 for mass limits in the plane of  $B(t' \rightarrow Ht)$  vs.  $B(t' \rightarrow Wb)$  from a combination of  $t'\bar{t}' \rightarrow Wb + X$  and  $t'\bar{t}' \rightarrow Ht + X$  searches. Any branching ratio scenario is excluded for mass below  $715 \text{ GeV}$ .
- <sup>26</sup>AAD 15BY based on  $20.3 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ . Limit on pair-produced vector-like  $t'$  assuming the branching fractions to  $W, Z$ , and  $h$  modes of the singlet model. Used events containing  $\geq 2\ell + E_T + \geq 2j$  ( $\geq 1b$ ) and including a same-sign lepton pair.
- <sup>27</sup>KHACHATRYAN 15AI based on  $19.7 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ . The search exploits all-hadronic final states by tagging boosted Higgs boson using jet substructure and  $b$ -tagging.
- <sup>28</sup>Based on  $19.5 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ . The  $t'$  quark is pair produced and is assumed to decay into three different final states of  $bW, tZ$ , and  $th$ . The search is carried out using events with at least one isolated lepton.
- <sup>29</sup>Based on  $4.7 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 7 \text{ TeV}$ . No signal is found for the search of heavy quark pair production that decay into  $W$  and a  $b$  quark in the events with a high  $p_T$  isolated lepton, large  $E_T$ , and at least 3 jets ( $\geq 1b$ -tag). Vector-like quark of charge  $2/3$  with  $400 < m_{t'} < 550 \text{ GeV}$  and  $B(t' \rightarrow Wb) > 0.63$  is excluded at 95% CL.
- <sup>30</sup>Based on  $5.0 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 7 \text{ TeV}$ . CHATRCHYAN 13I looked for events with one isolated electron or muon, large  $E_T$ , and at least four jets with large transverse momenta, where one jet is likely to originate from the decay of a bottom quark.
- <sup>31</sup>Based on  $1.04 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 7 \text{ TeV}$ . No signal is found in the search for pair produced heavy quarks that decay into  $W$  boson and a  $b$  quark in the events with a high  $p_T$  isolated lepton, large  $E_T$  and at least 3 jets ( $\geq 1b$ -tag).
- <sup>32</sup>Based on  $5.0 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 7 \text{ TeV}$ . CHATRCHYAN 12BC looked for  $t'\bar{t}'$  production events with a single isolated high  $p_T$  lepton, large  $E_T$  and at least 4 high  $p_T$  jets with a  $b$ -tag. The absence of signal above the SM background gives the limit for  $B(t' \rightarrow Wb) = 1$ .
- <sup>33</sup>Based on  $5.7 \text{ fb}^{-1}$  of data in  $p\bar{p}$  collisions at  $1.96 \text{ TeV}$ . AALTONEN 11AH looked for  $t'\bar{t}'$  production followed by  $t'$  decaying into a top quark and  $X$ , an invisible particle, in the all hadronic decay mode of  $t\bar{t}$ . No excess over the SM  $t\bar{t}$  production gives the upper limit on  $t'\bar{t}'$  production cross section as a function of  $m_{t'}$  and  $m_X$ . The result is obtained for  $B(t' \rightarrow Xt) = 1$ .
- <sup>34</sup>Based on  $5.6 \text{ fb}^{-1}$  of data in  $p\bar{p}$  collisions at  $1.96 \text{ TeV}$ . AALTONEN 11AL looked for  $\ell + \geq 4j$  events and set upper limits on  $\sigma(t'\bar{t}')$  as functions of  $m_{t'}$ .
- <sup>35</sup>Based on  $4.8 \text{ fb}^{-1}$  of data in  $p\bar{p}$  collisions at  $1.96 \text{ TeV}$ . AALTONEN 11O looked for  $t'\bar{t}'$  production signal when  $t'$  decays into a top quark and  $X$ , an invisible particle, in  $\ell + E_T + \text{jets}$  channel. No excess over the SM  $t\bar{t}$  production gives the upper limit on  $t'\bar{t}'$  production cross section as a function of  $m_{t'}$  and  $m_X$ . The result is obtained for  $B(t' \rightarrow Xt) = 1$ .
- <sup>36</sup>Based on  $5.3 \text{ fb}^{-1}$  of data in  $p\bar{p}$  collisions at  $1.96 \text{ TeV}$ . ABAZOV 11Q looked for  $\ell + E_T + \geq 4j$  events and set upper limits on  $\sigma(t'\bar{t}')$  as functions of  $m_{t'}$ .
- <sup>37</sup>Searches for pair production of a new heavy top-like quark  $t'$  decaying to a  $W$  boson and another quark by fitting the observed spectrum of total transverse energy and reconstructed  $t'$  mass in the lepton + jets events.
- <sup>38</sup>HUANG 08 reexamined the  $t'$  mass lower bound of  $256 \text{ GeV}$  obtained in AALTONEN 08H that assumes  $B(b' \rightarrow qZ) = 1$  for  $q = u, c$  which does not hold when  $m_{b'} < m_{t'} - m_W$  or the mixing  $\sin^2(\theta_{bt'})$  is so tiny that the decay occurs outside of the vertex detector. Fig. 1 gives that lower bound on  $m_{t'}$  in the plane of  $\sin^2(\theta_{bt'})$  and  $m_{b'}$ .

• • • We do not use the following data for averages, fits, limits, etc. • • •

- >1350 95 <sup>8</sup> AABOUD 18AW ATLS  $t'(5/3) \rightarrow tW^+$
- <sup>1</sup>AAD 23AG based on  $139 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . Pair production of vector-like top or  $b'$  is searched for in the mode  $1\ell + \geq 4j$  ( $\geq 1b$ -tagged) +  $E_T$ . The data are consistent with the SM background predictions and limits are obtained for different branching ratios.
- <sup>2</sup>SIRUNYAN 19T based on  $35.9 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . Signals are searched in the final states of  $t'$  pair production, with same-sign leptons (which come from a  $t'$  decay) or a single lepton (which comes from a  $W$  out of  $4W$ s), along with jets, and no excess over the SM expectation is found.
- <sup>3</sup>AABOUD 18CE based on  $36.1 \text{ fb}^{-1}$  of proton-proton data taken at  $\sqrt{s} = 13 \text{ TeV}$ . Events including a same-sign lepton pair are used. The limit is for the pair-produced vector-like  $t'$ . With single  $t'$  production included, assuming  $t'tW$  coupling of one, the limit is  $m_{t'} > 1.6 \text{ TeV}$ .
- <sup>4</sup>SIRUNYAN 17J based on  $2.3 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . Signals are searched in the final states of  $t'$  pair production, with same-sign leptons (which come from a  $t'$  decay) or a single lepton (which comes from a  $W$  out of  $4W$ s), along with jets, and no excess over the SM expectation is found.
- <sup>5</sup>AAD 15BY based on  $20.3 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ . Limit on  $t'(5/3)$  in pair and single production assuming its coupling to  $Wt$  is equal to one. Used events containing  $\geq 2\ell + E_T + \geq 2j$  ( $\geq 1b$ ) and including a same-sign lepton pair.
- <sup>6</sup>AAD 15Z based on  $20.3 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ . Used events with  $\ell + E_T + \geq 6j$  ( $\geq 1b$ ) and at least one pair of jets from weak boson decay, sensitive to the final state  $b\bar{b}W^+W^-W^+W^-$ .
- <sup>7</sup>CHATRCHYAN 14T based on  $19.5 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ . Non-observation of anomaly in  $H_T$  distribution in the same-sign dilepton events leads to the limit when pair produced  $t'(5/3)$  quark decays exclusively into  $t$  and  $W^+$ , resulting in the final state with  $b\bar{b}W^+W^-W^+W^-$ .
- <sup>8</sup>AABOUD 18AW based on  $36.1 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . Limit on  $t'(5/3)$  in pair production assuming its coupling to  $Wt$  is equal to one. Lepton-plus-jets final state is used, characterized by  $\ell + E_T + \text{jets}$  ( $\geq 1b$ -tagged).

### $t'(2/3)$ mass limits from single production in $p\bar{p}$ and $pp$ collisions

		3 AAD	22G ATLS	$t' \rightarrow Ht$ , singlet $t'$
		4 TUMASYAN	22X CMS	$t' \rightarrow Zt$

• • • We do not use the following data for averages, fits, limits, etc. • • •

- <sup>1</sup>AAD 16AV based on  $20.3 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 8 \text{ TeV}$ . No significant excess over SM expectation is found in the search for a fully reconstructed vector-like  $t'$  in the mode  $\ell + E_T + \geq 2j$  ( $\geq 1b$ ). A veto on massive large-radius jets is used to reject the  $t\bar{t}$  background.
- <sup>2</sup>ABAZOV 11F based on  $5.4 \text{ fb}^{-1}$  of data in  $p\bar{p}$  collisions at  $1.96 \text{ TeV}$ . It looked for single production of  $t'$  via the  $Z$  or  $E$  coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes  $p\bar{p} \rightarrow t'q \rightarrow (Wd)q$ , and  $p\bar{p} \rightarrow t'q \rightarrow (Zd)q$  are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks.
- <sup>3</sup>AAD 22G based on  $139 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . No significant excess over SM expectation is found in the search for a vector-like  $t'$  in the  $Ht$  decay channel, where  $H$  and  $t$  are reconstructed as single jets. The mass range between  $1.0$  and  $2.3 \text{ TeV}$  is targeted and 95% CL limits on the production section times the decay branching fraction are set depending on the coupling and mass of  $t'$ .
- <sup>4</sup>TUMASYAN 22X based on  $137 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . No significant excess over SM expectation is found in the search for a vector-like  $t'$  in the  $Zt$  decay channel, where  $Z$  decays to neutrinos and  $t$  decays hadronically. The 95% CL limits on the production section times the decay branching fraction are set depending on the coupling and mass of  $t'$ .

### $t'(5/3)$ mass limits from single production in $p\bar{p}$ and $pp$ collisions

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
	1 SIRUNYAN 19AI CMS	$tW \rightarrow t'(5/3) \rightarrow tW$	

• • • We do not use the following data for averages, fits, limits, etc. • • •

- <sup>1</sup>SIRUNYAN 19AI based on  $35.9 \text{ fb}^{-1}$  of  $pp$  data at  $\sqrt{s} = 13 \text{ TeV}$ . Exclusion limits are set on the product of the production cross section and branching fraction for the  $b'(-1/3) + t$  and  $t'(5/3) + t$  modes as a function of the vector-like quark mass in Fig. 8 and Tab. 2 for relative vector-like quark widths between 1 and 30% for left- and right-handed vector-like quark couplings. No significant deviation from the SM prediction is observed.

- 1 CHATRCHYAN 13AR limits assume pair-produced long-lived spin-1/2 particles neutral under  $SU(3)_C$  and  $SU(2)_L$ .
- 2 ABE 92I flux limits decrease as the mass increases from 50 to 500 GeV.
- 3 HE 91I limits are for charges of the form  $N \pm 1/3$  from 2/3/3 to 38/3.
- 4 Hadronic or leptonic quarks.
- 5 Cross section  $\text{cm}^2/\text{GeV}^2$ .
- 6  $3 \times 10^{-5}$  <lifetime <  $1 \times 10^{-3}$  s.
- 7 Includes BOTT 72 results.
- 8 Assumes isotropic cm production.
- 9 Cross section inferred from flux.

### Free Quark Searches

#### FREE QUARK SEARCHES

Quarks are fractionally charged particles, the constituents of hadrons, with charges  $1/3 e$  or  $2/3 e$ . The charge of every known charged system is an integer multiple of  $1/3 e$ . Quantum Chromodynamics predicts that quarks cannot be observed as freely propagating particles, being confined inside hadrons or deconfined in quark-gluon plasma (QGP). We observe the top quark decaying as still free, because its lifetime is too short to allow its hadronization. Experiments have produced no evidence for free propagating quarks.

Reviews can be found in Refs. 1-5.

#### Quark Flux — Accelerator Searches

The definition of FLUX depends on the experiment

- (a) is the ratio of measured free quarks to predicted free quarks if there is no "confinement."
- (b) is the probability of fractional charge on nuclear fragments. Energy is in GeV/nucleon.
- (c) is the 90%CL upper limit on fractionally-charged particles produced per interaction.
- (d) is quarks per collision.
- (e) is inclusive quark-production cross-section ratio to  $\sigma(e^+e^- \rightarrow \mu^+\mu^-)$ .
- (f) is quark flux per charged particle.
- (g) is the flux per  $\nu$ -event.
- (h) is quark yield per  $\pi^-$  yield.
- (i) is 2-body exclusive quark-production cross-section ratio to  $\sigma(e^+e^- \rightarrow \mu^+\mu^-)$ .

<sup>1</sup> HUENTRUP 96 quote 95% CL limits for production of fragments with charge differing by as much as ±1/3 (in units of e) for charge 6 ≤ Z ≤ 10.  
<sup>2</sup> BUSKULIC 93c limits for inclusive quark production are more conservative if the ALEPH hadronic fragmentation function is assumed.  
<sup>3</sup> CECCINI 93 limit at 90%CL for 23/3 ≤ Z ≤ 40/3, for 16A GeV O, 14.5A Si, and 200A S incident on Cu target. Other limits are 2.3 × 10<sup>-4</sup> for 17/3 ≤ Z ≤ 20/3 and 1.2 × 10<sup>-4</sup> for 20/3 ≤ Z ≤ 23/3.  
<sup>4</sup> GHOSH 92 reports measurement of spallation fragment charge based on ionization in emulsion. Out of 650 measured tracks, 2 were consistent with charge 5e/3, and 4 with 7e/3.  
<sup>5</sup> Hadronic quark.  
<sup>6</sup> Leptonic quark.  
<sup>7</sup> HE 91 limits are for charges of the form N±1/3 from 23/3 to 38/3, and correspond to cross-section limits of 380μb (Pb) and 320μb (Cu).  
<sup>8</sup> The limits apply to projectile fragment charges of 17, 19, 20, 22, 23 in units of e/3.  
<sup>9</sup> The limits apply to projectile fragment charges of 16, 17, 19, 20, 22, 23 in units of e/3.  
<sup>10</sup> Flux limits and mass range depend on charge.  
<sup>11</sup> Bound to nuclei.  
<sup>12</sup> Quark lifetimes > 1 × 10<sup>-8</sup> s.  
<sup>13</sup> One candidate m < 0.17 GeV.

<sup>1</sup> ALEMANNNO 22 uses data from the DAMPE satellite, with calorimetry and tracking to search for fractionally charged particles with q = ±2/3e with a exposure time of 2.3 × 10<sup>7</sup> s.  
<sup>2</sup> See AGNESE 15 Fig.6 for limits on vertical density as function of charge extending to |q|/e < 1/10.  
<sup>3</sup> AMBROSIO 00c limit is below 11 × 10<sup>-15</sup> for 0.25 < q/e < 0.5, and is changing rapidly near q/e=2/3, where it is 2 × 10<sup>-14</sup>.  
<sup>4</sup> Distribution in celestial sphere was described as anisotropic.  
<sup>5</sup> With telescope axis at zenith angle 40° to the south.  
<sup>6</sup> Leptonic quarks.  
<sup>7</sup> Lifetime > 10<sup>-8</sup> s; charge ±0.70, 0.68, 0.42; and mass >4.4, 4.8, and 20 GeV, respectively.  
<sup>8</sup> Time delayed air shower search.  
<sup>9</sup> Prompt air shower search.  
<sup>10</sup> Also e/4 and e/6 charges.  
<sup>11</sup> No events in subsequent experiments.

- 1 95% CL limit for fractional charge particles with 0.18e ≤ |Q\_residual| ≤ 0.82e in total of 70.1 mg of silicone oil.
2 95% CL limit for particles with fractional charge |Q\_residual| > 0.16e in total of 17.4 mg of silicone oil.
3 Also set limits for Q = ±e/6.
4 Note that in PHILLIPS 88 these authors report a subtle magnetic effect which could account for the apparent fractional charges.
5 Limit inferred by JONES 77b.

# LIGHT UNFLAVORED MESONS (S = C = B = 0)

For  $I = 1$  ( $\pi, b, \rho, a$ ):  $u\bar{d}, (u\bar{u}-d\bar{d})/\sqrt{2}, d\bar{u}$ ;  
for  $I = 0$  ( $\eta, \eta', h, h', \omega, \phi, f, f'$ ):  $c_1(u\bar{u} + d\bar{d}) + c_2(s\bar{s})$

$\pi^\pm$

$$J^G(J^P) = 1^-(0^-)$$

We have omitted some results that have been superseded by later experiments. The omitted results may be found in our 1988 edition Physics Letters **B204** 1 (1988).

## $\pi^\pm$ MASS

The most accurate charged pion mass measurements are based upon x-ray wavelength measurements for transitions in  $\pi^-$ -mesonic atoms. The observed line is the blend of three components, corresponding to different K-shell occupancies. JECKELMANN 94 revisits the occupancy question, with the conclusion that two sets of occupancy ratios, resulting in two different pion masses (Solutions A and B), are equally probable. We choose the higher Solution B since only this solution is consistent with a positive mass-squared for the muon neutrino, given the precise muon momentum measurements now available (DAUM 91, ASSAMAGAN 94, and ASSAMAGAN 96) for the decay of pions at rest. Earlier mass determinations with  $\pi^-$ -mesonic atoms may have used incorrect K-shell screening corrections.

Measurements with an error of  $> 0.005$  MeV have been omitted from this Listing.

139.5660 ± 0.0024	<sup>9,10</sup> MARUSHEN... 76	CNTR	-	Mesonic atoms

- <sup>1</sup> DAUM 19 value is based on their previous (1991+1996) measurements of the  $\mu^+$  momentum of  $29.79200 \pm 0.00011$  MeV for  $\pi^+$  decay at rest. It also uses  $m_\mu = 105.6583745 \pm 0.0000024$  MeV, and assumes conservatively  $m_{\nu_\mu} = 2.0 \pm 2.0$  MeV. It is the most precise charged pion mass determination.
- <sup>2</sup> TRASSINELLI 16 use the muonic oxygen line for online energy calibration of the pionic line.
- <sup>3</sup> LENZ 98 result does not suffer K-electron configuration uncertainties as does JECKELMANN 94.
- <sup>4</sup> JECKELMANN 94 Solution B (dominant 2-electron K-shell occupancy), chosen for consistency with positive  $m_{\nu_\mu}^2$ .
- <sup>5</sup> ASSAMAGAN 96 measures the  $\mu^+$  momentum  $p_\mu$  in  $\pi^+ \rightarrow \mu^+ \nu_\mu$  decay at rest to be  $29.79200 \pm 0.00011$  MeV/c. Combined with the  $\mu^+$  mass and the assumption  $m_{\nu_\mu} = 0$ , this gives the  $\pi^+$  mass above; if  $m_{\nu_\mu} > 0$ ,  $m_{\pi^+}$  given above is a lower limit. Combined instead with  $m_\mu$  and (assuming CPT) the  $\pi^-$  mass of JECKELMANN 94,  $p_\mu$  gives an upper limit on  $m_{\nu_\mu}$  (see the  $\nu_\mu$ ).
- <sup>6</sup> JECKELMANN 94 Solution A (small 2-electron K-shell occupancy) in combination with either the DAUM 91 or ASSAMAGAN 94 pion decay muon momentum measurement yields a significantly negative  $m_{\nu_\mu}^2$ . It is accordingly not used in our fits.
- <sup>7</sup> The DAUM 91 value includes the ABELA 84 result. The value is based on a measurement of the  $\mu^+$  momentum for  $\pi^+$  decay at rest,  $p_\mu = 29.79179 \pm 0.00053$  MeV, uses  $m_\mu = 105.658389 \pm 0.000034$  MeV, and assumes that  $m_{\nu_\mu} = 0$ . The last assumption means that in fact the value is a lower limit.
- <sup>8</sup> JECKELMANN 86b gives  $m_\pi/m_e = 273.12677(71)$ . We use  $m_e = 0.51099906(15)$  MeV from COHEN 87. The authors note that two solutions for the probability distribution of K-shell occupancy fit equally well, and use other data to choose the lower of the two possible  $\pi^\pm$  masses.
- <sup>9</sup> These values are scaled with a new wavelength-energy conversion factor  $V\lambda = 1.23984244(37) \times 10^{-6}$  eV m from COHEN 87. The LU 80 screening correction relies upon a theoretical calculation of inner-shell refilling rates.
- <sup>10</sup> This MARUSHENKO 76 value used at the authors' request to use the accepted set of calibration  $\gamma$  energies. Error increased from 0.0017 MeV to include QED calculation error of 0.0017 MeV (12 ppm).

$$m_{\pi^+} - m_{\mu^+}$$

## $\pi^+$ DECAY MODES

$\pi^-$  modes are charge conjugates of the modes below.

For decay limits to particles which are not established, see the section on Searches for Axions and Other Very Light Bosons.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Confidence level
$\Gamma_1$ $\mu^+ \nu_\mu$	[a] (99.98770 ± 0.00004) %	
$\Gamma_2$ $\mu^+ \nu_\mu \gamma$	[b] ( 2.00 ± 0.25 ) × 10 <sup>-4</sup>	
$\Gamma_3$ $e^+ \nu_e$	[a] ( 1.230 ± 0.004 ) × 10 <sup>-4</sup>	
$\Gamma_4$ $e^+ \nu_e \gamma$	[b] ( 7.39 ± 0.05 ) × 10 <sup>-7</sup>	
$\Gamma_5$ $e^+ \nu_e \pi^0$	( 1.036 ± 0.006 ) × 10 <sup>-8</sup>	
$\Gamma_6$ $e^+ \nu_e e^+ e^-$	( 3.2 ± 0.5 ) × 10 <sup>-9</sup>	
$\Gamma_7$ $\mu^+ \nu_\mu \nu \bar{\nu}$	< 9 × 10 <sup>-6</sup>	90%
$\Gamma_8$ $e^+ \nu_e \nu \bar{\nu}$	< 1.6 × 10 <sup>-7</sup>	90%

### Lepton Family number (LF) or Lepton number (L) violating modes

$\Gamma_9$ $\mu^+ \bar{\nu}_e$	L	[c] < 1.5	× 10 <sup>-3</sup>	90%
$\Gamma_{10}$ $\mu^+ \nu_e$	LF	[c] < 8.0	× 10 <sup>-3</sup>	90%
$\Gamma_{11}$ $\mu^- e^+ e^+ \nu$	LF	< 1.6	× 10 <sup>-6</sup>	90%

[a] Measurements of  $\Gamma(e^+ \nu_e)/\Gamma(\mu^+ \nu_\mu)$  always include decays with  $\gamma$ 's, and measurements of  $\Gamma(e^+ \nu_e \gamma)$  and  $\Gamma(\mu^+ \nu_\mu \gamma)$  never include low-energy  $\gamma$ 's. Therefore, since no clean separation is possible, we consider the modes with  $\gamma$ 's to be subtractions of the modes without them, and let  $[\Gamma(e^+ \nu_e) + \Gamma(\mu^+ \nu_\mu)]/\Gamma_{\text{total}} = 100\%$ .

[b] See the Particle Listings below for the energy limits used in this measurement; low-energy  $\gamma$ 's are not included.

[c] Derived from an analysis of neutrino-oscillation experiments.

## $\pi^+$ BRANCHING RATIOS

••• We do not use the following data for averages, fits, limits, etc. •••					
1.15 ± 0.22	52	<sup>4</sup> DEPOMMIER	63	CNTR	+ See DEPOMMIER 68

<sup>1</sup> POCANIC 04 normalizes to  $e^+ \nu_e$  decays, using the PDG 2004 value  $B(\pi^+ \rightarrow e^+ \nu_e) = (1.230 \pm 0.004) \times 10^{-4}$ . We add their statistical  $(0.004 \times 10^{-8})$ , systematic  $(0.004 \times 10^{-8})$  and systematic error due to the uncertainty of  $B(\pi^+ \rightarrow e^+ \nu_e)$   $(0.003 \times 10^{-8})$  in quadrature.  
<sup>2</sup> This result can be used to calculate  $V_{ud}$  from pion beta decay:  $V_{ud}^{PIBETA} = 0.9728 \pm 0.0030$ .  
<sup>3</sup> MCFARLANE 85 combines a measured rate  $(0.394 \pm 0.015)/s$  with 1982 PDG mean life.  
<sup>4</sup> DEPOMMIER 68 says the result of DEPOMMIER 63 is at least 10% too large because of a systematic error in the  $\pi^0$  detection efficiency, and that this may be true of all the previous measurements (also V. Soergel, private communication, 1972).

0.011 ± 0.003		1,4,5 STETZ	78 SPEC	$\pi^+ \rightarrow e^+ \nu \gamma$

<sup>1</sup>These values come from fixing the vector form factor at the CVC prediction,  $F_V = 0.0259 \pm 0.0005$ .  
<sup>2</sup>When  $F_V$  is released, the BYCHKOV 09  $F_A$  is  $0.0117 \pm 0.0017$ , and  $F_A$  and  $F_V$  results are highly (anti-)correlated:  $F_A + 1.0286 F_V = 0.03853 \pm 0.00014$ .  
<sup>3</sup>The sign of  $\gamma = F_A / F_V$  is determined to be positive.  
<sup>4</sup>Only the absolute value of  $F_A$  is determined.  
<sup>5</sup>The result of STETZ 78 has a two-fold ambiguity. We take the solution compatible with later determinations.

## $\pi^\pm$ CHARGE RADIUS

The charge radius of the pion  $\sqrt{\langle r_\pi^2 \rangle}$  is defined in relation to the form factor of the pion electromagnetic vertex, called vector form factor VFF,  $F_V$ . The VFF is a function of the squared four-momentum transfer  $t$ , or of the squared c.m. energy  $s$ , depending on the channel in which the photon exchange takes place. In both cases, it is related to the slope of the VFF at zero, namely

$$\langle r_\pi^2 \rangle = 6 \frac{dF_V(q^2)}{dq^2} (q=0) \text{ where } q = t, s$$

The quantity cannot be measured directly. It can be extracted from the cross sections of three processes: pion electroproduction,  $eN \rightarrow eN\pi$ , and pion electron scattering  $e\pi \rightarrow e\pi$ , for the  $t$  channel, and positron electron annihilation into two charged pions,  $e^+e^- \rightarrow \pi^+\pi^-$ , for the  $s$  channel. We encode all measurements, but we do not use electroproduction data in averaging because the extraction of the pion radius involves, in this case, theoretical uncertainties that cannot be controlled at the needed level of accuracy. In case of analyses based on the same data set, as ANANTHANARAYAN 17 and COLANGELO 19, which cannot be averaged, we combine the results into a common value, with the uncertainty range chosen to cover both analyses. Note that for consistency the form factor needs to be defined in both channels with the vacuum polarisation removed. For details see COLANGELO 19 or Appendix B of ANANTHANARAYAN 16a.

- This value combines the measurements of ANANTHANARAYAN 17 and COLANGELO 19 which are based on the same data set. The uncertainty range is chosen to cover both results.
- CUI 21A perform a fit including spacelike data only. Employ a new mathematical procedure based on interpolation via continued fractions augmented by statistical sampling. Also do not impose the charge conserving normalization condition  $F(0) = 1$ .
- COLANGELO 19 fit existing  $F_V$  data, using an extended Omnes dispersive representation. This analysis is based on the same data set of ANANTHANARAYAN 17. Accordingly, they cannot be averaged. We combine the results into a common value, with the uncertainty range chosen to cover the uncertainty ranges of both analyses.
- ANANTHANARAYAN 17 fit existing  $F_V$  data, using a mixed phase-modulus dispersive representation. This analysis is based on the same data set of COLANGELO 19. Accordingly, they cannot be averaged. We combine the results into a common value, with the uncertainty range chosen to cover the uncertainty ranges of both analyses.
- According to the authors the uncertainty could be underestimated. The value quoted omits the BaBar data AUBERT 09.
- The extractions could contain an additional theoretical uncertainty which cannot be sufficiently quantified.
- BIJNENS 98 fits existing data.
- The extraction is based on a parametrization that does not have correct analytic properties.

## $\pi^\pm$ REFERENCES

### $\pi^0$ MEAN LIFE

Most experiments measure the  $\pi^0$  width which we convert to a lifetime. ATHERTON 85 is the only direct measurement of the  $\pi^0$  lifetime. The two Primakoff measurements from 1970 have been excluded from our average because they suffered model-related systematics unknown at the time. More information on the  $\pi^0$  lifetime can be found in BERNSTEIN 13.

VALUE ( $10^{-17}$ s)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>8.43 ± 0.13 OUR AVERAGE</b>				Error includes scale factor of 1.2.

9 ± 0.68		KRYSHKIN 70	CNTR	Primakoff effect
7.3 ± 1.1		BELLETTINI 65B	CNTR	Primakoff effect

- LARIN 20 reported this lifetime value from a measurement of  $\Gamma(\pi^0 \rightarrow \gamma\gamma) = 7.802 \pm 0.052 \pm 0.105$  eV, combining data from PrimEX-II on 12C and 28Si targets with previous PrimEX-I LARIN 11 measurements. This result supersedes LARIN 11.
- BYCHKOV 09 obtains this using the conserved-vector-current relation between the vector form factor  $F_V$  and the  $\pi^0$  lifetime.
- WILLIAMS 88 gives  $\Gamma(\gamma\gamma) = 7.7 \pm 0.5 \pm 0.5$  eV. We give here  $\tau = \hbar/\Gamma(\text{total})$ .
- BROWMAN 74 gives a  $\pi^0$  width  $\Gamma = 8.02 \pm 0.42$  eV. The mean life is  $\hbar/\Gamma$ .
- LARIN 11 reported  $\Gamma(\pi^0 \rightarrow \gamma\gamma) = 7.82 \pm 0.14 \pm 0.17$  eV which we converted to mean life  $\tau = \hbar/\Gamma(\text{total})$ .

### $\pi^0$ DECAY MODES

For decay limits to particles which are not established, see the appropriate Search sections ( $A^0$  (axion) and Other Light Boson ( $X^0$ ) Searches, etc.).

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level
$\Gamma_1$	$2\gamma$	(98.823 ± 0.034) % S=1.5

$\Gamma_{15}$	$\mu^+ e^- + \mu^- e^+$	LF	< 3.6	× 10 <sup>-10</sup> CL=90%

### CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 6 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 4.6$  for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_2$	-100
$x_4$	0    -1
	$x_1$ $x_2$

$\pi^0$

## $\Gamma(e^+e^-e^-e^-)/\Gamma(2\gamma)$ $\Gamma_4/\Gamma_1$

VALUE (units $10^{-5}$ )	EVTS	DOCUMENT ID	TECN	COMMENT
<b>3.38 ± 0.16 OUR FIT</b>				
<b>3.38 ± 0.16 OUR AVERAGE</b>				
3.46 ± 0.19	30.5k	<sup>1</sup> ABOUZAIID 08D	KTEV	$K_L^0 \rightarrow \pi^0 \pi^0 \pi^0_{DD}$
3.18 ± 0.30	146	<sup>2</sup> SAMIOS 62B	HBC	

<sup>1</sup> This ABOUZAIID 08D value includes all radiative final states. The error includes both statistical and systematic errors. The correlation between the Dalitz-pair planes gives a direct measurement of the  $\pi^0$  parity. The  $\pi^0 2\gamma^*$  form factor is measured and limits are placed on a scalar contribution to the decay.  
<sup>2</sup> SAMIOS 62B value uses a Panofsky ratio = 1.62.

## $\Gamma(e^+e^-)/\Gamma_{total}$ $\Gamma_5/\Gamma$

Experimental results are listed; branching ratios corrected for radiative effects are given in the footnotes. BERMAN 60 found  $B(\pi^0 \rightarrow e^+e^-) \geq 4.69 \times 10^{-8}$  via an exact QED calculation.

### $\pi^0$ ELECTROMAGNETIC FORM FACTOR

The amplitude for the process  $\pi^0 \rightarrow e^+e^-\gamma$  contains a form factor  $F(x)$  at the  $\pi^0 \gamma \gamma$  vertex, where  $x = [m_{e^+e^-}/m_{\pi^0}]^2$ . The parameter  $a$  in the linear expansion  $F(x) = 1 + ax$  is listed below.

All the measurements except that of BEHREND 91 are in the time-like region of momentum transfer.

### LINEAR COEFFICIENT OF $\pi^0$ ELECTROMAGNETIC FORM FACTOR

-15 ± 10	7.6k	KOBRAK 61	HBC	No radiation corr.
-24 ± 16	3.0k	SAMIOS 61	HBC	No radiation corr.

<sup>1</sup> BEHREND 91 estimates that their systematic error is of the same order of magnitude as their statistical error, and so we have included a systematic error of this magnitude. The value of  $a$  is obtained by extrapolation from the region of large space-like momentum transfer assuming vector dominance.

<sup>2</sup> TUPPER 83 is a theoretical analysis of FISCHER 78 including 2-photon exchange in the corrections.

<sup>3</sup> The FISCHER 78 error is statistical only. The result without radiation corrections is +0.05 ± 0.03.

## $\eta$

We have omitted some results that have been superseded by later experiments. The omitted results may be found in our 1988 edition Physics Letters **B204** (1988).

## $\eta$ MASS

Recent measurements resolve the obvious inconsistency in previous  $\eta$  mass measurements in favor of the higher value first reported by NA48 (LAI 02). We use only precise measurements consistent with this higher mass value for our  $\eta$  mass average.

[a] Forbidden by angular momentum conservation.

[b] C parity forbids this to occur as a single-photon process.

## CONSTRAINED FIT INFORMATION

An overall fit to 2 decay rate and 22 branching ratios uses 54 measurements and one constraint to determine 9 parameters. The overall fit has a  $\chi^2 = 46.2$  for 46 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

Table with 17 columns (x3 to x16) and 17 rows (x3 to G). Values are integers representing a correlation matrix.

Table with 3 columns: Mode, Rate (keV), and Scale factor. Lists decay modes like 2γ, 3π0, π0 2γ, etc., with their corresponding rates and scale factors.

$\eta$  DECAY RATES

$\Gamma(2\gamma)$  See the table immediately above giving the fitted decay rates. Following the advice of NEFKENS 02, we have removed the Primakoff-effect measurement from the average. See also the "Note on the Decay Width ( $\eta \rightarrow \gamma\gamma$ )," in our 1994 edition, Phys. Rev. D50, 1 August 1994, Part 1, p. 1451, for a discussion of the various measurements.

Table with 5 columns: VALUE (keV), EVTS, DOCUMENT ID, TECN, COMMENT. Lists various measurements for  $\Gamma(2\gamma)$  with values like 0.515 ± 0.018 OUR FIT and 0.516 ± 0.018 OUR AVERAGE.

1 RODRIGUES 08 uses a more sophisticated calculation for the inelastic background due to incoherent photoproduction to reanalyze the  $\eta$  photoproduction data on Be and Cu at 9 GeV from BROWMAN 74b. This brings the value of  $\Gamma(\eta \rightarrow 2\gamma)$  in line with direct measurements of the width. The error here is only statistical.
2 BEMPORAD 67 gives  $\Gamma(2\gamma) = 1.21 \pm 0.26$  keV assuming  $\Gamma(2\gamma)/\Gamma(\text{total}) = 0.314$ . Bemporad private communication gives  $\Gamma(2\gamma)^2/\Gamma(\text{total}) = 0.380 \pm 0.083$ . We evaluate this using  $\Gamma(2\gamma)/\Gamma(\text{total}) = 0.38 \pm 0.01$ . Not included in average because the uncertainty resulting from the separation of the coulomb and nuclear amplitudes has apparently been underestimated.

$\Gamma(\pi^0 2\gamma)$  Table with 5 columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Lists measurements for  $\Gamma(\pi^0 2\gamma)$  with values like 0.334 ± 0.028 OUR FIT and 0.33 ± 0.03.

$\eta$  BRANCHING RATIOS

Neutral modes

$\Gamma(\text{neutral modes})/\Gamma_{\text{total}}$  Table with 5 columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Lists measurements for neutral mode branching ratios with values like 0.7196 ± 0.0030 OUR FIT and 0.705 ± 0.008.

$\Gamma(2\gamma)/\Gamma_{\text{total}}$  Table with 5 columns: VALUE (units  $10^{-2}$ ), EVTS, DOCUMENT ID, TECN, COMMENT. Lists measurements for  $\Gamma(2\gamma)/\Gamma_{\text{total}}$  with values like 0.3936 ± 0.18 OUR FIT and 0.3953 ± 0.33 OUR AVERAGE.

$\Gamma(2\gamma)/\Gamma(\text{neutral modes})$  Table with 5 columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Lists measurements for the ratio of  $\Gamma(2\gamma)$  to neutral modes with values like 0.5470 ± 0.0018 OUR FIT and 0.548 ± 0.023 OUR AVERAGE.

$\Gamma(3\pi^0)/\Gamma_{\text{total}}$  Table with 5 columns: VALUE (units  $10^{-2}$ ), EVTS, DOCUMENT ID, TECN, COMMENT. Lists measurements for  $\Gamma(3\pi^0)/\Gamma_{\text{total}}$  with values like 0.3257 ± 0.21 OUR FIT and 0.3196 ± 0.07 ± 0.84.

1 ABLIKIM 21AM normalize the branching ratio ( $\eta \rightarrow 3\pi^0$ ) to  $B(J/\psi \rightarrow \gamma\eta)$ , which they measured absolutely.
2 Not independent of other results listed for LOPEZ 07. Assuming decays of  $\eta \rightarrow \gamma\gamma$ ,  $3\pi^0$ ,  $\pi^+\pi^-\pi^0$ ,  $\pi^+\pi^-\gamma$ , and  $e^+e^-\gamma$  account for all  $\eta$  decays within a contribution of 0.3% to the systematic error.

$\Gamma(3\pi^0)/\Gamma(\text{neutral modes})$  Table with 5 columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Lists measurements for the ratio of  $\Gamma(3\pi^0)$  to neutral modes with values like 0.4526 ± 0.0019 OUR FIT and 0.439 ± 0.024.

$\Gamma(3\pi^0)/\Gamma(2\gamma)$  Table with 5 columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Lists measurements for the ratio of  $\Gamma(3\pi^0)$  to  $\Gamma(2\gamma)$  with values like 0.827 ± 0.006 OUR FIT and 0.829 ± 0.007 OUR AVERAGE.

1 Uses result from AKHMETSHIN 01b.

$\Gamma(\pi^0 2\gamma)/\Gamma_{\text{total}}$  Table with 5 columns: VALUE (units  $10^{-4}$ ), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Lists measurements for  $\Gamma(\pi^0 2\gamma)/\Gamma_{\text{total}}$  with values like 2.55 ± 0.22 OUR FIT and 2.21 ± 0.24 ± 0.47.

$\Gamma(\pi^0 2\gamma)/\Gamma(2\gamma)$  Table with 5 columns: VALUE (units  $10^{-3}$ ), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Lists measurements for the ratio of  $\Gamma(\pi^0 2\gamma)$  to  $\Gamma(2\gamma)$  with values like 0.65 ± 0.06 OUR FIT and 1.8 ± 0.4.

<sup>1</sup>This ADOLPH 09 result is independent of the BASHKANOV 07 result.<sup>2</sup>The PRAKHOV 09 and UNVERZAGT 09 results are independent.<sup>3</sup>This AMBROSINO 08D value is an indirect result using  $\eta \rightarrow \pi^+ \pi^0 \pi^-$  events and a rescattering matrix that mixes isospin decay amplitudes.

PARAMETER  $\Lambda$  IN  $\eta \rightarrow \ell^+ \ell^- \gamma$  DECAY

In the pole approximation the electromagnetic transition form factor for a resonance of mass  $M$  is given by the expression:  
 $|F|^2 = (1 - M^2/\Lambda^2)^{-2}$ ,  
 where for the parameter  $\Lambda$  vector dominance predicts  $\Lambda \approx 0.770$  GeV.

### $f_0(500)$

$$J^G(J^{PC}) = 0^+(0^{++})$$

also known as  $\sigma$ ; was  $f_0(600)$ ,  $f_0(400-1200)$

See the related review(s):  
 Scalar Mesons below 1 GeV

### $f_0(500)$ T-MATRIX POLE $\sqrt{s}$

Note that  $\Gamma = -2 \text{Im}(\sqrt{s})$ .

1 Data driven analysis using partial-wave dispersion relations.  
 2 S-matrix pole; 8595 events.  
 3 Applying the chiral unitary approach at NLO to the  $K_{e4}$  data of BATLEY 10 and  $\pi N \rightarrow \pi\pi N$  data of HYAMS 73, GRAYER 74, and PROTOPODESCU 73.  
 4 Uses the  $K_{e4}$  data of BATLEY 10c and the  $\pi N \rightarrow \pi\pi N$  data of HYAMS 73, GRAYER 74, and PROTOPODESCU 73.  
 5 Analytic continuation using Roy equations.  
 6 Analytic continuation using GKPY equations.  
 7 Using Roy equations.  
 8 Average of three variants of the analytic K-matrix model. Uses the  $K_{e4}$  data of BATLEY 08a and the  $\pi N \rightarrow \pi\pi N$  data of HYAMS 73 and GRAYER 74.  
 9 Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08a, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82b.  
 10 From the  $K_{e4}$  data of BATLEY 08a and  $\pi N \rightarrow \pi\pi N$  data of HYAMS 73.  
 11 From the  $K_{e4}$  data of BATLEY 08a and  $\pi N \rightarrow \pi\pi N$  data of PROTOPODESCU 73, GRAYER 74, and ESTABROOKS 74.  
 12 From a mean of three different  $f_0(500)$  parametrizations. Uses 40k events.

13 From an isobar model using 2.6k events.  
 14 Reanalysis of ABLIKIM 04a, PISLAK 01, and HYAMS 73 data.  
 15 Using the N/D method.  
 16 From the solution of the Roy equation (ROY 71) for the isoscalar S-wave and using a phase-shift analysis of HYAMS 73 and PROTOPODESCU 73 data.  
 17 Reanalysis of the data from PROTOPODESCU 73, ESTABROOKS 74, GRAYER 74, ROSSELET 77, PISLAK 03, and AKHMETSHIN 04.  
 18 From a mean of six different analyses and  $f_0(500)$  parameterizations.  
 19 Using data on  $\psi(2S) \rightarrow J/\psi\pi\pi$  from BAI 00e and on  $\Upsilon(nS) \rightarrow \Upsilon(mS)\pi\pi$  from BUTLER 94b and ALEXANDER 98.  
 20 From a combined analysis of HYAMS 73, AUGUSTIN 89, AITALA 01b, and PISLAK 01.  
 21 A similar analysis (KOMADA 01) finds  $(580 \pm 79) - i(190 \pm 107)$  MeV.  
 22 Coupled channel reanalysis of BATON 70, BENSINGER 71, BAILLON 72, HYAMS 73, HYAMS 75, ROSSELET 77, COHEN 80, and ETKIN 82b using the uniformizing variable.  
 23 Using the inverse amplitude method and data of ESTABROOKS 73, GRAYER 74, and PROTOPODESCU 73.  
 24 Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.  
 25 Average and spread of 4 variants ("up" and "down") of KAMINSKI 97B 3-channel model.  
 26 Uses data from BEIER 72b, OCHS 73, HYAMS 73, GRAYER 74, ROSSELET 77, CASON 83, ASTON 88, and ARMSTRONG 91b. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems.  
 27 Demonstrates explicitly that  $f_0(500)$  and  $f_0(1370)$  are two different poles.  
 28 Analysis of data from FALVARD 88.  
 29 Analysis of data from OCHS 73, ESTABROOKS 75, ROSSELET 77, and MUKHIN 80.  
 30 Analysis of data from OCHS 73, GRAYER 74, and ROSSELET 77.  
 31 Coupled-channel analysis using data from PROTOPODESCU 73, HYAMS 73, HYAMS 75, GRAYER 74, ESTABROOKS 74, ESTABROOKS 75, FROGGATT 77, CORDEN 79, BISWAS 81.  
 32 Analysis of data from APEL 72c, GRAYER 74, CASON 76, PAWLICKI 77. Includes spread and errors of 4 solutions.  
 33 Analysis of data from BATON 70, BENSINGER 71, COLTON 71, BAILLON 72, PROTOPODESCU 73, and WALKER 67.

Meson Particle Listings

ρ(770)

Table of experimental data for ρ(770) mass, including columns for value, error, EVTS, DOCUMENT ID, TECN, and COMMENT. Includes entries from ABLIKIM, COLANGELO, ABELE, etc.

- Footnotes 1-15 providing details on data selection, fit methods (Breit-Wigner, relativistic Breit-Wigner), and systematic error treatments.

WEIGHTED AVERAGE 769.0±0.9 (Error scaled by 1.4)

m\_ρ(770)^0 - m\_ρ(770)^±

Table of mass differences between neutral and charged ρ mesons, including columns for VALUE (MeV), EVTS, DOCUMENT ID, TECN, CHG, and COMMENT.

- Footnotes 1-5 providing details on the combined fit, assumptions, and data sources for the mass difference measurements.

WEIGHTED AVERAGE -0.7±0.8 (Error scaled by 1.5)

m\_ρ(770)^+ - m\_ρ(770)^-

Table of mass differences between charged ρ mesons, including columns for VALUE (MeV), EVTS, DOCUMENT ID, TECN, and COMMENT.

ρ(770) RANGE PARAMETER

The range parameter R enters an energy-dependent correction to the width, of the form (1 + q\_r^2 R^2) / (1 + q^2 R^2), where q is the momentum of one of the pions in the ππ rest system.

Table of the range parameter R, including columns for VALUE (GeV^-1), DOCUMENT ID, TECN, CHG, and COMMENT.

ρ(770) WIDTH

We no longer list S-wave Breit-Wigner fits, or data with high combinatorial background.

NEUTRAL ONLY, e+e-

Table of neutral ρ(770) width measurements from e+e- collisions, including columns for VALUE (MeV), EVTS, DOCUMENT ID, TECN, and COMMENT.

- Footnotes 1-6 providing details on fit procedures, parameterizations, and data sources for the width measurements.

# Meson Particle Listings

## $\rho(770)$

- <sup>7</sup> From a fit in the energy range 0.61 to 0.96 GeV. Update of AKHMETSHIN 02.
- <sup>8</sup> Assuming  $m_{\rho^+} = m_{\rho^-}$ ,  $\Gamma_{\rho^+} = \Gamma_{\rho^-}$ .
- <sup>9</sup> From the GOUNARIS 68 parametrization of the pion form factor.
- <sup>10</sup> Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of LEES 12G and ABLIKIM 16c.
- <sup>11</sup> Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of ACHASOV 06, AKHMETSHIN 07, AUBERT 09as, and AMBROSINO 11A.
- <sup>12</sup> Assuming  $m_{\rho^+} = m_{\rho^-} = m_{\rho^0}$ ,  $\Gamma_{\rho^+} = \Gamma_{\rho^-} = \Gamma_{\rho^0}$ .
- <sup>13</sup> Without limitations on masses and widths.
- <sup>14</sup> Assuming  $m_{\rho^0} = m_{\rho^+}$ ,  $g_{\rho^0\pi\pi} = g_{\rho^+\pi\pi}$ .
- <sup>15</sup> Using the data of BARKOV 85 in the hidden local symmetry model.
- <sup>16</sup> From the fit to  $e^+e^- \rightarrow \pi^+\pi^-$  data from the compilations of HEYN 81 and BARKOV 85, including the GOUNARIS 68 parametrization of the pion form factor.
- <sup>17</sup> A fit of BARKOV 85 data assuming the direct  $\omega\pi\pi$  coupling.
- <sup>18</sup> Applying the S-matrix formalism to the BARKOV 85 data.
- <sup>19</sup> Includes BARKOV 85 data. Model-dependent width definition.

$\Gamma_{11} \mu^+\mu^-$	[a] ( 4.55 ± 0.28 ) × 10 <sup>-5</sup>	
$\Gamma_{12} e^+e^-$	[a] ( 4.72 ± 0.05 ) × 10 <sup>-5</sup>	
$\Gamma_{13} \pi^+\pi^-\pi^0$	( 1.01 <sup>+0.54</sup> <sub>-0.36</sub> ± 0.34 ) × 10 <sup>-4</sup>	
$\Gamma_{14} \pi^+\pi^-\pi^+\pi^-$	( 1.8 ± 0.9 ) × 10 <sup>-5</sup>	
$\Gamma_{15} \pi^+\pi^-\pi^0\pi^0$	( 1.6 ± 0.8 ) × 10 <sup>-5</sup>	
$\Gamma_{16} \pi^0e^+e^-$	< 1.2	× 10 <sup>-5</sup> CL=90%
$\Gamma_{17} \eta e^+e^-$		

[a] The  $\omega\rho$  interference is then due to  $\omega\rho$  mixing only, and is expected to be small. If  $e\mu$  universality holds,  $\Gamma(\rho^0 \rightarrow \mu^+\mu^-) = \Gamma(\rho^0 \rightarrow e^+e^-) \times 0.99785$ .

CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 10 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 10.7$  for 8 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

## $\rho(770)$

- <sup>1</sup> A combined fit of AKHMETSHIN 07, AULCHENKO 06, and AULCHENKO 05.
- <sup>2</sup> Using the GOUNARIS 68 parametrization with the complex phase of the  $\rho$ - $\omega$  interference.
- <sup>3</sup> From a fit in the energy range 0.61 to 0.96 GeV. Update of AKHMETSHIN 02.
- <sup>4</sup> Supersedes ACHASOV 05A.
- <sup>5</sup> Using the data of BARKOV 85 in the hidden local symmetry model.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- <sup>1</sup> Possibly large  $\rho$ - $\omega$  interference leads us to increase the minus error.
- <sup>2</sup> Result contains 11 ± 11% correction using SU(3) for central value. The error on the correction takes account of possible  $\rho$ - $\omega$  interference and the upper limit agrees with the upper limit of  $\omega \rightarrow \mu^+\mu^-$  from this experiment.
- <sup>3</sup> But he even enlarges his error to take residual  $\omega$  contamination into account. Since his value is high, seems the other experiments also can't have too many  $\omega$ 's. But maybe Hyams has additional  $\mu$ 's from  $\rho \rightarrow \pi\pi$ , decaying  $\pi$ 's.
- <sup>4</sup> HYAMS 67's mass resolution is 20 MeV. The  $\omega$  region was excluded.

781.0 ± 0.6	510	BIZZARRI	71	HBC	0.0 $\rho\bar{p} \rightarrow K_1 K_1 \omega$
783.7 ± 1.0	3583	12 COYNE	71	HBC	3.7 $\pi^+ p \rightarrow \rho \pi^+ \pi^+ \pi^- \pi^0$
784.1 ± 1.2	750	ABRAMOVI...	70	HBC	3.9 $\pi^- p$
783.2 ± 1.6	13 BIGGS	70B	CNTR	<4.1 $\gamma C \rightarrow \pi^+ \pi^- C$	
782.4 ± 0.5	2400	BIZZARRI	69	HBC	0.0 $\bar{p} p$

- Update of AKHMETSHIN 00c.
- From the combined fit of ANTONELLI 92, ACHASOV 01e, ACHASOV 02e, and ACHASOV 03d data on the  $\pi^+ \pi^- \pi^0$  and ANTONELLI 92 on the  $\omega \pi^+ \pi^-$  final states. Supersedes ACHASOV 99e and ACHASOV 02e.
- From the  $\eta \rightarrow \gamma\gamma$  decay.
- From the  $\eta \rightarrow 3\pi^0$  decay.
- Observed by threshold-crossing technique. Mass resolution = 4.8 MeV FWHM.
- The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization. Inclusion of vacuum polarization gives 782.736 ± 0.024 MeV.
- The  $\omega$  mass was extracted from a dispersively improved Breit-Wigner parameterization, the  $\omega$  width fixed at 8.49 ± 0.08 MeV. The value does not include vacuum polarization which would shift the mass to 781.81 ± 0.09 ± 0.03 MeV. The mixing parameter is assumed real valued.
- The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization.
- From the  $\rho-\omega$  interference in the  $\pi^+ \pi^-$  mass spectrum using the Breit-Wigner for the  $\omega$  and leaving its mass and width as free parameters of the fit.
- Systematic uncertainties underestimated.
- Systematic uncertainties not estimated.
- From best-resolution sample of COYNE 71.
- From  $\omega-p$  interference in the  $\pi^+ \pi^-$  mass spectrum assuming  $\omega$  width 12.6 MeV.

- Update of AKHMETSHIN 00c.
- From the combined fit of ANTONELLI 92, ACHASOV 01e, ACHASOV 02e, and ACHASOV 03d data on the  $\pi^+ \pi^- \pi^0$  and ANTONELLI 92 on the  $\omega \pi^+ \pi^-$  final states. Supersedes ACHASOV 99e and ACHASOV 02e.
- The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization. Inclusion of vacuum polarization gives 8.63 ± 0.05 MeV.

- <sup>4</sup> The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization.
- <sup>5</sup> From the  $\rho-\omega$  interference in the  $\pi^+\pi^-$  mass spectrum using the Breit-Wigner for the  $\omega$  and leaving its mass and width as free parameters of the fit.
- <sup>6</sup> Systematic uncertainties underestimated.
- <sup>7</sup> Relativistic Breit-Wigner includes radiative corrections. Systematic uncertainties not estimated.
- <sup>8</sup> Systematic uncertainties not estimated.
- <sup>9</sup> Observed by threshold-crossing technique. Mass resolution = 4.8 MeV FWHM.

**CONSTRAINED FIT INFORMATION**

An overall fit to 15 branching ratios uses 48 measurements and one constraint to determine 10 parameters. The overall fit has a  $\chi^2 = 48.0$  for 39 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{total}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

WEIGHTED AVERAGE  
 1.49 ± 0.13 (Error scaled by 1.3)

<sup>1</sup> A combined fit of AKHMETSHIN 07, AULCHENKO 06, and AULCHENKO 05.  
<sup>2</sup> Update of AKHMETSHIN 02.  
<sup>3</sup> From the  $m_{\pi^+\pi^-}$  spectrum taking into account the interference of the  $\rho\pi$  and  $\omega\pi$  amplitudes.  
<sup>4</sup> From a fit to  $\pi^+\pi^-$  mass using  $\rho(770)$  (parametrized with the Gounaris-Sakurai approach),  $\omega(782)$ , and box anomaly components.  
<sup>5</sup> ABLIKIM 18c reports  $[\Gamma(\omega(782) \rightarrow \pi^+\pi^-)/\Gamma_{total}] \times [B(\eta'(958) \rightarrow \omega\gamma)] = (3.25 \pm 0.21 \pm 0.52) \times 10^{-4}$  which we divide by our best value  $B(\eta'(958) \rightarrow \omega\gamma) = (2.52 \pm$

0.07)  $\times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>6</sup>From a fit to  $\pi^+\pi^-$  mass using  $\rho(770)$  (parametrized with the Gounaris-Sakurai approach),  $\omega(782)$ , and  $\rho(1450)$  components.

<sup>7</sup>ABLIKIM 18c reports  $[\Gamma(\omega(782) \rightarrow \pi^+\pi^-)/\Gamma_{total}] \times [B(\eta'(958) \rightarrow \omega\gamma)] = (3.22 \pm 0.21 \pm 0.52) \times 10^{-4}$  which we divide by our best value  $B(\eta'(958) \rightarrow \omega\gamma) = (2.52 \pm 0.07) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>8</sup>Dispersive analysis. Value extracted from average of data from AUBERT 09As, AKHMETSHIN 07, ACHASOV 06, AMBROSINO 11A, BABUSCI 13D, ABLIKIM 16b normalised by PDG 16 evaluation for  $\Gamma(\omega \rightarrow e^+e^-)$ .

<sup>9</sup>Using  $\Gamma(\omega \rightarrow e^+e^-)$  from the 2004 Edition of this Review (PDG 04).

<sup>10</sup>Using the data of AKHMETSHIN 02 in the hidden local symmetry model.

<sup>11</sup>Using the data of BARKOV 85.

<sup>12</sup>Using the data of BARKOV 85 in the hidden local symmetry model.

<sup>13</sup>From a model-dependent analysis assuming complete coherence.

<sup>14</sup>Re-evaluated under  $\Gamma(\pi^+\pi^-)/\Gamma(\pi^+\pi^-\pi^0)$  by BEHREND 71 using more accurate  $\omega \rightarrow \rho$  photoproduction cross-section ratio.

$\Gamma(\pi^+\pi^-)/\Gamma(\pi^+\pi^-\pi^0)$   $\Gamma_3/\Gamma_1$

See also  $\Gamma(\pi^+\pi^-)/\Gamma_{total}$ .

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Includes 'OUR FIT' and 'OUR AVERAGE' values.

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Lists experimental data points.

<sup>1</sup>The fitted width of these data is 160 MeV in agreement with present average, thus the  $\omega$  contribution is overestimated. Assuming  $\rho$  width 145 MeV.

<sup>2</sup>Significant interference effect observed. NB of  $\omega \rightarrow 3\pi$  comes from an extrapolation.

<sup>3</sup>ROOS 70 combines ABRAMOVICH 70 and BIZZARRI 70.

[a] C parity forbids this to occur as a single-photon process.

## CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, 2 combinations of partial widths obtained from integrated cross section, and 20 branching ratios uses 52 measurements and one constraint to determine 9 parameters. The overall fit has a  $\chi^2 = 69.5$  for 44 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

 $\eta'(958) \rightarrow \eta\pi\pi$  DECAY PARAMETERS

$$|\text{MATRIX ELEMENT}|^2 = |1 + \alpha Y|^2 + C X + D X^2$$

$X$  and  $Y$  are Dalitz variables;  $\alpha$  is complex and  $C$ , and  $D$  are real-valued. Parameters  $C$  and  $D$  are not necessarily equal to  $c$  and  $d$ , respectively, in the generalized parameterization following this one. May be different for  $\eta'(958) \rightarrow \eta\pi^+\pi^-$  and  $\eta'(958) \rightarrow \eta\pi^0\pi^0$  decays. Because of different initial assumptions and strong correlations of the parameters we do not average the parameters in the section below.

 $Re(\alpha)$  decay parameter

$(973^{+39}_{-127}) - i(11^{+189}_{-11})$	8 PELAEZ 04A	RVUE	$\pi\pi \rightarrow \pi\pi$

- Data driven analysis using partial-wave dispersion relations.
- 5 poles, 5 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ), and BINON 84c ( $\eta\eta'$ ). Based on 18.5k events. Second solution  $977.8 \pm 1.7$  MeV.
- Reanalysis of the  $K_{e4}$  data of BATLEY 10c and the  $\pi N \rightarrow \pi\pi N$  data of HYAMS 73, GRAYER 74, and PROTOPOESCU 73 using Roy equations.
- Reanalysis of the  $K_{e4}$  data of BATLEY 10c and the  $\pi N \rightarrow \pi\pi N$  data of HYAMS 73, GRAYER 74, and PROTOPOESCU 73 using GKPY equations.
- Uses Roy equations.
- Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08a, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82b.
- On sheet II in a 2-pole solution. The other pole is found on sheet III at  $(850 - i 100)$  MeV.
- Reanalysis of data from PROTOPOESCU 73, ESTABROOKS 74, GRAYER 74, and COHEN 80 in the unitarized ChPT model.

- From the  $D^\pm \rightarrow K^\pm K^+ K^-$  Dalitz plot fit with the Triple-M amplitude in the multi-meson model of AOUE 18.
- Using a relativistic Breit-Wigner function and taking into account the finite  $D_S$  mass.
- Breit-Wigner mass. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio  $g_{f_0 K\bar{K}}/g_{f_0 \pi\pi} = 0$ .
- In the kaon-loop fit.
- In the no-structure fit.
- Systematic errors not estimated.
- FLATTE 76 parameterization.  $g_{f_0 \pi\pi} = 329 \pm 96$  MeV/c<sup>2</sup> assuming  $g_{f_0 K\bar{K}}/g_{f_0 \pi\pi} = 2$ .
- Breit-Wigner mass. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio  $g_{f_0 K\bar{K}}/g_{f_0 \pi\pi} = 4.21 \pm 0.25 \pm 0.21$  from ABLIKIM 05.
- In the kaon-loop fit following formalism of ACHASOV 89.
- In the no-structure fit assuming a direct coupling of  $\phi$  to  $f_0 \gamma$ .
- FLATTE 76 parameterization. Supersedes GARMASH 05.
- FLATTE 76 parameterization.  $g_{f_0 K\bar{K}}/g_{f_0 \pi\pi} = 4.21 \pm 0.25 \pm 0.21$ .
- K-matrix pole from combined analysis of  $\pi^- p \rightarrow \pi^0 \pi^0 n, \pi^- p \rightarrow K\bar{K} n, \pi^+ \pi^- \rightarrow \pi^+ \pi^-, \bar{p}p \rightarrow \pi^0 \pi^0 \pi^0, \pi^0 \eta\eta, \pi^0 \pi^0 \eta, \pi^+ \pi^- \pi^0, K^+ K^- \pi^0, K_S^0 K_S^0 \pi^0, K^+ K_S^0 \pi^-$  at rest,  $\bar{p}n \rightarrow \pi^- \pi^- \pi^+, K_S^0 K^- \pi^0, K_S^0 K_S^0 \pi^-$  at rest.
- From the negative interference with the  $f_0(500)$  meson of AITALA 01B using the ACHASOV 89 parameterization for the  $f_0(980)$ , a Breit-Wigner for the  $f_0(500)$ , and ACHASOV 01F for the  $\rho\pi$  contribution.
- Coupled-channel Breit-Wigner, couplings  $g_\pi = 0.09 \pm 0.01 \pm 0.01, g_K = 0.02 \pm 0.04 \pm 0.03$ .
- Supersedes ACHASOV 98i. Using the model of ACHASOV 89.
- Supersedes ACHASOV 98i.
- In the "narrow resonance" approximation.
- Assuming  $\Gamma(f_0) = 40$  MeV.
- From a narrow pole fit taking into account  $f_0(980)$  and  $f_0(1200)$  intermediate mechanisms.
- From the combined fit of the photon spectra in the reactions  $e^+ e^- \rightarrow \pi^+ \pi^- \gamma, \pi^0 \pi^0 \gamma$ .
- Supersedes BARBERIS 99 and BARBERIS 99B
- T-matrix pole.
- From invariant mass fit.
- On sheet II in a 2 pole solution. The other pole is found on sheet III at  $(1039-93i)$  MeV.
- On sheet II in a 2 pole solution. The other pole is found on sheet III at  $(963-29i)$  MeV.
- Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.
- At high  $|t|$ .
- At low  $|t|$ .

See key on page 1171

Meson Particle Listings

$f_0(980)$

- 30 On sheet II in a 4-pole solution, the other poles are found on sheet III at (953–55i) MeV and on sheet IV at (938–35i) MeV.
- 31 Combined fit of ALDE 95B, ANISOVICH 94, AMSLER 94D.
- 32 On sheet II in a 2 pole solution. The other pole is found on sheet III at (996–103i) MeV.
- 33 From sheet II pole position.
- 34 On sheet II in a 2 pole solution. The other pole is found on sheet III at (797–185i) MeV and can be interpreted as a shadow pole.
- 35 On sheet II in a 2 pole solution. The other pole is found on sheet III at (978–28i) MeV.
- 36 From coupled channel analysis.
- 37 Coupled channel analysis with finite width corrections.
- 38 Included in AGUILAR-BENITEZ 78 fit.

- 27 LEEPER 77 ASPK 2–2.4  $\pi^- p \rightarrow \pi^+ \pi^- n, K^+ K^- n$
- 27 BINNIE 73 CNTR  $\pi^- p \rightarrow nMM$
- 30 GRAYER 73 ASPK 17  $\pi^- p \rightarrow \pi^+ \pi^- n$
- 30 HYAMS 73 ASPK 17  $\pi^- p \rightarrow \pi^+ \pi^- n$
- 30 PROTOPOP... 73 HBC 7  $\pi^+ p \rightarrow \pi^+ p \pi^+ \pi^-$

- 1 Using a relativistic Breit-Wigner function and taking into account the finite  $D_S$  mass.
- 2 Breit-Wigner  $\pi\pi$  width. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio  $g_{f_0} K K / g_{f_0} \pi\pi = 0$ .
- 3 Systematic errors not estimated.
- 4 Breit-Wigner  $\pi\pi$  width. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio  $g_{f_0} K K / g_{f_0} \pi\pi = 4.21 \pm 0.25 \pm 0.21$  from ABLIKIM 05.
- 5 Breit-Wigner, solution 1, PWA ambiguous.
- 6 K-matrix pole from combined analysis of  $\pi^- p \rightarrow \pi^0 \pi^0 n, \pi^- p \rightarrow K \bar{K} n, \pi^+ \pi^- \rightarrow \pi^+ \pi^-, \bar{p} p \rightarrow \pi^0 \pi^0 \pi^0, \pi^0 \eta, \pi^0 \pi^0 \eta, \pi^+ \pi^- \pi^0, K^+ K^- \pi^0, K_S^0 K_S^0 \pi^0, K^+ K_S^0 \pi^-$  at rest,  $\bar{p} n \rightarrow \pi^- \pi^- \pi^+, K_S^0 K^- \pi^0, K_S^0 K_S^0 \pi^-$  at rest.
- 7 Using the data of AKHMETSHIN 99C, ACHASOV 00H, and ALOISIO 02D.
- 8 Breit-Wigner width.
- 9 Supersedes ACHASOV 98i. Using the model of ACHASOV 89.
- 10 Supersedes ACHASOV 98i.
- 11 In the “narrow resonance” approximation.
- 12 From the combined fit of the photon spectra in the reactions  $e^+ e^- \rightarrow \pi^+ \pi^- \gamma, \pi^0 \pi^0 \gamma$ .
- 13 Supersedes BARBERIS 99 and BARBERIS 99B
- 14 T-matrix pole.
- 15 On sheet II in a 2 pole solution. The other pole is found on sheet III at (1039–93i) MeV.
- 16 From invariant mass fit.
- 17 On sheet II in a 2 pole solution. The other pole is found on sheet III at (963–29i) MeV.
- 18 Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.
- 19 At high  $|t|$ .
- 20 At low  $|t|$ .
- 21 On sheet II in a 4-pole solution, the other poles are found on sheet III at (953–55i) MeV and on sheet IV at (938–35i) MeV.
- 22 Combined fit of ALDE 95B, ANISOVICH 94,
- 23 On sheet II in a 2 pole solution. The other pole is found on sheet III at (996–103i) MeV.
- 24 From sheet II pole position.
- 25 On sheet II in a 2 pole solution. The other pole is found on sheet III at (797–185i) MeV and can be interpreted as a shadow pole.
- 26 On sheet II in a 2 pole solution. The other pole is found on sheet III at (978–28i) MeV.
- 27 From coupled channel analysis.
- 28 Coupled channel analysis with finite width corrections.
- 29 From coupled channel fit to the HYAMS 73 and PROTOPODESCU 73 data. With a simultaneous fit to the  $\pi\pi$  phase-shifts, inelasticity and to the  $K_S^0 K_S^0$  invariant mass.
- 30 Included in AGUILAR-BENITEZ 78 fit.

$f_0(980)$  WIDTH

Width determination very model dependent. Peak width in  $\pi\pi$  is about 50 MeV, but decay width can be much larger.

# Meson Particle Listings

## $f_0(980), a_0(980)$

- <sup>5</sup> Uses an analytic K-matrix model. Compilation.
- <sup>6</sup> Using dispersion integral with phase input from Roy equations and data from MARSISKE 90, BOYER 90, BEHREND 92, UEHARA 08A, and MORI 07.
- <sup>7</sup> Solution A (preferred solution based on  $\chi^2$ -analysis).
- <sup>8</sup> Dispersion theory based amplitude analysis of BOYER 90, MARSISKE 90, BEHREND 92, and MORI 07.
- <sup>9</sup> Solution B (worse than solution A; still acceptable when systematic uncertainties are included).
- <sup>10</sup> Supersedes MORGAN 90.
- <sup>11</sup> From analysis allowing arbitrary background unconstrained by unitarity.
- <sup>12</sup> Data included in MORGAN 90, BOGLIONE 99 analyses.
- <sup>13</sup> From amplitude analysis of BOYER 90 and MARSISKE 90, data corresponds to resonance parameters  $m = 989$  MeV,  $\Gamma = 61$  MeV.

- Average of KOZYREV 16 and KOZYREV 18 values taking into account the correlated uncertainties. Supersedes individual KOZYREV 16 and KOZYREV 18 results.
- Using a vector meson dominance model with contribution from  $\phi(1020)$  and higher mass excitations of  $\rho(770)$ ,  $\omega(782)$ , and  $\phi(1020)$ .
- Using a phenomenological model based on KUHN 90 with a sum of Breit-Wigner resonances for  $\rho(770)$ ,  $\omega(782)$ ,  $\phi(1020)$  and their higher mass excitations.
- Update of AKHMETSHIN 99d
- From the combined fit assuming that the total  $\phi(1020)$  production cross section is saturated by those of  $K^+ K^-$ ,  $K_S K_L$ ,  $\pi^+ \pi^- \pi^0$ , and  $\eta \gamma$  decays modes and using ACHASOV 00b for the  $\eta \gamma$  decay mode.
- Using a total width of  $4.43 \pm 0.05$  MeV. Systematic uncertainty included.
- Using a total width of  $4.43 \pm 0.05$  MeV.

- <sup>8</sup>PELLINEN 82 review includes AKERLOF 77, DAUM 81, BALDI 77, AYRES 74, DE-GROOT 74.
- <sup>9</sup>Width fixed at 4.2 MeV.
- <sup>10</sup>The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization. Inclusion of vacuum polarization gives 1019.457 ± 0.020 MeV.
- <sup>11</sup>From the  $D^\pm \rightarrow K^\pm K^+ K^-$  Dalitz plot fit with the Triple-M amplitude in the multi-meson model of AOUE 18.
- <sup>12</sup>The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization.
- <sup>13</sup>Strongly correlated with AKHMETSHIN 04.
- <sup>14</sup>Systematic errors not evaluated.
- <sup>15</sup>Weighted and scaled average of 12 measurements of DIJKSTRA 86.
- <sup>16</sup>Mass errors enlarged by us to  $\Gamma/\sqrt{N}$ ; see the note with the  $K^*(892)$  mass.

CONSTRAINED FIT INFORMATION

An overall fit to 30 branching ratios uses 80 measurements and one constraint to determine 14 parameters. The overall fit has a  $\chi^2 = 61.8$  for 67 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

<sup>1</sup> Using a phenomenological model based on KUHN 90 with a sum of Breit-Wigner resonances for  $\rho(770), \omega(782), \phi(1020)$  and their higher mass excitations. The first error combines statistical and systematic uncertainties. The second one is due to the parametrization of the charged kaon form factor and mass calibration.

< 20	90		DRUZHININ	87 ND	$e^+e^- \rightarrow \pi^0\pi^0\gamma$

1 Obtained by the authors taking into account the  $\pi^+\pi^-$  decay mode. Includes a component due to  $\pi\pi$  production via the  $f_0(500)$  meson. Supersedes ALOISIO 02D.2 From the combined fit of the photon spectra in the reactions  $e^+e^- \rightarrow \pi^+\pi^-\gamma$ ,  $\pi^0\pi^0\gamma$ .3 From the negative interference with the  $f_0(500)$  meson of AITALA 01B using the ACHASOV 89 parameterization for the  $f_0(980)$ , a Breit-Wigner for the  $f_0(500)$ , and ACHASOV 01F for the  $\rho\pi$  contribution. Superseded by AMBROSINO 07.4 Assuming that the  $\pi^0\pi^0\gamma$  final state is completely determined by the  $f_0\gamma$  mechanism, neglecting the decay  $B(\phi \rightarrow K\bar{K}\gamma)$  and using  $B(f_0 \rightarrow \pi^+\pi^-) = 2B(f_0 \rightarrow \pi^0\pi^0)$ .5 Using the value  $B(\phi \rightarrow \eta\gamma) = (1.338 \pm 0.053) \times 10^{-2}$ .6 For  $E_\gamma > 20$  MeV. Supersedes AKHMETSHIN 97C.7 Neglecting other intermediate mechanisms ( $\rho\pi, \sigma\gamma$ ).8 A narrow pole fit taking into account  $f_0(980)$  and  $f_0(1200)$  intermediate mechanisms.

9 For destructive interference with the Bremsstrahlung process

10 For constructive interference with the Bremsstrahlung process

 $\Gamma(f_0(980)\gamma)/\Gamma(\eta\gamma)$   $\Gamma_{16}/\Gamma_5$

3 Recalculated by us to match the notations of AKHMETSHIN 98.
4 Assuming zero phase for the contact term.

PARAMETER beta IN phi -> Pe+e- DECAYS

In the one-pole approximation the electromagnetic transition form factor for phi -> Pe+e- (P = pi, eta) is given as a function of the e+e- invariant mass squared, q^2, by the expression:

|F(q^2)|^2 = (1 - q^2/Lambda^2)^-2,

where vector meson dominance predicts parameter Lambda approx 0.770 GeV (Lambda^-2 approx 1.687 GeV^-2). The slope of this form factor, beta = dF/dq^2(q^2=0), equals Lambda^-2 in this approximation.

The measurements below obtain beta in the one-pole approximation.

- Statistical error negligible.
- Reanalysis of CLEO data using Breit-Wigner parameterization.
- Superseded by AGHASYAN 2018B.
- The  $\rho^\pm \pi^\mp$  state can be also due to the  $\pi(1300)$ .
- Using the Breit-Wigner parameterization; strong correlation between mass and width.
- Using the data of BARATE 98R.
- From a fit to the  $3\pi$  mass spectrum including the  $K\bar{K}^*(892)$  threshold.
- Uses the model of KUHN 90.
- Uses the model of ISGUR 89.
- Includes the effect of a possible  $a_1'$  state.
- Uses the model of FEINDT 90.
- Supersedes AKERS 95P.
- Average and spread of values using 2 variants of the model of BOWLER 75.
- Reanalysis of RUCKSTUHL 86.
- Reanalysis of SCHMIDKE 86.
- Reanalysis of ALBRECHT 86B.
- From a combined reanalysis of ALBRECHT 86B, SCHMIDKE 86, and RUCKSTUHL 86.
- From a combined reanalysis of ALBRECHT 86B and DAUM 81B.
- Uses the model of BOWLER 75.
- Produced in  $K^-$  backward scattering.

### CONSTRAINED FIT INFORMATION

An overall fit to the total width, 4 partial widths, a combination of partial widths obtained from integrated cross sections, and 6 branching ratios uses 44 measurements and one constraint to determine 8 parameters. The overall fit has a  $\chi^2 = 82.3$  for 37 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{total}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

VALUE (keV)	EVTS	DOCUMENT ID	TECN	COMMENT	

The value of this width depends on the theoretical model used. Unitary approaches with scalars typically (with exception of PENNINGTON 08) give values clustering around 2.6 keV; without an S-wave contribution, values are systematically higher (typically around 3 keV).

2.3  $\pm 0.8$  <sup>14</sup> BERGER 80B PLUT  $e^+e^-$

<sup>1</sup> Based on a K-matrix analysis of BELLE data from MORI 07, UEHARA 08A, UEHARA 09 and UEHARA 13. The width is derived for the pole on the third sheet which is closest to the physical axis. Supersedes PENNINGTON 08.

<sup>2</sup> Solution A (preferred solution based on  $\chi^2$ -analysis).

<sup>3</sup> Dispersion theory based amplitude analysis of BOYER 90, MARSISKE 90, BEHREND 92, and MORI 07.

<sup>4</sup> Solution B (worse than solution A; still acceptable when systematic uncertainties are included).

<sup>5</sup> From analysis of L3 data at 91 and 183–209 GeV and using SU(3) relations.

<sup>6</sup> With a narrow scalar state around 1220 MeV.

<sup>7</sup> Using a unitarized model with a 300–500 keV wide scalar at 1100 MeV.

<sup>8</sup> Using the unitarized model of LYTH 85.

<sup>9</sup> Error includes spread of different solutions. Data of MARK2 and CRYSTAL BALL used in the analysis. Authors report strong correlations with  $\gamma\gamma$  width of  $f_0(1370)$ :  $\Gamma(f_2) + 1/4 \Gamma(f_0) = 3.6 \pm 0.3$  KeV.

<sup>10</sup> Radiative corrections modify the partial widths; for instance the COURAU 84 value becomes  $2.66 \pm 0.21$  in the calculation of LANDRO 86.

<sup>11</sup> Using the MENNESSIER 83 model.

<sup>12</sup> Superseded by BOYER 90.

<sup>13</sup> If helicity = 2 assumption is not made.

<sup>14</sup> Using mass, width and  $B(f_2(1270) \rightarrow 2\pi)$  from PDG 78.

### CONSTRAINED FIT INFORMATION

An overall fit to 6 branching ratios uses 18 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 24.0$  for 14 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 18 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 9.3$  for 15 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

## $a_2(1320)$

• • • We do not use the following data for averages, fits, limits, etc. • • •

VALUE	EVTS	DOCUMENT ID	TECN	CHG	COMMENT	
$0.29 \pm 0.08$	140	<sup>1</sup> KARSHON	74	HBC	0	$4.9 \pi^+ p$
$0.10 \pm 0.04$	60	<sup>1</sup> KARSHON	74	HBC	+	$4.9 \pi^+ p$
$0.19 \pm 0.08$		DEFOIX	73	HBC	0	$0.7 \bar{p} p$

<sup>1</sup> KARSHON 74 suggest an additional  $l = 0$  state strongly coupled to  $\omega \pi \pi$  which could explain discrepancies in branching ratios and masses. We use a central value and a systematic spread.

<sup>2</sup> Decays to  $b_1(1040) \pi$ ,  $b_1 \rightarrow \omega \pi$ . Error increased to account for possible systematic errors of complicated analysis.

WEIGHTED AVERAGE  
 $0.15 \pm 0.05$  (Error scaled by 1.3)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

1 From forward dispersion relation applied to  $\pi\pi$  scattering data.  
 2 From partial-wave dispersion relation applied to  $\pi\pi \rightarrow \bar{K}K$  data.  
 3 T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ), and BINON 84C ( $\eta\eta'$ ).  
 4 Another pole is found at  $(1510 \pm 130) - i(800^{+100}_{-150})$  MeV.  
 5 Coupled channel analysis of  $\pi^+ \pi^- \pi^0, K^+ K^- \pi^0$ , and  $K^\pm K_S^0 \pi^\mp$ .  
 6 Average between  $\pi^+ \pi^- 2\pi^0$  and  $2(\pi^+ \pi^-)$ .  
 7 T-matrix pole on sheet ---.  
 8 Supersedes ANISOVICH 94.  
 9 Coupled-channel analysis of  $\bar{p}p \rightarrow 3\pi^0, \pi^0 \eta\eta$ , and  $\pi^0 \pi^0 \eta$  on sheet IV. Demonstrates explicitly that  $f_0(500)$  and  $f_0(1370)$  are two different poles.

10 Analysis of data from FALVARD 88.  
 11 The pole is on Sheet III. Demonstrates explicitly that  $f_0(500)$  and  $f_0(1370)$  are two different poles.  
 12 Uses data from BEIER 72B, OCHS 73, HYAMS 73, GRAYER 74, ROSSELET 77, CASON 83, ASTON 88, and ARMSTRONG 91B. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems.  
 13 Reanalysis of ANISOVICH 94 data.  
 14 T-matrix pole on sheet III.  
 15 Analysis of data from OCHS 73, GRAYER 74, BECKER 79, and CASON 83.

$\sim 400$		<sup>6</sup> FROGGATT	77	RVUE $\pi^+ \pi^-$ channel

<sup>1</sup> The systematic errors are not reported.

<sup>2</sup> Breit-Wigner width. May also be the  $f_0(1500)$ .

<sup>3</sup> Also observed by GARMASH 07 in  $B^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays. Supersedes GARMASH 05.

<sup>4</sup> Uses data from BEIER 72b, OCHS 73, HYAMS 73, GRAYER 74, ROSSELET 77, CA-SON 83, ASTON 88, and ARMSTRONG 91b. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems.

<sup>5</sup> Also observed by ASNER 00 in  $\tau^- \rightarrow \pi^- \pi^0 \pi^0 \nu_\tau$  decays

<sup>6</sup> Width defined as distance between 45 and 135° phase shift.

### $\pi_1(1400)$

$$I^G(J^{PC}) = 1^-(1^-+)$$

OMITTED FROM SUMMARY TABLE

Coupled channel analyses favor the existence of only one broad  $1^-+$  isovector state consistent with  $\pi_1(1600)$  in the 1400–1600 MeV region. See the review on "Spectroscopy of Light Meson Resonances". See also  $\pi_1(1600)$ .

# Meson Particle Listings

## $\eta(1405)$

$\eta(1405)$

$$I^G(J^{PC}) = 0^+(0^{-+})$$

See also the  $\eta(1475)$ .

### $\eta(1405)$ MASS

VALUE (MeV) DOCUMENT ID  
**1408.7 $\pm$ 2.0 OUR AVERAGE** Includes data from the 2 datablocks that follow this one.  
 Error includes scale factor of 2.2. See the ideogram below.

### $\eta\pi\pi$ MODE

VALUE (MeV) EVTS DOCUMENT ID TECN COMMENT  
 The data in this block is included in the average printed for a previous datablock.

**1405.8 $\pm$ 2.6 OUR AVERAGE** Error includes scale factor of 2.3. See the ideogram below.

0.13±0.04		2 ABLIKIM	181 BES3	$J/\psi \rightarrow \gamma\gamma\phi(1020)$
<0.77	95	3 BAI	04J BES2	$J/\psi \rightarrow \gamma\gamma K^+K^-$

1 Constructive interference between  $X(1835)$  and  $\eta(1405)/\eta(1475)$  decays to  $\gamma\phi$  is assumed. Also see  $\eta(1475)$ . ABLIKIM 181 reports the inverse as  $11.10 \pm 3.5$ .

2 Destructive interference between  $X(1835)$  and  $\eta(1405)/\eta(1475)$  decays to  $\gamma\phi$  is assumed. Also see  $\eta(1475)$ . ABLIKIM 181 reports the inverse as  $7.53 \pm 2.49$ .

3 Calculated by us from  $B(J/\psi \rightarrow \eta(1405)\gamma \rightarrow \phi\gamma\gamma) < 0.82 \times 10^{-4}$  and  $B(J/\psi \rightarrow \eta(1405)\gamma \rightarrow \rho^0\gamma\gamma) = (1.07 \pm 0.17 \pm 0.11) \times 10^{-4}$ .

1 T-matrix pole from coupled channel K-matrix fit to data on  $J/\psi \rightarrow \gamma\pi^0 \pi^0$  (ABLIKIM 15AE) and  $J/\psi \rightarrow \gamma K_S^0 K_S^0$  (ABLIKIM 18AA).  
 2 T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ), and BINON 84c ( $\eta\eta'$ ).  
 3 T-matrix pole of 3 channel unitary model fit to data from AAIJ 14BR and AAIJ 17V extracted using Pade approximants.  
 4 Pole position from combined analysis of  $\pi^- p \rightarrow \pi^0 \pi^0 n, \pi^- p \rightarrow K\bar{K}n, \pi^+ \pi^- \rightarrow \pi^+ \pi^-, \bar{p}p \rightarrow \pi^0 \pi^0 \pi^0, \pi^0 \eta \eta, \pi^0 \pi^0 \eta, \pi^+ \pi^- \pi^0, K^+ K^- \pi^0, K_S^0 K_S^0 \pi^0, K^+ K_S^0 \pi^-$  at rest,  $\bar{p}n \rightarrow \pi^- \pi^- \pi^+, K_S^0 K^- \pi^0, K_S^0 K_S^0 \pi^-$  at rest.  
 5 Average between  $\pi^+ \pi^- 2\pi^0$  and  $2(\pi^+ \pi^-)$ .  
 6 Supersedes BARBERIS 99 and BARBERIS 99B.  
 7 T-matrix pole on sheet --+.  
 8 Coupled-channel analysis of AMSLER 95B, AMSLER 95C, and AMSLER 94D.  
 9 From a simultaneous analysis of the annihilations  $\bar{p}p \rightarrow 3\pi^0, \pi^0 \eta \eta$ .  
 10 Reanalysis of ANISOVICH 94 data.

CONSTRAINED FIT INFORMATION

An overall fit to 6 branching ratios uses 10 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 5.6$  for 6 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$\Gamma_8$ $\gamma\gamma$	( 1.12 ± 0.15 ) × 10 <sup>-6</sup>

### CONSTRAINED FIT INFORMATION

An overall fit to 2 partial widths, a combination of partial widths obtained from integrated cross sections, and 3 branching ratios uses 16 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 14.2$  for 12 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$\pi_1(1600)$

$\pi_1(1600)$

$$J^G(J^{PC}) = 1^-(1^-+)$$

Coupled channel analyses favor the existence of only one broad  $1^-+$  isovector state consistent with  $\pi_1(1600)$  in the 1400–1600 MeV region. Accordingly, the  $\pi_1(1400)$  entries of the previous Reviews have been moved into this section. See the review on "Spectroscopy of Light Meson Resonances."

$\pi_1(1600)$  T-Matrix Pole  $\sqrt{s}$

## $a_1(1640)$

$$I^G(J^{PC}) = 1^-(1^{++})$$

Possibly seen in the study of the hadronic structure in decay  $\tau \rightarrow 3\pi\nu_\tau$  (ABREU 98G and ASNER 00).

1652	$\pm 17$		COSME	79	OSPK	$e^+e^- \rightarrow 3\pi$	

- From a VDM fit to AKHMETSHIN 17A  $\omega\eta$  data with two additional resonances of low statistical evidences.
- From a fit with contributions from  $\omega(1420)$ ,  $\omega(1650)$ , and  $\phi(1680)$ . The mass of  $\omega(1420)$  is fixed to the PDG 18 value of 1420 MeV. Fixing also the width of  $\omega(1420)$  to the PDG 18 value of 220 MeV results in  $1694 \pm 9$  MeV measurement.
- Could also be  $\rho(1700)$ . Branching ratio  $J/\psi \rightarrow X\pi^0 \rightarrow K^+K^-\pi^0 = (5.3 \pm 0.3^{+0.6}_{-0.5}) \times 10^{-5}$ .
- From a fit of the interfering  $\omega(1420)$  and  $\omega(1650)$  with a relative phase of  $\pi$  and other parameters floating.
- From a fit with contributions from  $\omega(1420)$ ,  $\omega(1650)$ , and  $\phi(1680)$ .
- From a fit with contributions from  $\omega(782)$ ,  $\phi(1020)$ ,  $\omega(1420)$ , and  $\omega(1650)$ . See ACHASOV 20A for a further analysis of the  $\pi^+\pi^-\pi^0$  data.
- From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the  $\pi^+\pi^-\pi^0$  and ANTONELLI 92 on the  $\omega\pi^+\pi^-$  final states. Supersedes ACHASOV 99E and ACHASOV 02E.
- Using results of CORDIER 81 and preliminary data of DOLINSKY 91 and ANTONELLI 92.
- Using the data of AKHMETSHIN 00D and ANTONELLI 92. The  $\rho\pi$  dominance for the energy dependence of the  $\omega(1420)$  and  $\omega(1650)$  width assumed.
- Using data from BARKOV 87, DOLINSKY 91, and ANTONELLI 92.
- Using the data from ANTONELLI 92.
- Using the data from IVANOV 81 and BISELLO 88B.
- Using the data from BISELLO 91c.
- From a fit to two Breit-Wigner functions and using the data of DOLINSKY 91 and ANTONELLI 92.
- From the combined fit of the  $\rho\pi$  and  $\omega\pi\pi$  final states.

### CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 6 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 1.9$  for 3 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{total}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_5$	-53		
$x_7$	-29	-59	
$x_9$	-8	-21	-9
	$x_4$	$x_5$	$x_7$

- From a VDM fit to ZHU 23  $\eta\phi\gamma$  data with two resonances,  $\phi(1680)$ ,  $\phi(2170)$ , and a third resonance with mass  $1850.7 \pm 5.3$  MeV and width  $25 \pm 35$  MeV of 1.7  $\sigma$  statistical evidence.
- From a fit using a vector meson dominance model with contributions from  $\phi(1680)$ ,  $\phi(2170)$  and non resonant contribution.
- From the analysis of the combined measurements of  $\sigma(e^+e^- \rightarrow \eta\phi)$  from BaBar, Belle, BESIII, CMD3.
- From a partial wave amplitude analysis at  $\sqrt{s} = 2.125$  GeV which includes all the possible intermediate states that match  $J^{PC}$  conservation in the subsequent two-body decay. The intermediate states are parameterized with the relativistic Breit-Wigner functions. Statistical error only.
- Seen in  $\psi(2S)$  decay with branching ratio  $\psi(2S) \rightarrow X\eta \rightarrow K^+K^-\eta = (12.0 \pm 1.3^{+6.5}_{-6.9}) \times 10^{-6}$ .
- From a fit using a vector meson dominance model with contribution from  $\rho(770)$ ,  $\omega(782)$ ,  $\phi(1020)$ ,  $\omega(1420)$ ,  $\rho(1450)$ .
- From a fit with coherent interference of the  $\phi(1680)$  with a non-resonant contribution.
- Assuming the  $K\bar{K}^*(892) + c.c.$  dynamics. Systematic uncertainties not estimated.
- Using a vector meson dominance model with contribution from  $\phi(1020)$ ,  $\phi(1680)$ , and higher mass excitations of  $\rho(770)$  and  $\omega(782)$ .
- Using events with  $\pi\pi$  invariant mass less than 0.85 GeV.
- From a fit with two incoherent Breit-Wigners.
- From the simultaneous fit to the  $K\bar{K}^*(892) + c.c.$  and  $\phi\eta$  data from AUBERT 08s using the results of AUBERT 07AK.
- From the combined fit of AKHMETSHIN 03 and MANE 81 also including  $\rho, \omega$ , and  $\phi$ . Neither isospin nor flavor structure known.
- Using data from IVANOV 81, BARKOV 87, BISELLO 88B, DOLINSKY 91, and AN-TONELLI 92.
- Using the data from BISELLO 91C.
- Using BISELLO 88B and MANE 82 data.
- From global fit including  $\rho, \omega, \phi$  and  $\rho(1700)$  assume mass 1570 MeV and width 510 MeV for  $\rho$  radial excitation.
- From global fit of  $\rho, \omega, \phi$  and their radial excitations to channels  $\omega\pi^+\pi^-, K^+K^-, K_S^0 K_L^0, K_S^0 K^\pm \pi^\mp$ . Assume mass 1570 MeV and width 510 MeV for  $\rho$  radial excitations, mass 1570 and width 500 MeV for  $\omega$  radial excitation.
- Fit to one channel only, neglecting interference with  $\omega, \rho(1700)$ .

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 10 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 14.7$  for 7 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

### $a_0(1710)$

$$I^G(J^{PC}) = 1^-(0^{++})$$

### OMITTED FROM SUMMARY TABLE

Evidence for this state is also inferred from the interference of the  $K^+K^-$  and  $K_S^0 K_S^0$  decays of the  $f_0(1710)$  in  $D_s^+ \rightarrow f_0(1710)\pi^+$ , leading to a relative branching ratio an order of magnitude larger than expected from isospin symmetry (ABLIKIM 22F). See also the review on "Spectroscopy of Light Meson Resonances."

- From partial wave analysis including all possible combinations of  $0^{++}, 2^{++}$ , and  $4^{++}$  resonances.
- Spin 0 favored over spin 2.
- In the SU(3) based model with a specific interference pattern of the  $f_2(1270), a_2^0(1320)$ , and  $f_2'(1525)$  mesons incoherently added to the  $f_0(1710)$  and non-resonant background.
- $J^P = 0^+$ , supersedes ARMSTRONG 89D.
- Using CLEO-c data but not authored by the CLEO Collaboration.
- From a fit to a Breit-Wigner line shape with fixed  $\Gamma = 135$  MeV.
- Systematic errors not estimated.
- Decaying to  $f_0(1370)\pi\pi$ .
- No  $J^{PC}$  determination.
- No  $J^{PC}$  determination, width not determined.
- $J^P = 2^+$ .
- From a fit to the  $0^+$  partial wave.
- No  $J^{PC}$  determination.
- ALDE 92D combines all the GAMS-2000 data.
- $J^P = 2^+$ , superseded by FRENCH 99.
- From an analysis ignoring interference with  $f_2'(1525)$ .
- From an analysis including interference with  $f_2'(1525)$ .
- Superseded by ALDE 92D.
- Uses MRK3 data. From a partial-wave analysis of data using a K-matrix formalism with 5 poles, but assuming spin 2. Fit with constrained inelasticity.
- $J^P = 2^+$  preferred.
- From fit neglecting nearby  $f_2'(1525)$ . Replaced by BLOOM 83.
- Superseded by LONGACRE 86.

$1831 \pm 7$		9,10 ABLIKIM	05R	BES2 $J/\psi \rightarrow \gamma\rho\bar{p}$
$1859^{+3}_{-10} \pm 25$		9 BAI	03F	BES2 $J/\psi \rightarrow \gamma\rho\bar{p}$

<sup>1</sup>From a fit of the measured  $\pi^+\pi^-\eta'$  lineshape that accounts for the abrupt distortion observed at the  $p\bar{p}$  threshold through interference with a second previously unseen narrow resonance near 1870 MeV. The fit uses Breit-Wigner functions for the signal shapes and includes known backgrounds and contributors.

<sup>2</sup>Decay dominated by  $f_0(980)\eta$  hence  $I^G(J^{PC}) = 0^+(0^-+)$ .

<sup>3</sup>From a fit to  $\gamma\phi$  invariant mass. Angular analysis consistent with  $J^{PC} = 0^-+$ . Other  $J^{PC}$  not excluded.

<sup>4</sup>Pole mass from a fit of the measured  $\pi^+\pi^-\eta'$  lineshape to a Flatte formula that accounts for the abrupt distortion observed at the  $p\bar{p}$  threshold; the fit also includes known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner function ( $M \approx 1919$  MeV;  $\Gamma \approx 51$  MeV) that is required for a good fit.

<sup>5</sup>From the fit including final state interaction effects in isospin 0 S-wave according to SIBIRTEV 05A. Supersedes ABLIKIM 10G.

<sup>6</sup>From a fit of the  $\pi^+\pi^-\eta'$  mass distribution to a combination of  $\gamma f_1(1510)$ ,  $\gamma X(1835)$ , and two states  $\gamma X(2120)$  and  $\gamma X(2370)$ , for  $M(\pi^+\pi^-\eta') < 2.8$  GeV, and accounting for backgrounds from non- $\eta'$  events and  $J/\psi \rightarrow \pi^0\pi^+\pi^-\eta'$ .

<sup>7</sup>The selected process is  $J/\psi \rightarrow \omega a_0(980)\pi$ . This state may be due also to  $\eta_2(1870)$  or to a combination of  $X(1835)$  and  $\eta_2(1870)$ .

<sup>8</sup>From a fit of the  $p\bar{p}$  mass distribution to a combination of  $\gamma X(1835)$ ,  $\gamma R$  with  $M(R) = 2100$  MeV and  $\Gamma(R) = 160$  MeV, and  $\gamma\rho\bar{p}$  phase space, for  $M(p\bar{p}) < 2.85$  GeV.

<sup>9</sup>Evidence for a threshold enhancement in the  $p\bar{p}$  mass spectrum was also reported by ABE 02K, AUBERT, B 05L, and WANG 05A in  $B^+ \rightarrow p\bar{p}K^+$ , WANG 05A in  $B^0 \rightarrow p\bar{p}K_S^0$ , ABE 02W in  $\bar{B}^0 \rightarrow p\bar{p}D^0$ , DEL-AMO-SANCHEZ 12 in  $B \rightarrow D(D^*)\rho\bar{p}(\pi)$ , and WEI 08 in  $B^+ \rightarrow p\bar{p}\pi^+$  decays. Not seen by ATHAR 06 in  $\Upsilon(1S) \rightarrow p\bar{p}\gamma$ .

<sup>10</sup>From the fit including final state interaction effects in isospin 0 S-wave according to SIBIRTEV 05A. Systematic errors not estimated.

<sup>1</sup>From a fit of the measured  $\pi^+\pi^-\eta'$  lineshape that accounts for the abrupt distortion observed at the  $p\bar{p}$  threshold through interference with a second previously unseen narrow resonance near 1870 MeV. The fit uses Breit-Wigner functions for the signal shapes and includes known backgrounds and contributors.

<sup>2</sup>Decay dominated by  $f_0(980)\eta$  hence  $I^G(J^{PC}) = 0^+(0^-+)$ .

<sup>3</sup>From a fit to  $\gamma\phi$  invariant mass. Angular analysis consistent with  $J^{PC} = 0^-+$ . Other  $J^{PC}$  not excluded.

<sup>4</sup>Pole width from a fit of the measured  $\pi^+\pi^-\eta'$  lineshape to a Flatte formula that accounts for the abrupt distortion observed at the  $p\bar{p}$  threshold; the fit also includes known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner function ( $M \approx 1919$  MeV;  $\Gamma \approx 51$  MeV) that is required for a good fit.

<sup>5</sup>From the fit including final state interaction effects in isospin 0 S-wave according to SIBIRTEV 05A. Supersedes ABLIKIM 10G.

<sup>6</sup>From a fit of the  $\pi^+\pi^-\eta'$  mass distribution to a combination of  $\gamma f_1(1510)$ ,  $\gamma X(1835)$ , and two states  $\gamma X(2120)$  and  $\gamma X(2370)$ , for  $M(\pi^+\pi^-\eta') < 2.8$  GeV, and accounting for backgrounds from non- $\eta'$  events and  $J/\psi \rightarrow \pi^0\pi^+\pi^-\eta'$ .

<sup>7</sup>The selected process is  $J/\psi \rightarrow \omega a_0(980)\pi$ . This state may be due also to  $\eta_2(1870)$  or to a combination of  $X(1835)$  and  $\eta_2(1870)$ .

<sup>8</sup>From a fit of the  $p\bar{p}$  mass distribution to a combination of  $\gamma X(1835)$ ,  $\gamma R$  with  $M(R) = 2100$  MeV and  $\Gamma(R) = 160$  MeV, and  $\gamma\rho\bar{p}$  phase space, for  $M(p\bar{p}) < 2.85$  GeV.

<sup>9</sup>Evidence for a threshold enhancement in the  $p\bar{p}$  mass spectrum was also reported by ABE 02K, AUBERT, B 05L, and WANG 05A in  $B^+ \rightarrow p\bar{p}K^+$ , WANG 05A in  $B^0 \rightarrow$

## $\eta_1(1855)$

$$I^G(J^{PC}) = 0^+(1^{-+})$$

OMITTED FROM SUMMARY TABLE

Meson with exotic (non- $q\bar{q}$ ) quantum numbers. A state decaying into  $\eta\eta'$  with possible quantum numbers  $1^{-+}$  was reported earlier in this mass region BARBERIS 00A in high energy central  $pp$  production and by ALDE 91B in  $\pi^-p$  interactions, see the  $f_2(1910)$ , and the review on "Spectroscopy of Light Meson Resonances."

<sup>5</sup> OAKDEN 94 makes an amplitude analysis of LEAR data on  $\bar{p} p \rightarrow \pi \pi$  using a method based on Barrelet zeros. This is solution A. The amplitude analysis of HASAN 94 includes earlier data as well, and assume that the data can be parametrized in terms of towers of nearly degenerate resonances on the leading Regge trajectory. See also KLOET 96 and MARTIN 97 who make related analyses.  
<sup>6</sup> From solution B of amplitude analysis of data on  $\bar{p} p \rightarrow \pi \pi$ .  
<sup>7</sup>  $I(J^P) = 0(2^+)$  from simultaneous analysis of  $p\bar{p} \rightarrow \pi^- \pi^+ \pi^0$  and  $\pi^0 \pi^0$ .  
<sup>8</sup>  $I^G(J^P) = 0^+(2^+)$  from partial-wave amplitude analysis.

- <sup>1</sup> From a fit to the  $e^+e^-$  cross section between 2.00 and 3.08 GeV with a sum of Breit-Wigner amplitude and a non-resonant contribution.
- <sup>2</sup> By a simultaneous fit of the  $K_S^0(1430)^+K^-$  and  $K^*(892)^+K^-$  intermediate channels in a partial-wave analysis, assuming the same structure, modelled with a coherent sum of a nonresonant component and a resonant component by a Breit-Wigner function.
- <sup>3</sup> From a fit to the cross section between 2.00 and 3.08 GeV with a coherent sum of Breit-Wigner amplitudes, including contributions from  $\omega(1420)$  and  $\omega(1650)/\phi(1680)$ .
- <sup>4</sup> From a fit to the cross section below 3.5 GeV measured by BaBar and BESIII with a coherent sum of two modified Breit-Wigner amplitudes ( $\phi(1680)$  and  $\phi(2170)$ ) and a nonresonant term.
- <sup>5</sup> From a fit using a coherent sum of a phase-space modified Breit-Wigner function and a phase-space term.
- <sup>6</sup> By a simultaneous fit of the intermediate channels in a partial-wave analysis, assuming the same structure, modelled with a coherent sum of a nonresonant component and a resonant component by a Breit-Wigner function.
- <sup>7</sup> From a VDM fit to ZHU 23  $\eta\phi\gamma$  data with two resonances,  $\phi(1680)$ ,  $\phi(2170)$ , and a third resonance with mass  $1850.7 \pm 5.3$  MeV and width  $25 \pm 35$  MeV of 1.7  $\sigma$  statistical evidence.
- <sup>8</sup> From the analysis of the combined measurements of  $\sigma(e^+e^- \rightarrow \eta\phi)$  from BaBar, Belle, BESIII, CMD3. The statistical significance for  $\phi(2170)$  is 7.2  $\sigma$ .
- <sup>9</sup> From a fit to the cross section between 2.00 and 3.08 GeV with a sum of Breit-Wigner amplitude and a nonresonant contribution. The observed structure can be also due to  $\rho(2150)$ .
- <sup>10</sup> The observed structure can be due to both the  $\phi(2170)$  and  $\rho(2150)$ .
- <sup>11</sup> Fit includes interference with the  $\phi(1680)$ .
- <sup>12</sup> From the  $\phi f_0(980)$  component.
- <sup>13</sup> From a fit with two incoherent Breit-Wigners.
- <sup>14</sup> From the  $K^+K^-\pi f_0(980)$  component.
- <sup>15</sup> Superseded by LEES 12F.

- From a fit to the e<sup>+</sup>e<sup>-</sup> cross section between 2.00 and 3.08 GeV with a sum of Breit-Wigner amplitude and a non-resonant contribution.
- By a simultaneous fit of the K<sub>S</sub><sup>0</sup>(1430)+K<sup>-</sup> and K\*(892)+K<sup>-</sup> intermediate channels in a partial-wave analysis, assuming the same structure, modelled with a coherent sum of a nonresonant component and a resonant component by a Breit-Wigner function.
- From a fit to the cross section between 2.00 and 3.08 GeV with a coherent sum of Breit-Wigner amplitudes, including contributions from ω(1420) and ω(1650)/φ(1680).
- From a fit to the cross section below 3.5 GeV measured by BaBar and BESIII with a coherent sum of two modified Breit-Wigner amplitudes (φ(1680) and φ(2170)) and a nonresonant term.
- From a fit using a coherent sum of a phase-space modified Breit-Wigner function and a phase-space term.
- By a simultaneous fit of the intermediate channels in a partial-wave analysis, assuming the same structure, modelled with a coherent sum of a nonresonant component and a resonant component by a Breit-Wigner function.
- From a VDM fit to ZHU 23 ηφγ data with two resonances, φ(1680), φ(2170), and a third resonance with mass 1850.7 ± 5.3 MeV and width 25 ± 35 MeV of 1.7 σ statistical evidence.
- From the analysis of the combined measurements of σ(e<sup>+</sup>e<sup>-</sup> → ηφ) from BaBar, Belle, BESIII, CMD3. The statistical significance for φ(2170) is 7.2 σ.
- From a fit to the cross section between 2.00 and 3.08 GeV with a sum of Breit-Wigner amplitude and a nonresonant contribution. The observed structure can be also due to ρ(2150).
- The observed structure can be due to both the φ(2170) and ρ(2150).
- Fit includes interference with the φ(1680).
- From the φ f<sub>0</sub>(980) component.
- From a fit with two incoherent Breit-Wigners.
- From the K<sup>+</sup>K<sup>-</sup>f<sub>0</sub>(980) component.
- Superseded by LEES 12F.

1.7 ± 0.7 ± 1.3		483	AUBERT	08S BABR	10.6 e <sup>+</sup> e <sup>-</sup> → φηγ

- From a solution of the fit using a vector meson dominance model with contributions from φ(1680), φ(2170) and non resonant contribution with mass and width of φ(2170) fixed at 2163.5 MeV and 31.1 MeV respectively. Four solutions are found with equal fit quality giving 0.17 eV (solution I and II) and 18.6 eV (III and IV) at 90% CL.
- From the analysis of the combined measurements of σ(e<sup>+</sup>e<sup>-</sup> → ηφ) from BaBar, Belle, BESIII, CMD3. The statistical significance for φ(2170) is 7.2 σ. Four solutions are found, with equal fit quality: (0.56<sup>+0.03</sup><sub>-0.02</sub> ± 0.07) eV, (0.36<sup>+0.05</sup><sub>-0.03</sub> ± 0.07) eV, (38 ± 1 ± 5) eV, (41 ± 2 ± 6) eV.
- From a solution of the fit to the cross section below 3.5 GeV measured by BaBar and BESIII with a coherent sum of two modified Breit-Wigner amplitudes (φ(1680) and φ(2170)) and a nonresonant term. The other solution gives 10.11<sup>+3.87</sup><sub>-3.13</sub> eV.

218 ± 16	80k	4 UMAN	06	E835	5.2	$\bar{p}p \rightarrow \eta\eta\pi^0$
198 ± 50		BOOTH	86	OMEG	85	$\pi^- \text{Be} \rightarrow 2\phi\text{Be}$
150 <sup>+150</sup> <sub>-50</sub>		LINDENBAUM	84	RVUE		

- From a partial wave analysis of the systems ( $\gamma X$ ), with  $X \rightarrow \eta'\eta'$ , and ( $\eta' X$ ), with  $X \rightarrow \gamma\eta'$  in the decay  $J/\psi \rightarrow \gamma\eta'\eta'$ . The intermediate resonance  $X$  is parametrized by a constant-width, relativistic Breit-Wigner.
- From partial wave analysis including all possible combinations of  $0^{++}$ ,  $2^{++}$ , and  $4^{++}$  resonances.
- Includes data of ETKIN 85.
- Statistical error only.

## CHARGED KAON MASS

Revised 1994 by T.G. Trippe (LBNL).

The average of the six charged kaon mass measurements which we use in the Particle Listings is

$$m_{K^\pm} = 493.677 \pm 0.013 \text{ MeV } (S = 2.4), \quad (1)$$

where the error has been increased by the scale factor  $S$ . The large scale factor indicates a serious disagreement between different input data. The average before scaling the error is

$$m_{K^\pm} = 493.677 \pm 0.005 \text{ MeV }, \quad (2)$$

$$\chi^2 = 22.9 \text{ for } 5 \text{ D.F.}, \text{ Prob. } = 0.04\%,$$

where the high  $\chi^2$  and correspondingly low  $\chi^2$  probability further quantify the disagreement.

The main disagreement is between the two most recent and precise results,

$$m_{K^\pm} = 493.696 \pm 0.007 \text{ MeV} \quad \text{DENISOV 91}$$

$$m_{K^\pm} = 493.636 \pm 0.011 \text{ MeV } (S = 1.5) \quad \text{GALL 88}$$

$$\text{Average} = 493.679 \pm 0.006 \text{ MeV}$$

$$\chi^2 = 21.2 \text{ for } 1 \text{ D.F.}, \text{ Prob. } = 0.0004\%, \quad (3)$$

both of which are measurements of x-ray energies from kaonic atoms. Comparing the average in Eq. (3) with the overall average in Eq. (2), it is clear that DENISOV 91 [1] and GALL 88 [2] dominate the overall average, and that their disagreement is responsible for most of the high  $\chi^2$ .

The GALL 88 measurement was made using four different kaonic atom transitions,  $K^- \text{Pb } (9 \rightarrow 8)$ ,  $K^- \text{Pb } (11 \rightarrow 10)$ ,  $K^- \text{W } (9 \rightarrow 8)$ , and  $K^- \text{W } (11 \rightarrow 10)$ . The  $m_{K^\pm}$  values they obtain from each of these transitions is shown in the Particle Listings and in Fig. 1. Their  $K^- \text{Pb } (9 \rightarrow 8)$   $m_{K^\pm}$  is below and somewhat inconsistent with their other three transitions. The average of their four measurements is

$$m_{K^\pm} = 493.636 \pm 0.007,$$

$$\chi^2 = 7.0 \text{ for } 3 \text{ D.F.}, \text{ Prob. } = 7.2\%. \quad (4)$$

This is a low but acceptable  $\chi^2$  probability so, to be conservative, GALL 88 scaled up the error on their average by  $S=1.5$  to obtain their published error  $\pm 0.011$  shown in Eq. (3) above and used in the Particle Listings average.

**Figure 1:** Ideogram of  $m_{K^\pm}$  mass measurements. GALL 88 and CHENG 75 measurements are shown separately for each transition they measured.

The ideogram in Fig. 1 shows that the DENISOV 91 measurement and the GALL 88  $K^- \text{Pb } (9 \rightarrow 8)$  measurement yield two well-separated peaks. One might suspect the GALL 88  $K^- \text{Pb } (9 \rightarrow 8)$  measurement since it is responsible both for the internal inconsistency in the GALL 88 measurements and the disagreement with DENISOV 91.

To see if the disagreement could result from a systematic problem with the  $K^- \text{Pb } (9 \rightarrow 8)$  transition, we have separated the CHENG 75 [3] data, which also used  $K^- \text{Pb}$ , into its separate transitions. Figure 1 shows that the CHENG 75 and GALL 88  $K^- \text{Pb } (9 \rightarrow 8)$  values are consistent, suggesting the possibility of a common effect such as contaminant nuclear  $\gamma$  rays near the  $K^- \text{Pb } (9 \rightarrow 8)$  transition energy, although the CHENG 75 errors are too large to make a strong conclusion. The average of all 13 measurements has a  $\chi^2$  of 52.6 as shown in Fig. 1 and the first line of Table 1, yielding an unacceptable  $\chi^2$  probability of 0.00005%. The second line of Table 1 excludes both the GALL 88 and CHENG 75 measurements of the  $K^- \text{Pb } (9 \rightarrow 8)$  transition and yields a  $\chi^2$  probability of 43%. The third [fourth] line of Table 1 excludes only the GALL 88  $K^- \text{Pb } (9 \rightarrow 8)$  [DENISOV 91] measurement and yields a  $\chi^2$  probability of 20% [8.6%]. Table 1 shows that removing both measurements of the  $K^- \text{Pb } (9 \rightarrow 8)$  transition produces the most consistent set of data, but that excluding only the GALL 88  $K^- \text{Pb } (9 \rightarrow 8)$  transition or DENISOV 91 also produces acceptable probabilities.

**Table 1:**  $m_{K^\pm}$  averages for some combinations of Fig. 1 data.

$m_{K^\pm}$ (MeV)	$\chi^2$	D.F.	Prob. (%)	Measurements used
$493.664 \pm 0.004$	52.6	12	0.00005	all 13 measurements
$493.690 \pm 0.006$	10.1	10	43	no $K^-$ Pb(9→8)
$493.687 \pm 0.006$	14.6	11	20	no GALL 88 $K^-$ Pb(9→8)
$493.642 \pm 0.006$	17.8	11	8.6	no DENISOV 91

Yu.M. Ivanov, representing DENISOV 91, has estimated corrections needed for the older experiments because of improved  $^{192}\text{Ir}$  and  $^{198}\text{Au}$  calibration  $\gamma$ -ray energies. He estimates that CHENG 75 and BACKENSTOSS 73 [4]  $m_{K^\pm}$  values could be raised by about 15 keV and 22 keV, respectively. With these estimated corrections, Table 1 becomes Table 2. The last line of Table 2 shows that if such corrections are assumed, then GALL 88  $K^-$  Pb (9 → 8) is inconsistent with the rest of the data even when DENISOV 91 is excluded. Yu.M. Ivanov warns that these are rough estimates. Accordingly, we do not use Table 2 to reject the GALL 88  $K^-$  Pb (9 → 8) transition, but we note that a future reanalysis of the CHENG 75 data could be useful because it might provide supporting evidence for such a rejection.

**Table 2:**  $m_{K^\pm}$  averages for some combinations of Fig. 1 data after raising CHENG 75 and BACKENSTOSS 73 values by 0.015 and 0.022 MeV respectively.

$m_{K^\pm}$ (MeV)	$\chi^2$	D.F.	Prob. (%)	Measurements used
$493.666 \pm 0.004$	53.9	12	0.00003	all 13 measurements
$493.693 \pm 0.006$	9.0	10	53	no $K^-$ Pb(9→8)
$493.690 \pm 0.006$	11.5	11	40	no GALL 88 $K^-$ Pb(9→8)
$493.645 \pm 0.006$	23.0	11	1.8	no DENISOV 91

The GALL 88 measurement uses a Ge semiconductor spectrometer which has a resolution of about 1 keV, so they run the risk of some contaminant nuclear  $\gamma$  rays. Studies of  $\gamma$  rays following stopped  $\pi^-$  and  $\Sigma^-$  absorption in nuclei (unpublished) do not show any evidence for contaminants according to GALL 88 spokesperson, B.L. Roberts. The DENISOV 91 measurement uses a crystal diffraction spectrometer with a resolution of 6.3 eV for radiation at 22.1 keV to measure the 4f-3d transition in  $K^-$   $^{12}\text{C}$ . The high resolution and the light nucleus reduce the probability for overlap by contaminant  $\gamma$  rays, compared with the measurement of GALL 88. The DENISOV 91 measurement is supported by their high-precision measurement of the 4d-2p transition energy in  $\pi^-$   $^{12}\text{C}$ , which is good agreement with the calculated energy.

While we suspect that the GALL 88  $K^-$  Pb (9 → 8) measurements could be the problem, we are unable to find clear grounds for rejecting it. Therefore, we retain their measurement in the average and accept the large scale factor until further information can be obtained from new measurements and/or from reanalysis of GALL 88 and CHENG 75 data.

We thank B.L. Roberts (Boston Univ.) and Yu.M. Ivanov (Petersburg Nuclear Physics Inst.) for their extensive help in understanding this problem.

<sup>1</sup> Error increased from 0.0059 based on the error analysis in IVANOV 92.  
<sup>2</sup> This value is the authors' combination of all of the separate transitions listed for this paper.  
<sup>3</sup> The CHENG 75 values for separate transitions were calculated from their Table 7 transition energies. The first error includes a 20% systematic error in the noncircular contaminant shift. The second error is due to a  $\pm 5$  eV uncertainty in the theoretical transition energies.

- [a] See the Particle Listings below for the energy limits used in this measurement.
- [b] Most of this radiative mode, the low-momentum  $\gamma$  part, is also included in the parent mode listed without  $\gamma$ 's.
- [c] Structure-dependent part.
- [d] See the review on "Form Factors for Radiative Pion and Kaon Decays" for definitions and details.
- [e] Direct-emission branching fraction.
- [f] Derived from an analysis of neutrino-oscillation experiments.
- [g] Violates angular-momentum conservation.

## CONSTRAINED FIT INFORMATION

An overall fit to the mean life, a decay rate, and 15 branching ratios uses 35 measurements and one constraint to determine 8 parameters. The overall fit has a  $\chi^2 = 53.4$  for 28 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

- <sup>1</sup> BATLEY 12 uses data collected in 2003–2004. The result is inclusive of  $K^\pm \rightarrow \pi^+ \pi^- e^\pm \nu \gamma$  decays. Using PDG 12 value for  $\Gamma(\pi^+ \pi^- \pi^+) / \Gamma = (5.59 \pm 0.04) \times 10^{-2}$ .
- BATLEY 12 obtains  $B(\pi^+ \pi^- e \nu) = (4.257 \pm 0.004 \pm 0.035) \times 10^{-5}$  where the syst. error is dominated by the error on the normalization mode.
- <sup>2</sup> PISLAK 01 reports  $\Gamma(\pi^+ \pi^- e^+ \nu_e) / \Gamma_{\text{total}} = (4.109 \pm 0.008 \pm 0.110) \times 10^{-5}$  using the PDG 00 value  $\Gamma(\pi^+ \pi^+ \pi^-) / \Gamma_{\text{total}} = (5.59 \pm 0.05) \times 10^{-2}$ . We divide by the PDG value and unfold its error from the systematic error. PISLAK 03 and PISLAK 10A give additional details on the branching ratio measurement and give improved errors on the S-wave  $\pi$ - $\pi$  scattering length:  $a_0^0 = 0.235 \pm 0.013$  and  $a_0^2 = -0.0410 \pm 0.0027$ .

$< 500$	90	0	KLEMS	71	OSPK	+ $T_\pi < 117$ MeV
$-100 \pm 600$			CHEN	68	OSPK	+ $T_\pi$ 60–90 MeV

<sup>1</sup> LAZZERONI 14 combines NA62 and NA48/2 results. The result for the full kinematic range is extrapolated from the model-independent branching fraction  $(9.65 \pm 0.61 \pm 0.14) \times 10^{-7}$  for  $(m_{\gamma\gamma}/m_K)^2 > 0.2$ . The measured ChPT parameter  $\tilde{c} = 1.86 \pm 0.25$ .

<sup>2</sup> KITCHING 97 is extrapolated from their model-independent branching fraction  $(6.0 \pm 1.5 \pm 0.7) \times 10^{-7}$  for  $100 \text{ MeV}/c < P_{\pi^+} < 180 \text{ MeV}/c$  using Chiral Perturbation Theory.

<sup>3</sup> BATLEY 14 uses data collected in 2003 and 2004. Branching ratio is obtained by determining the parameter  $\tilde{c} = 1.41 \pm 0.38 \pm 0.11$  and integrating the  $\mathcal{O}(p^6)$  chiral spectrum. A model independent value for the branching ratio is also obtained  $(8.77 \pm 0.87 \pm 0.17) \times 10^{-7}$  for kinematic range  $(m_{\gamma\gamma}/m_K)^2 > 0.2$ .

<sup>4</sup> ARTAMONOV 05 limit assumes ChPT with  $\tilde{c} = 1.8$  with unitarity corrections. With  $\tilde{c} = 1.6$  and no unitarity corrections they obtain  $< 2.3 \times 10^{-8}$  at 90% CL. This partial branching ratio is predicted to be  $6.10 \times 10^{-9}$  and  $0.49 \times 10^{-9}$  for the cases with and without unitarity correction.

$2.7 \pm 0.5$	41	<sup>4</sup> BLOCH 75	SPEC	+

$\Gamma_{37} / \Gamma$

<sup>1</sup> Value extrapolated from a measurement in the region  $z = (m_{e\bar{e}}/m_K)^2 > 0.08$ . BATLEY 09 also evaluated the shape of the form factor using four different theoretical models.

<sup>2</sup> APPEL 99 establishes vector nature of this decay and determines form factor  $f(z) = f_0(1 + \delta z)$ ,  $Z = M_{e\bar{e}}^2/m_K^2$ ,  $\delta = 2.14 \pm 0.13 \pm 0.15$ . Also reports constraints on scalar and tensor interactions:  $|f_S| < 6.6 \times 10^{-5}$ ,  $|f_T| < 3.7 \times 10^{-4}$  at 90% C.L.

<sup>3</sup> ALLIEGRO 92 assumes a vector interaction with a form factor given by  $\lambda = 0.105 \pm 0.035 \pm 0.015$  and a correlation coefficient of  $-0.82$ .

<sup>4</sup> BLOCH 75 assumes a vector interaction.

$\Gamma(\pi^+ \mu^+ \mu^-) / \Gamma_{total}$

Test for  $\Delta S = 1$  weak neutral current. Allowed by higher-order electroweak interactions.

<23	90	ATIYA 89	B787	+

<sup>1</sup> CORTINA-GIL 22a also studies the form factor  $f(z)$  dependence of the decay, described via single photon exchange: assuming a linear form factor including  $\pi\pi$  rescattering,  $W_{\pi\pi^+}$ , as in DAMBROSIO 98a, finding  $f(z) = G_F m_K^2 (a_+ + b_+ z) + W_{\pi\pi}(z)$ ,  $a_+ = -0.575 \pm 0.013$ ,  $b_+ = -0.722 \pm 0.043$ .

<sup>2</sup> BATLEY 11a also studies the form factor  $f(z)$  dependence of the decay, described via single photon exchange: i) assuming a linear form factor,  $f(z) = f_0(1 + \delta z)$ ,  $z = (M_{\mu\mu}/m_K)^2$ , finding  $f_0 = 0.470 \pm 0.040$  and  $\delta = 3.11 \pm 0.57$  and ii) assuming a linear form factor including  $\pi\pi$  rescattering,  $W_{\pi\pi}$ , as in DAMBROSIO 98a, finding  $f(z) = G_F m_K^2 (a_+ + b_+ z) + W_{\pi\pi}(z)$ ,  $a_+ = -0.575 \pm 0.039$ ,  $b_+ = -0.813 \pm 0.145$ .

<sup>3</sup> PARK 02 “±” result comes from combining  $K^+ \rightarrow \pi^+ \mu^+ \mu^-$  and  $K^- \rightarrow \pi^- \mu^+ \mu^-$ , assuming CP is conserved.

<sup>4</sup> MA 00 establishes vector nature of this decay and determines form factor  $f(z) = f_0(1 + \delta z)$ ,  $z = (M_{\mu\mu}/m_K)^2$ ,  $\delta = 2.45^{+1.30}_{-0.95}$ .

<sup>5</sup> ADLER 97c gives systematic error  $0.7 \times 10^{-8}$  and theoretical uncertainty  $0.6 \times 10^{-8}$ , which we combine in quadrature to obtain our second error.

$\Gamma(\pi^+ e^+ e^- e^+ e^-) / \Gamma_{total}$

VALUE	CL%	DOCUMENT ID	TECN	CHG
< $1.4 \times 10^{-8}$	90	<sup>1</sup> CORTINA-GIL 23b	NA62	+

$\Gamma_{39} / \Gamma$

<sup>1</sup> Quoted limit is obtained using data collected from 2017 to 2018. CORTINA-GIL 23b also reports upper limits at 90% C.L. at the level of  $10^{-9}$  for the branching ratios of two prompt decay chains involving pair-production of hidden-sector mediators:  $K^+ \rightarrow \pi^+ a a$ ,  $a \rightarrow e^+ e^-$  and  $K^+ \rightarrow \pi^+ S$ ,  $S \rightarrow X X$ ,  $X \rightarrow e^+ e^-$ .

$\Gamma(\pi^+ \nu \bar{\nu}) / \Gamma_{total}$

Test for  $\Delta S = 1$  weak neutral current. Allowed by higher-order electroweak interactions. Branching ratio values are extrapolated from the momentum or energy regions shown in the comments assuming Standard Model phase space except for those labeled “Scalar” or “Tensor” to indicate the assumed non-Standard-Model interaction.

<sup>1</sup> CORTINA-GIL 21b analysis of the NA62 data taken in 2016–2018 observed 20 candidate events with an expected background of 7 events. The achieved single event sensitivity is  $(0.839 \pm 0.054) \times 10^{-11}$ . The quoted branching ratio includes result from CORTINA-GIL 20c which observed two candidate events. This provides evidence for the very rare  $K^+ \rightarrow \pi^+ \nu \bar{\nu}$  decay, observed with a significance of  $3.4 \sigma$ . Search for a feebly interacting scalar or pseudo-scalar particle  $X$  in the decay  $K^+ \rightarrow \pi^+ X$  was performed and an upper limit from  $3 \times 10^{-11}$  to  $6 \times 10^{-11}$  at the 90% C.L. was set for an invisible particle with a mass of 0–110 MeV/c<sup>2</sup> and  $< 1 \times 10^{-11}$  for mass of 160–260 MeV/c<sup>2</sup>.

<sup>2</sup> Value obtained combining ANISIMOVSKY 04, ADLER 04, and the present ARTAMONOV 08 results.

<sup>3</sup> CORTINA-GIL 20c analysis of the NA62 data taken in 2017 observed two candidate events with an expected background of 1.5 events. The achieved single event sensitivity is  $(0.389 \pm 0.024) \times 10^{-10}$ . The quoted branching ratio includes result from CORTINA-GIL 19b which observed one candidate event. The corresponding upper limit  $B(K^+ \rightarrow \pi^+ \nu \bar{\nu}) < 1.78 \times 10^{-10}$  at 90% C.L. Superseded by CORTINA-GIL 21b.

<sup>4</sup> Based on a sample of  $1.21 \times 10^{11}$   $K^+$  decays collected in 2016. One signal candidate is observed while the expected background is 0.152 events. The single-event-sensitivity is estimated to be  $3.15 \times 10^{-10}$ .

<sup>5</sup> Observed 3 events with an estimated background of  $0.93 \pm 0.17^{+0.32}_{-0.24}$ . Signal-to-background ratio for each of these 3 events is 0.20, 0.42, and 0.47.

<sup>6</sup> Value obtained combining the previous result ADLER 02c with 1 event and the present result with 0 events to obtain an expected background  $1.22 \pm 0.24$  events and 1 event observed.

<sup>7</sup> Value obtained combining the previous E787 result ADLER 02 with 2 events and the present E949 with 1 event. The additional event has a signal-to-background ratio 0.9. Superseded by ARTAMONOV 08.

<sup>8</sup> Superseded by ADLER 04.

<sup>9</sup> Combining ATIYA 93 and ATIYA 93b results. Superseded by ADLER 96.

**DALITZ PLOT PARAMETERS FOR  $K \rightarrow 3\pi$  DECAYS**

Revised 1999 by T.G. Trippe (LBNL).

The Dalitz plot distribution for  $K^\pm \rightarrow \pi^\pm \pi^\pm \pi^\mp$ ,  $K^\pm \rightarrow \pi^0 \pi^0 \pi^\pm$ , and  $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$  can be parameterized by a series expansion such as that introduced by Weinberg [1]. We use the form

$$\begin{aligned} |M|^2 &\propto 1 + g \frac{(s_3 - s_0)}{m_{\pi^+}^2} + h \left[ \frac{s_3 - s_0}{m_{\pi^+}^2} \right]^2 \\ &+ j \frac{(s_2 - s_1)}{m_{\pi^+}^2} + k \left[ \frac{s_2 - s_1}{m_{\pi^+}^2} \right]^2 \\ &+ f \frac{(s_2 - s_1)(s_3 - s_0)}{m_{\pi^+}^2 m_{\pi^+}^2} + \dots, \end{aligned} \quad (1)$$

where  $m_{\pi^+}^2$  has been introduced to make the coefficients  $g$ ,  $h$ ,  $j$ , and  $k$  dimensionless, and

$$s_i = (P_K - P_i)^2 = (m_K - m_i)^2 - 2m_K T_i, \quad i = 1, 2, 3,$$

$$s_0 = \frac{1}{3} \sum_i s_i = \frac{1}{3} (m_K^2 + m_1^2 + m_2^2 + m_3^2).$$

Here the  $P_i$  are four-vectors,  $m_i$  and  $T_i$  are the mass and kinetic energy of the  $i^{\text{th}}$  pion, and the index 3 is used for the odd pion.

The coefficient  $g$  is a measure of the slope in the variable  $s_3$  (or  $T_3$ ) of the Dalitz plot, while  $h$  and  $k$  measure the quadratic dependence on  $s_3$  and  $(s_2 - s_1)$ , respectively. The coefficient  $j$  is related to the asymmetry of the plot and must be zero if  $CP$  invariance holds. Note also that if  $CP$  is good,  $g$ ,  $h$ , and  $k$  must be the same for  $K^+ \rightarrow \pi^+ \pi^+ \pi^-$  as for  $K^- \rightarrow \pi^- \pi^- \pi^+$ .

Since different experiments use different forms for  $|M|^2$ , in order to compare the experiments we have converted to  $g$ ,  $h$ ,  $j$ , and  $k$  whatever coefficients have been measured. Where such conversions have been done, the measured coefficient  $a_y$ ,  $a_t$ ,  $a_u$ , or  $a_v$  is given in the comment at the right. For definitions of these coefficients, details of this conversion, and discussion of the data, see the April 1982 version of this note [2].

1.8 ± 2.2 ± 1.3	47M	<sup>3</sup> BATLEY	06A NA48	

<sup>1</sup> BATLEY 07E includes data from BATLEY 06A. Uses quadratic parametrization and PDG 06 value  $g = 0.626 \pm 0.007$  to obtain  $g_+ - g_- = (2.2 \pm 2.1 \pm 0.7) \times 10^{-4}$ . Neglects any possible charge asymmetries in higher order slope parameters  $h$  or  $k$ .

<sup>2</sup> Asymmetry obtained assuming that  $g_+ + g_- = 2 \times 0.652$  (PDG 02) and that asymmetries in  $h$  and  $k$  are zero.

<sup>3</sup> Linear and quadratic slopes from PDG 04 are used. Any possible charge asymmetries in higher order slope parameters  $h$  or  $k$  are neglected.

ALTERNATIVE PARAMETRIZATIONS OF  $K^\pm \rightarrow \pi^\pm \pi^0 \pi^0$  DALITZ PLOT

The following functional form for the matrix element suggested by  $\pi\pi$  rescattering in  $K^+ \rightarrow \pi^+ \pi^+ \pi^- \pi^0 \rightarrow \pi^+ \pi^0 \pi^0$  is used for this fit (CABIBBO 04A, CABIBBO 05): Matrix element =  $M_0 + M_1$  where  $M_0 = 1 + (1/2)g_0 u + (1/2)h' u^2 + (1/2)k_0 v^2$  with  $u = (s_3 - s_0)/(m_{\pi^+})^2$ ,  $v = (s_2 - s_1)/(m_{\pi^+})^2$  and where  $M_1$  takes into account the non-analytic piece due to  $\pi\pi$  rescattering amplitudes  $a_0$  and  $a_2$ ; The parameters  $g_0$  and  $h'$  are related to the parameters  $g$  and  $h$  of the matrix element squared given in the previous section by the approximations  $g_0 \sim g^{PDG}$  and  $h' \sim h^{PDG} - (g/2)^2$  and  $k_0 \sim k^{PDG}$ .

In addition, we also consider the effective field theory framework of COLANGELO 06A and BISSEGGGER 09 to extract  $g_{BB}$  and  $h'_{BB}$ .

 $K_{\pi^0}^\pm$  FORM FACTORS

In the form factor comments, the following symbols are used.

$f_+$  and  $f_-$  are form factors for the vector matrix element.

$f_S$  and  $f_T$  refer to the scalar and tensor term.

$f_0 = f_+ + f_- t / (m_{K^\pm}^2 - m_{\pi^0}^2)$ .

$t$  = momentum transfer to the  $\pi$ .

$\lambda_+$  and  $\lambda_0$  are the linear expansion coefficients of  $f_+$  and  $f_0$ :

$f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2)$

For quadratic expansion

$f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2 + \frac{\lambda_+''}{2} t^2 / m_{\pi^+}^4)$

as used by KTeV. If there is a non-vanishing quadratic term, then  $\lambda_+$  represents an average slope, which is then different from  $\lambda_+'$ .

NA48/2 and OKA quadratic expansion coefficients are converted with

$\lambda_+^{PDG} = \lambda_+^{NA48/2}$  and  $\lambda_+''^{PDG} = 2 \lambda_+''^{NA48/2}$

$\lambda_+^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+^{OKA}$  and

$\lambda_+''^{PDG} = 2 (\frac{m_{\pi^+}}{m_{\pi^0}})^4 \lambda_+''^{OKA}$

OKA linear expansion coefficients are converted with

$\lambda_+^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+^{OKA}$  and  $\lambda_0^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_0^{OKA}$

The pole parametrization is

$f_+(t) = f_+(0) (\frac{M_V^2}{M_V^2 - t})$

$f_0(t) = f_0(0) (\frac{M_S^2}{M_S^2 - t})$

where  $M_V$  and  $M_S$  are the vector and scalar pole masses.

The following abbreviations are used:

DP = Dalitz plot analysis.

PI =  $\pi$  spectrum analysis.

MU =  $\mu$  spectrum analysis.

POL =  $\mu$  polarization analysis.

BR =  $K_{\mu^3}^\pm / K_{e^3}^\pm$  branching ratio analysis.

E = positron or electron spectrum analysis.

RC = radiative corrections.

For previous  $\lambda_+'$  and  $\lambda_+''$  parametrizations used by NA48 (e.g. LA1 07A) and ISTRA (e.g. YUSHCHENKO 04B) see PDG 18.

$\lambda_+$  (LINEAR ENERGY DEPENDENCE OF  $f_+$  IN  $K_{e3}^\pm$  DECAY)

These results are for a linear expansion only. See the next section for fits including a quadratic term. For radiative correction of the  $K_{e3}^\pm$  Dalitz plot, see GINSBERG 67, BECHERRAWY 70, CIRIGLIANO 02, CIRIGLIANO 04, and ANDRE 07. Results labeled OUR FIT are discussed in the review “ $K_{e3}^\pm$  and  $K_{\mu 3}^0$  Form Factors” above. For earlier, lower statistics results, see the 2004 edition of this review, Physics Letters **B592** 1 (2004).

**DECAY FORM FACTOR FOR  $K^\pm \rightarrow \pi^0 \pi^0 e^\pm \nu$**

Given in BOLOTOV 86b, BARMIN 88b, and SHIMIZU 04.

**$K^\pm \rightarrow \ell^\pm \nu \gamma$  FORM FACTORS**

For definitions of the axial-vector  $F_A$  and vector  $F_V$  form factor, see the "Note on  $\pi^\pm \rightarrow \ell^\pm \nu \gamma$  and  $K^\pm \rightarrow \ell^\pm \nu \gamma$  Form Factors" in the  $\pi^\pm$  section. In the kaon literature, often different definitions  $a_K = F_A/m_K$  and  $v_K = F_V/m_K$  are used.

**$F_A + F_V$ , SUM OF AXIAL-VECTOR AND VECTOR FORM FACTOR FOR  $K \rightarrow e\nu e\gamma$**

VALUE	EVTS	DOCUMENT ID	TECN	COMMENT
<b><math>0.133 \pm 0.008</math> OUR AVERAGE</b>				Error includes scale factor of 1.3. See the ideogram below.
$0.125 \pm 0.007 \pm 0.001$	1.4k	<sup>1</sup> AMBROSINO	09E	KLOE $E_\gamma$ in 10–250 MeV, $p_e > 200$ MeV/c

$0.150 \pm 0.018$ $-0.023$	56	<sup>3</sup> HEARD	75	SPEC

<sup>1</sup> AMBROSINO 09E measures the absolute value  $|F_A + F_V|$  which is parametrized as  $|F_A + F_V| = F_V (1 + \lambda(1-x)) + F_A$ ,  $x = 2E_\gamma/m_K$ . ( $F_A + F_V$ ) and  $\lambda$  are fit parameters. The fitted value of  $\lambda = 0.38 \pm 0.20 \pm 0.02$  with a correlation of  $-0.93$  between ( $F_A + F_V$ ) and  $\lambda$ .

<sup>2</sup> HEINTZE 79 quotes absolute value of  $|F_A + F_V| \sin\theta_C$ . We use  $\sin\theta_C = V_{us} = 0.2205$ .

<sup>3</sup> HEARD 75 quotes absolute value of  $|F_A + F_V| \sin\theta_C$ . We use  $\sin\theta_C = V_{us} = 0.2205$ .

### T-VIOLATION PARAMETER IN $K^0$ - $\bar{K}^0$ MIXING

The asymmetry  $A_T = \frac{\Gamma(\bar{K}^0 \rightarrow K^0) - \Gamma(K^0 \rightarrow \bar{K}^0)}{\Gamma(\bar{K}^0 \rightarrow K^0) + \Gamma(K^0 \rightarrow \bar{K}^0)}$  must vanish if  $T$  invariance holds.

### ASYMMETRY $A_T$ IN $K^0$ - $\bar{K}^0$ MIXING

VALUE (units 10 <sup>-3</sup> )	EVTS	DOCUMENT ID	TECN
<b>6.6 ± 1.3 ± 1.0</b>	640k	<sup>1</sup> ANGELOPO... 98E	CPLR

<sup>1</sup> ANGELOPOULOS 98E measures the asymmetry  $A_T = [\Gamma(\bar{K}^0_{t=0} \rightarrow e^+ \pi^- \nu_{t=\tau}) - \Gamma(K^0_{t=0} \rightarrow e^- \pi^+ \bar{\nu}_{t=\tau})] / [\Gamma(\bar{K}^0_{t=0} \rightarrow e^+ \pi^- \nu_{t=\tau}) + \Gamma(K^0_{t=0} \rightarrow e^- \pi^+ \bar{\nu}_{t=\tau})]$  as a function of the neutral-kaon eigentime  $\tau$ . The initial strangeness of the neutral kaon is tagged by the charge of the accompanying charged kaon in the reactions  $p\bar{p} \rightarrow K^- \pi^+ K^0$  and  $p\bar{p} \rightarrow K^+ \pi^- \bar{K}^0$ . The strangeness at the time of the decay is tagged by the lepton charge. The reported result is the average value of  $A_T$  over the interval  $1\tau_S < \tau < 20\tau_S$ . From this value of  $A_T$  ANGELOPOULOS 01B, assuming  $CP$  invariance in the  $e\nu$  decay amplitude, determine the  $T$ -violating  $\Delta S = \Delta S$  conserving parameter (for its definition, see Review below)  $4\text{Re}(\epsilon) = (6.2 \pm 1.4 \pm 1.0) \times 10^{-3}$ .

See the related review(s):

• • • We do not use the following data for averages, fits, limits, etc. • • •			
1.664 ± 0.010		<sup>2</sup> LAI 05A	NA48

<sup>1</sup> AMBROSINO 06H uses Bell-Steinberger relations with the following measurements:  $B(K_L^0 \rightarrow \pi^+ \pi^-)$  in AMBROSINO 06F,  $B(K_S^0 \rightarrow \pi^0 \pi^0 \pi^0)$  in AMBROSINO 05B, the  $K_S^0$ -semileptonic charge asymmetry in AMBROSINO 06E, and  $K^0$ -semileptonic results in ANGELOPOULOS 98F.

<sup>2</sup> LAI 05A values are obtained through unitarity (Bell-Steinberger relations), improving determination of  $\eta_{000}$  and combining other data from PDG 04 and APOSTOLAKIS 99B.

### CPT-VIOLATION PARAMETERS

In  $K^0$ - $\bar{K}^0$  mixing, if  $CP$ -violating interactions include a  $T$  conserving part then

$$|K_S\rangle = [|K_1\rangle + (\epsilon + \delta)|K_2\rangle] / \sqrt{1 + |\epsilon + \delta|^2}$$

$$|K_L\rangle = [|K_2\rangle + (\epsilon - \delta)|K_1\rangle] / \sqrt{1 + |\epsilon - \delta|^2}$$

where

$$|K_1\rangle = [|K^0\rangle + |\bar{K}^0\rangle] / \sqrt{2}$$

$$|K_2\rangle = [|K^0\rangle - |\bar{K}^0\rangle] / \sqrt{2}$$

and

$$|\bar{K}^0\rangle = CP|K^0\rangle.$$

The parameter  $\delta$  specifies the  $CP$ -violating part.

Estimates of  $\delta$  are given below assuming the validity of the  $\Delta S = \Delta Q$  rule. See also THOMSON 95 for a test of  $CP$ -symmetry conservation in  $K^0$  decays using the Bell-Steinberger relation.

### REAL PART OF $\delta$

A nonzero value violates  $CP$  invariance.

### $K_S^0$ MEAN LIFE

For earlier measurements, beginning with BOLDT 58b, see our 1986 edition, Physics Letters **170B** 130 (1986).

OUR FIT is described in the note on "CP violation in  $K_L^0$  decays" in the  $K^0$  Particle Listings. The result labeled "OUR FIT Assuming  $CP^T$ " ["OUR FIT Not assuming  $CP^T$ "] includes all measurements except those with the comment "Not assuming  $CP^T$ " ["Assuming  $CP^T$ "]. Measurements with neither comment do not assume  $CPT$  and enter both fits.

- <sup>1</sup>The two ABOUZAID 11 values use the same full KTeV dataset from 1996, 1997, and 1999. The first enters the "assuming  $CP^T$ " fit and the second enters the "not assuming  $CP^T$ " fit.
- <sup>2</sup>ABOUZAID 11 fit has  $\Delta m$ ,  $\tau_S$ ,  $\phi_e$ ,  $\text{Re}(e'/\epsilon)$ , and  $\text{Im}(e'/\epsilon)$  as free parameters. See  $\text{Im}(e'/\epsilon)$  in the " $K_L^0$  CP violation" section for correlation information.
- <sup>3</sup>ABOUZAID 11 fit has  $\Delta m$  and  $\tau_S$  free but constrains  $\phi_{e\pm}$  to the Superweak value, i.e. assumes  $CP^T$ . This  $\tau_S$  value is correlated with their  $\Delta m = m_{K_L^0} - m_{K_S^0}$  measurement in the  $K_L^0$  listings. The correlation coefficient  $\rho(\tau_S, \Delta m) = -0.670$ .
- <sup>4</sup>Fit to the proper time distribution.
- <sup>5</sup>This ALAVI-HARATI 03 fit has  $\Delta m$  and  $\tau_S$  free but constrains  $\phi_{\pm}$  to the Superweak value, i.e. assumes  $CP^T$ . This  $\tau_S$  value is correlated with their  $\Delta m = m_{K_L^0} - m_{K_S^0}$  measurement in the  $K_L^0$  listings. The correlation coefficient  $\rho(\tau_S, \Delta m) = -0.396$ . Superseded by ABOUZAID 11.
- <sup>6</sup>This ALAVI-HARATI 03 fit has  $\Delta m$ ,  $\phi_{\pm}$ , and  $\tau_{K_S}$  free. See  $\phi_{\pm}$  in the " $K_L$  CP violation" section for correlation information. Superseded by ABOUZAID 11.

<sup>7</sup>ARONSON 82 find that  $K_S^0$  mean life may depend on the kaon energy.  
<sup>8</sup>CARTHERS 75 measures the  $\Delta m$  dependence of the total decay rate (inverse mean life) to be  $\Gamma(K_S^0) = [(1.122 \pm 0.004) + 0.16(\Delta m - 0.5348)/\Delta m]10^{10}/s$ , or, in terms of mean life, CARTHERS 75 measures  $\tau_S = (0.8913 \pm 0.0032) - 0.238 [\Delta m - 0.5348] (10^{-10} s)$ . We have adjusted the measurement to use our best values of  $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \hbar s^{-1})$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.  
<sup>9</sup>HILL 68 has been changed by the authors from the published value  $(0.865 \pm 0.009)$  because of a correction in the shift due to  $\eta_{+-}$ . SKJEGGESTAD 72 and HILL 68 give detailed discussions of systematics encountered in this type of experiment.  
<sup>10</sup>Pre-1971 experiments are excluded from the average because of disagreement with later more precise experiments.

$\Gamma_{14}$ $\pi^0 e^+ e^-$	S1 [a] $(3.0^{+1.5}_{-1.2}) \times 10^{-9}$	
$\Gamma_{15}$ $\pi^0 \mu^+ \mu^-$	S1 $(2.9^{+1.5}_{-1.2}) \times 10^{-9}$	

[a] See the Particle Listings below for the energy limits used in this measurement.  
 [b] Most of this radiative mode, the low-momentum  $\gamma$  part, is also included in the parent mode listed without  $\gamma$ 's.  
 [c] The value is for the sum of the charge states or particle/antiparticle states indicated.  
 [d] Not a measurement. Calculated as  $0.666 \cdot B(\pi^\pm e^\mp \nu_e)$ .

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 5 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 0.6$  for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{total}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$4.8^{+2.2}_{-1.6} \pm 1.1$		<sup>3</sup> ZOU	96	E621
● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●				
$4.1^{+2.5+0.5}_{-1.9-0.6}$		<sup>4</sup> ADLER	96E	CPLR Sup. by ADLER 97b
$3.9^{+5.4+0.9}_{-1.8-0.7}$		<sup>5</sup> THOMSON	94	E621 Sup. by ZOU 96

<sup>1</sup> BATLEY 05 is obtained by measuring the interference parameters in  $K_S, K_L \rightarrow \pi^+ \pi^- \pi^0$ :  $\text{Re}(\lambda) = 0.038 \pm 0.008 \pm 0.006$  and  $\text{Im}(\lambda) = -0.013 \pm 0.005 \pm 0.004$ ; the correlation coeff. between  $\text{Re}(\lambda)$  and  $\text{Im}(\lambda)$  is 0.66 (statistical only).  
<sup>2</sup> ADLER 97b find the CP-conserving parameters  $\text{Re}(\lambda) = (28 \pm 7 \pm 3) \times 10^{-3}$ ,  $\text{Im}(\lambda) = (-10 \pm 8 \pm 2) \times 10^{-3}$ . They estimate  $B(K_S^0 \rightarrow \pi^+ \pi^- \pi^0)$  from  $\text{Re}(\lambda)$  and the  $K_L^0$  decay parameters. See also ANGELOPOULOS 98c.  
<sup>3</sup> ZOU 96 is from the the measured quantities  $|\rho_{+-0}| = 0.039^{+0.009}_{-0.006} \pm 0.005$  and  $\phi_\rho = (-9 \pm 18)^\circ$ .  
<sup>4</sup> ADLER 96E is from the measured quantities  $\text{Re}(\lambda) = 0.036 \pm 0.010^{+0.002}_{-0.003}$  and  $\text{Im}(\lambda)$  consistent with zero. Note that the quantity  $\lambda$  is the same as  $\rho_{+-0}$  used in other footnotes.  
<sup>5</sup> THOMSON 94 calculates this branching ratio from their measurements  $|\rho_{+-0}| = 0.035^{+0.019}_{-0.011} \pm 0.004$  and  $\phi_\rho = (-59 \pm 48)^\circ$  where  $|\rho_{+-0}| e^{i\phi_\rho} = A(K_S^0 \rightarrow \pi^+ \pi^- \pi^0, l=2)/A(K_L^0 \rightarrow \pi^+ \pi^- \pi^0)$ .

7.2 ± 1.4 75 AKHMETSHIN 99 CMD2 Tagged  $K_S^0$  using  $\phi \rightarrow K_L^0 K_S^0$ 

- Reconstructed from  $K^0(\bar{K}^0)(t) \rightarrow \pi e \nu$  distributions using PDG values of  $B(K_L^0 \rightarrow \pi e \nu) = 0.4053 \pm 0.0015$ ,  $\tau_L = (5.114 \pm 0.021) \times 10^{-8}$  s and  $\tau_S = (0.8958 \pm 0.0005) \times 10^{-10}$  s.
- Uses the PDG 00 value for  $B(K_S^0 \rightarrow \pi^+\pi^-)$ .
- Obtained by imposing  $\Sigma_i B(K_S^0 \rightarrow i) = 1$ , where  $i$  runs over all the four branching ratios  $\pi^+\pi^-$ ,  $\pi^0\pi^0$ ,  $\pi e \nu$ , and  $\pi \mu \nu$ . Input value of  $B(K_S^0 \rightarrow \pi^+\pi^-) / B(K_S^0 \rightarrow \pi^0\pi^0)$  from AMBROSINO 06c is used. To derive  $\Gamma(K_S^0 \rightarrow \pi^+\mu\nu) / \Gamma(K_S^0 \rightarrow \pi^+e\nu)$ , lepton universality is assumed, radiative corrections from ANDRE 07 are used, and phase space integrals are taken from KTeV, ALEXOPOULOS 04A. This branching fraction enters our fit via their  $\Gamma(\pi^\pm e^\mp \nu_e) / \Gamma(\pi^+\pi^-)$  branching ratio measurement.

<sup>1</sup>Background estimate is  $0.22 \pm 0.18$  events. Branching ratio assumes a vector matrix element and unit form factor. $K_S^0$  FORM FACTORS

For discussion, see note on  $K_{f3}$  form factors in the  $K^\pm$  section of the Particle Listings above. Because the semileptonic branching fraction is smaller in  $K_S^0$  than  $K_L^0$  by the ratio of the mean lives, the  $K_S^0$  semileptonic form factor has so far been measured only in the  $K_{e3}$  mode using the linear expansion  $f_+(t) = f_+(0) (1 + \lambda_+ t / m_\pi^2)$ , which gives the vector form factor  $f_+(t)$  relative to its value at  $t = 0$ .

 $CP$  VIOLATION IN  $K_S \rightarrow 3\pi$ 

Written 1996 by T. Nakada (Paul Scherrer Institute) and L. Wolfenstein (Carnegie-Mellon University).

The possible final states for the decay  $K^0 \rightarrow \pi^+\pi^-\pi^0$  have isospin  $I = 0, 1, 2$ , and  $3$ . The  $I = 0$  and  $I = 2$  states have  $CP = +1$  and  $K_S$  can decay into them without violating  $CP$  symmetry, but they are expected to be strongly suppressed by centrifugal barrier effects. The  $I = 1$  and  $I = 3$  states, which have no centrifugal barrier, have  $CP = -1$  so that the  $K_S$  decay to these requires  $CP$  violation.

In order to see  $CP$  violation in  $K_S \rightarrow \pi^+\pi^-\pi^0$ , it is necessary to observe the interference between  $K_S$  and  $K_L$  decay, which determines the amplitude ratio

$$\eta_{+-0} = \frac{A(K_S \rightarrow \pi^+\pi^-\pi^0)}{A(K_L \rightarrow \pi^+\pi^-\pi^0)}. \quad (1)$$

If  $\eta_{+-0}$  is obtained from an integration over the whole Dalitz plot, there is no contribution from the  $I = 0$  and  $I = 2$  final states and a nonzero value of  $\eta_{+-0}$  is entirely due to  $CP$  violation.

Only  $I = 1$  and  $I = 3$  states, which are  $CP = -1$ , are allowed for  $K^0 \rightarrow \pi^0\pi^+\pi^0$  decays and the decay of  $K_S$  into  $3\pi^0$

is an unambiguous sign of  $CP$  violation. Similarly to  $\eta_{+-0}$ ,  $\eta_{000}$  is defined as

$$\eta_{000} = \frac{A(K_S \rightarrow \pi^0\pi^0\pi^0)}{A(K_L \rightarrow \pi^0\pi^0\pi^0)}. \quad (2)$$

If one assumes that  $CPT$  invariance holds and that there are no transitions to  $I = 3$  (or to nonsymmetric  $I = 1$  states), it can be shown that

$$\begin{aligned} \eta_{+-0} &= \eta_{000} \\ &= \epsilon + i \frac{\text{Im } a_1}{\text{Re } a_1}. \end{aligned} \quad (3)$$

With the Wu-Yang phase convention,  $a_1$  is the weak decay amplitude for  $K^0$  into  $I = 1$  final states;  $\epsilon$  is determined from  $CP$  violation in  $K_L \rightarrow 2\pi$  decays. The real parts of  $\eta_{+-0}$  and  $\eta_{000}$  are equal to  $\text{Re}(\epsilon)$ . Since currently-known upper limits on  $|\eta_{+-0}|$  and  $|\eta_{000}|$  are much larger than  $|\epsilon|$ , they can be interpreted as upper limits on  $\text{Im}(\eta_{+-0})$  and  $\text{Im}(\eta_{000})$  and so as limits on the  $CP$ -violating phase of the decay amplitude  $a_1$ .

 $CP$ -VIOLATION PARAMETERS IN  $K_S^0$  DECAY

$A_S = [\Gamma(K_S^0 \rightarrow \pi^- e^+ \nu_e) - \Gamma(K_S^0 \rightarrow \pi^+ e^- \bar{\nu}_e)] / \text{SUM}$   
Such asymmetry violates  $CP$ . If  $CP$  is assumed then  $A_S = 2 \text{Re}(\epsilon)$ .

Continuation of references for  $K_S^0$  decays, including authors like GIBBONS, BURKHARDT, GROSSMAN, BARMIN, etc., and their respective publications.

### OTHER RELATED PAPERS

List of other related papers including LITTENBERG, BATTISTON, TRILLING, CRAWFORD, FITCH, GOOD, BIRGE, MULLER.

$$I(J^P) = \frac{1}{2}(0^-)$$

$$m_{K_L^0} - m_{K_S^0}$$

For earlier measurements, beginning with GOOD 61 and FITCH 61, see our 1986 edition, Physics Letters 170B 132 (1986).

OUR FIT is described in the note on "CP violation in  $K_L^0$  decays" in the  $K_L^0$  Particle Listings. The result labeled "OUR FIT Assuming CPT" ["OUR FIT Not assuming CPT"] includes all measurements except those with the comment "Not assuming CPT" ["Assuming CPT"]. Measurements with neither comment do not assume CPT and enter both fits.

Table with columns: VALUE (10^10 tau s^-1), DOCUMENT ID, TECN, COMMENT. Includes 'OUR FIT' and 'OUR FIT Not assuming CPT' results.

The two ABOUZAIID 11 values use the same data. The first enters the "assuming CPT" fit and the second enters the "not assuming CPT" fit.

See key on page 1171

Meson Particle Listings

$K_L^0$

- <sup>2</sup>ABOUZAID 11 fit has  $\Delta m$ ,  $\tau_S$ ,  $\phi_e$ ,  $\text{Re}(e'/\epsilon)$ , and  $\text{Im}(e'/\epsilon)$  as free parameters. See  $\text{Im}(e'/\epsilon)$  in the " $K_L^0$  CP violation" section for correlation information.
- <sup>3</sup>ABOUZAID 11 fit has  $\Delta m$  and  $\tau_S$  free but constrains  $\phi_e$  to the Superweak value, i.e. assumes  $CP T$ . See " $K_S^0$  Mean Life" section for correlation information.
- <sup>4</sup>Fits  $\Delta m$  and  $\phi_{+-}$  simultaneously. GIBBONS 93c systematic error is from B. Winstein via private communication. 20–160 GeV  $K$  beams.
- <sup>5</sup>GIBBONS 93 value assume  $\phi_{+-} = \phi_{00} = \phi_{SW} = (43.7 \pm 0.2)^\circ$ , i.e. assumes  $CP T$ . 20–160 GeV  $K$  beams.
- <sup>6</sup>These two experiments have a common systematic error due to the uncertainty in the momentum scale, as pointed out in WAHL 89.
- <sup>7</sup>GJESDAL 74 uses charge asymmetry in  $K_{S3}^0$  decays.
- <sup>8</sup>ALAVI-HARATI 03 fit  $\Delta m$  and  $\tau_{K_S^0}$  simultaneously.  $\phi_{+-}$  is constrained to the Superweak value, i.e.  $CP T$  is assumed. See " $K_S^0$  Mean Life" section for correlation information. Superseded by ABOUZAID 11.
- <sup>9</sup>ALAVI-HARATI 03 fit  $\Delta m$ ,  $\phi_{+-}$ , and  $\tau_{K_S}$  simultaneously. See  $\phi_{+-}$  in the " $K_L$  CP violation" section for correlation information. Superseded by ABOUZAID 11.
- <sup>10</sup>ANGELOPOULOS 01 uses strong interactions strangeness tagging at two different times.
- <sup>11</sup>Uses  $K_{e3}^0$  and  $K_{\mu 3}^0$  strangeness tagging at production and decay. Assumes  $CP T$  conservation on  $\Delta S = -\Delta Q$  transitions.
- <sup>12</sup>ADLER 96c is the result of a fit which includes nearly the same data as entered into the "OUR FIT" value above.
- <sup>13</sup>ARONSON 82 find that  $\Delta m$  may depend on the kaon energy
- <sup>14</sup>ARONSON 70 and CARNEGIE 71 use  $K_S^0$  mean life =  $(0.862 \pm 0.006) \times 10^{-10}$  s. We have not attempted to adjust these values for the subsequent change in the  $K_S^0$  mean life or in  $\eta_{+-}$ .

- [a] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [b] This mode includes gammas from inner bremsstrahlung but not the direct emission mode  $K_L^0 \rightarrow \pi^+ \pi^- \gamma$  (DE).
- [c] See the Particle Listings below for the energy limits used in this measurement.
- [d] Most of this radiative mode, the low-momentum  $\gamma$  part, is also included in the parent mode listed without  $\gamma$ 's.
- [e] Allowed by higher-order electroweak interactions.
- [f] Violates  $CP$  in leading order. Test of direct  $CP$  violation since the indirect  $CP$ -violating and  $CP$ -conserving contributions are expected to be suppressed.

CONSTRAINED FIT INFORMATION

An overall fit to the mean life and 15 branching ratios uses 27 measurements and one constraint to determine 11 parameters. The overall fit has a  $\chi^2 = 37.4$  for 17 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$\Gamma_{30}/\Gamma$

<sup>1</sup> LAI 05B uses 1998 and 1999 data. Data are normalized to the observed events of  $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$  ( $\pi^0$  into Dalitz pair) and PDG 04 values are used for  $B(K_L^0 \rightarrow \pi^+ \pi^- \pi^0)$  and  $B(\pi^0 \rightarrow e^+ e^- \gamma)$ . The systematic error includes a normalization error of ± 0.10.  
<sup>2</sup> Values are for the total branching fraction, acceptance-corrected for the  $m_{ee}$  cuts shown.  
<sup>3</sup> Distribution of angles between two  $e^+e^-$  pair planes favors  $CP = -1$  for  $K_L^0$ .

<sup>1</sup>AHN 21 result is based on data collected in 2016, 2017 and 2018, which corresponds to  $3.05 \times 10^{19}$  protons on target. A single event sensitivity of  $(7.20 \pm 0.05 \pm 0.66) \times 10^{-10}$  was achieved with 3 candidate events observed and total  $1.22 \pm 0.26$  background events.

<sup>2</sup>AHN 19 result is based on data collected in 2015, which corresponds to  $2.2 \times 10^{19}$  protons on target. A single event sensitivity of  $(1.30 \pm 0.01 \pm 0.14) \times 10^{-9}$  was achieved with no candidate events observed. An upper limit of  $< 2.4 \times 10^{-9}$  at the 90% C.L. for the  $K_L^0 \rightarrow \pi^0 X^0$  decay was also set, where  $X^0$  is an invisible particle with a mass of 135 MeV/c<sup>2</sup>.

<sup>3</sup>AHN 17 result is based on the first 100 hours of physics running in 2013. One candidate event was observed with an expected background of  $0.34 \pm 0.16$  events. An upper limit of  $< 3.7 \times 10^{-8}$  at the 90% C.L. for the  $K_L^0 \rightarrow \pi^0 X^0$  decay was also set, where  $X^0$  is an invisible particle with a mass of 135 MeV/c<sup>2</sup>.

<sup>4</sup>Obtained combining Run-2 (AHN 08) and Run-3 data.

<sup>5</sup>Value obtained using data from February to April 2005.

<sup>6</sup>Value obtained analyzing 10% of data of RUN 1 (performed in 2004).

-6.1 ± 0.9 ± 0.5	14.7M	<sup>2</sup> LAI	01B NA48
-3.3 ± 1.1 ± 0.7	5M	<sup>2,3</sup> SOMALWAR	92 E731

<sup>1</sup> Result obtained using Cl3pl model of CABIBBO 05 to include  $\pi\pi$  rescattering effects. The systematic error includes an external error of  $1.06 \times 10^{-3}$  from the parametrization input of  $(a_0 - a_2) m_{\pi^+} = 0.268 \pm 0.017$  from BATLEY 06b.

<sup>2</sup> LAI 01B and SOMALWAR 92 results do not include  $\pi\pi$  final state rescattering effects.

<sup>3</sup> SOMALWAR 92 chose  $m_{\pi^+}$  as normalization to make it compatible with the Particle Data Group  $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$  definitions.

**$K_L^0$  FORM FACTORS**

For discussion, see note on form factors in the  $K^\pm$  section of the Particle Listings above.

In the form factor comments, the following symbols are used.

$f_+$  and  $f_-$  are form factors for the vector matrix element.

$f_S$  and  $f_T$  refer to the scalar and tensor term.

$$f_0(t) = f_+(t) + f_-(t) / (m_{K^0}^2 - m_{\pi^+}^2).$$

$t$  = momentum transfer to the  $\pi$ .

$\lambda_+$  and  $\lambda_0$  are the linear expansion coefficients of  $f_+$  and  $f_0$ :

$$f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2)$$

For quadratic expansion

$$f_+(t) = f_+(0) (1 + \lambda'_+ t / m_{\pi^+}^2 + \frac{\lambda''_+}{2} t^2 / m_{\pi^+}^4)$$

as used by KTeV. If there is a non-vanishing quadratic term, then  $\lambda_+$

represents an average slope, which is then different from  $\lambda'_+$ .

NA48 ( $K_{e3}$ ) and ISTRA quadratic expansion coefficients are converted with

$$\lambda'_+ PDG = \lambda_+ NA48 \text{ and } \lambda''_+ PDG = 2 \lambda'_+ NA48$$

$$\lambda'_+ PDG = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+ ISTRA \text{ and}$$

$$\lambda''_+ PDG = 2 (\frac{m_{\pi^+}}{m_{\pi^0}})^4 \lambda'_+ ISTRA$$

ISTRA linear expansion coefficients are converted with

$$\lambda_+ PDG = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+ ISTRA \text{ and } \lambda_0 PDG = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_0 ISTRA$$

The pole parametrization is

$$f_+(t) = f_+(0) (\frac{M_V^2}{M_V^2 - t})$$

$$f_0(t) = f_0(0) (\frac{M_S^2}{M_S^2 - t})$$

where  $M_V$  and  $M_S$  are the vector and scalar pole masses.

The dispersive parametrization is

$$f_+(t) = f_+(0) \exp[\frac{t}{m_{\pi^+}^2} (\Lambda_+ + H(t))];$$

$$f_0(t) = f_+(0) \exp[\frac{t}{m_K^2 - m_{\pi^+}^2} (\ln[C] - G(t))],$$

where  $\Lambda_+$  is the slope parameter and  $\ln[C] = \ln[f_0(m_K^2 - m_{\pi^+}^2)]$

is the logarithm of the scalar form factor at the Callan-Treiman point.

$H(t)$  and  $G(t)$  are dispersive integrals.

The following abbreviations are used:

DP = Dalitz plot analysis.

PI =  $\pi$  spectrum analysis.

MU =  $\mu$  spectrum analysis.

POL =  $\mu$  polarization analysis.

BR =  $K_{\mu 3}^0 / K_{e 3}^0$  branching ratio analysis.

E = positron or electron spectrum analysis.

RC = radiative corrections.

**$\lambda_+$  (LINEAR ENERGY DEPENDENCE OF  $f_+$  IN  $K_{e 3}^0$  DECAY)**

3.41 ± 0.67	unknown	150k	<sup>5</sup> BIRULEV	81 SPEC	DP
-------------	---------	------	----------------------	---------	----

<sup>1</sup> LAI 07A gives a correlation -0.40 between their  $\lambda_0$  and  $\lambda_+$  measurements.

<sup>2</sup> ALEXOPOULOS 04A gives a correlation -0.38 between their  $\lambda_0$  and  $\lambda_+$  measurements.

<sup>3</sup> ALEXOPOULOS 04A gives a correlation -0.36 between their  $\lambda_0$  and  $\lambda_+$  measurements.

<sup>4</sup> DONALDSON 74B  $d\lambda_0/d\lambda_+$  obtained from figure 18.

<sup>5</sup> BIRULEV 81 gives  $d\lambda_0/d\lambda_+ = -1.5$ , giving an unreasonably narrow error ellipse which dominates all other results. We use  $d\lambda_0/d\lambda_+ = 0$ .

**$\alpha_{K^*}^{\text{eff}}$  DECAY FORM FACTOR FOR  $K_L \rightarrow e^+ e^- e^+ e^-$**

$\alpha_{K^*}^{\text{eff}}$  is the parameter describing the relative strength of an intermediate pseudoscalar decay amplitude and a vector meson decay amplitude in the model of BERGSTROM 83. It takes into account both the radiative effects and the form factor. Since there are two  $e^+ e^-$  pairs here compared with one in  $e^+ e^- \gamma$  decays, a factorized expression is used for the  $e^+ e^- e^+ e^-$  decay form factor.

<sup>1</sup> Value obtained from the NA48 measurements of  $\Gamma(K_L^0 \rightarrow \pi^+ \pi^-)/\Gamma(K_L^0 \rightarrow \pi^0 \nu_e)$  and  $\tau_{K_S^0}$  and KLOE measurements of  $B(K_S^0 \rightarrow \pi^+ \pi^-)$  and  $\tau_{K_L^0}$ .  $\Gamma(K_L^0 \rightarrow \pi^+ \pi^-)$  is defined to include the inner bremsstrahlung component  $\Gamma(K_L^0 \rightarrow \pi^+ \pi^- \gamma(\text{IB}))$  but exclude the direct emission component  $B(K_S^0 \rightarrow \pi^+ \pi^- (\text{DE}))$ . Their  $|\eta_{+-}|$  value is not directly used in our fit, but enters the fit via their branching ratio and lifetime measurements.<sup>2</sup> AMBROSINO 06f uses KLOE branching ratios and  $\tau_L$  together with  $\tau_S$  from PDG 04. Their  $|\eta_{+-}|$  value is not directly used in our fit, but enters the fit via their branching ratio and lifetime measurements.

- <sup>3</sup>ALEXOPOULOS 04  $|\eta_{+-}|$  uses their  $K_L^0 \rightarrow \pi\pi$  branching fractions,  $\tau_S = (0.8963 \pm 0.0005) \times 10^{-10}$  s from the average of KTeV and NA48  $\tau_S$  measurements, and assumes that  $\Gamma(K_S^0 \rightarrow \pi\ell\nu_\ell) = \Gamma(K_L^0 \rightarrow \pi\ell\nu_\ell)$  giving  $B(K_S^0 \rightarrow \pi\ell\nu_\ell) = 0.118\%$ . Their  $\eta_{+-}$  is not directly used in our fit, but enters our fit via their branching ratio measurements.
- <sup>4</sup>APOSTOLAKIS 99c report  $(2.264 \pm 0.023 \pm 0.026 + 9.1[\tau_S - 0.8934]) \times 10^{-3}$ . We evaluate for our 2006 best value  $\tau_S = (0.8958 \pm 0.0005) \times 10^{-10}$  s.
- <sup>5</sup>ADLER 95b report  $(2.312 \pm 0.043 \pm 0.030 - 1[\Delta m - 0.5274] + 9.1[\tau_S - 0.8926]) \times 10^{-3}$ . We evaluate for our 1996 best values  $\Delta m = (0.5304 \pm 0.0014) \times 10^{-10}$   $\hbar s^{-1}$  and  $\tau_S = (0.8927 \pm 0.0009) \times 10^{-10}$  s. Superseded by APOSTOLAKIS 99c.

$$|\epsilon| = (2|\eta_{+-}| + |\eta_{00}|)/3$$

This expression is a very good approximation, good to about one part in  $10^{-4}$  because of the small measured value of  $\phi_{00} - \phi_{+-}$  and small theoretical ambiguities.

VALUE (units $10^{-3}$ )	DOCUMENT ID
<b>0.9950 ± 0.0007 OUR FIT</b>	Error includes scale factor of 1.6.
<b>0.9930 ± 0.0020 OUR AVERAGE</b>	

$$|\eta_{00}/\eta_{+-}|$$

VALUE	EVTS	DOCUMENT ID	TECN
<b>0.9950 ± 0.0007 OUR FIT</b>			Error includes scale factor of 1.6.
<b>0.9930 ± 0.0020 OUR AVERAGE</b>			
0.9931 ± 0.0020	1,2	BARR 93D	NA31

• • • We do not use the following data for averages, fits, limits, etc. • • •			
0.9939 ± 0.0013 ± 0.0015	1M	BARR 93D	NA31
0.9899 ± 0.0020 ± 0.0025	1	BURKHARDT 88	NA31

- <sup>1</sup>This is the square root of the ratio  $R$  given by BURKHARDT 88 and BARR 93D.
- <sup>2</sup>This is the combined results from BARR 93D and BURKHARDT 88, taking into account a common systematic uncertainty of 0.0014.
- <sup>3</sup>We calculate  $|\eta_{00}/\eta_{+-}| = 1 - 3(\epsilon'/\epsilon)$  from WOODS 88 ( $\epsilon'/\epsilon$ ) value.

$$\text{Re}(\epsilon'/\epsilon) = (1 - |\eta_{00}/\eta_{+-}|)/3$$

We have neglected terms of order  $\omega \cdot \text{Re}(\epsilon'/\epsilon)$ , where  $\omega = \text{Re}(A_2)/\text{Re}(A_0) \simeq 1/22$ . If included, this correction would lower  $\text{Re}(\epsilon'/\epsilon)$  by about  $0.04 \times 10^{-3}$ . See SOZZI 04.

- <sup>1</sup>The two ABOUZAID 11 values use the same data. The fits are performed with and without CPT invariance requirement.
- <sup>2</sup>These values are derived from  $|\eta_{00}/\eta_{+-}|$  measurements. They enter the average in this section but enter the fit via the  $|\eta_{00}/\eta_{+-}|$  only.
- <sup>3</sup>This is the combined results from BARR 93D and BURKHARDT 88, taking into account their common systematic uncertainty.
- <sup>4</sup>We use ABOUZAID 11  $\text{Re}(\epsilon'/\epsilon)$  value with CPT assumption in our fits for  $|\eta_{+-}|$ ,  $|\eta_{00}|$ , and  $\text{Re}(\epsilon'/\epsilon)$ .
- <sup>5</sup>These values are derived from  $|\eta_{00}/\eta_{+-}|$  measurements.

$\phi_{+-}$ , PHASE OF  $\eta_{+-}$

The dependence of the phase on  $\Delta m$  and  $\tau_S$  is given for each experiment in the comments below, where  $\Delta m$  is the  $K_L^0 - K_S^0$  mass difference in units  $10^{10} \hbar s^{-1}$  and  $\tau_S$  is the  $K_S$  mean life in units  $10^{-10}$  s. We also give the regeneration phase  $\phi_f$  in the comments below.

OUR FIT is described in the note on "CP violation in  $K_L$  decays" in the  $K_L^0$  Particle Listings. Most experiments in this section are included in both the "Not Assuming CPT" and "Assuming CPT" fits. In the latter fit, they have little direct influence on  $\phi_{+-}$  because their errors are large compared to that assuming CPT, but they influence  $\Delta m$  and  $\tau_S$  through their dependencies on these parameters, which are given in the footnotes.

- <sup>1</sup>APOSTOLAKIS 99c measures  $\phi_{+-} = (43.19 \pm 0.53 \pm 0.28) + 300 [\Delta m - 0.5301] (^\circ)$ . We have adjusted the measurement to use our best values of  $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \hbar s^{-1})$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>2</sup>SCHWINGENHEUER 95 measures  $\phi_{+-} = (43.53 \pm 0.76) + 173 [\Delta m - 0.5282] - 275 [\tau_S - 0.8926] (^\circ)$ . We have adjusted the measurement to use our best values of  $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \hbar s^{-1})$ ,  $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} s)$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>3</sup>These experiments measure  $\phi_{+-} - \phi_f$  and calculate the regeneration phase from the power law momentum dependence of the regeneration amplitude using analyticity and dispersion relations. SCHWINGENHEUER 95 [GIBBONS 93] includes a systematic error of  $0.35^\circ [0.5^\circ]$  for uncertainties in their modeling of the regeneration amplitude.
- <sup>4</sup>GIBBONS 93 measures  $\phi_{+-} = (42.21 \pm 0.9) + 189 [\Delta m - 0.5257] - 460 [\tau_S - 0.8922] (^\circ)$ . We have adjusted the measurement to use our best values of  $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \hbar s^{-1})$ ,  $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} s)$ . Our first error is their experiment's error and our second error is the systematic error from using our best values. This is actually reported in SCHWINGENHEUER 95, footnote 8. GIBBONS 93 reports  $\phi_{+-} (42.2 \pm 1.4)^\circ$ . They measure  $\phi_{+-} - \phi_f$  and calculate the regeneration phase  $\phi_f$  from the power law momentum dependence of the regeneration amplitude using analyticity. An error of  $0.6^\circ$  is included for possible uncertainties in the regeneration phase.
- <sup>5</sup>CAROSI 90 measures  $\phi_{+-} = (46.9 \pm 1.4 \pm 0.7) + 579 [\Delta m - 0.5351] + 303 [\tau_S - 0.8922] (^\circ)$ . We have adjusted the measurement to use our best values of  $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \hbar s^{-1})$ ,  $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} s)$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>6</sup>GEWENIGER 74B measures  $\phi_{+-} = (49.4 \pm 1.0) + 565 [\Delta m - 0.540] (^\circ)$ . We have adjusted the measurement to use our best values of  $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \hbar s^{-1})$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>7</sup>Not independent of other phase parameters reported in ABOUZAID 11.
- <sup>8</sup>ALAVI-HARATI 03  $\phi_{+-}$  is correlated with their  $\Delta m = m_{K_L^0} - m_{K_S^0}$  and  $\tau_{K_S}$  measurements in the  $K_L^0$  and  $K_S^0$  sections respectively. The correlation coefficients are  $\rho(\phi_{+-}, \Delta m) = +0.955$ ,  $\rho(\phi_{+-}, \tau_S) = -0.871$ , and  $\rho(\tau_S, \Delta m) = -0.840$ . CPT is not assumed. Uses scintillator Pb regenerator. Superseded by ABOUZAID 11.
- <sup>9</sup>ADLER 96c measures  $\phi_{+-} = (43.82 \pm 0.41) + 339 [\Delta m - 0.5307] - 252 [\tau_S - 0.8922] (^\circ)$ . We have adjusted the measurement to use our best values of  $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \hbar s^{-1})$ ,  $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} s)$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>10</sup>ADLER 96c is the result of a fit which includes nearly the same data as entered into the "OUR FIT" value in the 1996 edition of this Review (Physical Review D54 1 (1996)).
- <sup>11</sup>ADLER 95B measures  $\phi_{+-} = (42.7 \pm 0.9 \pm 0.6) + 316 [\Delta m - 0.5274] + 30 [\tau_S - 0.8926] (^\circ)$ . We have adjusted the measurement to use our best values of  $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \hbar s^{-1})$ ,  $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} s)$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>12</sup>ADLER 92B quote separately two systematic errors:  $\pm 0.4$  from their experiment and  $\pm 1.0$  degrees due to the uncertainty in the value of  $\Delta m$ .
- <sup>13</sup>KARLSSON 90 systematic error does not include regeneration phase uncertainty.
- <sup>14</sup>CARITHERS 75 measures  $\phi_{+-} = (45.5 \pm 2.8) + 224 [\Delta m - 0.5348] (^\circ)$ . We have adjusted the measurement to use our best values of  $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \hbar s^{-1})$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.  $\phi_f = -40.9 \pm 2.6^\circ$ .

## Meson Particle Listings

 $K_L^0$  $\phi_{00}$ , PHASE OF  $\eta_{00}$ 

See comment in  $\phi_{+-}$  header above for treatment of  $\Delta m$  and  $\tau_S$  dependence, as well as for the inclusion of data in both the "Assuming  $CPT$ " and "Not Assuming  $CPT$ " fits.

OUR FIT is described in the note on "CP violation in  $K_L$  decays" in the  $K_L^0$  Particle Listings.

VALUE (%)	DOCUMENT ID	TECN	COMMENT
<b>43.52 ± 0.05 OUR FIT</b>			Error includes scale factor of 1.2. Assuming $CPT$
<b>43.7 ± 0.6 OUR FIT</b>			Error includes scale factor of 1.2. Not assuming $CPT$
44.5 ± 2.3 ± 0.5	<sup>1</sup> CAROSI 90	NA31	
• • •	We do not use the following data for averages, fits, limits, etc. • • •		
44.06 ± 0.68	<sup>2</sup> ABOUZAID 11	KTEV	Not assuming $CPT$
41.7 ± 5.9 ± 0.2	<sup>3</sup> ANGELOPO... 98	CPLR	
50.8 ± 7.1 ± 1.7	<sup>4</sup> ADLER 96B	CPLR	Sup. by ANGELOPOULOS 98
47.4 ± 1.4 ± 0.9	<sup>5</sup> KARLSSON 90	E731	

<sup>1</sup> CAROSI 90 measures  $\phi_{00} = (47.1 \pm 2.1 \pm 1.0) + 579 [\Delta m - 0.5351] + 252 [\tau_S - 0.8922]$  (°). We have adjusted the measurement to use our best values of ( $\Delta m = 0.5293 \pm 0.0009$ ) ( $10^{10} \text{ h s}^{-1}$ ), ( $\tau_S = 0.8954 \pm 0.0004$ ) ( $10^{-10} \text{ s}$ ). Our first error is their experiment's error and our second error is the systematic error from using our best values.

<sup>2</sup> Not independent of other phase parameters reported in ABOUZAID 11.

<sup>3</sup> ANGELOPOULOS 98 measures  $\phi_{00} = (42.0 \pm 5.6 \pm 1.9) + 240 [\Delta m - 0.5307]$  (°). We have adjusted the measurement to use our best values of ( $\Delta m = 0.5293 \pm 0.0009$ ) ( $10^{10} \text{ h s}^{-1}$ ). Our first error is their experiment's error and our second error is the systematic error from using our best values. The  $\tau_S$  dependence is negligible.

<sup>4</sup> ADLER 96B identified initial neutral kaon individually as being a  $K^0$  or a  $\bar{K}^0$ . The systematic uncertainty is  $\pm 1.5^\circ$  combined in quadrature with  $\pm 0.8^\circ$  due to  $\Delta m$ .

<sup>5</sup> KARLSSON 90 systematic error does not include regeneration phase uncertainty.

 $\phi_\epsilon = (2\phi_{+-} + \phi_{00})/3$ 

This expression is a very good approximation, good to about  $10^{-3}$  degrees because of the small measured values of  $\phi_{00} - \phi_{+-}$  and  $\text{Re } \epsilon'/\epsilon$ , and small theoretical ambiguities.

VALUE (%)	DOCUMENT ID	TECN	COMMENT
<b>43.52 ± 0.04 OUR FIT</b>			Error includes scale factor of 1.2. Assuming $CPT$
<b>43.5 ± 0.5 OUR FIT</b>			Error includes scale factor of 1.3. Not assuming $CPT$
43.5164 ± 0.0002 ± 0.0509	<sup>1</sup> SUPERWEAK 16		Assuming $CPT$
43.86 ± 0.63	<sup>2</sup> ABOUZAID 11	KTEV	Not assuming $CPT$

<sup>1</sup> SUPERWEAK 16 is a fake measurement used to impose the  $CPT$  or Superweak constraint  $\phi_{+-} = \phi_{SW} = \tan^{-1}[2 \frac{\Delta m}{\hbar} (\frac{\tau_S \tau_L}{\tau_S - \tau_L})]$ . This "measurement" is linearized using values near the PDG 04 edition values of  $\Delta m$ ,  $\tau_S$  and  $\tau_L$ , and then adjusted to our current values as described in the following "measurement". SUPERWEAK 16 measures  $\phi_\epsilon = (43.50258 \pm 0.00021) + 54.1 [\Delta m - 0.5289] + 32.0 [\tau_S - 0.89564]$  (°). We have adjusted the measurement to use our best values of ( $\Delta m = 0.5293 \pm 0.0009$ ) ( $10^{10} \text{ h s}^{-1}$ ), ( $\tau_S = 0.8954 \pm 0.0004$ ) ( $10^{-10} \text{ s}$ ). Our first error is their experiment's error and our second error is the systematic error from using our best values.

<sup>2</sup> ABOUZAID 11 uses the full KTeV dataset collected in 1996, 1997, and 1999. See  $\text{Im}(\epsilon'/\epsilon)$  section for correlation information.

 $\text{Im}(\epsilon'/\epsilon) = -(\phi_{00} - \phi_{+-})/3$ 

For small  $|\epsilon'/\epsilon|$ ,  $\text{Im}(\epsilon'/\epsilon)$  is related to the phases of  $\eta_{00}$  and  $\eta_{+-}$  by the above expression.

VALUE (%)	DOCUMENT ID	TECN	COMMENT
<b>-0.002 ± 0.005 OUR FIT</b>			Error includes scale factor of 1.7. Assuming $CPT$
<b>-0.11 ± 0.11 OUR FIT</b>			Not assuming $CPT$
<b>-0.0985 ± 0.1157</b>	<sup>1</sup> ABOUZAID 11	KTEV	Not assuming $CPT$

<sup>1</sup> ABOUZAID 11 uses the full KTeV dataset collected in 1996, 1997, and 1999. The fit has  $\Delta m$ ,  $\tau_S$ ,  $\phi_\epsilon$ ,  $\text{Re}(\epsilon'/\epsilon)$ , and  $\text{Im}(\epsilon'/\epsilon)$  as free parameters. The reported value of  $\text{Im}(\epsilon'/\epsilon) = (-17.20 \pm 20.20) \times 10^{-4}$  rad. The correlation coefficients are  $\rho(\phi_\epsilon, \Delta m) = 0.828$ ,  $\rho(\phi_\epsilon, \tau_S) = -0.765$ ,  $\rho(\Delta m, \tau_S) = -0.858$ ,  $\rho(\text{Im}(\epsilon'/\epsilon), \phi_\epsilon) = -0.041$ ,  $\rho(\text{Im}(\epsilon'/\epsilon), \Delta m) = 0.026$ ,  $\rho(\text{Im}(\epsilon'/\epsilon), \tau_S) = -0.010$ .

DECAY-PLANE ASYMMETRY IN  $\pi^+ \pi^- e^+ e^-$  DECAYS

This is the  $CP$ -violating asymmetry

$$A = \frac{N_{\sin\phi\cos\phi>0.0} - N_{\sin\phi\cos\phi<0.0}}{N_{\sin\phi\cos\phi>0.0} + N_{\sin\phi\cos\phi<0.0}}$$

where  $\phi$  is the angle between the  $e^+ e^-$  and  $\pi^+ \pi^-$  planes in the  $K_L^0$  rest frame.

CP ASYMMETRY  $A$  in  $K_L^0 \rightarrow \pi^+ \pi^- e^+ e^-$

- Data driven analysis using partial-wave dispersion relations.
- Extracted employing  $\pi K$  partial wave analysis from ESTABROOKS 78 and ASTON 88, Roy-Steiner equations and once subtracted forward dispersion relations.
- Reanalysis of ESTABROOKS 78 and ASTON 88 satisfying Forward Dispersion Relations and using sequences of Pade approximants.
- Extracted from Breit-Wigner parameters.
- Fit to scattering phase shifts using UChPT amplitudes with explicit resonances.
- Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06c, AITALA 06, and LINK 09 using an  $s$ -dependent width with couplings to  $K\pi$  and  $K\eta'$ , and the Adler zero near thresholds.
- From a complex pole included in the fit. Using parameters from the model that fits data best.
- Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06c using for the  $\kappa$  an  $s$ -dependent width with an Adler zero near threshold.
- Using Roy-Steiner equations (ROY 71) consistent with unitarity, analyticity and crossing symmetry constraints.
- From UChPT fitted to MERCER 71, BINGHAM 72 and ESTABROOKS 78. Amplitude shown to be consistent with data of ABLIKIM 06c.
- Reanalysis of ASTON 88 data.
- Reanalysis of ASTON 88 using interfering Breit-Wigner amplitudes. Extracted from Breit-Wigner parameters.
- Unitarized Quark Model.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- The Breit-Wigner parameters from a fit with seven intermediate resonances. The  $S$ -matrix pole position is  $(764 \pm 63^{+71}_{-54}) - i (306 \pm 149^{+143}_{-85})$  MeV.
  - From a fit including ten additional resonances and energy-independent Breit-Wigner width.
  - A fit in the  $K_0^*(700) + K^*(892) + K^*(1410)$  model with mass and width of the  $K_0^*(700)$  from ABLIKIM 06c well describes the left slope of the  $K_S^0 \pi^-$  invariant mass spectrum in  $\tau^- \rightarrow K_0^* \pi^- \nu_\tau$  decay studied by EPIFANOV 07. Averaged value from different parameterizations.
  - Not seen by KOPP 01 using 7070 events of  $D^0 \rightarrow K^- \pi^+ \pi^0$ . LINK 02e and LINK 05i show clear evidence for a constant non-resonant scalar amplitude rather than  $K_0^*(700)$  in their high statistics analysis of  $D^+ \rightarrow K^- \pi^+ \mu^+ \nu_\mu$ .
  - AUBERT 07r does not find evidence for the charged  $K_0^*(700)$  using 11k events of  $D^0 \rightarrow K^- K^+ \pi^0$ .
  - Using parameters from the model that fits data best.
  - Breit-Wigner parameters. A significant  $S$ -wave can be also modeled as a non-resonant contribution.
  - Reanalysis of ASTON 88 using interfering Breit-Wigner amplitudes.

- Taking into account the  $K^*(892)^0$ , S-wave and P-wave ( $K^*(1410)^0$ ).
- From the isobar model with a complex pole for the  $\kappa$ .
- Fit to  $K\pi$  mass spectrum includes a non-resonant scalar component.
- Inclusive reaction. Complicated background and phase-space effects.
- From pole extrapolation.
- Mass errors enlarged by us to  $\Gamma/\sqrt{N}$ . See note.
- Number of events in peak reevaluated by us.
- For transverse momenta between 0.6 and 0.8 GeV/c and rapidity  $0 < y < 0.5$ .
- From a Dalitz plot analysis in an isobar model with charged and neutral  $K^*(892)$  masses and widths floating.
- This value comes from a fit with  $\chi^2$  of 178/117.
- Systematic uncertainties not estimated.

WEIGHTED AVERAGE  
895.55 ± 0.20 (Error scaled by 1.7)

$K^*(892)$  MASSES AND MASS DIFFERENCES

Unrealistically small errors have been reported by some experiments. We use simple “realistic” tests for the minimum errors on the determination of a mass and width from a sample of  $N$  events:

$$\delta_{\min}(m) = \frac{\Gamma}{\sqrt{N}}, \quad \delta_{\min}(\Gamma) = 4 \frac{\Gamma}{\sqrt{N}}. \quad (1)$$

We consistently increase unrealistic errors before averaging. For a detailed discussion, see the 1971 edition of this Note.

- Taking also into account the  $K_S^0(1430)^0$  and  $K_S^0(1430)^0$ .
- Taking into account the  $K^*(892)^0$ , S-wave and P-wave ( $K^*(1410)^0$ ).
- From the isobar model with a complex pole for the  $\kappa$ .
- Fit to  $K\pi$  mass spectrum includes a non-resonant scalar component.
- Inclusive reaction. Complicated background and phase-space effects.
- Width errors enlarged by us to  $4 \times \Gamma/\sqrt{N}$ ; see note.
- Number of events in peak reevaluated by us.
- For transverse momenta between 0.6 and 0.8 GeV/c and rapidity  $0 < y < 0.5$ .
- From a Dalitz plot analysis in an isobar model with charged and neutral  $K^*(892)$  masses and widths floating.
- This value comes from a fit with  $\chi^2$  of 178/117.
- Systematic uncertainties not estimated.

WEIGHTED AVERAGE  
47.3±0.5 (Error scaled by 2.0)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

NEUTRAL ONLY (MeV)

### $K^*(892)$ DECAY MODES

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Confidence level
$\Gamma_1$ $K\pi$	~ 100	%
$\Gamma_2$ $(K\pi)^\pm$	( 99.902 ± 0.009 )	%
$\Gamma_3$ $(K\pi)^0$	( 99.754 ± 0.021 )	%
$\Gamma_4$ $K^0 \gamma$	( 2.46 ± 0.21 )	$\times 10^{-3}$
$\Gamma_5$ $K^\pm \gamma$	( 9.8 ± 0.9 )	$\times 10^{-4}$
$\Gamma_6$ $K\pi\pi$	< 7	$\times 10^{-4}$ 95%

### CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 14 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 10.7$  for 12 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_5$	-100
$\Gamma$	17 -17
	$x_2 \quad x_5$

Mode	Rate (MeV)
$\Gamma_2$ $(K\pi)^\pm$	51.4 ± 0.8
$\Gamma_5$ $K^\pm \gamma$	0.050 ± 0.005

### CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 23 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 68.4$  for 21 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_4$	-100
$\Gamma$	13 -13
	$x_3 \quad x_4$

Mode	Rate (MeV)	Scale factor
$\Gamma_3$ $(K\pi)^0$	47.2 ± 0.5	2.0
$\Gamma_4$ $K^0 \gamma$	0.117 ± 0.010

- From Dalitz plot analyses of  $\eta_c(1S, 2S) \rightarrow K_S^0 K^+ \pi^- + c.c.$
- Using a  $K\pi - K\eta'$  coupled channel Breit-Wigner function.
- Using both  $\eta \rightarrow \gamma\gamma$  and  $\eta \rightarrow \pi^+ \pi^- \pi^0$ . From a likelihood scan in the presence of several interfering scalar-meson resonances with fixed width  $\Gamma(K_0^*(1430)) = 210$  MeV.
- S-Matrix pole. Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06c, AITALA 06, and LINK 09 using an s-dependent width with couplings to  $K\pi$  and  $K\eta'$ , and the Adler zero near thresholds.
- From the isobar model with a complex pole for the  $\kappa$ .
- From a non-parametric analysis.
- A Breit-Wigner mass and width.
- S-matrix pole. Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06c including the  $\kappa$  with an s-dependent width and an Adler zero near threshold.
- S-matrix pole. Using ASTON 88 and assuming  $K_0^*(700)$ ,  $K_0^*(1950)$ .
- Using ASTON 88 and assuming  $K_0^*(700)$ .
- T-matrix pole. Reanalysis of ASTON 88 data.
- Breit-Wigner fit. Using ASTON 88.
- Assuming a low-mass scalar  $K\pi$  resonance,  $\kappa(700)$ .
- T-matrix pole. Using data from ESTABROOKS 78 and ASTON 88.
- $J^P$  not determined, could be  $K_2^*(1430)$ .
- T-matrix pole.
- Uses a model for the background, without this background they get a mass 1340 MeV, where the phase shift passes 90°.
- Mass defined by pole position. From elastic  $K\pi$  partial-wave analysis.

### CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 10 branching ratios uses 32 measurements and one constraint to determine 8 parameters. The overall fit has a  $\chi^2 = 21.1$  for 25 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

**CONSTRAINED FIT INFORMATION**

An overall fit to 4 branching ratios uses 4 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 2.9$  for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_2$	-36	
$x_3$	-39	-72

$\Gamma_3$ $K\pi$	(18.8 ± 1.0) %	
$\Gamma_4$ $K\eta$	(30 ± 13) %	
$\Gamma_5$ $K_2^*(1430)\pi$	< 16 %	95%

**CONSTRAINED FIT INFORMATION**

An overall fit to 3 branching ratios uses 4 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 0.0$  for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

<sup>1</sup>ABUDINEN 21A determines the lifetime ratio  $\tau(D^+)/\tau(D^0) = 2.510 \pm 0.013 \pm 0.007$ .

<sup>2</sup>BARLAG 90c estimates the systematic error to be negligible.

 **$D^+$  DECAY MODES**

Most decay modes (other than the semileptonic modes) that involve a neutral  $K$  meson are now given as  $K_S^0$  modes, not as  $\bar{K}^0$  modes. Nearly always it is a  $K_S^0$  that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that  $2\Gamma(K_S^0) = \Gamma(\bar{K}^0)$ .

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level
------	--------------------------------	-----------------------------------

**Inclusive modes**

$\Gamma_1$	$e^+$ semileptonic	(16.07 ± 0.30) %

--------------------------	-----------------------	------	-------------

<sup>1</sup> This LINK 09 model-independent partial-wave analysis of the  $K^- \pi^+$  S-wave slices the  $K^- \pi^+$  mass range into 39 bins.  
<sup>2</sup> The BONVICINI 08A QMIPWA (quasi-model-independent partial-wave analysis) of the  $K^- \pi^+$  S-wave amplitude slices the  $K^- \pi^+$  mass range into 26 bins but keeps the Breit-Wigner  $\bar{K}_0^*(1430)^0$ .  
<sup>3</sup> This LINK 07B fit uses a K matrix. The  $K^- \pi^+$  S-wave fit fraction given above breaks down into  $(207.3 \pm 25.5 \pm 12.4)\%$  isospin-1/2 and  $(40.5 \pm 9.6 \pm 3.2)\%$  isospin-3/2 — with large interference between the two. The isospin-1/2 component includes the  $\kappa$  (or  $\bar{K}_0^*(700)^0$ ) and  $\bar{K}_0^*(1430)^0$ .

$\Gamma(\bar{K}_0^*(700)^0 \pi^+, \bar{K}_0^*(700)^0 \rightarrow K^- \pi^+) / \Gamma(K^- 2\pi^+)$      $\Gamma_{54} / \Gamma_{52}$   
 This is the "fit fraction" from the Dalitz-plot analysis.

 $-0.1 \pm 1.5 \pm 0.8$  DOBBS 07 CLEO See BONVICINI 14 and RUBIN 08

<sup>1</sup> This is the integrated  $CP$  asymmetry. LEES 13F also searches for  $CP$  asymmetries in four regions of the Dalitz plots (two of which are listed below); in comparisons of binned  $D^+$  and  $D^-$  Dalitz plots; in parametrized fits to those plots, including 2-body submodes; and in comparisons of Legendre-polynomial distributions for the  $K^+ K^-$  and  $K^- \pi^+$  systems.

<sup>2</sup> AUBERT 05s measures  $N(D^+ \rightarrow K^+ K^- \pi^+)/N(D_S^+ \rightarrow K^+ K^- \pi^+)$ , the ratio of the numbers of events observed, and similarly for the  $D^-$ .

<sup>3</sup> FRABETTI 94I, AITALA 98C, and LINK 00B measure  $N(D^+ \rightarrow K^- K^+ \pi^+)/N(D^+ \rightarrow K^- \pi^+ \pi^+)$ , the ratio of numbers of events observed, and similarly for the  $D^-$ .

<sup>4</sup> RUBIN 08 performs a dedicated analysis of this decay mode on the same dataset, with slightly better precision. We therefore take that BONVICINI 14 does not supersede RUBIN 08's  $A_{CP}$  result.

 $D^\pm \chi^2$  TESTS OF  $CP$ -VIOLATION (CPV)We list model-independent searches for local  $CP$  violation in phase-space distributions of multi-body decays.Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a  $\chi^2$  test comparing normalised yields  $N_i, \bar{N}_i$  in  $CP$ -conjugate bin pairs  $i$ :  $\chi^2 = \sum_i (N_i - \alpha \bar{N}_i) / \sigma(N_i - \alpha \bar{N}_i)$ . The factor  $\alpha = (\sum_i N_i) / (\sum_i \bar{N}_i)$  removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured  $\chi^2$  or larger under the assumption of  $CP$  conservation [AUBERT 08A0, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAJ 14C]. Results can be combined using Fisher's method [MOSTELLER 48].Local CPV in  $D^\pm \rightarrow \pi^+\pi^-\pi^\pm$

## CP VIOLATING ASYMMETRIES OF P-ODD (T-ODD) MOMENTS

 $A_{Tviol}(K_S^0 K^\pm\pi^+\pi^-)$  in  $D^\pm \rightarrow K_S^0 K^\pm\pi^+\pi^-$  $C_T \equiv \bar{p}_{K^+} \cdot (\bar{p}_{\pi^+} \times \bar{p}_{\pi^-})$  is a parity-odd correlation of the  $K^+$ ,  $\pi^+$ , and  $\pi^-$  momenta for the  $D^+$ .  $\bar{C}_T \equiv \bar{p}_{K^-} \cdot (\bar{p}_{\pi^-} \times \bar{p}_{\pi^+})$  is the corresponding quantity for the  $D^-$ . Then $A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$ , and  $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$ , and $A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$ .  $C_T$  and  $\bar{C}_T$  are commonly referred to as  $T$ -odd moments, because they are odd under  $T$  reversal. However, the  $T$ -conjugate process  $K_S^0 K^\pm\pi^+\pi^- \rightarrow D^\pm$  is not accessible, while the  $P$ -conjugate process is.

### $D^0$ MASS

The fit includes  $D^\pm, D^0, D_S^\pm, D^{*\pm}, D^{*0}, D_1(2420)^0, D_2^*(2460)^0$ , and  $D_{S1}(2536)^\pm$  mass and mass difference measurements.

Given the recent addition of much more precise measurements, we have omitted all those masses published up through 1990. See any Review before 2015 for those earlier results.

1864.847 ± 0.150 ± 0.095	0.3k	CAWLFIELD 07	CLEO	$D^0 \rightarrow K_S^0 \phi$

<sup>1</sup> Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration. The largest source of error in the TOMARADZE 14 value is from the uncertainties in the  $K^-$  and  $K_S^0$  masses. The systematic error given above is the addition in quadrature of  $\pm 0.022 \pm 0.053$  MeV, where the second error is from those mass uncertainties.

<sup>2</sup> The largest source of error in the LEES 13s value is from the uncertainty of the  $K^+$  mass. The quoted systematic error is in fact  $\pm 0.043 + 3 (m_{K^+} - 493.677)$ , in MeV.

### $m_{D^\pm} - m_{D^0}$

The fit includes  $D^\pm, D^0, D_S^\pm, D^{*\pm}, D^{*0}, D_1(2420)^0, D_2^*(2460)^0$ , and  $D_{S1}(2536)^\pm$  mass and mass difference measurements.

<sup>1</sup> ABUDINEN 21A determines the lifetime ratio  $\tau(D^+)/\tau(D^0) = 2.510 \pm 0.013 \pm 0.007$ .

<sup>2</sup> BARLAG 90c estimate systematic error to be negligible.

### See the related review(s):

#### $D^0 - \bar{D}^0$ Mixing

$$|m_{D_1^0} - m_{D_2^0}| = x \Gamma$$

The  $D_1^0$  and  $D_2^0$  are the mass eigenstates of the  $D^0$  meson, as described in the note on " $D^0 - \bar{D}^0$  Mixing," above. The experiments usually present  $x \equiv \Delta m/\Gamma$ . Then  $\Delta m = x \Gamma = x \hbar/\tau$ .

• • • We do not use the following data for averages, fits, limits, etc. • • •

<sup>1</sup> AAIJ 23Bc analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  from  $B \rightarrow D^0 \mu\nu X$  events allows for  $CP$  violation (none seen).

<sup>2</sup> AAIJ 21AB measurement allows for  $CP$  violation (none seen).

<sup>3</sup> AAIJ 19x  $D^0$  come from  $D^{*+}$  and  $\bar{B} \rightarrow D^0 \mu^- X$  decays (and c.c.). Measurement allows for  $CP$  violation (none seen).

<sup>4</sup> The result was established with  $D^0$  from prompt and secondary  $D^*$ . Based on 5 fb<sup>-1</sup> of data collected at  $\sqrt{s} = 7, 8, 13$  TeV. Assumes no  $CP$  violation. Reported  $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$  and  $y' = (5.28 \pm 0.52) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y$ .

<sup>5</sup> Model-independent measurement of the charm mixing parameters in the decay  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  using 1.0 fb<sup>-1</sup> of LHCB data at  $\sqrt{s} = 7$  TeV.

<sup>6</sup> Time-dependent amplitude analysis of  $D^0 \rightarrow \pi^+ \pi^- \pi^0$ .

<sup>7</sup> Based on 976 fb<sup>-1</sup> of data collected at Y(nS) resonances. Assumes no  $CP$  violation. Reported  $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$  and  $y' = (4.6 \pm 3.4) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .

<sup>8</sup> The time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+} \pi^-$  and  $\bar{D}^0 \rightarrow K^{*+} \pi^-$ . This value allows  $CP$  violation and is sensitive to the sign of  $\Delta m$ .

<sup>9</sup> Based on 9.6 fb<sup>-1</sup> of data collected at the Tevatron. Assumes no  $CP$  violation. Reported  $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$  and  $y' = (4.3 \pm 4.3) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y$ .

- sin( $\delta$ ),  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- 10 DEL-AMO-SANCHEZ 10D uses 540,800 ± 800  $K_S^0 \pi^+ \pi^-$  and 79,900 ± 300  $K_S^0 K^+ K^-$  events in a time-dependent amplitude analysis of the  $D^0$  and  $\bar{D}^0$  Dalitz plots. No evidence was found for  $CP$  violation, and the values here assume no such violation.
- 11 The result was established with  $D^0$  from prompt and secondary  $D^*$ . Based on 3 fb<sup>-1</sup> of data collected at  $\sqrt{s} = 7, 8$  TeV. Assumes no  $CP$  violation. Reported  $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$  and  $y' = (5.23 \pm 0.84) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- 12 Based on 3 fb<sup>-1</sup> of data collected at  $\sqrt{s} = 7, 8$  TeV. Assumes no  $CP$  violation. Reported  $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$  and  $y' = (4.8 \pm 1.0) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- 13 Based on 1 fb<sup>-1</sup> of data collected at  $\sqrt{s} = 7$  TeV in 2011. Assumes no  $CP$  violation. Reported  $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$  and  $y' = (7.2 \pm 2.4) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- 14 The AUBERT 09AN values are inferred from the branching ratio  $\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0)$  via  $\bar{D}^0/\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0)$  given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between  $D^0 \rightarrow K^+ \pi^- \pi^0$  and  $\bar{D}^0 \rightarrow K^+ \pi^- \pi^0$  is assumed to be small. The width difference here is  $y''$ , which is not the same as  $y_{CP}$  in the note on  $D^0$ - $\bar{D}^0$  mixing.
- 15 LOWREY 09 uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$ . See below for coherence factors and average relative strong phases for both  $D^0 \rightarrow K^- \pi^+ \pi^0$  and  $D^0 \rightarrow K^- \pi^- 2\pi^+$ . A fit that includes external measurements of charm mixing parameters gets  $\Delta m = (2.34 \pm 0.61) \times 10^{10} \text{ h}^{-1}$ .
- 16 The ASNER 05 and ZHANG 07B values are from the time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ . Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^* \pi^-$  and  $\bar{D}^0 \rightarrow K^* \pi^-$ . This value allows  $CP$  violation and is sensitive to the sign of  $\Delta m$ .
- 17 The AUBERT 03Z, LI 05A, and ZHANG 06 limits are inferred from the  $D^0$ - $\bar{D}^0$  mixing ratio  $\Gamma(K^+ \pi^- \text{ via } \bar{D}^0)/\Gamma(K^- \pi^+)$  given near the end of this  $D^0$  Listings. Decay-time information is used to distinguish DCS decays from  $D^0$ - $\bar{D}^0$  mixing. The limit allows interference between the DCS and mixing ratios, and also allows  $CP$  violation. AUBERT 03Z assumes the strong phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$  amplitudes is small; if an arbitrary phase is allowed, the limit degrades by 20%. The LI 05A and ZHANG 06 limits are valid for an arbitrary strong phase.
- 18 This LINK 05H limit is inferred from the  $D^0$ - $\bar{D}^0$  mixing ratio  $\Gamma(K^+ \pi^- \text{ via } \bar{D}^0)/\Gamma(K^- \pi^+)$  given near the end of this  $D^0$  Listings. Decay-time information is used to distinguish DCS decays from  $D^0$ - $\bar{D}^0$  mixing. The limit allows interference between the DCS and mixing ratios, and also allows  $CP$  violation. The strong phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$  is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by 25%.
- 19 This GODANG 00 limit is inferred from the  $D^0$ - $\bar{D}^0$  mixing ratio  $\Gamma(K^+ \pi^- \text{ via } \bar{D}^0)/\Gamma(K^- \pi^+)$  given near the end of this  $D^0$  Listings. Decay-time information is used to distinguish DCS decays from  $D^0$ - $\bar{D}^0$  mixing. The limit allows interference between the DCS and mixing ratios, and also allows  $CP$  violation. The strong phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$  is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by a factor of two.
- 20 AITALA 98 allows interference between the doubly Cabibbo-suppressed and mixing amplitudes, and also allows  $CP$  violation in this term, but assumes that  $A_D = A_R = 0$ . See the note on " $D^0$ - $\bar{D}^0$  Mixing," above.
- 21 This limit is inferred from  $R_M$  for  $f = K^+ \pi^-$  and  $f = K^+ \pi^- \pi^+ \pi^-$ . See the note on " $D^0$ - $\bar{D}^0$  Mixing," above. Decay-time information is used to distinguish doubly Cabibbo-suppressed decays from  $D^0$ - $\bar{D}^0$  mixing.
- 22 This limit is inferred from  $R_M$  for  $f = K^+ \ell^- \bar{\nu}_\ell$ . See the note on " $D^0$ - $\bar{D}^0$  Mixing," above.
- 23 ANJOS 88C assumes that  $y = 0$ . See the note on " $D^0$ - $\bar{D}^0$  Mixing," above. Without this assumption, the limit degrades by about a factor of two.

Some early results have been omitted. See our 2006 Review (Journal of Physics G33 1 (2006)).

$$(\Gamma_{D_1^0} - \Gamma_{D_2^0})/\Gamma = 2y$$

The  $D_1^0$  and  $D_2^0$  are the mass eigenstates of the  $D^0$  meson, as described in the note on " $D^0$ - $\bar{D}^0$  Mixing," above.

Due to the strong phase difference between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ , we exclude from the average those measurements of  $y'$  that are inferred from the  $D^0$ - $\bar{D}^0$  mixing ratio  $\Gamma(K^+ \pi^- \text{ via } \bar{D}^0) / \Gamma(K^+ \pi^-)$  given near the end of this  $D^0$  Listings. OUR AVERAGE assumes  $CP$  conservation, though this is disfavored by data.

In the absence of  $CP$  violation, the experimental measurement of the observable  $y_{CP}$  corresponds to  $y$ . In the presence of  $CP$  violation,  $y_{CP}$  is approximately equal to  $y$  up to a  $CP$ -violating weak phase cosine, that is very close to unity, and higher order  $CP$ -violating effects. Many experiments measure  $y_{CP}$  with respect to a reference channel, such that the quoted results below are often  $y_{CP} \pm y_{CP}(\text{reference})$ . We denote the actual observable and the reference channel below for those experiments with sufficient sensitivity such that  $y_{CP}(\text{reference})$  cannot be neglected.

WEIGHTED AVERAGE  
1.35±0.08 (Error scaled by 1.5)

$$(\Gamma_1 - \Gamma_2)/\Gamma = 2y$$

1 AAIJ 23BC analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  from  $B \rightarrow D^0 \mu \nu X$  events allows for  $CP$  violation (none seen).

## Meson Particle Listings

 $D^0$ 

- <sup>2</sup> AAIJ 22o is the combination of the measurement in the  $D^0 \rightarrow \pi^- \pi^+$  channel and the one in the  $D^0 \rightarrow K^- K^+$  channel, that are  $(1.314 \pm 0.106 \pm 0.032)\%$  and  $(1.416 \pm 0.060 \pm 0.028)\%$  respectively, assuming fully correlated systematics except those related to peaking backgrounds.
- <sup>3</sup> AAIJ 21AB analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  events allows for  $CP$  violation (none seen).
- <sup>4</sup> NAYAK 20 reports  $(1.92 \pm 1.82 \pm 1.24 \pm 0.34) \times 10^{-2}$  where the last uncertainty is due to possible presence of  $CP$ -even decays in the data sample. Extracts  $y_{CP} = (\Gamma_{CP+} - \Gamma_{CP-}) / (\Gamma_{CP+} + \Gamma_{CP-})$  in  $D^0 \rightarrow K_S^0 \omega$  versus  $\bar{D}^0 \rightarrow K_S^0 \omega$ , by measuring the decay lifetime of  $D^0 \rightarrow K_S^0 \omega$  with  $\omega \rightarrow \pi^+ \pi^- \pi^0$  versus  $\bar{D}^0 \rightarrow K^- \pi^+$ . We list  $2y_{CP} = 2y (= \Delta\Gamma/\Gamma)$  in the absence of  $CP$  violation.
- <sup>5</sup> Based on  $3 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8 \text{ TeV}$ . Measures the lifetime difference between  $D^0 \rightarrow K^- K^+$  and  $D^0 \rightarrow \pi^- \pi^+$  ( $CP$ -even) decays and  $D^0 \rightarrow K^- \pi^+$  ( $CP$ -mixed) decays, or  $y_{CP} = (\Gamma_{CP+} - \Gamma_{CP-}) / (\Gamma_{CP+} + \Gamma_{CP-})$ . The  $D^0$  mesons are required to originate from semimuonic decays of  $B$  mesons. We list  $2y_{CP} = \Delta\Gamma/\Gamma$ .
- <sup>6</sup> AAIJ 19x  $D^0$  come from  $D^{*+}$  and  $\bar{B} \rightarrow D^0 \mu^- X$  decays (and c.c.) in  $pp$  collisions at 7 and 8 TeV. Measurement allows for  $CP$  violation (none seen).
- <sup>7</sup> The result was established with  $D^0$  from prompt and secondary  $D^*$ . Based on  $5 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8, 13 \text{ TeV}$ . Assumes no  $CP$  violation. Reported  $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$  and  $y' = (5.28 \pm 0.52) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>8</sup> Model-independent measurement of the charm mixing parameters in the decay  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  using  $1.0 \text{ fb}^{-1}$  of LHCb data at  $\sqrt{s} = 7 \text{ TeV}$ .
- <sup>9</sup> Time-dependent amplitude analysis of  $D^0 \rightarrow \pi^+ \pi^- \pi^0$ .
- <sup>10</sup> An improved measurement of  $\bar{D}^0 - D^0$  mixing and a search for  $CP$  violation in  $D^0$  decays to  $CP$ -even final states  $K^+ K^-$  and  $\pi^+ \pi^-$  using the final Belle data sample of  $976 \text{ fb}^{-1}$ .
- <sup>11</sup> ABLIKIM 15D uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$ .
- <sup>12</sup> Based on  $976 \text{ fb}^{-1}$  of data collected at  $Y(\text{nS})$  resonances. Assumes no  $CP$  violation. Reported  $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$  and  $y' = (4.6 \pm 3.4) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>13</sup> The time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+} \pi^-$  and  $\bar{D}^0 \rightarrow K^{*+} \pi^-$ . This value allows  $CP$  violation and is sensitive to the sign of  $\Delta m$ .
- <sup>14</sup> Based on  $9.6 \text{ fb}^{-1}$  of data collected at the Tevatron. Assumes no  $CP$  violation. Reported  $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$  and  $y' = (4.3 \pm 4.3) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>15</sup> Obtained  $y_{CP} = (0.72 \pm 0.18 \pm 0.12)\%$  based on three effective  $D^0$  lifetimes measured in  $K^+ \pi^+$ ,  $K^- K^+$ , and  $\pi^- \pi^+$ . We list  $2y_{CP} = \Delta\Gamma/\Gamma$ .
- <sup>16</sup> Compared the lifetimes of  $D^0$  decay to the  $CP$  eigenstate  $K^+ K^-$  with  $D^0$  decay to  $\pi^+ K^-$ . The values here assume no  $CP$  violation.
- <sup>17</sup> DEL-AMO-SANCHEZ 10b uses  $540,800 \pm 800 K_S^0 \pi^+ \pi^-$  and  $79,900 \pm 300 K_S^0 K^+ K^-$  events in a time-dependent amplitude analyses of the  $D^0$  and  $\bar{D}^0$  Dalitz plots. No evidence was found for  $CP$  violation, and the values here assume no such violation.
- <sup>18</sup> ZUPANC 09 uses a method based on measuring the mean decay time of  $D^0 \rightarrow K_S^0 K^+ K^-$  events for different  $K^+ K^-$  mass intervals.
- <sup>19</sup> LINK 00, AITALA 99E, and ABE 02i measure the lifetime difference between  $D^0 \rightarrow K^- K^+$  ( $CP$ -even) decays and  $D^0 \rightarrow K^- \pi^+$  ( $CP$ -mixed) decays, or  $y_{CP} = [(\Gamma_{CP+}) - (\Gamma_{CP-})] / [(\Gamma_{CP+}) + (\Gamma_{CP-})]$ . We list  $2y_{CP} = \Delta\Gamma/\Gamma$ .
- <sup>20</sup> CSORNA 02 measures the lifetime difference between  $D^0 \rightarrow K^- K^+$  and  $\pi^- \pi^+$  ( $CP$ -even) decays and  $D^0 \rightarrow K^- \pi^+$  ( $CP$ -mixed) decays, or  $y_{CP} = [(\Gamma_{CP+}) - (\Gamma_{CP-})] / [(\Gamma_{CP+}) + (\Gamma_{CP-})]$ . We list  $2y_{CP} = \Delta\Gamma/\Gamma$ .
- <sup>21</sup> The result was established with  $D^0$  from prompt and secondary  $D^*$ . Based on  $3 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8 \text{ TeV}$ . Assumes no  $CP$  violation. Reported  $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$  and  $y' = (5.23 \pm 0.84) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>22</sup> Based on  $3 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8 \text{ TeV}$ . Assumes no  $CP$  violation. Reported  $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$  and  $y' = (4.8 \pm 1.0) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>23</sup> Based on  $1 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7 \text{ TeV}$  in 2011. Assumes no  $CP$  violation. Reported  $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$  and  $y' = (7.2 \pm 2.4) \times 10^{-3}$ , where  $x' = x \cos(\delta) + y \sin(\delta)$ ,  $y' = y \cos(\delta) - x \sin(\delta)$  and  $\delta$  is the strong phase between the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>24</sup> This combines the  $y_{CP} = (\tau_{K^+ \pi^+} / \tau_{K^- K^+}) - 1$  using untagged  $K^- \pi^+$  and  $K^- K^+$  events of AUBERT 09A1 with the disjoint  $y_{CP}$  using tagged  $K^- \pi^+$ ,  $K^- K^+$ , and  $\pi^- \pi^+$  events of AUBERT 08U.
- <sup>25</sup> The AUBERT 09AN values are inferred from the branching ratio  $\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0) / \Gamma(D^0 \rightarrow K^- \pi^+ \pi^0)$  given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between  $D^0 \rightarrow K^+ \pi^- \pi^0$  and  $\bar{D}^0 \rightarrow K^+ \pi^- \pi^0$  is assumed to be small. The width difference here is  $y''$ , which is not the same as  $y_{CP}$  in the note on  $D^0 - \bar{D}^0$  mixing.
- <sup>26</sup> LOWREY 09 uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$ . See below for coherence factors and average relative strong phases for both  $D^0 \rightarrow K^- \pi^+ \pi^0$  and  $D^0 \rightarrow K^- \pi^- \pi^+$ . A fit that includes external measurements of charm mixing parameters gets  $2y = (1.62 \pm 0.32) \times 10^{-2}$ .
- <sup>27</sup> The GODANG 00, AUBERT 03Z, LINK 05H, LI 05A, ZHANG 06, AUBERT 07W, and AALTONEN 08E limits are inferred from the  $D^0 - \bar{D}^0$  mixing ratio  $\Gamma(K^+ \pi^-)$  (via  $\bar{D}^0) / \Gamma(K^- \pi^+)$  given near the end of this  $D^0$  Listings. Decay-time information is used to distinguish DCS decays from  $D^0 - \bar{D}^0$  mixing. The limits allow interference between

the DCS and mixing ratios, and all except AUBERT 07W and AALTONEN 08E also allow  $CP$  violation. The phase between  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$  is assumed to be small. This is a measurement of  $y'$  and is not the same as the  $y_{CP}$  of our note above on " $D^0 - \bar{D}^0$  Mixing."

- <sup>28</sup> This value combines the results of AUBERT 08U and AUBERT 03P.
- <sup>29</sup> STARIC 07 compares the lifetimes of  $D^0$  decay to the  $CP$  eigenstates  $K^+ K^-$  and  $\pi^+ \pi^-$  with  $D^0$  decay to  $K^- \pi^+$ .
- <sup>30</sup> The ASNER 05 and ZHANG 07B values are from the time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ . Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+} \pi^-$  and  $\bar{D}^0 \rightarrow K^{*+} \pi^-$ . This limit allows  $CP$  violation.
- <sup>31</sup> The ranges of AUBERT 03Z, LINK 05H, LI 05A, and ZHANG 06 measurements are for 95% confidence level.
- <sup>32</sup> AUBERT 03P measures  $Y \equiv 2\tau^0 / (\tau^+ + \tau^-) - 1$ , where  $\tau^0$  is the  $D^0 \rightarrow K^- \pi^+$  (and  $\bar{D}^0 \rightarrow K^+ \pi^-$ ) lifetime, and  $\tau^+$  and  $\tau^-$  are the  $D^0$  and  $\bar{D}^0$  lifetimes to  $CP$ -even states (here  $K^- K^+$  and  $\pi^- \pi^+$ ). In the limit of  $CP$  conservation,  $Y = y \equiv \Delta\Gamma / 2\Gamma$  (we list  $2y = \Delta\Gamma/\Gamma$ ). AUBERT 03P also uses  $\tau^+ - \tau^-$  to get  $\Delta Y = -0.008 \pm 0.006 \pm 0.002$ .

 $|q/p|$ 

The mass eigenstates  $D_1^0$  and  $D_2^0$  are related to the  $C = \pm 1$  states by  $|D_{1,2}^0\rangle = p |D^0\rangle + q |\bar{D}^0\rangle$ . See the note on " $D^0 - \bar{D}^0$  Mixing" above.

- <sup>1</sup> AAIJ 21AB result comes from analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  events.
- <sup>2</sup> AAIJ 19x measurement comes from analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays.  $D^0$  come from  $D^{*+}$  and  $\bar{B} \rightarrow D^0 \mu^- X$  decays (and c.c.) in  $pp$  collisions at 7 and 8 TeV.
- <sup>3</sup> Based on  $5 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8, 13 \text{ TeV}$ . Allowing for  $CP$  violation, the direct  $CP$  violation in mixing is reported  $1.00 < |q/p| < 1.35$  at the 68.3% CL for the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>4</sup> The time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+} \pi^-$  and  $\bar{D}^0 \rightarrow K^{*+} \pi^-$ . This value allows  $CP$  violation and is sensitive to the sign of  $\Delta m$ .
- <sup>5</sup> Based on  $3 \text{ fb}^{-1}$  of data collected at  $\sqrt{s} = 7, 8 \text{ TeV}$ . Allowing for  $CP$  violation, the direct  $CP$  violation in mixing is reported  $0.75 < |q/p| < 1.24$  at the 68.3% CL for the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- <sup>6</sup> The phase of  $p/q$  is  $(-14 \pm 16 \pm 5)^\circ$ . The ZHANG 07B value is from the time-dependent Dalitz-plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ . Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between  $D^0 \rightarrow K^{*+} \pi^-$  and  $\bar{D}^0 \rightarrow K^{*+} \pi^-$ . This value allows  $CP$  violation.

 $A_\Gamma$ 

$A_\Gamma$  is the decay-rate asymmetry for  $CP$ -even final states  $A_\Gamma = (\bar{\tau}_+ - \tau_+) / (\bar{\tau}_+ + \tau_+)$ . See the note on " $D^0 - \bar{D}^0$  Mixing" above.

- <sup>1</sup> Requires  $D^0$  to originate from  $D^{*+}(2010)^+ \rightarrow D^0 \pi^+$ . AAIJ 21AI measures the parameter  $\Delta Y_\Gamma \approx -A_\Gamma^f$  up to 1% corrections from  $y_{CP}^f$ .

- <sup>2</sup> Measured using  $D^0 \rightarrow K^+K^-$  decays, combines measurements with  $D^0$  either from partially reconstructed semileptonic  $B$  hadron decays or from  $D^{*+} \rightarrow D^0\pi^+$ .
- <sup>3</sup> Measured using  $D^0 \rightarrow \pi^+\pi^-$  decays, combines measurements with  $D^0$  either from partially reconstructed semileptonic  $B$  hadron decays or from  $D^{*+} \rightarrow D^0\pi^+$ .
- <sup>4</sup> An improved measurement of  $\overline{D}^0 - D^0$  mixing and a search for  $CP$  violation in  $D^0$  decays to  $CP$ -even final states  $K^+K^-$  and  $\pi^+\pi^-$  using the final Belle data sample of  $976 \text{ fb}^{-1}$ .
- <sup>5</sup> Combined result from  $D^0 \rightarrow K^+K^-$  and  $D^0 \rightarrow \pi^+\pi^-$ , with  $D^0$  from  $D^{*+} \rightarrow D^0\pi^+$  (and cc).
- <sup>6</sup> Measured using  $D^{*+} \rightarrow D^0\pi^+$ ,  $D^0 \rightarrow K^+K^-$  decays (and cc).
- <sup>7</sup> Measured using  $D^{*+} \rightarrow D^0\pi^+$ ,  $D^0 \rightarrow \pi^+\pi^-$  decays (and cc).
- <sup>8</sup> Measured using  $D^0 \rightarrow K^+K^-$  decays, with  $D^0$  from partially reconstructed semileptonic  $B$  hadron decays.
- <sup>9</sup> Measured using  $D^0 \rightarrow \pi^+\pi^-$  decays, with  $D^0$  from partially reconstructed semileptonic  $B$  hadron decays.

$\phi_{K_S^0\pi\pi}$

Parametrizes  $CP$  violation in the interference between  $D^0$  mixing and decay. The mass eigenstates  $D_1^0$  and  $D_2^0$  are related to the  $C = \pm 1$  states by  $|D_{1,2}^0\rangle = p|D^0\rangle + q|\overline{D}^0\rangle$ . In the absence of  $CP$  violation in the decay, and using the usual phase convention where  $CP$  conservation implies  $q/p$  is real,  $\phi_{K_S^0\pi\pi}$  is identical to the decay-mode-independent parameter  $\phi = \arg(q/p)$ .

- <sup>1</sup> Uses quantum correlations in  $e^+e^- \rightarrow D^0\overline{D}^0$  at the  $\psi(3770)$  to measure the asymmetry of the branching fraction of  $D^0 \rightarrow K^-\pi^+$  in  $CP$ -odd and  $CP$ -even eigenstates to be  $(13.2 \pm 1.1 \pm 0.7)\%$  and  $(13.0 \pm 1.2 \pm 0.8)\%$  when using the predominantly  $CP$ -even tag  $D^0 \rightarrow \pi^+\pi^-\pi^0$ . A fit that includes external measurements of charm mixing parameters finds the value quoted above.
- <sup>2</sup> Uses quantum correlations in  $e^+e^- \rightarrow D^0\overline{D}^0$  at the  $\psi(3770)$  to measure the asymmetry of the branching fraction of  $D^0 \rightarrow K^-\pi^+$  in  $CP$ -odd and  $CP$ -even eigenstates to be  $(12.7 \pm 1.3 \pm 0.7)\%$ . A fit that includes external measurements of charm mixing parameters finds the value quoted above.
- <sup>3</sup> Uses quantum correlations in  $e^+e^- \rightarrow D^0\overline{D}^0$  at the  $\psi(3770)$ , where decay rates of  $CP$ -tagged  $K\pi$  final states depend on the strong phases between the decays of  $D^0 \rightarrow K^+\pi^-$  and  $\overline{D}^0 \rightarrow K^+\pi^-$ . The measurements obtained  $\sin(\delta) = -0.01 \pm 0.41 \pm 0.04$  and  $|\delta| = (10_{-53}^{+28+13})^\circ$  as well. A fit that includes external measurements of charm

mixing parameters finds  $\cos(\delta) = 1.15_{-0.17}^{+0.19+0.00}$ ,  $\sin(\delta) = 0.56_{-0.31}^{+0.32+0.21}$ , and  $|\delta| = (18_{-17}^{+11})^\circ$ .

- <sup>4</sup> ASNER 08 uses quantum correlations in  $e^+e^- \rightarrow D^0\overline{D}^0$  at the  $\psi(3770)$ , where decay rates of  $CP$ -tagged  $K\pi$  final states depend on  $\cos \delta$  because of interfering amplitudes. The above measurement implies  $|\delta| < 75^\circ$  with a confidence level of 95%. A fit that includes external measurements of charm mixing parameters finds  $\cos \delta = 1.10 \pm 0.35 \pm 0.07$ . See also the note on " $D^0 - \overline{D}^0$  Mixing" p. 783 in our 2008 Review (PDG 08).

$D^0 \rightarrow K^-\pi^+\pi^0$  COHERENCE FACTOR  $R_{K\pi\pi^0}$

See the note on ' $D^0 - \overline{D}^0$  Mixing' for the definition.  $R_{K\pi\pi^0}$  can have any value between 0 and 1. A value near 1 indicates the decay is dominated by a few intermediate states with limited interference.

<sup>1</sup> From a time-dependent analysis of  $D$  mixing in  $D^0 \rightarrow K^+ \pi^- \pi^+ \pi^-$ . This result uses external constraints on  $R_{M^j} = 1/2(x^2 + y^2)$ . Without such constraints, AAIJ 16F measure  $(0.3 \pm 1.8) \times 10^{-3}$ , with a large correlation coefficient to  $R_{M^j}$ .

 $D^0 \rightarrow K_S^0 K^+ \pi^-$  COHERENCE FACTOR  $R_{K_S^0 K^+ \pi^-}$ 

VALUE	DOCUMENT ID	TECN	COMMENT
-------	-------------	------	---------

<b>0.70 ± 0.08</b>	<sup>1</sup> INSLER	12	CLEO $e^+ e^- \rightarrow D^0 \bar{D}^0$ at 3.77 GeV
--------------------	---------------------	----	--

<sup>1</sup> Uses quantum correlations in  $e^+ e^- \rightarrow D^0 \bar{D}^0$  at the  $\psi(3770)$ , where the signal side  $D$  decays to  $K_S^0 K^+ \pi^-$  and the tag-side  $D$  decays to  $K\pi$ ,  $K\pi\pi\pi$ ,  $K\pi\pi^0$ , and 10 additional  $CP$ -even,  $CP$ -odd, and mixed  $CP$  modes involving  $K_S^0$  or  $K_L^0$ .

 $D^0 \rightarrow K_S^0 K^+ \pi^-$  AVERAGE RELATIVE STRONG PHASE  $\delta^{K_S^0 K^+ \pi^-}$ 

The quoted value of  $\delta$  is based on the same sign  $CP$  phase of  $D^0$  and  $\bar{D}^0$  convention.

 **$D^0$  DECAY MODES**

Most decay modes (other than the semileptonic modes) that involve a neutral  $K$  meson are now given as  $K_S^0$  modes, not as  $\bar{K}^0$  modes. Nearly always it is a  $K_S^0$  that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that  $2\Gamma(K_S^0) = \Gamma(\bar{K}^0)$ .

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level
------	--------------------------------	-----------------------------------

**Topological modes**

$\Gamma_1$	0-prongs	[a] (15 ± 6) %
$\Gamma_2$	2-prongs	(71 ± 6) %
$\Gamma_3$	4-prongs	[b] (14.6 ± 0.5) %
$\Gamma_4$	6-prongs	[c] (6.5 ± 1.3) × 10 <sup>-4</sup>

**Inclusive modes**

$\Gamma_5$	$e^+$ anything	[d] (6.49 ± 0.11) %	
$\Gamma_6$	$\mu^+$ anything	(6.8 ± 0.6) %	
$\Gamma_7$	$K^-$ anything	(54.7 ± 2.8) %	S=1.3
$\Gamma_8$	$K_S^0$ anything	(20.75 ± 0.23) %	
$\Gamma_9$	$K^+$ anything	(3.4 ± 0.4) %
