## $\chi_{b2}(1P)$

$$I^G(J^{PC}) = 0^+(2^{++})$$

$J$  needs confirmation.

Observed in radiative decay of the  $\Upsilon(2S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .  $J = 2$  from SKWARNICKI 87.

## FIT INFORMATION

An overall fit to 3 branching ratios uses 13 measurements to determine 2 parameters. The overall fit has a  $\chi^2 = 11.8$  for 11 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ .

$$x_7 \begin{vmatrix} & 2 \\ & x_1 \end{vmatrix}$$

WEIGHTED AVERAGE  
122.2±0.5 (Error scaled by 1.4)

$\Upsilon_2(1D)$   $I^G(J^{PC}) = 0^-(2^{--})$

was  $\Upsilon(1D)$   
 First observed by BONVICINI 04 in the decay to  $\gamma\gamma \Upsilon(1S)$  and confirmed by DEL-AMO-SANCHEZ 10R in the decay to  $\pi^+\pi^- \Upsilon(1S)$ .  
 Data consistent with  $J^P = 2^-$ . The states with  $J = 1$  and 3 also possibly seen, but need confirmation.

BONVICINI 04	PR D70 032001	G. Bonvicini et al. (CLEO Collab.)

$\chi_{b0}(2P)$   $I^G(J^{PC}) = 0^+(0^{++})$   
 $J$  needs confirmation.

Observed in radiative decay of the  $\Upsilon(3S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .

**$\chi_{b1}(2P)$**   $J^{G(JPC)} = 0^+(1^{++})$   
 $J$  needs confirmation.

Observed in radiative decay of the  $T(3S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .

## $\chi_{b2}(2P)$

$$J^{G(J^{PC})} = 0^+(2^{++})$$

$J$  needs confirmation.

Observed in radiative decay of the  $\Upsilon(3S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .

### $\Upsilon(4S)$ BRANCHING RATIOS

#### $B\bar{B}$ DECAYS

The ratio of branching fraction to charged and neutral B mesons is often derived assuming isospin invariance in the decays, and relies on the knowledge of the  $B^+/B^0$  lifetime ratio. "OUR EVALUATION" is obtained based on averages of rescaled data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account the common dependence of the measurement on the value of the lifetime ratio.

## $\Upsilon(10753)$

$$I^G(J^{PC}) = ?^?(1^{--})$$

OMITTED FROM SUMMARY TABLE

A candidate for  $\Upsilon(3D)$  state or an exotic structure.

Seen by MIZUK 19 in  $e^+e^- \rightarrow \Upsilon(nS)\pi^+\pi^-$  ( $n=1,2,3$ ) with a significance of 5.2  $\sigma$ .

### $\Upsilon(10753)$ MASS

VALUE (MeV)	DOCUMENT ID	TECN	COMMENT
<b><math>10752.7 \pm 5.9 \pm 0.7</math></b> <b><math>-11.3 - 1.1</math></b>	<sup>1</sup> MIZUK	19 BELL	$e^+e^- \rightarrow \Upsilon(nS)\pi^+\pi^-$
10761 $\pm$ 2	<sup>2</sup> DONG	20A	$e^+e^- \rightarrow b\bar{b}$

- • • We do not use the following data for averages, fits, limits, etc. • • •
- <sup>1</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n = 1, 2, 3$ , cross sections at 28 energy points within  $\sqrt{s} = 10.63$ –11.02 GeV, including the initial-state radiation at  $\Upsilon(10860)$ .
- <sup>2</sup> From a fit to the dressed cross sections of AUBERT 09E by BaBar and SANTEL 16 by Belle above 10.68 GeV with a coherent sum of a continuum amplitude and three Breit-Wigner functions with constant widths.

### $\Upsilon(10753)$ WIDTH

- <sup>1</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n = 1, 2, 3$ , cross sections at 28 energy points within  $\sqrt{s} = 10.6$ –11.05 GeV, including the initial-state radiation at  $\Upsilon(10860)$ .
- <sup>2</sup> From a simultaneous fit to the  $h_b(nP)\pi^+\pi^-$ ,  $n = 1, 2$  cross sections at 22 energy points within  $\sqrt{s} = 10.77$ –11.02 GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , a single relative phase, a single relative amplitude, and two overall normalization factors, one for each  $n$ ). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.
- <sup>3</sup> From a fit to the dressed cross sections of AUBERT 09E by BaBar and SANTEL 16 by Belle above 10.68 GeV with a coherent sum of a continuum amplitude and three Breit-Wigner functions with constant widths.
- <sup>4</sup> From a fit to the total hadronic cross sections measured at 60 energy points within  $\sqrt{s} = 10.82$ –11.05 GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with  $1/\sqrt{s}$  dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , one relative phase, and one decoherence coefficient).
- <sup>5</sup> Not including uncertain and potentially large systematic errors due to assumed continuum amplitude  $1/\sqrt{s}$  dependence and related interference contributions.
- <sup>6</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n = 1, 2, 3$ , cross sections at 25 energy points within  $\sqrt{s} = 10.6$ –11.05 GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with fourteen resonance parameters (a mass, width, and three amplitudes for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , a single universal relative phase, and three decoherence coefficients, one for each  $n$ ). Continuum contributions were measured (and therefore fixed) to be zero.

- <sup>7</sup> Superseded by MIZUK 19.  
<sup>8</sup> In a model where a flat non-resonant  $b\bar{b}$ -continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.  
<sup>9</sup> The parameters of the  $\Upsilon(11020)$  are fixed to those in AUBERT 09E.  
<sup>10</sup> In a model where a flat nonresonant  $\Upsilon(1S, 2S, 3S)\pi^+\pi^-$  continuum interferes with a single Breit-Wigner resonance.  
<sup>11</sup> In a model where a non-resonant  $b\bar{b}$ -continuum represented by a threshold function at  $\sqrt{s}=2m_B$  is incoherently added to a flat component interfering with two Breit-Wigner resonances. Not independent of other AUBERT 09E results. Systematic uncertainties not estimated.  
<sup>12</sup> Assuming four Gaussians with radiative tails and a single step in  $R$ .  
<sup>13</sup> In a coupled-channel model with three resonances and a smooth step in  $R$ .

$0.73 \pm 0.30$	<sup>1,2</sup> MIZUK	19	BELL $e^+e^- \rightarrow \Upsilon(nS)\pi^+\pi^-$	

- <sup>1</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n = 1, 2, 3$ , cross sections at 28 energy points within  $\sqrt{s} = 10.6\text{--}11.05$  GeV, including the initial-state radiation at  $\Upsilon(10860)$ .  
<sup>2</sup> Reported as the range 0.43–1.03 eV obtained from multiple solutions of an amplitude fit within a model composed as a sum of Breit-Wigner functions.

## Meson Particle Listings

 $\Upsilon(10860)$  $\Upsilon(10860)$  BRANCHING RATIOS

"OUR EVALUATION" is obtained based on averages of rescaled data listed below. The averages and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>.

• • • We do not use the following data for averages, fits, limits, etc. • • •

<sup>1</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n=1, 2, 3$ , cross sections at 28 energy points within  $\sqrt{s} = 10.6\text{--}11.05$  GeV, including the initial-state radiation at  $\Upsilon(10860)$ .  
<sup>2</sup> From a simultaneous fit to the  $h_b(nP)\pi^+\pi^-$ ,  $n=1, 2$  cross sections at 22 energy points within  $\sqrt{s} = 10.77\text{--}11.02$  GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , a single relative phase, a single relative amplitude, and two overall normalization factors, one for each  $n$ ). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.  
<sup>3</sup> From a fit to the dressed cross sections of AUBERT 09E by BaBar and SANTEL 16 by Belle above 10.68 GeV with a coherent sum of a continuum amplitude and three Breit-Wigner functions with constant widths.

- <sup>4</sup> From a fit to the total hadronic cross sections measured at 60 energy points within  $\sqrt{s} = 10.82\text{--}11.05$  GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with  $1/\sqrt{s}$  dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , one relative phase, and one decoherence coefficient).  
<sup>5</sup> Not including uncertain and potentially large systematic errors due to assumed continuum amplitude  $1/\sqrt{s}$  dependence and related interference contributions.  
<sup>6</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n=1, 2, 3$ , cross sections at 25 energy points within  $\sqrt{s} = 10.6\text{--}11.05$  GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with fourteen resonance parameters (a mass, width, and three amplitudes for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , a single universal relative phase, and three decoherence coefficients, one for each  $n$ ). Continuum contributions were measured (and therefore fixed) to be zero.  
<sup>7</sup> Superseded by MIZUK 19.  
<sup>8</sup> In a model where a flat non-resonant  $b\bar{b}$ -continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.

## $T_{c\bar{c}1}(3900)$

$$I^G(J^{PC}) = 1^+(1^{+-})$$

was  $Z_c(3900)$ ,  $X(3900)$

Properties incompatible with a  $q\bar{q}$  structure (exotic state). See the review on non- $q\bar{q}$  states.

Charged  $T_{c\bar{c}1}(3900)^\pm$  seen as a peak in the invariant mass distribution of the  $J/\psi \pi^\pm$  system by BES III (ABLIKIM 13T) in  $e^+ e^- \rightarrow \pi^+ \pi^- J/\psi$  at c.m. energy of 4.26 GeV and by radiative return from  $e^+ e^-$  collisions at  $\sqrt{s}$  from 9.46 to 10.86 GeV at Belle (LIU 13B). Partial wave analysis of ABLIKIM 17J determines  $J^P = 1^+$  with more than 7  $\sigma$  significance. Neutral  $T_{c\bar{c}1}(3900)^0$  seen in the  $J/\psi \pi^0$  invariant mass distribution in  $e^+ e^- \rightarrow \pi^0 \pi^0 J/\psi$  at c.m. energies of 4.23, 4.26, and 4.36 GeV by BES III (ABLIKIM 15U) and at 4.17 GeV by XIAO 13A. Peaks in  $(D\bar{D}^*)_{0,1}^\pm$  reported by BES III (ABLIKIM 14A, ABLIKIM 15AB) are assumed to be related.

 $T_{c\bar{c}1}(4000)$ 

$$J(J^P) = \frac{1}{2}(1^+)$$

OMITTED FROM SUMMARY TABLE

was  $Z_{cs}(4000)$

Properties incompatible with a  $q\bar{q}$  structure (exotic state). See the review on "Heavy Non- $q\bar{q}$  Mesons."

Seen by AAIJ 21E in  $B^+ \rightarrow T_{c\bar{c}1}(4000)^+ \phi$  with  $T_{c\bar{c}1}(4000)^+ \rightarrow J/\psi K^+$  using an amplitude analysis of  $B^+ \rightarrow J/\psi \phi K^+$  with a significance (accounting for systematic uncertainties) of  $15\sigma$ . The  $J^P = 1^+$  assignment is favored with high significance. ABLIKIM 21G also reports a  $J^P = 1^+ Z_{cs}$  state in this mass region using  $e^+e^- \rightarrow K^+(D_s^- D^{*0} + D_s^* D^0)$  with a significance of  $5.3\sigma$ . The incompatible values for the widths reported by AAIJ 21E and ABLIKIM 21G could either indicate the existence of two separate states or possibly be explained in a coupled channel model (see ORTEGA 21).

$T_{c\bar{c}}(4020)$

$I^G(J^{PC}) = 1^+(?^-)$

was  $X(4020)$

Properties incompatible with a  $q\bar{q}$  structure (exotic state). See the review on non- $q\bar{q}$  states.

Charged  $T_{c\bar{c}}(4020)$  seen by ABLIKIM 13X from  $e^+ e^- \rightarrow \pi^+ \pi^- h_c(1P)$  at c.m. energy from 3.90 to 4.42 GeV as a peak in the invariant mass distribution of the  $\pi^\pm h_c(1P)$  system, and by ABLIKIM 14B from  $e^+ e^- \rightarrow (D^* \bar{D}^*)^\pm \pi^\mp$  events in  $(D^* \bar{D}^*)^\pm$  mass. A neutral  $T_{c\bar{c}}(4020)$  seen by ABLIKIM 14P at three c.m. energies in the same range in  $e^+ e^- \rightarrow \pi^0 \pi^0 h_c(1P)$  as a peak in the larger of the two masses recoiling against a  $\pi^0$ . ABLIKIM 15AA observes a 5.9  $\sigma$  signal in  $(D^* \bar{D}^*)^0$  in  $e^+ e^- \rightarrow (D^* \bar{D}^*)^0 \pi^0$  events using collisions at two c.m. energies. Production rates and mass values support grouping neutral and charged  $T_{c\bar{c}}(4020)$  together as manifestations of a single  $I = 1$  particle.

2075±12±5	90±35±9	<sup>3</sup> ABLIKIM	04J	BES2	$J/\psi \rightarrow K^-p\bar{K}$

- <sup>1</sup> The reported mass and width are the pole positions in the complex (M,  $\Gamma$ ) plane.  
<sup>2</sup> Signal observed with a statistical significance  $>20\sigma$  comes from 3883 candidate events. Spin parity determined to be  $J^P = 1^+$  with a statistical significance  $>5\sigma$  over  $0^-, 1^-, 2^+$  hypotheses, and in the range within 3.1-7.5  $\sigma$  with respect to  $2^-$ .  
<sup>3</sup> From a fit in the region  $M_{p\bar{K}} - M_{p-\bar{K}} < 150$  MeV. S-wave in the  $p\bar{K}$  system preferred.

A similar near-threshold enhancement in the  $p\bar{K}$  system is observed in  $B^+ \rightarrow p\bar{K}D^0$  by CHEN 11f.

1.007276470 ± 0.000000012	COHEN 87	RVUE	1986 CODATA value

- <sup>1</sup>FINK 21 simultaneously measure the cyclotron frequencies of an  $H_2^+$  ion and a deuteron in a coupled magnetron orbit. The proton mass is extracted using the precise deuteron mass value.
- <sup>2</sup>The 2018 CODATA combination in TIESINGA 21 includes data from HEISSE 17, but does not include updates in HEISSE 19, which superseded HEISSE 17. Consequently, we do not average HEISSE 19 and TIESINGA 21. Updating the 2018 CODATA combination to use HEISSE 19 would shift the central value for the proton mass upwards by less than half a standard deviation. Therefore, we take the 2018 CODATA result in TIESINGA 21 as the recommended value for the proton mass.
- <sup>3</sup>The value is an update of HEISSE 17; the result is shifted by  $1.5 \times 10^{-11}$  u, corresponding to 0.45  $\sigma$  due to the corrected motional temperatures of the particles. The statistical and total systematic uncertainties are given as 16 and 29 in the last two digits.
- <sup>4</sup>The statistical and systematic errors are 15 and 29 in the last two places of the value. Superseded by HEISSE 19.

**p MASS (MeV)**

The mass is known more precisely in u (atomic mass units) than in MeV. The conversion is: 1 u = 931.494 102 42(28) MeV/c<sup>2</sup> (2018 CODATA value, TIESINGA 21).

<6 × 10 <sup>-8</sup>	90	<sup>1</sup> HORI 01	SPEC	$\bar{p}e^-$ He atom
<5 × 10 <sup>-7</sup>		<sup>2</sup> TORII 99	SPEC	$\bar{p}e^-$ He atom

- <sup>1</sup>HORI 01, HORI 03, HORI 06, and HORI 11 use the more-precisely-known constraint on the  $\bar{p}$  charge-to-mass ratio of GABRIELSE 99 (see below) to get their results. Their results are not independent of the HORI 01, HORI 03, HORI 06, and HORI 11 values for  $|q_p + q_{\bar{p}}|/e$ , below.

<sup>2</sup>TORII 99 uses the more-precisely-known constraint on the  $\bar{p}$  charge-to-mass ratio of GABRIELSE 95 (see below) to get this result. This is not independent of the TORII 99 value for  $|q_p + q_{\bar{p}}|/e$ , below.

**$\bar{p}/p$  CHARGE-TO-MASS RATIO,  $|q_{\bar{p}}/m_{\bar{p}}|/(q_p/m_p)$**

A test of CPT invariance. Listed here are measurements involving the inertial masses. For a discussion of what may be inferred about the ratio of  $\bar{p}$  and p gravitational masses, see ERICSON 90; they obtain an upper bound of  $10^{-6}$ – $10^{-7}$  for violation of the equivalence principle for  $\bar{p}$ 's.

VALUE	DOCUMENT ID	TECN	COMMENT
<b>1.000000000003 ± 0.00000000016</b>	<b>OUR AVERAGE</b>		
1.000000000003 ± 0.00000000016	BORCHERT 22	TRAP	Penning trap
1.000000000001 ± 0.00000000069	ULMER 15	TRAP	Penning trap
• • • We do not use the following data for averages, fits, limits, etc. • • •			
0.99999999991 ± 0.00000000009	GABRIELSE 99	TRAP	Penning trap
1.0000000015 ± 0.0000000011	<sup>1</sup> GABRIELSE 95	TRAP	Penning trap
1.0000000023 ± 0.0000000042	<sup>2</sup> GABRIELSE 90	TRAP	Penning trap

<sup>1</sup>Equation (2) of GABRIELSE 95 should read  $M(\bar{p})/M(p) = 0.999\,999\,9985$  (11) (G. Gabrielse, private communication).

<sup>2</sup>GABRIELSE 90 also measures  $m_{\bar{p}}/m_{e^-} = 1836.152660 \pm 0.000083$  and  $m_p/m_{e^-} = 1836.152680 \pm 0.000088$ . Both are completely consistent with the 1986 CODATA (COHEN 87) value for  $m_p/m_{e^-}$  of  $1836.152701 \pm 0.000037$ .

$(|q_{\bar{p}}/m_{\bar{p}}| - q_p/m_p)/q_p/m_p$

A test of CPT invariance. Taken from the  $\bar{p}/p$  charge-to-mass ratio, above.

**VALUE DOCUMENT ID COMMENT**  
**(0.3 ± 1.6) × 10<sup>-11</sup> OUR EVALUATION**

$|q_p + q_{\bar{p}}|/e$

A test of CPT invariance. Note that the comparison of the  $\bar{p}$  and p charge-to-mass ratios given above is much better determined. See also a similar test involving the electron.

<sup>1</sup>HORI 01, HORI 03, HORI 06, and HORI 11 use the more-precisely-known constraint on the  $\bar{p}$  charge-to-mass ratio of GABRIELSE 99 (see above) to get their results. Their results are not independent of the HORI 01, HORI 03, HORI 06, and HORI 11 values for  $|m_p - m_{\bar{p}}|/m_p$ , above.

<sup>2</sup>TORII 99 uses the more-precisely-known constraint on the  $\bar{p}$  charge-to-mass ratio of GABRIELSE 95 (see above) to get this result. This is not independent of the TORII 99 value for  $|m_p - m_{\bar{p}}|/m_p$ , above.

<sup>3</sup>HUGHES 92 uses recent measurements of Rydberg-energy and cyclotron-frequency ratios.

$|q_p + q_e|/e$

See BRESSI 11 for a summary of experiments on the neutrality of matter. See also "n CHARGE" in the neutron Listings.

VALUE	DOCUMENT ID	COMMENT
<b>&lt;1 × 10<sup>-21</sup></b>	<sup>1</sup> BRESSI 11	Neutrality of SF <sub>6</sub>
• • • We do not use the following data for averages, fits, limits, etc. • • •		
<3.2 × 10 <sup>-20</sup>	<sup>2</sup> SENGUPTA 00	binary pulsar
<0.8 × 10 <sup>-21</sup>	MARINELLI 84	Magnetic levitation
<1.0 × 10 <sup>-21</sup>	<sup>1</sup> DYLLA 73	Neutrality of SF <sub>6</sub>

<sup>1</sup>BRESSI 11 uses the method of DYLLA 73 but finds serious errors in that experiment that greatly reduce its accuracy. The BRESSI 11 limit assumes that  $n \rightarrow p e^- \nu_e$  conserves charge. Thus the limit applies equally to the charge of the neutron.

<sup>2</sup>SENGUPTA 00 uses the difference between the observed rate of rotational energy loss by the binary pulsar PSR B1913+16 and the rate predicted by general relativity to set this limit. See the paper for assumptions.

**p MAGNETIC MOMENT**

<sup>1</sup> SAHOO 17 and DMITRIEV 03 are not direct measurements of the proton electric dipole moment. They use theory to calculate this limit from the limit on the electric dipole moment of the <sup>199</sup>Hg atom.

<sup>2</sup> This WILKENING 84 value includes a finite-size effect and a magnetic effect.

<sup>3</sup> This WILKENING 84 value is more cautious than the other and excludes the finite-size effect, which relies on uncertain nuclear integrals.

 $p$  ELECTRIC POLARIZABILITY  $\alpha_p$ 

For a very complete review of the "polarizability of the nucleon and Compton scattering," see SCHUMACHER 05, updated in SCHUMACHER 19.

See LI 22d and therein for measurements of the mean square proton electric polarizability radius.

9.8 ± 0.4 ± 1.1	HALLIN	93	CNTR $\gamma p$ Compton scattering
10.62 ± 1.25 ± 1.07 -1.19 - 1.03	ZIEGER	92	CNTR $\gamma p$ Compton scattering
10.9 ± 2.2 ± 1.3	7 FEDERSPIEL	91	CNTR $\gamma p$ Compton scattering

<sup>1</sup> BEANE 03 uses effective field theory and low-energy  $\gamma p$  and  $\gamma d$  Compton-scattering data. It also gets for the isoscalar polarizabilities (see the erratum)  $\alpha_N = (13.0 \pm 1.9 + 3.9) \times 10^{-4}$  fm<sup>3</sup> and  $\beta_N = (-1.8 \pm 1.9 + 2.1) \times 10^{-4}$  fm<sup>3</sup>.

<sup>2</sup> BLANPIED 01 gives  $\alpha_p + \beta_p$  and  $\alpha_p - \beta_p$ . The separate  $\alpha_p$  and  $\beta_p$  are provided to us by A. Sandorfi. The first error above is statistics plus systematics; the second is from the model.

<sup>3</sup> This OLMOSDELEON 01 result uses the TAPS data alone, and does not use the (re-evaluated) sum-rule constraint that  $\alpha + \beta = (13.8 \pm 0.4) \times 10^{-4}$  fm<sup>3</sup>. See the paper for a discussion.

<sup>4</sup> MACGIBBON 95 combine the results of ZIEGER 92, FEDERSPIEL 91, and their own experiment to get a "global average" in which model errors and systematic errors are treated in a consistent way. See MACGIBBON 95 for a discussion.

<sup>5</sup> PASQUINI 19 fit data sets for the unpolarized proton RCS cross section, using fixed-t subtracted dispersion relations and a bootstrap-based fitting technique.

<sup>6</sup> BARANOV 01 combines the results of 10 experiments from 1958 through 1995 to get a global average that takes into account both systematic and model errors and does not use the theoretical constraint on the sum  $\alpha_p + \beta_p$ .

<sup>7</sup> FEDERSPIEL 91 obtains for the (static) electric polarizability  $\alpha_p$ , defined in terms of the induced electric dipole moment by  $\mathbf{D} = 4\pi\epsilon_0\alpha_p\mathbf{E}$ , the value  $(7.0 \pm 2.2 \pm 1.3) \times 10^{-4}$  fm<sup>3</sup>.

 $p$  MAGNETIC POLARIZABILITY  $\beta_p$ 

The electric and magnetic polarizabilities are subject to a dispersion sum-rule constraint  $\bar{\alpha} + \bar{\beta} = (14.2 \pm 0.5) \times 10^{-4}$  fm<sup>3</sup>. Errors here are anticorrelated with those on  $\bar{\alpha}_p$  due to this constraint.

See LI 22d and therein for measurements of the mean square proton magnetic polarizability radius.

 $p$  CHARGE RADIUS

This is the rms electric charge radius,  $\sqrt{\langle r_E^2 \rangle}$ .

There are three kinds of measurements of the proton radius: via transitions in atomic hydrogen; via electron scattering off hydrogen; and via muonic hydrogen Lamb shift. Most measurements of the radius of the proton involve electron-proton interactions, the most recent of which is the electron scattering measurement  $r_p = 0.831(14)$  fm (XIONG 19), and the atomic-hydrogen value,  $r_p = 0.833(10)$  fm (BEZGINOV 19). These agree well with another recent atomic-hydrogen value  $r_p = 0.8335(95)$  fm (BEYER 17), and with the best measurement using muonic hydrogen  $r_p = 0.84087(39)$  fm (ANTOGNINI 13), that is far more precise.

The MOHR 16 value (2014 CODATA), obtained from the electronic results available at the time, was 0.8751(61) fm. This differs by 5.6 standard deviations from the muonic hydrogen value, leading to the so-called proton charge radius puzzle. See our 2018 edition (Physical Review **D98** 030001 (2018)) for a further discussion of interpretations of this puzzle. However, reflecting the new electronic measurements, the 2018 CODATA, TIESINGA 21, recommended value is 0.8414(19) fm, and the puzzle appears to be resolved.

See our 2014 edition (Chinese Physics **C38** 070001 (2014)) for values published before 2003.

- BEZGINOV 19 measures the  $2S_{1/2}$  to  $2P_{1/2}$  transition frequency in atomic hydrogen using the frequency-offset separated oscillatory field (FOSOF) technique. The result agrees well with the muonic hydrogen Lamb shift value.
- The XIONG 19 value from *ep* → *ep* scattering and supports the muonic hydrogen Lamb shift value.
- CUI 21 employ a new mathematical procedure (statistical SPM, Schlessinger point method) based on form-unbiased interpolations of existing *ep* scattering data.
- MIHOVLOVIC 21 reports a value of  $0.878 ± 0.011 ± 0.031 ± 0.002$  fm where the last uncertainty comes from the dependence on the model form factor function.
- FLEURBAEY 18 measures the 1S-3S transition frequency in hydrogen and in combination with the 1S-2S transition frequency deduces the proton radius and the Rydberg constant.
- The BEYER 17 result is 3.3 combined standard deviations below the MOHR 16 (2014 CODATA) value. The experiment measures the 2S-4P transition in hydrogen and gets the proton radius and the Rydberg constant.
- Authors also provide values for combinations of all available data.

**p MAGNETIC RADIUS**

This is the rms magnetic radius,  $\sqrt{\langle r_M^2 \rangle}$ .

VALUE (fm)	DOCUMENT ID	TECN	COMMENT
<b>0.851 ± 0.026</b>	<sup>1</sup> LEE	15	Combination of world and Mainz data

• • • We do not use the following data for averages, fits, limits, etc. • • •

0.817 ± 0.027	<sup>2</sup> CUI	21B	FIT use existing <i>ep</i> data
0.87 ± 0.02	EPSTEIN	14	Using <i>ep</i> , <i>en</i> , $\pi\pi$ data

0.777 ± 0.013 ± 0.010	BERNAUER	10	SPEC <i>ep</i> → <i>ep</i> form factor
0.876 ± 0.010 ± 0.016	BORISYUK	10	Reanalyzes old <i>ep</i> → <i>ep</i> data
0.854 ± 0.005	BELUSHKIN	07	Dispersion analysis

- In a consistent reanalysis LEE 2015 extract values separately for the Mainz 2010 data only (0.776±0.034±0.017) fm and for the world data without Mainz data (0.914±0.035) fm. The quoted value is a simple combination of the two, which ignores possible discrepancies and unknown correlations and should be considered with caution.
- CUI 21B employ a new mathematical procedure (statistical SPM, Schlessinger point method) based on form-unbiased interpolations of existing *ep* scattering data.

**p MEAN LIFE**

A test of baryon conservation. See the “p Partial Mean Lives” section below for limits for identified final states. The limits here are to “anything” or are for “disappearance” modes of a bound proton (*p*) or (*n*). See also the 3ν modes in the “Partial Mean Lives” section. Table 1 of BACK 03 is a nice summary.

- ALLEGA 22 look for γ rays from the de-excitation of a residual  $^{15}\text{O}^*$  following the disappearance of *p* in  $^{16}\text{O}$ .
- ALLEGA 22 look for γ rays from the de-excitation of a residual  $^{15}\text{O}^*$  following the disappearance of *n* in  $^{16}\text{O}$ .

- AHMED 04 and ANDERSON 19A look for γ rays from the de-excitation of a residual  $^{15}\text{O}^*$  or  $^{15}\text{N}^*$  following the disappearance of a neutron or proton in  $^{16}\text{O}$ .
- ARAKI 06 looks for signs of de-excitation of the residual nucleus after disappearance of a neutron from the s shell of  $^{12}\text{C}$ .
- BACK 03 looks for decays of unstable nuclides left after *N* decays of parent  $^{12}\text{C}$ ,  $^{13}\text{C}$ ,  $^{16}\text{O}$  nuclei. These are “invisible channel” limits.
- ZDESENKO 03 gets this limit on proton disappearance in deuterium by analyzing SNO data in AHMAD 02.
- AHMAD 02 (see its footnote 7) looks for neutrons left behind after the disappearance of the proton in deuterons.
- BERNABEI 00B looks for the decay of a  $^{128}_{53}\text{Xe}$  nucleus following the disappearance of a proton in the otherwise-stable  $^{129}\text{Xe}$  nucleus.
- EVANS 77 looks for the daughter nuclide  $^{129}\text{Xe}$  from possible  $^{130}\text{Te}$  decays in ancient Te ore samples.
- This mean-life limit has been obtained from a half-life limit by dividing the latter by  $\ln(2) = 0.693$ .
- FLEROV 58 looks for the spontaneous fission of a  $^{232}\text{Th}$  nucleus after the disappearance of one of its nucleons.

**p̄ MEAN LIFE**

Of the two astrophysical limits here, that of GEER 00D involves considerably more refinements in its modeling. The other limits come from direct observations of stored antiprotons. See also “p̄ Partial Mean Lives” after “p Partial Mean Lives,” below, for exclusive-mode limits. The best (lifetime/branching fraction) limit there is  $7 \times 10^5$  years, for  $\bar{p} \rightarrow e^- \gamma$ . We advance only the exclusive-mode limits to our Summary Tables.

- GEER 00D uses agreement between a model of galactic  $\bar{p}$  production and propagation and the observed  $\bar{p}/p$  cosmic-ray spectrum to set this limit.

**p DECAY MODES**

See the “Note on Nucleon Decay” in our 1994 edition (Phys. Rev. **D50**, 1173) for a short review.

The “partial mean life” limits tabulated here are the limits on  $\tau/B_j$ , where  $\tau$  is the total mean life and  $B_j$  is the branching fraction for the mode in question. For *N* decays, *p* and *n* indicate proton and neutron partial lifetimes.

$\tau_{95}$	$\bar{p} \rightarrow e^- \omega$	> 200	90%

### $\rho$ PARTIAL MEAN LIVES

The "partial mean life" limits tabulated here are the limits on  $\tau/B_i$ , where  $\tau$  is the total mean life for the proton and  $B_i$  is the branching fraction for the mode in question.

Decaying particle:  $p$  = proton,  $n$  = bound neutron. The same event may appear under more than one partial decay mode. Background estimates may be accurate to a factor of two.

### Antilepton + meson

<sup>1</sup>In estimating the background, this HIRATA 89c limit (as opposed to the later limits of WALL 00B and MCGREW 99) does not take into account present understanding that the flux of  $\nu_\mu$  originating in the upper atmosphere is depleted. Doing so would reduce the background and thus also would reduce the limit here.  
<sup>2</sup>We have calculated 90% CL limit from 1 confined event.  
<sup>3</sup>We have converted 2 possible events to 90% CL limit.  
<sup>4</sup>We have converted half-life to 90% CL mean life.

<sup>1</sup> MATSUMOTO 22 limit > 4500 × 10<sup>30</sup> is derived from the latest dataset SKA IV phase (from 2008 to 2018) with 0.20 Mton-years of exposure.  
<sup>2</sup> MATSUMOTO 22 limit > 3600 × 10<sup>30</sup> is derived from a combination of all datasets SKA I, II, III and IV phase (from 1996 to 2018) with a total of 0.37 Mton-years of exposure. Note, the limit from only SKA IV is stronger, because there were some events observed in SKA II.  
<sup>3</sup> BARTELT 87 limit applies to  $p \rightarrow \mu^+ K_S^0$ .  
<sup>4</sup> Limit based on zero events.  
<sup>5</sup> We have calculated 90% CL limit from 1 confined event.  
<sup>6</sup> We have converted half-life to 90% CL mean life.

**$\tau(nn \rightarrow \text{invisible})$  778**

LIMIT (10 <sup>30</sup> years)	CL%	EVTs	BKGD EST	DOCUMENT ID	TECN	COMMENT
>1.4	90			1 ARAKI 06	KLND	$nn \rightarrow$ invisible
>0.015	90			2,3 ALLEGA 22	SNO+	$nn \rightarrow$ invisible
>0.013	90			2 ANDERSON 19A	SNO+	$nn \rightarrow$ invisible
>0.000042	90			4 TRETAK 04	CNTR	$nn \rightarrow$ invisible
>0.000049	90			5 BACK 03	BORX	$nn \rightarrow$ invisible
>0.000012	90			6 BERNABEI 00B	DAMA	$nn \rightarrow$ invisible

<sup>1</sup> ARAKI 06 looks for signs of de-excitation of the residual nucleus after disappearance of two neutrons from the s shell of <sup>12</sup>C.

<sup>2</sup> ALLEGA 22 and ANDERSON 19A look for  $\gamma$  rays from the de-excitation of a residual <sup>14</sup>O\* following the disappearance of  $nn$  in <sup>16</sup>O.

<sup>3</sup> ALLEGA 22 replaces the previous SNO+ value of ANDERSON 19A.

<sup>4</sup> TRETAK 04 uses data from an old Homestake-mine radiochemical experiment on limits for invisible decays of <sup>39</sup>K to <sup>37</sup>Ar.

<sup>5</sup> BACK 03 looks for decays of unstable nuclides left after  $NN$  decays of parent <sup>12</sup>C, <sup>13</sup>C, <sup>16</sup>O nuclei. These are "invisible channel" limits.

<sup>6</sup> BERNABEI 00B looks for the decay of a <sup>127</sup>Xe nucleus following the disappearance of an  $nn$  pair in the otherwise-stable <sup>129</sup>Xe nucleus. The limit here applies as well to  $nn \rightarrow \nu_\mu \bar{\nu}_\mu, nn \rightarrow \nu_\tau \bar{\nu}_\tau$ , or any "disappearance" mode.

**$\tau(nn \rightarrow \nu_e \bar{\nu}_e)$  779**

- We use the 1998 CODATA  $u$ -to-MeV conversion factor (see the heading above) to get this mass in MeV from the much more precisely measured KESSLER 99 value of  $1.00866491637 \pm 0.0000000082u$ .
- The mass is known much more precisely in  $u$ :  $m = 1.0086649235 \pm 0.0000000023u$ . We use the 1986 CODATA conversion factor to get the mass in MeV.
- These determinations are not independent of the  $m_n - m_p$  measurements below.
- The mass is known much more precisely in  $u$ :  $m = 1.008664919 \pm 0.000000014u$ .

$\bar{n}$  MASS

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>939.485 ± 0.051</b>	59	1 CRESTI	86	HBC $\bar{p}p \rightarrow \bar{\pi}n$

- This is a corrected result (see the erratum). The error is statistical. The maximum systematic error is 0.029 MeV.

$n$  MEAN LIFE

Limits on lifetimes for bound neutrons are given in the section "p PARTIAL MEAN LIVES."

We average eight of the best nine measurements, those made with ultracold neutrons (UCN's). If we include the one in-beam measurement with a comparable error (YUE 13), we get  $878.6 \pm 0.6$  s, where the scale factor is now 2.2.

For a recent discussion of the long-standing disagreement between in-beam and UCN results, see CZARNECKI 18 (*Physical Review Letters* **120** 202002 (2018)). For a full review of all matters concerning the neutron lifetime until about 2010, see WIETFELDT 11, F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," *Reviews of Modern Physics* **83** 1173 (2011).

- PATTIE 18 uses a new technique, with a semi-toroidal magneto-gravitational asymmetric trap and a novel in situ  $n$ -detector.

## Baryon Particle Listings

*n*

- <sup>2</sup> ARZUMANOV 15 is a reanalysis of their 2008–2010 dataset, with improved systematic corrections of ARZUMANOV 00 and ARZUMANOV 12.
- <sup>3</sup> STEYERL 12 is a detailed reanalysis of neutron storage loss corrections to the raw data of MAMPE 89, and it replaces that value.
- <sup>4</sup> WILSON 21 extract the value from the flux of *n* escaping the moon using data from the Lunar Prospector Neutron Spectrometer.
- <sup>5</sup> YUE 13 differs from NICO 05 in that a different and better method was used to measure the neutron density in the fiducial volume. This shifted the lifetime by +1.4 seconds and reduced the previously largest source of systematic uncertainty by a factor of five.
- <sup>6</sup> ARZUMANOV 12 reanalyzes its systematic corrections in ARZUMANOV 00 and obtains this corrected value.
- <sup>7</sup> IGNATOVICH 95 calls into question some of the corrections and averaging procedures used by MAMPE 93. The response, BONDARENKO 96, denies the validity of the criticisms.
- <sup>8</sup> The NESVIZHEVSKII 92 measurement has been withdrawn by A. Serebrov.
- <sup>9</sup> The BYRNE 80 measurement has been withdrawn (J. Byrne, private communication, 1990).

*n* MAGNETIC MOMENT

See the "Quark Model" review.

VALUE ( $\mu_N$ )	DOCUMENT ID	TECN	COMMENT
<b>-1.91304273±0.00000045</b>	TIESINGA	21 RVUE	2018 CODATA value
••• We do not use the following data for averages, fits, limits, etc. •••

- <sup>1</sup> ABEL 20 reports  $d = (0.0 \pm 1.1 \pm 0.2) \times 10^{-26}$  e cm value corresponding to the listed limit.

- <sup>2</sup> SAHOO 17 develops theory to calculate this limit from the measured limit by GRANER 16 of the <sup>199</sup>Hg atom EDM.
- <sup>3</sup> PENDLEBURY 15 reports  $d = (-0.21 \pm 1.82) \times 10^{-26}$  e cm value corresponding to the listed limit.
- <sup>4</sup> SEREBROV 14 includes the data of ALTAREV 96.
- <sup>5</sup> LAMOREAUX 07 faults BAKER 06 for not including in the estimate of systematic error an effect due to the Earth's rotation. BAKER 07 replies (1) that the effect was included implicitly in the analysis and (2) that further analysis confirms that the BAKER 06 limit is correct as is. See also SILENKO 07.
- <sup>6</sup> This HARRIS 99 result includes the result of SMITH 90. However, the averaging of the results of these two experiments has been criticized by LAMOREAUX 00.

*n* MEAN-SQUARE CHARGE RADIUS

The mean-square charge radius of the neutron,  $\langle r_n^2 \rangle$ , is related to the neutron-electron scattering length  $b_{ne}$  by  $\langle r_n^2 \rangle = 3(m_e a_0 / m_n) b_{ne}$ , where  $m_e$  and  $m_n$  are the masses of the electron and neutron, and  $a_0$  is the Bohr radius. Numerically,  $\langle r_n^2 \rangle = 86.34 b_{ne}$ , if we use  $a_0$  for a nucleus with infinite mass.

### LIMIT ON $n\bar{n}$ OSCILLATIONS

#### Mean Time for $n\bar{n}$ Transition

A test of  $\Delta B=2$  baryon number nonconservation. MOHAPATRA 80 and MOHAPATRA 89 discuss the theoretical motivations for looking for  $n\bar{n}$  oscillations. DOVER 83 and DOVER 85 give phenomenological analyses. The best limits come from looking for the decay of neutrons bound in nuclei. However, these analyses require model-dependent corrections for nuclear effects. See KABIR 83, DOVER 89, ALBERICO 91, and GAL 00 for discussions. Direct searches for  $n \rightarrow \bar{n}$  transitions using reactor neutrons are cleaner but give somewhat poorer limits. We include limits for both free and bound neutrons in the Summary Table. See MOHAPATRA 09 and PHILLIPS 16 for recent reviews.

### LIMIT ON $nn'$ OSCILLATIONS

Lee and Yang (LEE 56) proposed the existence of mirror world in an attempt to restore global parity symmetry. A possible candidate for dark matter. Limits depend on assumptions about fields  $B$  and  $B'$ . See the papers for details. See BEREZHIANI 18 for a recent discussion.

VALUE (s)	CL%	DOCUMENT ID	TECN	COMMENT
<b><math>&gt; 448</math></b>	90	SEREBROV	09a CNTR	Assumes $B' < 100 \text{ nT}$

• • • We do not use the following data for averages, fits, limits, etc. • • •

$> 1$	95	<sup>1</sup> BAN	23 CNTR	UCN, scan of $B$ field
		<sup>2</sup> ALMAZAN	22 CNTR	STEREO, hidden neutron search $ m_n - m_{n'}  \geq 0$ .

$> 414$	90	SEREBROV	08 CNTR	UCN, $B$ field on & off
$> 103$	95	BAN	07 CNTR	UCN, $B$ field on & off

<sup>1</sup> BAN 23 determine limits on the oscillation time for the  $|\delta m(nn')|$  range of 2–59 eV. The quoted value is  $\tau_{nn'}/\sqrt{\cos(\beta)} > 1$  sec. for  $B$  in 30–1143  $\mu\text{T}$ , for the case  $\beta = 0$ .

<sup>2</sup> ALMAZAN 22 reports an experimental constraint on the probability for neutron conversion into a hidden neutron,  $p < 3.1 \times 10^{-11}$  at 95% CL, which may be used to set a limit on the  $nn'$  oscillation time.

<sup>3</sup> ABEL 21 determine several limits on the oscillation time as a function of the mirror magnetic field  $B'$ , and of the fixed angle,  $\beta$ , between the applied magnetic field and  $B'$ . The latter is assumed to be bound to Earth. Two values are quoted from two analysis methods: (i)  $\tau_{nn'}/\sqrt{\cos(\beta)} > 9$  sec for  $B'$  in 5–25.4  $\mu\text{T}$ , and (ii) for any angle  $\beta$ ,  $\tau_{nn'} > 6$  sec for  $B'$  in 0.4–25.7  $\mu\text{T}$ . The authors also quote a limit of 352 sec for the case  $B' = 0$  T.

<sup>4</sup> The  $B$  field was set to (0.09, 0.12, 0.21) G. Limits on oscillation time are valid for any mirror field  $B'$  in (0.08–0.17) G, and for aligned fields  $B$  and  $B'$ . For larger values of  $B'$ , the limits are significantly reduced.

<sup>5</sup> Losses of neutrons due to oscillations to mirror neutrons would be maximal when the magnetic fields  $B$  and  $B'$  in the two worlds were equal. Hence the scan over  $B$  by ALTAREV 09a: the limit applies for any  $B'$  over the given range. At  $B' = 0$ , the limit is 141 s (95% CL).

$\lambda \equiv g_A / g_V$

- <sup>1</sup> HASSAN 21 include earlier data of DARIUS 17. The value is extracted from the angular correlation coefficient *a*.

- <sup>2</sup> BECK 20 calculates this value from the measurement of the  $\beta$ -decay  $e-\bar{\nu}_e$  angular correlation coefficient *a*.
- <sup>3</sup> MAERKISCH 19 gets  $A = -0.11985 \pm 0.00017 \pm 0.00012$ .
- <sup>4</sup> BROWN 18 gets  $A = -0.12054 \pm 0.00044 \pm 0.00068$  and  $\lambda = -1.2783 \pm 0.0022$ . We quote the combined values that include the earlier UCNA measurements (MENDENHALL 13).
- <sup>5</sup> This MUND 13 value includes earlier PERKEO II measurements (ABELE 02 and ABELE 97D).
- <sup>6</sup> MOSTOVOI 01 measures the two *P*-odd correlations *A* and *B*, or rather *SA* and *SB*, where *S* is the *n* polarization, in free neutron decay.
- <sup>7</sup> YEROZOLIMSKY 97 makes a correction to the EROZOLIMSKII 91 value.
- <sup>8</sup> SAUL 20 quote this value of  $\lambda$  under the SM assumption of the Fierz term *b* = 0. In a combined fit authors extract a value of  $\lambda = -1.2792 \pm 0.0060$ .
- <sup>9</sup> DARIUS 17 calculates this value from the measurement of the *a* parameter (see below). Data is included in HASSAN 21.
- <sup>10</sup> MENDENHALL 13 gets  $A = -0.11954 \pm 0.00055 \pm 0.00098$  and  $\lambda = -1.2756 \pm 0.0030$ . We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.
- <sup>11</sup> This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.
- <sup>12</sup> This is the combined result of ABELE 02 and ABELE 97D.
- <sup>13</sup> These experiments measure the absolute value of  $g_A/g_V$  only.
- <sup>14</sup> KROHN 75 includes events of CHRISTENSEN 70.
- <sup>15</sup> KROPF 74 reviews all data through 1972.

## *e*<sup>-</sup> ASYMMETRY PARAMETER *A*

This is the neutron-spin electron-momentum correlation coefficient. Unless otherwise noted, the values are corrected for radiative effects and weak magnetism. In the Standard Model, *A* is related to  $\lambda \equiv g_A/g_V$  by  $A = -2\lambda(\lambda + 1)/(1 + 3\lambda^2)$ ; this assumes that  $g_A$  and  $g_V$  are real.

- <sup>1</sup> MAERKISCH 19 further derive a value for the CKM-element  $|V_{ud}| = 0.97351 \pm 0.00060$ , using  $\tau_n = 879.7(8)$  sec and the relation from CZARNECKI 18.
- <sup>2</sup> BROWN 18 gets  $A = -0.12054 \pm 0.00044 \pm 0.00068$  and  $\lambda = -1.2783 \pm 0.0022$ . We quote the combined values that include the earlier UCNA measurements (MENDENHALL 13).
- <sup>3</sup> This MUND 13 value includes earlier PERKEO II measurements (ABELE 02 and ABELE 97D), with a correction to those results.
- <sup>4</sup> YEROZOLIMSKY 97 makes a correction to the EROZOLIMSKII 91 value.
- <sup>5</sup> Under the SM assumption that the Fierz term *b* = 0, SAUL 20 obtain the quoted asymmetry parameter *A* and  $\lambda = -1.27607 \pm 0.00068$ . In a combined fit authors extract the values  $A = -0.1209 \pm 0.0015$ ,  $\lambda = -1.2792 \pm 0.0060$ , and  $b = 0.017 \pm 0.021$ .

See key on page 1171

## Baryon Particle Listings

*n*

<sup>6</sup> MENDENHALL 13 gets  $A = -0.11954 \pm 0.00055 \pm 0.00098$  and  $\lambda = -1.2756 \pm 0.0030$ . We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.

<sup>7</sup> This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.

<sup>8</sup> This is the combined result of ABELE 02 and ABELE 97D.

<sup>9</sup> MOSTOVOI 01 calculates this from its measurement of  $\lambda = g_A/g_V$  above.

<sup>10</sup> These results are not corrected for radiative effects and weak magnetism, but the corrections are small compared to the errors.

 **$\overline{\nu}_e$  ASYMMETRY PARAMETER B**

This is the neutron-spin antineutrino-momentum correlation coefficient. In the Standard Model,  $B$  is related to  $\lambda \equiv g_A/g_V$  by  $B = 2\lambda(\lambda - 1) / (1 + 3\lambda^2)$ ; this assumes that  $g_A$  and  $g_V$  are real.

<sup>1</sup> MOSTOVOI 01 calculates this from its measurement of  $\lambda = g_A/g_V$  above.

**PROTON ASYMMETRY PARAMETER C**

Describes the correlation between the neutron spin and the proton momentum. In the Standard Model,  $C$  is related to  $\lambda \equiv g_A/g_V$  by  $C = -x_c(A + B) = x_c 4\lambda/(1 + 3\lambda^2)$ , where  $x_c = 0.27484$  is a kinematic factor; this assumes that  $g_A$  and  $g_V$  are real.

<b>-0.2377 ± 0.0010 ± 0.0024</b>	SCHUMANN 08	CNTR	Cold <i>n</i> , polarized

 **$e$ - $\overline{\nu}_e$  ANGULAR CORRELATION COEFFICIENT  $a$** 

For a review of past experiments and plans for future measurements of the  $a$  parameter, see WIETFELDT 05. In the Standard Model,  $a$  is related to  $\lambda \equiv g_A/g_V$  by  $a = (1 - \lambda^2) / (1 + 3\lambda^2)$ ; this assumes that  $g_A$  and  $g_V$  are real.

VALUE	DOCUMENT ID	TECN	COMMENT
<b>-0.1049 ± 0.0013 OUR AVERAGE</b>			Error includes scale factor of 1.8.

-0.1045 ± 0.0014	<sup>3</sup> MOSTOVOI 01	CNTR	Inferred

<sup>1</sup> The result of HASSAN 21 includes the data of DARIUS 17, and thus supersedes those entries. HASSAN 21 uses the asymmetry in time-of-flight between the beta electron and recoil proton in delayed coincidence.

<sup>2</sup> DARIUS 17 exploits a "wishbone" correlation, where the  $p$  time of flight is correlated with the momentum of the electron in delayed coincidence. Data is included in HASSAN 21.

<sup>3</sup> MOSTOVOI 01 calculates this from its measurement of  $\lambda = g_A/g_V$  above.

 **$\phi_{AV}$ , PHASE OF  $g_A$  RELATIVE TO  $g_V$** 

Time reversal invariance requires this to be 0 or 180°. This is related to  $D$  given in the next data block and  $\lambda \equiv g_A/g_V$  by  $\sin(\phi_{AV}) \equiv D(1+3\lambda^2)/2|\lambda|$ ; this assumes that  $g_A$  and  $g_V$  are real.

-22 ± 50	<sup>1</sup> ERZOZOLIM... 74	CNTR	Cold <i>n</i> , polarized
-11 ± 17	STEINBERG 74	CNTR	Cold <i>n</i> , polarized

<sup>1</sup> ERZOZOLIMSKII 78 says asymmetric proton losses and nonuniform beam polarization may give a systematic error up to  $30 \times 10^{-4}$ , thus increasing the ERZOZOLIMSKII 74 error to  $50 \times 10^{-4}$ . STEINBERG 74 and STEINBERG 76 estimate these systematic errors to be insignificant in their experiment.

**TRIPLE CORRELATION COEFFICIENT R**

Another test of time-reversal invariance.  $R$  measures the polarization of the electron in the direction perpendicular to the plane defined by the neutron spin and the electron momentum.  $R = 0$  for  $T$  invariance.

VALUE	DOCUMENT ID	TECN	COMMENT
<b>+0.004 ± 0.012 ± 0.005</b>	<sup>1</sup> KOZELA 12	CNTR	Mott polarimeter
••• We do not use the following data for averages, fits, limits, etc. •••			
+0.008 ± 0.015 ± 0.005	KOZELA 09	CNTR	See KOZELA 12

<sup>1</sup> KOZELA 12 also measures the polarization of the electron along the direction of the neutron spin. This is nonzero in the Standard Model; the correlation coefficient is  $N = +0.067 \pm 0.011 \pm 0.004$ .

**FIERZ INTERFERENCE TERM b**

The coefficient of the Fierz interference term,  $b$ , probes additional contributions to the differential decay rate of the neutron from scalar or tensor current interactions, beyond the Standard Model.

VALUE	DOCUMENT ID	TECN	COMMENT
<b>0.017 ± 0.020 ± 0.003</b>	<sup>1</sup> SAUL 20	SPEC	Cold <i>n</i> , polarized

<sup>1</sup> In a combined fit SAUL 20 extract this best fit value of the Fierz interference term  $b$  and the values  $A = -0.1209 \pm 0.0015$  and  $\lambda = -1.2792 \pm 0.0060$ . For  $b$  it translates into a 90% CL region of  $-0.018 \leq b \leq 0.052$  as a function of  $A$ .

## N(1520) DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1$ $N\pi$	55–65 %
$\Gamma_2$ $N\eta$	0.07–0.09 %
$\Gamma_3$ $N\pi\pi$	25–35 %
$\Gamma_4$ $\Delta(1232)\pi$	22–34 %
$\Gamma_5$ $\Delta(1232)\pi, S\text{-wave}$	15–23 %
$\Gamma_6$ $\Delta(1232)\pi, D\text{-wave}$	7–11 %
$\Gamma_7$ $N\rho$	10–16 %
$\Gamma_8$ $N\rho, S=3/2, S\text{-wave}$	10–16 %
$\Gamma_9$ $N\rho, S=1/2, D\text{-wave}$	0.2–0.4 %
$\Gamma_{10}$ $N\sigma$	<10 %
$\Gamma_{11}$ $p\gamma$	0.31–0.52 %
$\Gamma_{12}$ $p\gamma, \text{helicity}=1/2$	0.01–0.02 %
$\Gamma_{13}$ $p\gamma, \text{helicity}=3/2$	0.30–0.50 %
$\Gamma_{14}$ $n\gamma$	0.30–0.53 %
$\Gamma_{15}$ $n\gamma, \text{helicity}=1/2$	0.04–0.10 %
$\Gamma_{16}$ $n\gamma, \text{helicity}=3/2$	0.25–0.45 %

### N(1535) DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1$ $N\pi$	32-52 %
$\Gamma_2$ $N\eta$	30-55 %
$\Gamma_3$ $N\pi\pi$	4-31 %
$\Gamma_4$ $\Delta(1232)\pi, D\text{-wave}$	1-4 %
$\Gamma_5$ $N\rho$	2-17 %
$\Gamma_6$ $N\rho, S=1/2, S\text{-wave}$	2-16 %
$\Gamma_7$ $N\rho, S=3/2, D\text{-wave}$	<1 %
$\Gamma_8$ $N\sigma$	2-10 %
$\Gamma_9$ $N(1440)\pi$	5-12 %
$\Gamma_{10}$ $p\gamma, \text{helicity}=1/2$	0.15-0.30 %
$\Gamma_{11}$ $n\gamma, \text{helicity}=1/2$	0.01-0.25 %

## N(1650) DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1$ $N\pi$	50–70 %
$\Gamma_2$ $N\eta$	15–35 %
$\Gamma_3$ $\Lambda K$	5–15 %
$\Gamma_4$ $N\pi\pi$	20–58 %
$\Gamma_5$ $\Delta(1232)\pi, D\text{-wave}$	6–18 %
$\Gamma_6$ $N\rho$	12–22 %
$\Gamma_7$ $N\rho, S=1/2, S\text{-wave}$	<4 %
$\Gamma_8$ $N\rho, S=3/2, D\text{-wave}$	12–18 %
$\Gamma_9$ $N\sigma$	2–18 %
$\Gamma_{10}$ $N(1440)\pi$	6–26 %
$\Gamma_{11}$ $\rho\gamma, \text{ helicity}=1/2$	0.04–0.20 %
$\Gamma_{12}$ $\eta\gamma, \text{ helicity}=1/2$	0.003–0.17 %

**N(1675) DECAY MODES**

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1$ $N\pi$	38-42 %
$\Gamma_2$ $N\eta$	< 1 %
$\Gamma_3$ $\Lambda K$	< 0.04 %
$\Gamma_4$ $N\pi\pi$	25-45 %
$\Gamma_5$ $\Delta(1232)\pi, D\text{-wave}$	23-37 %
$\Gamma_6$ $N\rho$	0.1-0.9 %
$\Gamma_7$ $N\rho, S=1/2$	< 0.2 %
$\Gamma_8$ $N\rho, S=3/2, D\text{-wave}$	0.1-0.7 %
$\Gamma_9$ $N\sigma$	3-7 %
$\Gamma_{10}$ $p\gamma$	0-0.02 %
$\Gamma_{11}$ $p\gamma, \text{helicity}=1/2$	0-0.01 %
$\Gamma_{12}$ $p\gamma, \text{helicity}=3/2$	0-0.01 %
$\Gamma_{13}$ $n\gamma$	0-0.15 %
$\Gamma_{14}$ $n\gamma, \text{helicity}=1/2$	0-0.05 %
$\Gamma_{15}$ $n\gamma, \text{helicity}=3/2$	0-0.10 %

## Baryon Particle Listings

 $N(1700)$  $N(1700)$  DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1$ $N\pi$	7–17 %
$\Gamma_2$ $N\eta$	1–2 %
$\Gamma_3$ $N\omega$	10–34 %
$\Gamma_4$ $\Lambda K$	1–2 %
$\Gamma_5$ $N\pi\pi$	>89 %
$\Gamma_6$ $\Delta(1232)\pi$	55–85 %
$\Gamma_7$ $\Delta(1232)\pi$ , S-wave	50–80 %
$\Gamma_8$ $\Delta(1232)\pi$ , D-wave	4–14 %
$\Gamma_9$ $N\rho$ , S=3/2, S-wave	32–44 %
$\Gamma_{10}$ $N\sigma$	2–14 %
$\Gamma_{11}$ $N(1440)\pi$	3–11 %
$\Gamma_{12}$ $N(1520)\pi$	<4 %
$\Gamma_{13}$ $p\gamma$	0.01–0.05 %
$\Gamma_{14}$ $p\gamma$ , helicity=1/2	0.0–0.024 %
$\Gamma_{15}$ $p\gamma$ , helicity=3/2	0.002–0.026 %
$\Gamma_{16}$ $n\gamma$	0.01–0.13 %
$\Gamma_{17}$ $n\gamma$ , helicity=1/2	0.0–0.09 %
$\Gamma_{18}$ $n\gamma$ , helicity=3/2	0.01–0.05 %

 **$N(1710)$  DECAY MODES**

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1$ $N\pi$	5–20 %
$\Gamma_2$ $N\eta$	10–50 %
$\Gamma_3$ $N\omega$	1–5 %
$\Gamma_4$ $\Lambda K$	5–25 %
$\Gamma_5$ $\Sigma K$	seen
$\Gamma_6$ $N\pi\pi$	14–48 %
$\Gamma_7$ $\Delta(1232)\pi$ , $P$ -wave	3–9 %
$\Gamma_8$ $N\rho$ , $S=1/2$ , $P$ -wave	11–23 %
$\Gamma_9$ $N\sigma$	<16 %
$\Gamma_{10}$ $N(1535)\pi$	9–21 %
$\Gamma_{11}$ $p\gamma$ , helicity=1/2	0.002–0.08 %
$\Gamma_{12}$ $n\gamma$ , helicity=1/2	0.0–0.02 %

N(1860) 5/2<sup>+</sup>

I(J<sup>P</sup>) = ½(½<sup>+</sup>) Status: \*\*

OMITTED FROM SUMMARY TABLE

Before the 2012 Review, all the evidence for a J<sup>P</sup> = 5/2<sup>+</sup> state with a mass above 1800 MeV was filed under a two-star N(2000). There is now some evidence from ANISOVICH 12A for two 5/2<sup>+</sup> states in this region, so we have split the older data (according to mass) between two two-star 5/2<sup>+</sup> states, an N(1860) and an N(2000).

 $N(1895) 1/2^-$ 

$$I(J^P) = \frac{1}{2}(1/2^-) \text{ Status: } ***$$

was  $N(2090)$ 

Before our 2012 Review, this state appeared in our Listings as the  $N(2090)$ . Any structure in the  $S_{11}$  wave above 1800 MeV is listed here. A few early results that are now obsolete have been omitted.

 $N(1895)$  POLE POSITION

$I(J^P) = \frac{1}{2}(\frac{5}{2}^+)$  Status: \*\*

OMITTED FROM SUMMARY TABLE was N(1900)

Before the 2012 Review, all the evidence for a  $J^P = 5/2^+$  state with a mass above 1800 MeV was filed under a two-star N(2000). There is now some evidence from ANISOVICH 12A for two  $5/2^+$  states in this region, so we have split the older data (according to mass) between two two-star  $5/2^+$  states, an N(1860) and an N(2000).

## Baryon Particle Listings

 $N(2120)$  $N(2120) 3/2^-$ 

$$I(J^P) = \frac{1}{2}(\frac{3}{2}^-) \text{ Status: } ***$$

Before the 2012 *Review*, all the evidence for a  $J^P = 3/2^-$  state with a mass above 1800 MeV was filed under a two-star  $N(2080)$ .

There is now evidence from ANISOVICH 12A for two  $3/2^-$  states in this region, so we have split the older data (according to mass) between a three-star  $N(1875)$  and a two-star  $N(2120)$ .

 $N(2190)$  DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1$ $N\pi$	10–20 %
$\Gamma_2$ $N\eta$	1–5 %
$\Gamma_3$ $N\omega$	8–20 %
$\Gamma_4$ $\Lambda K$	0.2–0.8 %
$\Gamma_5$ $N\pi\pi$	22–51 %
$\Gamma_6$ $\Delta(1232)\pi, D\text{-wave}$	19–31 %
$\Gamma_7$ $N\rho, S=3/2, D\text{-wave}$	<11 %
$\Gamma_8$ $N\sigma$	3–9 %
$\Gamma_9$ $\Lambda K^*(892)$	0.2–0.8 %
$\Gamma_{10}$ $p\gamma$	<0.08 %
$\Gamma_{11}$ $p\gamma, \text{helicity}=1/2$	<0.06 %
$\Gamma_{12}$ $p\gamma, \text{helicity}=3/2$	<0.02 %
$\Gamma_{13}$ $n\gamma$	<0.04 %
$\Gamma_{14}$ $n\gamma, \text{helicity}=1/2$	<0.01 %
$\Gamma_{15}$ $n\gamma, \text{helicity}=3/2$	<0.03 %

Partial-Wave Analyses

OMITTED FROM SUMMARY TABLE

We list here miscellaneous high-mass candidates for isospin-1/2 resonances found in partial-wave analyses.

Our 1982 edition had an  $N(3245)$ , an  $N(3690)$ , and an  $N(3755)$ , each a narrow peak seen in a production experiment. Since nothing has been heard from them since the 1960's, we declare them to be dead. There was also an  $N(3030)$ , deduced from total cross-section and 180° elastic cross-section measurements; it is the KOCH 80  $L_{1,15}$  state below.

 $N(\sim 3000)$  BREIT-WIGNER MASS

 **$\Delta(\sim 3000)$  Region  
Partial-Wave Analyses**

OMITTED FROM SUMMARY TABLE

We list here miscellaneous high-mass candidates for isospin-3/2 resonances found in partial-wave analyses.

Our 1982 edition also had a  $\Delta(2850)$  and a  $\Delta(3230)$ . The evidence for them was deduced from total cross-section and  $180^\circ$  elastic cross-section measurements. The  $\Delta(2850)$  has been resolved into the  $\Delta(2750) I_{3,13}$  and  $\Delta(2950) K_{3,15}$ . The  $\Delta(3230)$  is perhaps related to the  $K_{3,13}$  of HENDRY 78 and to the  $L_{3,17}$  of KOCH 80.

 $\Delta(\sim 3000)$  BREIT-WIGNER MASS

<sup>1</sup>We assume CPT invariance: this is the  $\bar{\Lambda}$  mass as measured by HARTOUNI 94. See below for the fractional mass difference, testing CPT.  
<sup>2</sup>The SCHMIDT 65 masses have been reevaluated using our April 1973 proton and  $K^\pm$  and  $\pi^\pm$  masses. P. Schmidt, private communication (1974).  
<sup>3</sup>The mass has been raised 35 keV to take into account a 46 keV increase in the proton mass and an 11 keV decrease in the  $\pi^\pm$  mass (note added Reviews of Modern Physics **39** 1 (1967)).

## CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 11 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 6.9$  for 9 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_2$	-100	
$x_6$	0	0
	$x_1$	$x_2$

<sup>1</sup> The tabulated result assumes the weak-magnetism coupling w ≡ g<sub>W</sub>(0)/g<sub>V</sub>(0) to be 0.97, as given by the CVC hypothesis and as assumed by the other listed measurements. However, DWORKIN 90 measures w to be 0.15 ± 0.30, and then g<sub>A</sub>/g<sub>V</sub> = -0.731 ± 0.016.

<sup>2</sup> This experiment measures only the absolute value of g<sub>A</sub>/g<sub>V</sub>.

$\Lambda(1405) 1/2^-$

$J^P = 0(1/2^-)$  Status: \*\*\*

In the 1998 Note on the  $\Lambda(1405)$  in PDG 98, R.H. Dalitz discussed the S-shaped cusp behavior of the intensity at the  $N\bar{K}$  threshold observed in THOMAS 73 and HEMINGWAY 85. He commented that this behavior "is characteristic of S-wave coupling; the other below threshold hyperon, the  $\Sigma(1385)$ , has no such threshold distortion because its  $N\bar{K}$  coupling is P-wave. For  $\Lambda(1405)$  this asymmetry is the sole direct evidence that  $J^P = 1/2^-$ ."

A recent measurement by the CLAS collaboration, MORIYA 14, definitively established the long-assumed  $J^P = 1/2^-$  spin-parity assignment of the  $\Lambda(1405)$ . The experiment produced the  $\Lambda(1405)$  spin-polarized in the photoproduction process  $\gamma p \rightarrow K^+ \Lambda(1405)$  and measured the decay of the  $\Lambda(1405)$  (polarized)  $\rightarrow \Sigma^+ (\text{polarized}) \pi^-$ . The observed isotropic decay of  $\Lambda(1405)$  is consistent with spin  $J = 1/2$ . The polarization transfer to the  $\Sigma^+$  (polarized) direction revealed negative parity, and thus established  $J^P = 1/2^-$ .

$\Lambda(1520) 3/2^-$

 $I(J^P) = 0(\frac{3}{2}^-)$  Status: \*\*\*

Discovered by FERRO-LUZZI 62; the elaboration in WATSON 63 is the classic paper on the Breit-Wigner analysis of a multichannel resonance.

The measurements of the mass, width, and elasticity published before 1975 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

Production and formation experiments agree quite well, so they are listed together here.

$0.041 \pm 0.005$	CHAN 72	HBC	$K^- p \rightarrow \Lambda \pi \pi$

 $\Gamma(\Sigma(1385)\pi \rightarrow \Lambda \pi \pi)/\Gamma(\Lambda \pi \pi)$   $\Gamma_7/\Gamma_3$ 

The  $\Lambda \pi \pi$  mode is largely due to  $\Sigma(1385)\pi$ . Only the values of  $(\Sigma(1385)\pi) / (\Lambda \pi \pi)$  given by MAST 73B and CORDEN 75 are based on real 3-body partial-wave analyses. The discrepancy between the two results is essentially due to the different hypotheses made concerning the shape of the  $(\pi\pi)_{S\text{-wave}}$  state.

## $\Lambda(1690) 3/2^-$

$$I(J^P) = 0(\frac{3}{2}^-) \text{ Status: } ***$$

The measurements of the mass, width, and elasticity published before 1974 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

-----------------------	--------------------------	------------

OMITTED FROM SUMMARY TABLE

was  $\Lambda(2020)$ 

In LITCHFIELD 71, need for the state rests solely on a possibly inconsistent polarization measurement at 1.784 GeV/c. HEMINGWAY 75 does not require this state. GOPAL 77 does not need it in either  $N\bar{K}$  or  $\Sigma\pi$ . With new  $K^-n$  angular distributions included, DECLAIS 77 sees it. However, this and other new data are included in GOPAL 80 and the state is not required. BACCARI 77 weakly supports it.

 $\Lambda(2100) 7/2^-$ 

$$I(J^P) = 0(\frac{7}{2}^-) \text{ Status: } ***$$

Most of the results published before 1973 are now obsolete and have been omitted. They may be found in our 1982 edition Physics Letters **111B** 1 (1982).

This entry only includes results from partial-wave analyses. Parameters of peaks seen in cross sections and in invariant-mass distributions around 2100 MeV used to be listed in a separate entry immediately following. It may be found in our 1986 edition Physics Letters **170B** 1 (1986).

 $\Lambda(2100)$  FOOTNOTES<sup>1</sup> The NAKKASYAN 75 values are from the two best solutions found. Each has the  $\Lambda(2100)$  and one additional resonance ( $P_3$  or  $F_5$ ).<sup>2</sup> Note that the three for BACCARI 77 entries are for three different waves.<sup>3</sup> The published sign has been changed to be in accord with the baryon-sign convention. The upper limit on the  $G_3$  wave is 0.03.

 **$\Lambda(2110)$  FOOTNOTES**

- Found in one of two best solutions.
- The published error of 0.6 was a misprint.
- The CAMERON 78 upper limit on F-wave decay is 0.03. The sign here has been changed to be in accord with the baryon-first convention.
- The published sign has been changed to be in accord with the baryon-first convention. The CAMERON 78B upper limits on the  $P_3$  and  $F_3$  waves are each 0.03.

$\Lambda(2325)$ 3/2 <sup>-</sup>	$I(J^P) = 0(\frac{3}{2}^-)$ Status: *
----------------------------------	---------------------------------------

## OMITTED FROM SUMMARY TABLE

BACCARI 77 finds this state with either  $J^P = 3/2^-$  or  $3/2^+$  in an energy-dependent partial-wave analyses of  $K^- p \rightarrow \Lambda\omega$  from 2070 to 2436 MeV. A subsequent semi-energy-independent analysis from threshold to 2436 MeV selects  $3/2^-$ . DEBELLEFON 78 (same group) also sees this state in an energy-dependent partial-wave analysis of  $K^- p \rightarrow \bar{K}N$  data, and finds  $J^P = 3/2^-$  or  $3/2^+$ . They again prefer  $J^P = 3/2^-$ , but only on the basis of model-dependent considerations.

## $\Sigma$ BARYONS

### ( $S = -1, I = 1$ )

$\Sigma^+ = uus, \Sigma^0 = uds, \Sigma^- = dds$

$\Sigma^+$

$$I(J^P) = 1(\frac{1}{2}^+)$$
 Status: \* \* \* \*

We have omitted some results that have been superseded by later experiments. See our earlier editions.

### $\Sigma^+$ MASS

The fit uses  $\Sigma^+, \Sigma^0, \Sigma^-$ , and  $\Lambda$  mass and mass-difference measurements.

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>1189.37 ± 0.07 OUR FIT</b>				Error includes scale factor of 2.2.
<b>1189.37 ± 0.06 OUR AVERAGE</b>				Error includes scale factor of 1.8. See the ideogram below.
1189.33 ± 0.04	607	<sup>1</sup> BOHM	72 EMUL	
1189.16 ± 0.12		HYMAN	67 HEBE	
1189.61 ± 0.08	4205	SCHMIDT	65 HBC	See note with $\Lambda$ mass
1189.48 ± 0.22	58	<sup>2</sup> BHOWMIK	64 EMUL	
1189.38 ± 0.15	144	<sup>2</sup> BARKAS	63 EMUL	

<sup>1</sup> BOHM 72 is updated with our 1973  $K^-, \pi^-,$  and  $\pi^0$  masses (Reviews of Modern Physics **45** 51 (1973)).  
<sup>2</sup> These masses have been raised 30 keV to take into account a 46 keV increase in the proton mass and a 21 keV decrease in the  $\pi^0$  mass (note added 1967 edition, Reviews of Modern Physics **39** 1 (1967)).

### $\Sigma^+$ MEAN LIFE

Measurements with fewer than 1000 events have been omitted.

VALUE ( $10^{-10}$ s)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>0.8018 ± 0.0026 OUR AVERAGE</b>				
0.8038 ± 0.0040 ± 0.0014		BARBOSA	00 E761	hyperons, 375 GeV
0.8043 ± 0.0080 ± 0.0014		<sup>1</sup> BARBOSA	00 E761	hyperons, 375 GeV
0.798 ± 0.005	30k	MARRAFFINO	80 HBC	$K^- p$ 0.42-0.5 GeV/c
0.807 ± 0.013	5719	CONFORTO	76 HBC	$K^- p$ 1-1.4 GeV/c
0.795 ± 0.010	20k	EISELE	70 HBC	$K^- p$ at rest
0.803 ± 0.008	10664	BARLOUTAUD	69 HBC	$K^- p$ 0.4-1.2 GeV/c
0.83 ± 0.032	1300	<sup>2</sup> CHANG	66 HBC	

<sup>1</sup> This is a measurement of the  $\Sigma^-$  lifetime. Here we assume  $CPT$  invariance; see below for the fractional  $\Sigma^+ - \Sigma^-$  lifetime difference obtained by BARBOSA 00.  
<sup>2</sup> We have increased the CHANG 66 error of 0.018; see our 1970 edition, Reviews of Modern Physics **42** 87 (1970).

$$(\tau_{\Sigma^+} - \tau_{\Sigma^-}) / \tau_{\Sigma^+}$$

A test of  $CPT$  invariance.

VALUE	DOCUMENT ID	TECN	COMMENT
<b>(-6 ± 12) × 10<sup>-4</sup></b>	BARBOSA	00 E761	hyperons, 375 GeV

### $\Sigma^+$ MAGNETIC MOMENT

See the "Quark Model" review. Measurements with an error  $\geq 0.1 \mu_N$  have been omitted.

VALUE ( $\mu_N$ )	EVTS	DOCUMENT ID	TECN	COMMENT
<b>2.458 ± 0.010 OUR AVERAGE</b>				Error includes scale factor of 2.1. See the ideogram below.
2.4613 ± 0.0034 ± 0.0040	250k	MORELOS	93 SPEC	$p$ Cu 800 GeV
2.428 ± 0.036 ± 0.007	12k	<sup>1</sup> MORELOS	93 SPEC	$p$ Cu 800 GeV
2.479 ± 0.012 ± 0.022	137k	WILKINSON	87 SPEC	$p$ Be 400 GeV
2.4040 ± 0.0198	44k	<sup>2</sup> ANKENBRA...	83 CNTR	$p$ Cu 400 GeV

<sup>1</sup> We assume  $CPT$  invariance: this is (minus) the  $\Sigma^-$  magnetic moment as measured by MORELOS 93. See below for the moment difference testing  $CPT$ .  
<sup>2</sup> ANKENBRANDT 83 gives the value  $2.38 \pm 0.02 \mu_N$ . MORELOS 93 uses the same hyperon magnet and channel and claims to determine the field integral better, leading to the revised value given here.

$$(\mu_{\Sigma^+} + \mu_{\Sigma^-}) / \mu_{\Sigma^+}$$

A test of  $CPT$  invariance.

VALUE	DOCUMENT ID	TECN	COMMENT
<b>0.014 ± 0.015</b>	<sup>1</sup> MORELOS	93 SPEC	$p$ Cu 800 GeV

<sup>1</sup> This is our calculation from the MORELOS 93 measurements of the  $\Sigma^+$  and  $\Sigma^-$  magnetic moments given above. The statistical error on  $\mu_{\Sigma^-}$  dominates the error here.

### $\Sigma^+$ DECAY MODES

Mode	Fraction ( $\Gamma_i / \Gamma$ )	Confidence level
$\Gamma_1$ $p \pi^0$	(51.57 ± 0.30) %	
$\Gamma_2$ $n \pi^+$	(48.31 ± 0.30) %	
$\Gamma_3$ $p \gamma$	(1.23 ± 0.05) × 10 <sup>-3</sup>	
$\Gamma_4$ $n \pi^+ \gamma$	[a] (4.5 ± 0.5) × 10 <sup>-4</sup>	
$\Gamma_5$ $\Lambda e^+ \nu_e$	(2.3 ± 0.4) × 10 <sup>-5</sup>	

### $\Delta S = \Delta Q$ (SQ) violating modes or $\Delta S = 1$ weak neutral current (S1) modes

Mode	Fraction	Confidence level
$\Gamma_6$ $n e^+ \nu_e$	SQ < 5 × 10 <sup>-6</sup>	90%
$\Gamma_7$ $n \mu^+ \nu_\mu$	SQ < 3.0 × 10 <sup>-5</sup>	90%
$\Gamma_8$ $p e^+ e^-$	S1 < 7 × 10 <sup>-6</sup>	
$\Gamma_9$ $p \mu^+ \mu^-$	S1 (2.4 ± 1.7 / -1.3) × 10 <sup>-8</sup>	

[a] See the Listings below for the pion momentum range used in this measurement.

### CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 14 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 7.7$  for 12 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_2$	-100	
$x_3$	12	-14
	$x_1$	$x_2$

Σ<sup>0</sup>

I(J<sup>P</sup>) = 1(½<sup>+</sup>) Status: \*\*\*

COURANT 63 and ALFF 65, using Σ<sup>0</sup> → Λe<sup>+</sup>e<sup>-</sup> decays (Dalitz decays), determined the Σ<sup>0</sup> parity to be positive, given that J = 1/2 and that certain very reasonable assumptions about form factors are true. The results of experiments involving the Primakoff effect, from which the Σ<sup>0</sup> mean life and Σ<sup>0</sup> → Λ transition magnetic moment come (see below), strongly support J = 1/2.

Σ<sup>0</sup> MASS

The fit uses Σ<sup>+</sup>, Σ<sup>0</sup>, Σ<sup>-</sup>, and Λ mass and mass-difference measurements.

Σ<sup>0</sup> MEAN LIFE

These lifetimes are deduced from measurements of the cross sections for the Primakoff process Λ → Σ<sup>0</sup> in nuclear Coulomb fields. An alternative expression of the same information is the Σ<sup>0</sup>-Λ transition magnetic moment given in the following section. The relation is (μ<sub>Σ<sup>0</sup></sub>/μ<sub>N</sub>)<sup>2</sup> τ = 1.92951 × 10<sup>-19</sup> s (see DEVLIN 86).

----------------------	----------------------------	-----

[a] See the Listings below for the pion momentum range used in this measurement.

## CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 16 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 8.7$  for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_3$	-64		
$x_4$	-77	0	
$x_5$	-5	0	0
	$x_1$	$x_3$	$x_4$

 $\Sigma^-$  BRANCHING RATIOS $\Gamma(n\pi^-\gamma)/\Gamma(n\pi^-)$   $\Gamma_2/\Gamma_1$ 

The  $\pi^+$  momentum cuts differ, so we do not average the results but simply use the latest value for the Summary Table.

 $g_A/g_V$  FOR  $\Sigma^- \rightarrow ne^-\bar{\nu}_e$ 

Measurements with fewer than 500 events have been omitted. Where necessary, signs have been changed to agree with our conventions, which are given in the "Note on Baryon Decay Parameters" in the neutron Listings. What is actually listed is  $|g_1/f_1 - 0.237g_2/f_1|$ . This reduces to  $g_A/g_V \equiv g_1(0)/f_1(0)$  on making the usual assumption that  $g_2 = 0$ . See also the note on HSUEH 88.

VALUE	EVTS	DOCUMENT ID	TECN	COMMENT
<b>0.340 ± 0.017 OUR AVERAGE</b>				
+ 0.327 ± 0.007 ± 0.019	50k	<sup>1</sup> HSUEH 88	SPEC	$\Sigma^-$ 250 GeV
+ 0.34 ± 0.05	4456	<sup>2</sup> BOURQUIN 83c	SPEC	SPS hyperon beam

0.17 + 0.07 - 0.09	519	DECAMP 77	ELEC	Hyperon beam

<sup>1</sup> The sign is, with our conventions, unambiguously positive. The value assumes, as usual, that  $g_2 = 0$ . If  $g_2$  is included in the fit, then (with our sign convention)  $g_2 = -0.56 \pm 0.37$ , with a corresponding reduction of  $g_A/g_V$  to  $+0.20 \pm 0.08$ .

<sup>2</sup> BOURQUIN 83c favors the positive sign by at least 2.6 standard deviations.

<sup>3</sup> TANENBAUM 74 gives  $0.435 \pm 0.035$ , assuming no  $q^2$  dependence in  $g_A$  and  $g_V$ . The listed result allows  $q^2$  dependence, and is taken from HSUEH 88.

 $f_2(0)/f_1(0)$  FOR  $\Sigma^- \rightarrow ne^-\bar{\nu}_e$ 

The signs have been changed to be in accord with our conventions, given in the "Note on Baryon Decay Parameters" in the neutron Listings.

## $\Sigma(1385) 3/2^+$

$$I(J^P) = 1(\frac{3}{2}^+) \text{ Status: } ***$$

Discovered by ALSTON 60. Early measurements of the mass and width for combined charge states have been omitted. They may be found in our 1984 edition Reviews of Modern Physics 56 S1 (1984).

We average only the most significant determinations. We do not average results from inclusive experiments with large backgrounds or results which are not accompanied by some discussion of experimental resolution. Nevertheless systematic differences between experiments remain. (See the ideograms in the Listings below.) These differences could arise from interference effects that change with production mechanism and/or beam momentum. They can also be accounted for in part by differences in the parametrizations employed. (See BORENSTEIN 74 for a discussion on this point.) Thus BORENSTEIN 74 uses a Breit-Wigner with energy-independent width, since a *P*-wave was found to give unsatisfactory fits. CAMERON 78 uses the same form. On the other hand HOLMGREN 77 obtains a good fit to their  $\Lambda\pi$  spectrum with a *P*-wave Breit-Wigner, but includes the partial width for the  $\Sigma\pi$  decay mode in the parametrization. AGUILAR-BENITEZ 81D gives masses and widths for five different Breit-Wigner shapes. The results vary considerably. Only the best-fit *S*-wave results are given here.

### $\Sigma(1385)$ FOOTNOTES

- From fit to inclusive  $\Lambda \pi$  spectrum.
- Includes data of HOLMGREN 77.
- The errors are statistical only. The resolution is not unfolded.
- The error is enlarged to  $\Gamma/\sqrt{N}$ . See the note on the  $K^*(892)$  mass in the 1984 edition.
- From a fit to  $\Lambda \pi^0$  with the width fixed at 34 MeV.
- From fit to inclusive  $\Lambda \pi^0$  spectrum with the width fixed at 40 MeV.
- Redundant with data in the mass Listings.
- Results from  $\Lambda \pi^+ \pi^-$  and  $\Lambda \pi^+ \pi^- \pi^0$  combined by us.
- The error is enlarged to  $4\Gamma/\sqrt{N}$ . See the note on the  $K^*(892)$  mass in the 1984 edition.
- Consistent with +, 0, and - widths equal.
- KELLER 12 gives  $\Gamma(\Sigma^+ \gamma)/\Gamma(\Sigma^+ \pi^0) = (11.95 \pm 2.21 + 0.53)_{-1.21}$ %, using 1/2 our total  $\Sigma(1385)^+ \rightarrow \Sigma \pi$  fraction for  $\Sigma^+ \pi^0$ . We divide the KELLER 12 value by two.
- We calculate this from the MOLCHANOV 04 upper limit of 9.5 keV on the  $\Sigma^- \gamma$  width.
- We calculate this from the ARIK 77 upper limit of 24 keV on the  $\Sigma^- \gamma$  width.
- An extrapolation of the parametrized amplitude below threshold.

### $\Sigma(1580) 3/2^-$

$$I(J^P) = 1(\frac{3}{2}^-) \text{ Status: } *$$

#### OMITTED FROM SUMMARY TABLE

Seen in the isospin-1  $\bar{K}N$  cross section at BNL (LI 73, CARROLL 76) and in a partial-wave analysis of  $K^-p \rightarrow \Lambda\pi^0$  for c.m. energies 1560–1600 MeV by LITCHFIELD 74. LITCHFIELD 74 finds  $J^P = 3/2^-$ . Not seen by ENGLER 78, CAMERON 78C, OLMSTED 04, nor by PRAKHOV 04.

Neither ZHANG 13A nor SARANTSEV 19 see any evidence for this state.

 $\Sigma(1620) 1/2^-$ 

$I(J^P) = 1(1/2^-)$  Status: \*

OMITTED FROM SUMMARY TABLE

The  $S_{11}$  state at 1697 MeV reported by VANHORN 75 is tentatively listed under the  $\Sigma(1750)$ . CARROLL 76 sees two bumps in the isospin-1 total cross section near this mass. GAO 12 sees no evidence for this resonance.

Production experiments are listed separately in the next entry.

 $\Sigma(1750) 1/2^-$ 

$$I(J^P) = I(\frac{1}{2}^-) \text{ Status: } ***$$

For most results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

There is evidence for this state in many partial-wave analyses, but with wide variations in the mass, width, and couplings. The latest analyses indicated significant couplings to  $N\bar{K}$  and  $\Lambda\pi$ , as well as to  $\Sigma\eta$  whose threshold is at 1746 MeV (JONES 74).

$$\Sigma(1775) 5/2^-$$

$$J(P) = 1(\frac{5}{2}^-) \text{ Status: } ****$$

Discovered by GALTIERI 63, this resonance plays the same role as cornerstone for isospin-1 analyses in this region as the  $\Lambda(1820)F_{05}$  does in the isospin-0 channel.

For most results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

 **$\Sigma(1880)$  FOOTNOTES**

- The two MARTIN 77 values are from a T-matrix pole and from a Breit-Wigner fit.
- From solution 1 of BAILLON 75; not present in solution 2.
- Only unconstrained states from table 1 of LEA 73 are listed.
- The published sign has been changed to be in accord with the baryon-first convention.

 $\Sigma(1910)$  FOOTNOTES

- <sup>1</sup> The two MARTIN 77 values are from a T-matrix pole and from a Breit-Wigner fit.  
<sup>2</sup> The published sign has been changed to be in accord with the baryon-first convention.  
<sup>3</sup> Upper limits on the  $D_1$  and  $D_3$  waves are each 0.03.

 $\Sigma(1915) 5/2^+$  $I(J^P) = 1(\frac{5}{2}^+)$  Status: \*\*\*

Discovered by COOL 66. For results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

This entry only includes results from partial-wave analyses. Parameters of peaks seen in cross sections and invariant-mass distributions in this region used to be listed in a separate entry immediately following. They may be found in our 1986 edition Physics Letters **170B** 1 (1986).

OMITTED FROM SUMMARY TABLE

This state suggested by BERTHON 70B finds support in GOPAL 80 with new  $K^- p$  polarization and  $K^- n$  angular distributions. The very broad state seen in KANE 72 is not required in the later (KANE 74) analysis of  $\bar{K} N \rightarrow \Sigma \pi$ .

## OMITTED FROM SUMMARY TABLE

Results from partial-wave analyses are too weak to warrant separating them from the production and cross-section experiments. LASINSKI 71 in  $\bar{K}N$  using a Pomeron + resonances model, and DEBELLEFON 76, DEBELLEFON 77, and DEBELLEFON 78 in energy-dependent partial-wave analyses of  $\bar{K}N \rightarrow \Lambda\pi$ ,  $\Sigma\pi$ , and  $N\bar{K}$ , respectively, suggest two resonances around this mass.

## CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 11 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 7.5$  for 7 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_2$	-57			
$x_4$	-82	0		
$x_5$	-7	0	0	
$x_6$	0	0	0	1
	$x_1$	$x_2$	$x_4$	$x_5$

 $\Xi^0$  BRANCHING RATIOS

$\Gamma(\Lambda\gamma)/\Gamma(\Lambda\pi^0)$	$\Gamma_2/\Gamma_1$			
<b>1.17 ± 0.07 OUR FIT</b>				
<b>1.17 ± 0.07 OUR AVERAGE</b>

### RADIATIVE HYPERON DECAYS

Revised July 2011 by J.D. Jackson (LBNL).

The weak radiative decays of spin-1/2 hyperons,  $B_i \rightarrow B_f \gamma$ , yield information about matrix elements (form factors) similar to that gained from weak hadronic decays. For a polarized spin-1/2 hyperon decaying radiatively via a  $\Delta Q = 0, \Delta S = 1$  transition, the angular distribution of the direction  $\hat{\mathbf{p}}$  of the final spin-1/2 baryon in the hyperon rest frame is

$$\frac{dN}{d\Omega} = \frac{N}{4\pi} (1 + \alpha_\gamma \mathbf{P}_i \cdot \hat{\mathbf{p}}). \quad (1)$$

Here  $\mathbf{P}_i$  is the polarization of the decaying hyperon, and  $\alpha_\gamma$  is the asymmetry parameter. In terms of the form factors  $F_1(q^2)$ ,  $F_2(q^2)$ , and  $G(q^2)$  of the effective hadronic weak electromagnetic vertex,

$$F_1(q^2)\gamma_\lambda + iF_2(q^2)\sigma_{\lambda\mu}q^\mu + G(q^2)\gamma_\lambda\gamma_5,$$

$\alpha_\gamma$  is

$$\alpha_\gamma = \frac{2 \operatorname{Re}[G(0)F_M^*(0)]}{|G(0)|^2 + |F_M(0)|^2}, \quad (2)$$

where  $F_M = (m_i - m_f)[F_2 - F_1/(m_i + m_f)]$ . If the decaying hyperon is unpolarized, the decay baryon has a longitudinal polarization given by  $P_f = -\alpha_\gamma$  [1].

The angular distribution for the weak hadronic decay,  $B_i \rightarrow B_f \pi$ , has the same form as Eq. (1), but of course with a different asymmetry parameter,  $\alpha_\pi$ . Now, however, if the decaying hyperon is unpolarized, the decay baryon has a

## Baryon Particle Listings

 $\Xi^0$ 

longitudinal polarization given by  $P_f = +\alpha_\pi$  [2,3]. The difference of sign is because the spins of the pion and photon are different.

$\Xi^0 \rightarrow \Lambda\gamma$  *decay*—The radiative decay  $\Xi^0 \rightarrow \Lambda\gamma$  of an unpolarized  $\Xi^0$  uses the hadronic decay  $\Lambda \rightarrow p\pi^-$  as the analyzer. As noted above, the longitudinal polarization of the  $\Lambda$  will be  $P_\Lambda = -\alpha_{\Xi\Lambda\gamma}$ . Let  $\alpha_-$  be the  $\Lambda \rightarrow p\pi^-$  asymmetry parameter and  $\theta_{\Lambda p}$  be the angle, as seen in the  $\Lambda$  rest frame, between the  $\Lambda$  line of flight and the proton momentum. Then the hadronic version of Eq. (1) applied to the  $\Lambda \rightarrow p\pi^-$  decay gives

$$\frac{dN}{d\cos\theta_{\Lambda p}} = \frac{N}{2} (1 - \alpha_{\Xi\Lambda\gamma} \alpha_- \cos\theta_{\Lambda p}) \quad (3)$$

for the angular distribution of the proton in the  $\Lambda$  frame. Our current value, from the CERN NA48/1 experiment [4], is  $\alpha_{\Xi\Lambda\gamma} = -0.704 \pm 0.019 \pm 0.064$ .

$\Xi^0 \rightarrow \Sigma^0\gamma$  *decay*—The asymmetry parameter here,  $\alpha_{\Xi\Sigma\gamma}$ , is measured by following the decay chain  $\Xi^0 \rightarrow \Sigma^0\gamma$ ,  $\Sigma^0 \rightarrow \Lambda\gamma$ ,  $\Lambda \rightarrow p\pi^-$ . Again, for an unpolarized  $\Xi^0$ , the longitudinal polarization of the  $\Sigma^0$  will be  $P_\Sigma = -\alpha_{\Xi\Sigma\gamma}$ . In the  $\Sigma^0 \rightarrow \Lambda\gamma$  decay, a parity-conserving magnetic-dipole transition, the polarization of the  $\Sigma^0$  is transferred to the  $\Lambda$ , as may be seen as follows. Let  $\theta_{\Sigma\Lambda}$  be the angle seen in the  $\Sigma^0$  rest frame between the  $\Sigma^0$  line of flight and the  $\Lambda$  momentum. For  $\Sigma^0$  helicity  $+1/2$ , the probability amplitudes for positive and negative spin states of the  $\Sigma^0$  along the  $\Lambda$  momentum are  $\cos(\theta_{\Sigma\Lambda}/2)$  and  $\sin(\theta_{\Sigma\Lambda}/2)$ . Then the amplitude for a negative helicity photon and a negative helicity  $\Lambda$  is  $\cos(\theta_{\Sigma\Lambda}/2)$ , while the amplitude for positive helicities for the photon and  $\Lambda$  is  $\sin(\theta_{\Sigma\Lambda}/2)$ . For  $\Sigma^0$  helicity  $-1/2$ , the amplitudes are interchanged. If the  $\Sigma^0$  has longitudinal polarization  $P_\Sigma$ , the probabilities for  $\Lambda$  helicities  $\pm 1/2$  are therefore

$$p(\pm 1/2) = \frac{1}{2} (1 \mp P_\Sigma) \cos^2(\theta_{\Sigma\Lambda}/2) + \frac{1}{2} (1 \pm P_\Sigma) \sin^2(\theta_{\Sigma\Lambda}/2), \quad (4)$$

and the longitudinal polarization of the  $\Lambda$  is

$$P_\Lambda = -P_\Sigma \cos\theta_{\Sigma\Lambda} = +\alpha_{\Xi\Sigma\gamma} \cos\theta_{\Sigma\Lambda}. \quad (5)$$

Using Eq. (1) for the  $\Lambda \rightarrow p\pi^-$  decay again, we get for the joint angular distribution of the  $\Sigma^0 \rightarrow \Lambda\gamma$ ,  $\Lambda \rightarrow p\pi^-$  chain,

$$\frac{d^2N}{d\cos\theta_{\Sigma\Lambda} d\cos\theta_{\Lambda p}} = \frac{N}{4} (1 + \alpha_{\Xi\Sigma\gamma} \cos\theta_{\Sigma\Lambda} \alpha_- \cos\theta_{\Lambda p}). \quad (6)$$

Our current average for  $\alpha_{\Xi\Sigma\gamma}$  is  $-0.69 \pm 0.06$  [4,5].

## References

1. R.E. Behrends, Phys. Rev. **111**, 1691 (1958); see Eq. (7) or (8).
2. In ancient times, the signs of the asymmetry term in the angular distributions of radiative and hadronic decays of polarized hyperons were sometimes opposite. For roughly 50 years, however, the overwhelming convention has been to make them the same. The aim, not always achieved, is to remove ambiguities.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 5 measurements and one constraint to determine 5 parameters. The overall fit has a χ² = 1.0 for 1 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients <δx<sub>i</sub>δx<sub>j</sub>>/((δx<sub>i</sub>δx<sub>j</sub>)), in percent, from the fit to the branching fractions, x<sub>i</sub> ≡ Γ<sub>i</sub>/Γ<sub>total</sub>. The fit constrains the x<sub>i</sub> whose labels appear in this array to sum to one.

$\Xi$  RESONANCES

Revised 2023 by V. Crede (FSU), U. Thoma (U. Bonn)

Most of our present knowledge of  $\Xi$  resonances stems from the low-statistics data samples recorded in the 1960s–1980s using  $K^-$  beams and in the 1980s and 1990s using hyperon ( $\Sigma^-, \Xi^-$ ) beams. This is because (1) they could only be produced as a part of a final state, and so the analysis is more complicated than if direct formation were possible, (2) the production cross sections are small (typically a few  $\mu\text{b}$ ), and (3) the final states are topologically complicated and difficult to study with electronic techniques. Thus, early information about  $\Xi$  resonances came entirely from bubble chamber experiments, where the numbers of events are small, and only in the 1980s did electronic experiments make any significant contributions.

# Baryon Particle Listings

## $\Xi$ 's, $\Xi(1530)$

In recent years, significant contributions have come from collider experiments. Excited  $\Xi$  baryons are produced and have been studied in the decay of the charmed  $\Lambda_c^+$  into  $(\Sigma^+ K^-)_{\Xi(1690)} K^+$  by the Belle Collaboration [1] and into  $(\Xi^- \pi^+)_{\Xi^*} K^+$  by the BaBar Collaboration [2]. Belle measures the decay  $\Xi_c^+ \rightarrow (\Xi^- \pi^+)_{\Xi^*} \pi^+$  [3] with unprecedented statistical quality.

Table 1. Our estimate of the status of the  $\Xi$  resonances. Only those with an overall status of \*\*\* or \*\*\*\* are included in the Baryon Summary Table.

Particle	$J^P$	Overall status	Status as seen in —				
			$\Xi\pi$	$\Lambda K$	$\Sigma K$	$\Xi(1530)\pi$	Other channels
$\Xi(1318)$	$1/2^+$	****					Decays weakly
$\Xi(1530)$	$3/2^+$	****	****				
$\Xi(1620)$		**	**				
$\Xi(1690)$		***	**	***	**		
$\Xi(1820)$	$3/2^-$	***	**	***	**	**	
$\Xi(1950)$		***	**	**		*	
$\Xi(2030)$		***	**	**	***		
$\Xi(2120)$		*		*			
$\Xi(2250)$		**					3-body decays
$\Xi(2370)$		**					3-body decays
$\Xi(2500)$		*		*	*		3-body decays

\*\*\*\* Existence is certain, and properties are at least fairly well explored.  
 \*\*\* Existence ranges from very likely to certain, but further confirmation is desirable and/or quantum numbers, branching fractions, etc. are not well determined.  
 \*\* Evidence of existence is only fair.  
 \* Evidence of existence is poor.

## $\Xi(1530) 3/2^+$

$$I(J^P) = \frac{1}{2}(\frac{3}{2}^+) \text{ Status: } ****$$

This is the only  $\Xi$  resonance whose properties are all reasonably well known. Assuming that the  $\Lambda_c^+$  has  $J^P = 1/2^+$ , AUBERT 08AK, in a study of  $\Lambda_c^+ \rightarrow \Xi^- \pi^+ K^+$ , finds conclusively that the spin of the  $\Xi(1530)^0$  is  $3/2$ . In conjunction with SCHLEIN 63B and BUTTON-SHAFER 66, this proves also that the parity is +.

We use only those determinations of the mass and width that are accompanied by some discussion of systematics and resolution.

## $\Xi(1690)$

$J(P) = \frac{1}{2}(?)$  Status: \*\*

AUBERT 08AK, in a study of  $\Lambda_c^+ \rightarrow \Xi^- \pi^+ K^+$ , finds some evidence that the  $\Xi(1690)$  has  $J^P = 1/2^-$ .

DIONISI 78 sees a threshold enhancement in both the neutral and negatively charged  $\Sigma \bar{K}$  mass spectra in  $K^- p \rightarrow (\Sigma \bar{K}) K \pi$  at 4.2 GeV/c. The data from the  $\Sigma \bar{K}$  channels alone cannot distinguish between a resonance and a large scattering length. Weaker evidence at the same mass is seen in the corresponding  $\Lambda \bar{K}$  channels, and a coupled-channel analysis yields results consistent with a new  $\Xi$ .

BIAGI 81 sees an enhancement at 1700 MeV in the diffractively produced  $\Lambda K^-$  system. A peak is also observed in the  $\Lambda K^0$  mass spectrum at 1660 MeV that is consistent with a 1720 MeV resonance decaying to  $\Sigma^0 \bar{K}^0$ , with the  $\gamma$  from the  $\Sigma^0$  decay not detected.

BIAGI 87 provides further confirmation of this state in diffractive dissociation of  $\Xi^-$  into  $\Lambda K^-$ . The significance claimed is 6.7 standard deviations.

ADAMOVICH 98 sees a peak of  $1400 \pm 300$  events in the  $\Xi^- \pi^+$  spectrum produced by 345 GeV/c  $\Sigma^-$ -nucleus interactions.

SUMIHAMA 19 observes a peak in the  $\Xi^- \pi^+$  spectrum with a significance of 4.0 standard deviations.

 $\Xi(1820) 3/2^-$ 

$$I(J^P) = \frac{1}{2}(3/2^-) \text{ Status: } ***$$

The clearest evidence is an 8-standard-deviation peak in  $\Lambda K^-$  seen by GAY 76C. TEODORO 78 favors  $J = 3/2$ , but cannot make a parity discrimination. BIAGI 87C is consistent with  $J = 3/2$  and favors negative parity for this  $J$  value.

 $\Xi(1820)$  MASS

We only average the measurements that appear to us to be most significant and best determined.

## $\Xi(1950)$

$$I(J^P) = \frac{1}{2}(?)^? \text{ Status: } ** *$$

We list here everything reported between 1875 and 2000 MeV. The accumulated evidence for a  $\Xi$  near 1950 MeV seems strong enough to include a  $\Xi(1950)$  in the main Baryon Table, but not much can be said about its properties. In fact, there may be more than one  $\Xi$  near this mass.

## $\Xi(2030)$

$$I(J^P) = \frac{1}{2} (\geq \frac{5}{2}^?) \text{status: } ***$$

The evidence for this state has been much improved by HEMINGWAY 77, who see an eight standard deviation enhancement in  $\Sigma \bar{K}$  and a weaker coupling to  $\Lambda \bar{K}$ . ALITTI 68 and HEMINGWAY 77 observe no signals in the  $\Xi \pi \pi$  (or  $\Xi(1530) \pi$ ) channel, in contrast to DIBIANCA 75. The decay  $(\Lambda/\Sigma) \bar{K} \pi$  reported by BARTSCH 69 is also not confirmed by HEMINGWAY 77.

A moments analysis of the HEMINGWAY 77 data indicates at a level of three standard deviations that  $J \geq 5/2$ .

 $\Xi(2120)$  FOOTNOTES

- <sup>1</sup> CHLIAPNIKOV 79 does not uniquely identify the  $K^+$  in the  $(\bar{K} K^+) X$  final state. It also reports bumps with fewer events at 2240, 2540, and 2830 MeV.  
<sup>2</sup> GAY 76c sees a 4-standard deviation signal. However, HEMINGWAY 77, with more events from the same experiment points out that the signal is greatly reduced if a cut is made on the 4-momentum  $u$ . This suggests an anomalous production mechanism if the  $\Xi(2120)$  is real.

OMITTED FROM SUMMARY TABLE

The evidence for this state is mixed. BARTSCH 69 sees a bump of not much statistical significance in  $\Lambda\bar{K}\pi$ ,  $\Sigma\bar{K}\pi$ , and  $\Xi\pi\pi$  mass spectra. GOLDWASSER 70 sees a narrower bump in  $\Xi\pi\pi$  at a higher mass. Not seen by HASSALL 81 with 45 events/ $\mu\text{b}$  at 6.5 GeV/c. Seen by JENKINS 83. Perhaps seen by BIAGI 87.

## $\Omega^-$ BARYONS

$(S = -3, I = 0)$

$\Omega^- = sss$

$I(J^P) = 0(\frac{3}{2}^+)$  Status: \* \* \* \*

The unambiguous discovery in both production and decay was by BARNES 64. The quantum numbers follow from the assignment of the particle to the baryon decuplet. DEUTSCHMANN 78 and BAUBILLIER 78 rule out  $J = 1/2$  and find consistency with  $J = 3/2$ . AUBERT, BE 06 finds from the decay angular distributions of  $\Xi_c^0 \rightarrow \Omega^- K^+$  and  $\Omega_c^0 \rightarrow \Omega^- K^+$  that  $J = 3/2$ ; this depends on the spins of the  $\Xi_c^0$  and  $\Omega_c^0$  being  $J = 1/2$ , their supposed values. ABLIKIM 21E determines the  $\Omega^-$  spin to be  $J = 3/2$  from the decay angular distributions of the complete decay chain  $\psi(3686) \rightarrow \Omega^- \bar{\Omega}^+$ , with subsequent decays  $\Omega^- \rightarrow K^- \Lambda$  and  $\bar{\Omega}^+ \rightarrow K^+ \bar{\Lambda}$ .

We have omitted some results that have been superseded by later experiments. See our earlier editions.

**$\Omega^-$  MASS**

The fit assumes the  $\Omega^-$  and  $\bar{\Omega}^+$  masses are the same, and averages them together.

1672.1 ± 1.0	1	<sup>4</sup> EISENBERG 54	EMUL	

<sup>1</sup>DIBIANCA 75 gives a mass for each event. We quote the average.  
<sup>2</sup>The FRY 55 and FRY 55B events were identified as  $\Omega^-$  by ALVAREZ 73. The masses assume decay to  $\Lambda K^-$  at rest. For FRY 55B, decay from an atomic orbit could Doppler shift the  $K^-$  energy and the resulting  $\Omega^-$  mass by several MeV. This shift is negligible for FRY 55 because the  $\Omega^-$  decay is approximately perpendicular to its orbital velocity, as is known because the  $\Lambda$  strikes the nucleus (L.Alvarez, private communication 1973). We have calculated the error assuming that the orbital n is 4 or larger.  
<sup>3</sup>Excluded from the average; the  $\Omega^-$  lifetimes measured by the experiments differ significantly from other measurements.  
<sup>4</sup>The EISENBERG 54 mass was calculated for decay in flight. ALVAREZ 73 has shown that the  $\Omega^-$  interacted with an Ag nucleus to give  $K^- \Xi Ag$ .

**$\bar{\Omega}^+$  MASS**

The fit assumes the  $\Omega^-$  and  $\bar{\Omega}^+$  masses are the same, and averages them together.

OMITTED FROM SUMMARY TABLE

A peak in the  $\Omega^-\pi^+\pi^-$  mass spectrum with a signal significance claimed to be at least 5.5 standard deviations. There is no reason to seriously doubt the existence of this state, but unless the evidence is overwhelming we usually wait for confirmation from a second experiment before elevating peaks to the Summary Table.

## Baryon Particle Listings

Charmed Baryons,  $\Lambda_c^+$ 

## CHARMED BARYONS (C = +1)

$$\Lambda_c^+ = udc, \quad \Sigma_c^{++} = uuc, \quad \Sigma_c^+ = udc, \quad \Sigma_c^0 = ddc, \\ \Xi_c^+ = usc, \quad \Xi_c^0 = dsc, \quad \Omega_c^0 = ssc$$

$\Lambda_c^+$

$$I(J^P) = 0(\frac{1}{2}^+) \text{ Status: } ****$$

The parity of the  $\Lambda_c^+$  is defined to be positive (as are the parities of the proton, neutron, and  $\Lambda$ ). The quark content is  $udc$ . Results of an analysis of  $pK^-\pi^+$  decays (JEZABEK 92) are consistent with  $J = 1/2$ . ABLIKIM 21N determines the  $\Lambda_c^+$  spin to be  $J = 1/2$ , from an angular analysis of various 2-body  $\Lambda_c^+$  decays in  $e^+e^- \rightarrow \Lambda_c^+\bar{\Lambda}_c^-$ .

We have omitted some results that have been superseded by later experiments. The omitted results may be found in earlier editions.

### $\Lambda_c^+$ MASS

Our value in 2004,  $2284.9 \pm 0.6$  MeV, was the average of the measurements now filed below as "not used." The BABAR measurement is so much better that we use it alone. Note that it is about 2.6 (old) standard deviations above the 2004 value.

The fit also includes  $\Sigma_c^-\Lambda_c^+$  and  $\Lambda_c^{*+}\Lambda_c^+$  mass-difference measurements, but this doesn't affect the  $\Lambda_c^+$  mass. The new (in 2006)  $\Lambda_c^+$  mass simply pushes all those other masses higher.

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>2286.46 ± 0.14 OUR FIT</b>				
2286.46 ± 0.14	4891	<sup>1</sup> AUBERT,B	05s BABR	$\Lambda_c^0 K_S^+ K^+$ and $\Sigma^0 K_S^0 K^+$
• • • We do not use the following data for averages, fits, limits, etc. • • •				
2284.7 ± 0.6 ± 0.7	1134	AVERY	91 CLEO	Six modes
2281.7 ± 2.7 ± 2.6	29	ALVAREZ	90b NA14	$pK^-\pi^+$
2285.8 ± 0.6 ± 1.2	101	BARLAG	89 NA32	$pK^-\pi^+$
2284.7 ± 2.3 ± 0.5	5	AGUILAR...	88b LEBE	$pK^-\pi^+$

2286.2 ± 1.7 ± 0.7	97	ANJOS	88b E691	$pK^-\pi^+$
2281 ± 3	2	JONES	87 HBC	$pK^-\pi^+$
2283 ± 3	3	BOSETTI	82 HBC	$pK^-\pi^+$
2290 ± 3	1	CALICCHIO	80 HYBR	$pK^-\pi^+$

<sup>1</sup> AUBERT,B 05s uses low-Q  $\Lambda_c^0 K_S^+ K^+$  and  $\Sigma^0 K_S^0 K^+$  decays to minimize systematic errors. The error above includes systematic as well as statistical errors. Many cross checks and adjustments to properties of the BABAR detector, as well as the large number of clean events, make this by far the best measurement of the  $\Lambda_c^+$  mass.

### $\Lambda_c^+$ MEAN LIFE

Measurements with an error  $\geq 100 \times 10^{-15}$  s or with fewer than 20 events have been omitted from the Listings.

VALUE ( $10^{-15}$ s)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>202.6 ± 1.0 OUR AVERAGE</b>				
203.20 ± 0.89 ± 0.77	107k	ABUDINEN	23A BEL2	$\Lambda_c^+ \rightarrow pK^-\pi^+$ , $e^+e^-$ near $\Upsilon(4S)$

220 ± 30 ± 20	97	ANJOS	88b E691	$pK^-\pi^+$ + c.c.

<sup>1</sup> AAIJ 19AG reports [ $\Lambda_c^+$  MEAN LIFE] / [ $D^{\pm}$  MEAN LIFE] =  $0.1956 \pm 0.0010 \pm 0.0013$  which we multiply by our best value  $D^{\pm}$  MEAN LIFE =  $(1.033 \pm 0.005) \times 10^{-12}$  s. Our first error is their experiment's error and our second error is the systematic error from using our best value.

### $\Lambda_c^+$ DECAY MODES

Branching fractions marked with a footnote, e.g. [a], have been corrected for decay modes not observed in the experiments. For example, the sub-mode fraction  $\Lambda_c^+ \rightarrow p\bar{K}^*(892)^0$  seen in  $\Lambda_c^+ \rightarrow pK^-\pi^+$  has been multiplied up to include  $\bar{K}^*(892)^0 \rightarrow \bar{K}^0\pi^0$  decays.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level

••• We do not use the following data for averages, fits, limits, etc. •••

4.38±0.79±0.21 75 <sup>1</sup> ABLIKIM 23BY BES3  $e^+e^-$  at 4.600–4.699 GeV

<sup>1</sup> We do not include this measurement in our average because it is highly correlated to the relative branching fractions  $B(\Lambda_c \rightarrow \Sigma^+K^+K^-) / B(\Lambda_c \rightarrow \Sigma^+\pi^+\pi^-)$  and  $B(\Lambda_c \rightarrow \Sigma^+\phi) / B(\Lambda_c \rightarrow \Sigma^+\pi^+\pi^-)$  measured in the same analysis (which we do use). Although the measurements are done on the same data, ABLIKIM 23BY do not obtain exactly  $B(\Lambda_c \rightarrow \Sigma^+\phi)B(\phi \rightarrow K^+K^-) / B(\Lambda_c \rightarrow \Sigma^+\pi^+\pi^-) + B(\Lambda_c^+ \rightarrow \Sigma^+K^+K^-(\text{non-}\phi)) / B(\Lambda_c \rightarrow \Sigma^+\pi^+\pi^-) = B(\Lambda_c \rightarrow \Sigma^+K^+K^-) / B(\Lambda_c \rightarrow \Sigma^+\pi^+\pi^-)$ .

#### $\alpha$ FOR $\Lambda_C^+ \rightarrow \Lambda \pi^+$

VALUE	EVTS	DOCUMENT ID	TECN	COMMENT
<b><math>-0.755 \pm 0.006</math> OUR AVERAGE</b>				
$-0.755 \pm 0.005 \pm 0.003$	264k	<sup>1</sup> LI	23c BELL	$e^+ e^-$ at/near $\Upsilon(nS)$ , $n=1, \dots, 5$
$-0.80 \pm 0.11 \pm 0.02$		ABLIKIM	19AX BES3	$e^+ e^-$ at 4.6 GeV
$-0.78 \pm 0.16 \pm 0.19$		LINK	06A FOCUS	$\gamma A, \bar{E}_{\gamma} \approx 180$ GeV
$-0.94 \pm 0.21 \pm 0.12$	414	<sup>2</sup> BISHAI	95 CLE2	$e^+ e^- \approx \Upsilon(4S)$
$-0.96 \pm 0.42$		ALBRECHT	92 ARG	$e^+ e^- \approx 10.4$ GeV
$-1.1 \pm 0.4$	86	AVERY	90B CLEO	$e^+ e^- \approx 10.6$ GeV

<sup>1</sup> LI 23c obtained the value by a fit for the product  $\alpha \times \alpha_{\Lambda}^{\text{avg}}$ , and dividing by the value  $\alpha_{\Lambda}^{\text{avg}} = 0.7542 \pm 0.0026$  reported in ABLIKIM 22Ac.

<sup>2</sup> BISHAI 95 actually gives  $\alpha = -0.94 \pm 0.21 \pm 0.12$ , chopping the errors at the physical limit  $-1.0$ . However, for  $\alpha \approx -1.0$ , some experiments should get unphysical values ( $\alpha < -1.0$ ), and for averaging with other measurements such values (or errors that extend below  $-1.0$ ) should not be chopped.

$-0.89 \pm 0.17 \pm 0.09$	350	<sup>5</sup> BERGFELD	94	CLE2 See CRAWFORD 95

<sup>1</sup> ABLIKIM 23AT measures  $\alpha$  of  $\Lambda_c^+ \rightarrow \Lambda \mu^+ \nu_{\mu}$  decay over eight  $q^2$  bins from zero to the kinematic endpoint. The value provided here is  $\langle \alpha \rangle$ , averaged over  $q^2$ . The analysis uses form factors extracted from a simultaneous fit to electron and muon mode data.

<sup>2</sup> HINSON 05 measures the form-factor ratio  $R \equiv f_2/f_1$  for  $\Lambda_c^+ \rightarrow \Lambda e^+ \nu_e$  events to be  $-0.31 \pm 0.05 \pm 0.04$  and the pole mass to be  $2.21 \pm 0.08 \pm 0.14$  GeV/ $c^2$ , and from these calculates  $\alpha$ , averaged over  $q^2$ , where  $\langle q^2 \rangle = 0.67$  (GeV/ $c^2$ ).

<sup>3</sup> ALBRECHT 94B uses  $\Lambda e^+$  and  $\Lambda \mu^+$  events in the mass range  $1.85 < M(\Lambda \ell^+) < 2.20$  GeV.

<sup>4</sup> CRAWFORD 95 measures the form-factor ratio  $R \equiv f_2/f_1$  for  $\Lambda_c^+ \rightarrow \Lambda e^+ \nu_e$  events to be  $-0.25 \pm 0.14 \pm 0.08$  and from this calculates  $\alpha$ , averaged over  $q^2$ , to be the above.

<sup>5</sup> BERGFELD 94 uses  $\Lambda e^+$  events.

OTHER RELATED PAPERS

References for other related papers: MIGLIOZZI, DUNIETZ, etc.

Λ<sub>c</sub>(2595)<sup>+</sup>

I(J<sup>P</sup>) = 0(1/2<sup>-</sup>) Status: \*\*\*

The Λ<sub>c</sub><sup>+</sup>π<sup>+</sup>π<sup>-</sup> mode is largely, and perhaps entirely, Σ<sub>c</sub>π, which is just at threshold; since the Σ<sub>c</sub> has J<sup>P</sup> = 1/2<sup>+</sup>, the J<sup>P</sup> here is almost certainly 1/2<sup>-</sup>. This result is in accord with the theoretical expectation that this is the charm counterpart of the strange Λ(1405).

Λ<sub>c</sub>(2595)<sup>+</sup> MASS

The mass is obtained from the Λ<sub>c</sub>(2595)<sup>+</sup> - Λ<sub>c</sub><sup>+</sup> mass-difference measurements below.

Table with columns: VALUE (MeV), DOCUMENT ID. Row: 2592.25 ± 0.28 OUR FIT

Λ<sub>c</sub>(2595)<sup>+</sup> - Λ<sub>c</sub><sup>+</sup> MASS DIFFERENCE

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Rows include 305.79 ± 0.24 OUR FIT, 305.79 ± 0.14 ± 0.20, 305.6 ± 0.3, 309.7 ± 0.9 ± 0.4, 309.2 ± 0.7 ± 0.3, 307.5 ± 0.4 ± 1.0.

1 BLECHMAN 03 finds that a more sophisticated treatment than a simple Breit-Wigner for the proximity of the threshold of the dominant decay, Σ<sub>c</sub>(2455)π, lowers the Λ<sub>c</sub>(2595)<sup>+</sup> - Λ<sub>c</sub><sup>+</sup> mass difference by 2 or 3 MeV. The analysis of AALTONEN 11H bears this out.

Λ<sub>c</sub>(2595)<sup>+</sup> WIDTH

## Baryon Particle Listings

 $\Lambda_c(2595)^+$ ,  $\Lambda_c(2625)^+$ 

<sup>2</sup>AALTONEN 11H treats the three charged modes  $\Lambda_c(2595)^+ \rightarrow \Sigma_c(2455)^{++}\pi^-$ ,  $\Sigma_c(2455)^+\pi^0$ ,  $\Sigma_c(2455)^0\pi^+$  separately in terms of a common coupling constant  $h_2$  and obtains  $h_2^2 = 0.36 \pm 0.08$ . From this the width is determined.

 $\Lambda_c(2595)^+$  DECAY MODES

$\Lambda_c^+\pi\pi$  and its submode  $\Sigma_c(2455)\pi$  — the latter just barely — are the only strong decays allowed to an excited  $\Lambda_c^+$  having this mass; and the submode seems to dominate.

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1$ $\Lambda_c^+\pi^+\pi^-$	[a] —
$\Gamma_2$ $\Sigma_c(2455)^{++}\pi^-$	$24 \pm 7\%$
$\Gamma_3$ $\Sigma_c(2455)^0\pi^+$	$24 \pm 7\%$
$\Gamma_4$ $\Lambda_c^+\pi^+\pi^-$ 3-body	$18 \pm 10\%$
$\Gamma_5$ $\Lambda_c^+\pi^0$	[b] not seen
$\Gamma_6$ $\Lambda_c^+\gamma$	not seen

[a] See AALTONEN 11H, Fig. 8, for the calculated ratio of  $\Lambda_c^+\pi^0\pi^0$  and  $\Lambda_c^+\pi^+\pi^-$  partial widths as a function of the  $\Lambda_c(2595)^+ - \Lambda_c^+$  mass difference. At our value of the mass difference, the ratio is about 4.

[b] A test that the isospin is indeed 0, so that the particle is indeed a  $\Lambda_c^+$ .

## $\Lambda_c(2765)^+$ , $\Lambda_c(2860)^+$ , $\Lambda_c(2880)^+$

**$\Lambda_c(2765)^+$**  or  $\Sigma_c(2765)$   $I(J^P) = ?(??)$  Status: \*

OMITTED FROM SUMMARY TABLE

A broad, statistically significant peak ( $997^{+141}_{-129}$  events) seen in  $\Lambda_c^+ \pi^+ \pi^-$ . However, nothing at all is known about its quantum numbers, including whether it is a  $\Lambda_c^+$  or a  $\Sigma_c$ , or whether the width might be due to overlapping states.

 **$\Lambda_c(2765)^+$  MASS**

The mass is obtained from the  $\Lambda_c(2765)^+ - \Lambda_c^+$  mass-difference measurement below.

$\Sigma_c(2520)$

$I(J^P) = 1(\frac{3}{2}^+)$  Status: \*\*\*

Seen in the  $\Lambda_c^+ \pi^+$  mass spectrum. The natural assignment is that this is the  $J^P = 3/2^+$  excitation of the  $\Sigma_c(2455)$ , the charm counterpart of the  $\Sigma(1385)$ , but neither  $J$  nor  $P$  has been measured.

$\Sigma_c(2520)$  MASSES

The masses are obtained from the mass-difference measurements that follow.

 $\Sigma_c(2800)$ 

$I(J^P) = 1(?)^?$  Status: \*\*\*

Seen in the  $\Lambda_c^+ \pi^+$ ,  $\Lambda_c^+ \pi^0$ , and  $\Lambda_c^+ \pi^-$  mass spectra.

 $\Sigma_c(2800)$  MASSES

The charged ++ and + masses are obtained from the mass-difference measurements that follow. The neutral mass is dominated by the mass-difference measurement, but is pulled up somewhat by the less well-determined but considerably higher direct-mass measurement. It is possible, in fact, that AUBERT 08BN is seeing a different  $\Sigma_c$ .

2460 ± 25	82	BIAGI	83 SPEC	$\Sigma^-$ Be 135 GeV

<sup>1</sup> AAIJ 14Z systematic error includes in quadrature the 0.14 MeV uncertainty from the  $m(\Lambda_c^+)$  mass value.  
<sup>2</sup> The systematic error was (wrongly) given the other way round in LESIAK 05; see the erratum.  
<sup>3</sup> Although COTEUS 87 claims to agree well with BIAGI 83 on the mass and width, there appears to be a discrepancy between the two experiments. BIAGI 83 sees a single peak (stated significance about 6 standard deviations) in the  $\Lambda K^- \pi^+ \pi^+$  mass spectrum. COTEUS 87 sees two peaks in the same spectrum, one at the  $\Xi_c^+$  mass, the other 75 MeV lower. The latter is attributed to  $\Xi_c^+ \rightarrow \Sigma^0 K^- \pi^+ \pi^+ \rightarrow (\Lambda \gamma) K^- \pi^+ \pi^+$ , with the  $\gamma$  unseen. The combined significance of the double peak is stated to be 5.5 standard deviations. But the absence of any trace of a lower peak in BIAGI 83 seems to us to throw into question the interpretation of the lower peak of COTEUS 87.

82 $\begin{smallmatrix} +59 \\ -30 \end{smallmatrix}$	4	BARLAG	90	ACCM $\pi^- (K^-)$ Cu 230 GeV

<sup>1</sup> Measured in  $\Xi_c^0$  produced promptly in  $pp$  collisions, using  $D^0 \rightarrow K^+ K^- \pi^+ \pi^-$  as normalisation mode. AAIJ 22Y reports this lifetime value as  $(148.0 \pm 2.3 \pm 2.2 \pm 0.2) \times 10^{-15}$  s where the last uncertainty is due to the uncertainty on the  $D^0$  lifetime value from PDG 20 average,  $\tau_{D^0} = (410.1 \pm 1.5)$  fs.

<sup>2</sup> AAIJ 19AG reports  $[\Xi_c^0 \text{ MEAN LIFE}] / [D^\pm \text{ MEAN LIFE}] = 0.1485 \pm 0.0017 \pm 0.0016$  which we multiply by our best value  $D^\pm \text{ MEAN LIFE} = (1.033 \pm 0.005) \times 10^{-12}$  s. Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>3</sup> Measured in  $\Xi_c^0$  produced in semileptonic  $\Xi_b^-$  decays.

## FIT INFORMATION

An overall fit to 7 branching ratios uses 8 measurements to determine 4 parameters. The overall fit has a  $\chi^2 = 1.4$  for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

VALUE (units $10^{-3}$ )	EVTS	DOCUMENT ID	TECN	COMMENT	
$5.5 \pm 1.1$ OUR FIT					
$5.5 \pm 0.2 \pm 1.8$	6.3k	<sup>1</sup> AAIJ	20AH	LHCb	$pp$ at 13 TeV

<sup>1</sup>AAIJ 20AH extracts  $B(\Xi_c^0 \rightarrow \Lambda_c^+ \pi^-)$  using two different normalization modes:  $\Lambda_c^+ \rightarrow p K^- \pi^+$  and  $\Xi_c^+ \rightarrow p K^- \pi^+$ . The mean value of both results, taking their correlations into account, is presented as the final result. The measurement assumes production fraction ratios  $f_{\Xi_c^0}/f_{\Lambda_c^+} = (9.7 \pm 0.9 \pm 3.1) \times 10^{-2}$  (from AAJ 19AB plus heavy quark symmetry arguments) as well as  $f_{\Xi_c^0}/f_{\Xi_c^+} = 1.00 \pm 0.01$ . It further uses the inputs  $B(\Lambda_c^+ \rightarrow p K^- \pi^+) = (6.23 \pm 0.33) \times 10^{-2}$  and  $B(\Xi_c^+ \rightarrow p K^- \pi^+) = (4.5 \pm 2.1 \pm 0.7) \times 10^{-3}$  (from LI 19c). Its correlation with  $B(\Xi_c^+ \rightarrow p K^- \pi^+)$ , as measured in AAJ 20AH, is 0.414.

$1.67 \pm 0.29 \pm 0.15$ $-0.09 \pm 0.25$	778	1 MOON	21 BELL	$e^+e^-$ at $\Upsilon(nS)$

<sup>1</sup> Measurement of the ratio of  $\Xi_c(2970)^+ \rightarrow \Xi_c(2645)^0 \pi^+$  versus  $\Xi_c(2970)^+ \rightarrow \Xi_c^0 \pi^+$ . The last uncertainty is from possible isospin-symmetry-breaking effects. MOON 21 determines from an angular analysis of the  $\Xi_c^+ \pi^+ \pi^-$  final state that the spin of the  $\Xi_c(2970)^+$  is strongly compatible with  $J = 1/2$ , assuming domination by the lowest partial wave in  $\Xi_c(2970)^+ \rightarrow \Xi_c(2645)^0 \pi^+$ . When further combined with the size of this ratio, MOON 21 determines from heavy quark symmetry that the spin-parity of the  $\Xi_c(2970)^+$  is favored to be  $J^P = 1/2^+$ , with light degrees of freedom in the  $0^+$  state.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- <sup>1</sup> Recent measurements by AAIJ 18J, AAIJ 22Y, and ABUDINEN 23 obtain consistent results that are nearly four times larger than the average result of previous experiments,  $(69 \pm 12) \times 10^{-15}$  s. We go with the more recent results, mostly obtained with much larger data samples, and also note the positive correlation between the measured value and the inverse of the estimated statistical uncertainty in lifetime measurements.
- <sup>2</sup> AAIJ 22Y reports this measurement as  $(276.5 \pm 13.4 \pm 4.4 \pm 0.7) \times 10^{-15}$  s. The last uncertainty is due to the uncertainty on the  $D^0$  lifetime  $\tau_{D^0} = (410.1 \pm 1.5)$  fs from PDG 20. Measured in  $\Omega_c$  produced promptly in  $pp$  collisions, using  $D^0 \rightarrow K^+ K^- \pi^+ \pi^-$  as normalisation mode.
- <sup>3</sup> Measured using  $\Omega_c$  produced in semileptonic  $\Omega_b$  decays.

## $\Omega_c^0$ DECAY MODES

No absolute branching fractions have been measured. The following are branching ratios relative to  $\Omega^- \pi^+$ .

Mode Fraction ( $\Gamma_i/\Gamma$ ) Confidence level

### Cabibbo-favored ( $S = -3$ ) decays — relative to $\Omega^- \pi^+$

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Confidence level
$\Omega^- \pi^+$	<b>DEFINED AS 1</b>	
$\Omega^- \pi^+ \pi^0$	1.80 ± 0.33

$$\Omega_c(2770)^0$$

$$I(J^P) = 0(\frac{3}{2}^+) \text{ Status: } ***$$

The natural assignment is that this goes with the  $\Sigma_c(2520)$  and  $\Xi_c(2645)$  to complete the lowest mass  $J^P = \frac{3}{2}^+$  SU(3) sextet, part of the SU(4) 20-plet that includes the  $\Delta(1232)$ . But  $J$  and  $P$  have not been measured.

 $\Omega_c(2770)^0$  MASS

The mass is obtained from the mass-difference measurement that follows.

VALUE (MeV)	DOCUMENT ID
$2765.9 \pm 2.0$ OUR FIT	Error includes scale factor of 1.2.

 $\Omega_c(2770)^0 - \Omega_c^0$  MASS DIFFERENCE

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
$70.7^{+0.8}_{-0.9}$ OUR FIT				
$70.7^{+0.8}_{-1.0}$ OUR AVERAGE				
$70.7 \pm 0.9^{+0.1}_{-0.9}$	54 ± 9	SOLOVIEVA 09	BELL	$\Omega_c^0 \gamma$ in $e^+ e^- \rightarrow \Upsilon(4S)$
$70.8 \pm 1.0 \pm 1.1$	105 ± 22	AUBERT, BE 06i	BABR	$e^+ e^- \approx \Upsilon(4S)$

 $\Omega_c(2770)^0$  DECAY MODES

The  $\Omega_c(2770)^0 - \Omega_c^0$  mass difference is too small for any strong decay to occur.

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1 \Omega_c^0 \gamma$	presumably 100%

(C = +2) $\Xi_{cc}^{++} = ucc$ ,  $\Xi_{cc}^+ = dcc$ ,  $\Omega_{cc}^+ = scc$  $\Xi_{cc}^+$  $I(J^P) = ?(?^?)$  Status: \*

OMITTED FROM SUMMARY TABLE

Nominally the isospin partner of the  $\Xi_{cc}^{++}$  ( $ccu$ ). While the SELEX experiment (MATTSON 02, OCHERASHVILI 05) claimed an observation of this state, subsequent searches by BABAR (AUBERT,B 06D), Belle (CHISTOV 06, KATO 14), and LHCb (AAIJ 13CD, AAIJ 20AX) did not find any significant signal or evidence for the  $\Xi_{cc}^+$ . However, AAIJ 21AE reports that its search for  $\Xi_{cc}^+ \rightarrow \Xi_c^+ \pi^+ \pi^-$ , when combined with a prior search for  $\Xi_{cc}^+ \rightarrow \Lambda_c^+ K^- \pi^+$  decays in AAIJ 20AX, yields a signal at 2.9  $\sigma$  global significance (4.0  $\sigma$  local).

 $\Xi_{cc}^+$  MASS

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>3518.9 ± 0.9 OUR AVERAGE</b>				
3518 ± 3	6	<sup>1</sup> OCHERASHVILI.05	SELX	$\Sigma^-$ nucleus $\approx$ 600 GeV
3519 ± 1	16	<sup>2</sup> MATTSON 02	SELX	$\Sigma^-$ nucleus $\approx$ 600 GeV
••• We do not use the following data for averages, fits, limits, etc. •••				
3623.0 ± 1.4	368 ± 193	<sup>3</sup> AAIJ	21AE LHCb	$pp$ at 7, 8, 13 TeV

<sup>1</sup> OCHERASHVILI 05 claims "an excess of 5.62 events over ... 1.38 ± 0.13 events" for a significance of 4.8  $\sigma$  in  $pD^+ K^-$  events.

<sup>2</sup> MATTSON 02 claims "an excess of 15.9 events over an expected background of 6.1 ± 0.5 events, a statistical significance of 6.3  $\sigma$ " in the  $\Lambda_c^+ K^- \pi^+$  invariant-mass spectrum. The probability that the peak is a fluctuation increases from 1.0 × 10<sup>-6</sup> to 1.1 × 10<sup>-4</sup> when the number of bins searched is considered.

<sup>3</sup> Uncertainties are statistical only. Because of undetermined systematic uncertainties in the extraction of this result it cannot be considered a mass measurement. AAIJ 21AE performs a combined fit to its  $\Xi_{cc}^+ \rightarrow \Xi_c^+ \pi^+ \pi^-$  data and the  $\Xi_{cc}^+ \rightarrow \Lambda_c^+ K^- \pi^+$  data from AAIJ 20AX, finding a global significance of 2.9  $\sigma$  (4.0  $\sigma$  local).

# Baryon Particle Listings

$\Lambda_b^0$

- <sup>3</sup> Measured with  $\Lambda_b^0 \rightarrow J/\psi(\mu^+\mu^-) \Lambda^0(p\pi^-)$  decays.
- <sup>4</sup> Uses fully reconstructed  $\Lambda_b \rightarrow J/\psi\Lambda$  decays.
- <sup>5</sup> Uses  $B^0 \rightarrow J/\psi K_S^0$  decays for denominator.
- <sup>6</sup> Measures  $1/\tau_{\Lambda_b^0} - 1/\tau_{B^0}$  and uses  $\tau_{B^0} = 1.519 \pm 0.007$  ps to extract lifetime ratio.
- <sup>7</sup> Measured mean life ratio using fully reconstructed decays.

## $\Lambda_b^0$ DECAY MODES

The branching fractions  $B(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{anything})$  and  $B(\Lambda_b^0 \rightarrow \Lambda_c^+ \ell^- \bar{\nu}_\ell \text{anything})$  are not pure measurements because the underlying measured products of these with  $B(b \rightarrow b\text{-baryon})$  were used to determine  $B(b \rightarrow b\text{-baryon})$ , as described in the note "Production and Decay of  $b$ -Flavored Hadrons."

For inclusive branching fractions, e.g.,  $\Lambda_b \rightarrow \bar{\Lambda}_c \text{anything}$ , the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level

[a]  $P_{c\bar{c}}^+$  is a pentaquark-charmonium state.

[b] Not a pure measurement. See note at head of  $\Lambda_b^0$  Decay Modes.

[c] Here  $h^-$  means  $\pi^-$  or  $K^-$ .

## FIT INFORMATION

An overall fit to 10 branching ratios uses 12 measurements to determine 6 parameters. The overall fit has a  $\chi^2 = 10.8$  for 6 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

$x_{33}$	92

## CP AND T VIOLATION PARAMETERS

Measured values of the triple-product asymmetry parameters, odd under time-reversal, are defined as  $A_{c(s)}(\Lambda/\phi) = (N_{c(s)}^+ - N_{c(s)}^-) / (\text{sum})$

where  $N_{c(s)}^+$ ,  $N_{c(s)}^-$  are the number of  $\Lambda$  or  $\phi$  candidates for which the  $\cos(\Phi)$  and  $\sin(\Phi)$  observables are positive and negative, respectively. Angles  $\cos(\Phi)$  and  $\sin(\Phi)$  are defined as in LEITNER 07.

 $\Lambda_b^0$  DECAY PARAMETERS

See the note on "Baryon Decay Parameters" in the neutron Listings.

 $\alpha$  decay parameter for  $\Lambda_b \rightarrow J/\psi \Lambda$ 

VALUE	DOCUMENT ID	TECN	COMMENT
<b><math>-0.017 \pm 0.026</math> OUR AVERAGE</b>			

<sup>1</sup> 0.022 ± 0.027 / -0.026

<sup>2</sup> 0.14 ± 0.14 ± 0.10

<sup>3</sup> 0.30 ± 0.16 ± 0.06

- • • We do not use the following data for averages, fits, limits, etc. • • •

<sup>4</sup> 0.05 ± 0.17 ± 0.07

<sup>1</sup> Extracted using a Bayesian analysis. The most probable value is given as  $-0.022$ , with a 68% credibility interval  $[-0.048, 0.005]$ . Transverse polarizations of  $\Lambda_b^0$  of  $-0.004$  (68% credibility interval  $[-0.064, 0.051]$ ),  $0.001$  (68% credibility interval  $[-0.035, 0.045]$ ), and  $0.032$  (68% credibility interval  $[-0.011, 0.065]$ ) are also reported at 7 TeV, 8 TeV and 13 TeV, respectively. Note that both statistical and systematic uncertainties are included.

<sup>2</sup> An angular analysis of  $\Lambda_b \rightarrow J/\psi \Lambda$  decay is performed. Note that the sign of  $\alpha$  in CMS definition is the opposite to that used by AAIJ 13AG and AAD 14L.  $\Lambda_b$  transverse production polarization of  $0.00 \pm 0.06 \pm 0.06$  is also reported, as well as squares of the helicity amplitudes.

<sup>3</sup> An angular analysis of  $\Lambda_b \rightarrow J/\psi \Lambda$  decay is performed and magnitudes of all helicity amplitudes are also reported.

<sup>4</sup> An angular analysis of  $\Lambda_b \rightarrow J/\psi \Lambda$  decay is performed and a  $\Lambda_b$  transverse production polarization of  $0.06 \pm 0.07 \pm 0.02$  is also reported.

See key on page 1171

Baryon Particle Listings

$\Lambda_b^0, \Lambda_b(5912)^0$

$\Sigma_b$

 $I(J^P) = 1(\frac{3}{2}^+)$  Status: \*\*\*  
 $I, J, P$  need confirmation.  
 In the quark model  $\Sigma_b^+$ ,  $\Sigma_b^0$ ,  $\Sigma_b^-$  are an isotriplet ( $uub, udb, ddb$ ) state. The lowest  $\Sigma_b$  ought to have  $J^P = 1/2^+$ . None of  $I, J$ , or  $P$  have actually been measured.

$$I(J^P) = \frac{1}{2}(\frac{1}{2}^+) \text{ Status: } ***$$

*I, J, P* need confirmation.

In the quark model,  $\Xi_b^0$  and  $\Xi_b^-$  are an isodoublet (*usb, dsb*) state; the lowest  $\Xi_b^0$  and  $\Xi_b^-$  ought to have  $J^P = 1/2^+$ . None of *I, J, or P* have actually been measured.

$\Xi_b^-$  MEAN LIFE

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

$$\Xi_b^0$$

$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$  Status: \*\*\*  
I, J, P need confirmation.

In the quark model,  $\Xi_b^0$  and  $\Xi_b^-$  are an isodoublet (*usb*, *dsb*) state; the lowest  $\Xi_b^0$  and  $\Xi_b^-$  ought to have  $J^P = 1/2^+$ . None of I, J, or P have actually been measured.

### $\Xi_b^0$ MEAN LIFE

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

 $b$ -baryon ADMIXTURE ( $\Lambda_b$ ,  $\Xi_b$ ,  $\Omega_b$ ) $b$ -baryon ADMIXTURE MEAN LIFE

Each measurement of the  $b$ -baryon mean life is an average over an admixture of various  $b$ -baryons which decay weakly. Different techniques emphasize different admixtures of produced particles, which could result in a different  $b$ -baryon mean life. More  $b$ -baryon flavor specific channels are not included in the measurement.

 $b$ -baryon ADMIXTURE DECAY MODES ( $\Lambda_b$ ,  $\Xi_b$ ,  $\Omega_b$ )

These branching fractions are actually an average over weakly decaying  $b$ -baryons weighted by their production rates at the LHC, LEP, and Tevatron, branching ratios, and detection efficiencies. They scale with the  $b$ -baryon production fraction  $B(b \rightarrow b\text{-baryon})$ .

The branching fractions  $B(b\text{-baryon} \rightarrow \Lambda\ell^-\bar{\nu}_\ell\text{anything})$  and  $B(\Lambda_b^0 \rightarrow \Lambda^+\ell^-\bar{\nu}_\ell\text{anything})$  are not pure measurements because the underlying measured products of these with  $B(b \rightarrow b\text{-baryon})$  were used to determine  $B(b \rightarrow b\text{-baryon})$ , as described in the note "Production and Decay of  $b$ -Flavored Hadrons."

For inclusive branching fractions, e.g.,  $B \rightarrow D^\pm\text{anything}$ , the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor
$\Gamma_1 p\mu^-\bar{\nu}$ anything	$(5.8^{+2.3}_{-2.0})\%$	
$\Gamma_2 p\ell\bar{\nu}_\ell$ anything	$(5.6 \pm 1.2)\%$	
$\Gamma_3 p$ anything	$(70 \pm 22)\%$	
$\Gamma_4 \Lambda\ell^-\bar{\nu}_\ell$ anything	$(3.8 \pm 0.6)\%$	
$\Gamma_5 \Lambda\ell^+\nu_\ell$ anything	$(3.2 \pm 0.8)\%$	
$\Gamma_6 \Lambda$ anything	$(39 \pm 7)\%$	
$\Gamma_7 \Xi^-\ell^-\bar{\nu}_\ell$ anything	$(4.6 \pm 1.4) \times 10^{-3}$	1.2

- AAD 23Co limits given for monopoles pair produced via a Drell-Yan or photon-fusion mechanism. Spins 1/2 and 0 are considered. The quoted limit is representative of the lowest values that were achieved.
- ACHARYA 22A give limits for monopoles pair-produced via a Drell-Yan production. Spins 0, 1/2, and 1 are considered. The cross section limit is representative of the lowest values that were achieved. The experiment used a combination of nuclear track detectors to look evidence of passing monopoles and a SQUID magnetometer to look for stopped monopoles.
- ACHARYA 22B achieved limits on monopole (point-like included) production via the Schwinger mechanism in Pb-Pb collisions at 5.02 TeV centre-of-mass energy per nucleon pair. The upper cross section limit value quoted here is representative of the lowest values achieved.
- ACHARYA 21 search for dyons at LHC. Using a production model limits (we report the lowest) are set for dyons with magnetic charge up to 5 gD, electric charges up to 200 e and spins 0, 1/2, 1. The corresponding mass limits for magnetic monopoles are in the range 870-2040 GeV for magnetic charges in the same range.
- AAD 20G give limits for Drell-Yan production with spin-0 and spin-1/2 monopoles. The above limit is for spin = 0 at mass = 3 TeV.
- ACHARYA 19B limits both β-dependent and β-independent on monopoles with spins 0, 1/2, and 1 and with magnetic charges ranging from one to five times the Dirac charge in mass ranges between 200 GeV and 5000 GeV.
- ACHARYA 18A provide limits on monopoles with spins 0, 1/2, and 1 and with magnetic charges ranging from two to five times the Dirac charge.
- The search was sensitive to monopoles which had stopped in aluminium trapping volumes. Monopoles with spins 0 and 1/2 were considered; mass-dependent spin 1/2 monopole limits are quoted here.
- AAD 16AB model-independent 95% CL limits estimated using a fiducial region of approximately constant acceptance. Limits are mass-dependent.
- ACHARYA 16 limits at 95% CL estimated using a Drell-Yan-like production mechanism for scalar monopoles.
- AAD 12cs searched for monopoles as highly ionising objects. The cross section limits are based on an assumed Drell-Yan-like production process for spin 1/2 monopoles. The limits are mass- and scenario-dependent.
- ABBIENDI 08 assume production of spin 1/2 monopoles with effective charge gβ (n=1), via e<sup>+</sup>e<sup>-</sup> → γ\* → M $\bar{M}$ , so that the cross section is proportional to (1 + cos<sup>2</sup>θ). There is no z information for such highly saturated tracks, so a parabolic track in the jet chamber is projected onto the xy plane. Charge per hit in the chamber produces a clean separation of signal and background.
- ABULENCIA 06k searches for high-ionizing signals in CDF central outer tracker and time-of-flight detector. For Drell-Yan M $\bar{M}$  production, the cross section limit implies M > 360 GeV at 95% CL.
- AKTAS 05A model-dependent limits as a function of monopole mass shown for arbitrary mass of 60 GeV. Based on search for stopped monopoles in the H1 Al beam pipe.
- AKTAS 05A limits with assumed elastic spin 0 monopole pair production.
- AKTAS 05A limits with assumed inelastic spin 1/2 monopole pair production.
- KALBFLEISCH 04 reports searches for stopped magnetic monopoles in Be, Al, and Pb samples obtained from discarded material from the upgrading of DØ and CDF. A large-aperture warm-bore cryogenic detector was used. The approach was an extension of the methods of KALBFLEISCH 00. Cross section results moderately model dependent; interpretation as a mass lower limit depends on possibly invalid perturbation expansion.
- KALBFLEISCH 00 used an induction method to search for stopped monopoles in pieces of the DØ (FNAL) beryllium beam pipe and in extensions to the drift chamber aluminium support cylinder. Results are model dependent.
- KALBFLEISCH 00 result is for aluminum.
- KALBFLEISCH 00 result is for beryllium.
- HE 97 used a lead target and barium phosphate glass detectors. Cross-section limits are well below those predicted via the Drell-Yan mechanism.
- This work has also been reinterpreted in the framework of monopole production via the thermal Schwinger process (GOULD 17); this gives rise to lower mass limits.
- Two-photon events.
- Cherenkov radiation polarization.
- Re-examines CERN neutrino experiments.

<sup>1</sup> ABBASI 22 search was based on Cherenkov light detection in an array of optical modules in the Antarctic ice cap. Limits are speed-dependent.

<sup>2</sup> ACERO 21 employ NOVA experiment to set reported 90% CL upper limit on the cosmic monopoles flux for velocity  $6 \times 10^{-4} < \beta < 5 \times 10^{-3}$  and mass  $> 5 \times 10^8$  GeV.

<sup>3</sup> GAPONENKO 21 use data of NT200 two-year operation at Baikal to give speed-dependent limits for different assumed catalysis cross sections. Reported limit is for  $\sigma = 10$  mb.

<sup>4</sup> ALBERT 17 limits were estimated using a Cherenkov light in an array of optical modules under the Mediterranean Sea. The limits are for MM masses between  $10^{10}$  and  $10^{14}$  GeV. The limits are speed-dependent.

<sup>5</sup> AAB 16 search was made with a set of telescopes sampling the longitudinal profile of fluorescence light emitted by extensive air showers. Limits are speed dependent.

<sup>6</sup> AARTSEN 16b was based on a Cherenkov signature in an array of optical modules which were sunk in the Antarctic ice cap. Limits are speed-dependent.

<sup>7</sup> Beyond the monopole speed, the limits of AARTSEN 14 depend on the catalysis cross section ( $\sigma$ ) which corresponds to the monopole radiating  $\bar{l}$  times the light per track length compared to the Cherenkov light from a single electrically charged, relativistic particle. The values quoted here correspond to  $\sigma = 1$  barn or  $\bar{l} = 30$ .

<sup>8</sup> ABBASI 13 and ABBASI 10A were based on a Cherenkov signature in an array of optical modules which were sunk in the Antarctic ice cap. Limits are speed-dependent.

<sup>9</sup> ADRIAN-MARTINEZ 12A measurements were based on a Cherenkov signature in an underwater telescope in the Western Mediterranean Sea. Limits are speed-dependent.

<sup>10</sup> The limits from UENO 12 depend on the monopole speed and are also sensitive to assumed values of monopole mass and the catalysis cross section.

<sup>11</sup> HOGAN 08 and DETRIXHE 11 limits on relativistic monopoles are based on nonobservation of radio Cherenkov signals at the South Pole. Limits are speed-dependent.

<sup>12</sup> BALESTRA 08 exposed of nuclear track detector modules totaling 400 m<sup>2</sup> for 4 years at the Chacaltaya Laboratory (5230 m) in search for intermediate-mass monopoles with  $\beta > 0.05$ . The analysis is mainly based on three CR39 modules. For  $M > 5 \times 10^{13}$  GeV there can be upward-going monopoles as well, hence the flux limit is half that obtained for less massive monopoles. Previous experiments (e.g. MACRO and OHYA (ORITO 91)) had set limits only for  $M > 1 \times 10^9$  GeV.

<sup>13</sup> AMBROSIO 02B direct search final result for  $m \geq 10^{17}$  GeV, based upon 4.2 to 9.5 years of running, depending upon the subsystem. Limit with CR39 track-etch detector extends the limit from  $\beta = 4 \times 10^{-5}$  ( $3.1 \times 10^{-16}$  cm<sup>-2</sup> sr<sup>-1</sup> s<sup>-1</sup>) to  $\beta = 1 \times 10^{-4}$  ( $2.1 \times 10^{-16}$  cm<sup>-2</sup> sr<sup>-1</sup> s<sup>-1</sup>). Limit curve in paper is piecewise continuous due to different detection techniques for different  $\beta$  ranges.

<sup>14</sup> AMBROSIO 02c limit for catalysis of nucleon decay with catalysis cross section of  $\approx 1$  mb. The flux limit increases by  $\sim 3$  at the higher  $\beta$  limit, and increases to  $1 \times 10^{-14}$  cm<sup>-2</sup> sr<sup>-1</sup> s<sup>-1</sup> if the catalysis cross section is 0.01 mb. Based upon 71193 hr of data with the streamer detector, with an acceptance of 425.0 m<sup>2</sup> sr.

<sup>15</sup> AMBROSIO 02b result for "more than two years of data." Ionization search using several subsystems. Limit curve as a function of  $\beta$  not given. Included in AMBROSIO 02b.

<sup>16</sup> AMBROSIO 97 global MACRO 90%CL is  $0.78 \times 10^{-15}$  at  $\beta = 1.1 \times 10^{-4}$ , goes through a minimum at  $0.61 \times 10^{-15}$  near  $\beta = (1.1-2.7) \times 10^{-3}$ , then rises to  $0.84 \times 10^{-15}$  at  $\beta = 0.1$ . The global limit in this region is below the Parker bound at  $10^{-15}$ . Less stringent limits are established for  $4 \times 10^{-5} < \beta < 1 \times 10^{-4}$ . Limits set by various triggers and different subdetectors are given in the paper. All limits assume a catalysis cross section smaller than a few mb.

<sup>17</sup> AHLEN 94 limit for dyons extends down to  $\beta = 0.9E-4$  and a limit of  $1.3E-14$  extends to  $\beta = 0.8E-4$ . Also see comment by PRICE 94 and reply of BARISH 94. One loophole in the AHLEN 94 result is that in the case of monopoles catalyzing nucleon decay, relativistic particles could veto the events. See AMBROSIO 97 for additional results.

<sup>18</sup> Catalysis of nucleon decay; sensitive to assumed catalysis cross section.

<sup>19</sup> ORITO 91 limits are functions of velocity. Lowest limits are given here.

<sup>20</sup> Used DKMPR mechanism and Penning effect.

<sup>21</sup> Assumes monopole attaches fermion nucleus.

<sup>22</sup> Limit from combining data of CAPLIN 86, BERMON 85, INCANDELA 84, and CABRERA 83. For a discussion of controversy about CAPLIN 86 observed event, see GUY 87. Also see SCHOUDEN 87.

<sup>23</sup> Based on lack of high-energy solar neutrinos from catalysis in the sun.

<sup>24</sup> Anomalous long-range  $\alpha$  (<sup>4</sup>He) tracks.

<sup>25</sup> CABRERA 82 candidate event has single Dirac charge within  $\pm 5\%$ .

<sup>26</sup> ALVAREZ 75, FLEISCHER 75, and FRIEDLANDER 75 explain as fragmenting nucleus. EBERHARD 75 and ROSS 76 discuss conflict with other experiments. HAGSTROM 77 reinterprets as antinucleus. PRICE 78 reassesses.

<sup>1</sup> KOBAYASHI 23A found Parker-type bounds on magnetic monopoles with arbitrary magnetic charge based on the survival of galactic, seed, and primordial magnetic fields. Bounds are between  $10^{-21}$  and  $10^{-5}$  cm<sup>-2</sup>sr<sup>-1</sup>s<sup>-1</sup> for masses between  $10^4$  and  $10^{18}$  GeV. Reported bound is the most stringent one.

<sup>2</sup> Catalysis of nucleon decay.

<sup>3</sup> ADAMS 93 limit based on "survival and growth of a small galactic seed field" is  $10^{-16}$  (m/10<sup>17</sup> GeV) cm<sup>-2</sup>s<sup>-1</sup>sr<sup>-1</sup>. Above  $10^{17}$  GeV, limit  $10^{-16}$  (10<sup>17</sup> GeV/m) cm<sup>-2</sup>s<sup>-1</sup>sr<sup>-1</sup> (from requirement that monopole density does not overclose the universe) is more stringent.

<sup>4</sup> Re-evaluates PARKER 70 limit for GUT monopoles.

- Light  $\tilde{G}$  (Gravitino) mass limits from collider experiments
- Supersymmetry miscellaneous results

The results shown below, unless stated otherwise, are based on the Minimal Supersymmetric Standard Model (MSSM), as described in the Note on Supersymmetry. Unless otherwise indicated, this includes the assumption of common gaugino and scalar masses at the scale of Grand Unification (GUT), and use of the resulting relations in the spectrum and decay branching ratios. Unless otherwise indicated, it is also assumed that  $R$ -parity ( $R$ ) is conserved and that:

- 1) The  $\tilde{\chi}_1^0$  is the lightest supersymmetric particle (LSP),
- 2)  $m_{\tilde{f}_L} = m_{\tilde{f}_R}$ , where  $\tilde{f}_{L,R}$  refer to the scalar partners of left- and right-handed fermions.

Limits involving different assumptions are identified in the Comments or in the Footnotes, in particular also the many simplified models, see definitions below. We summarize here the notations used in this Chapter to characterize some of the most common deviations from the MSSM (for further details, see the Note on Supersymmetry).

Theories with  $R$ -parity violation (RPV) are characterized by a superpotential of the form:  $\lambda_{ijk} L_i L_j e_k^c + \lambda'_{ijk} L_i Q_j d_k^c + \lambda''_{ijk} u_i^c d_j^c d_k^c$ , where  $i, j, k$  are generation indices. The presence of any of these couplings is often identified in the following by the symbols  $LL\bar{E}$ ,  $LQ\bar{D}$ , and  $U\bar{D}\bar{D}$ . Mass limits in the presence

of RPV will often refer to “direct” and “indirect” decays. Direct refers to RPV decays of the particle in consideration. Indirect refers to cases where RPV appears in the decays of the LSP. The LSP need not be the  $\tilde{\chi}_1^0$ .

In several models, most notably in theories with so-called Gauge Mediated Supersymmetry Breaking (GMSB), the gravitino ( $\tilde{G}$ ) is the LSP. It is usually much lighter than any other massive particle in the spectrum, and  $m_{\tilde{G}}$  is then neglected in all decay processes involving gravitinos. In these scenarios, particles other than the neutralino are sometimes considered as the next-to-lightest supersymmetric particle (NLSP), and are assumed to decay to their even- $R$  partner plus  $\tilde{G}$ . If the lifetime is short enough for the decay to take place within the detector,  $\tilde{G}$  is assumed to be undetected and to give rise to missing energy ( $E$ ) or missing transverse energy ( $E_T$ ) signatures.

When needed, specific assumptions on the eigenstate content of  $\tilde{\chi}^0$  and  $\tilde{\chi}^\pm$  states are indicated, using the notation  $\tilde{\gamma}$  (photino),  $\tilde{H}$  (higgsino),  $\tilde{W}$  (wino), and  $\tilde{Z}$  (zino) to signal that the limit of pure states was used. The term gaugino is also used, to generically indicate wino-like charginos and zino-like neutralinos.

In the listings we have made use of the following abbreviations for simplified models employed by the experimental collaborations in supersymmetry searches published in the past year.

**WARNING:** Experimental lower mass limits determined within simplified models are to be treated with extreme care as they might not be directly applicable to realistic models. This is outlined in detail in the publications and we recommend consulting them before using bounds. For example, branching ratios, typically fixed to specific values in simplified models, can vary substantially in more elaborate models.

#### Simplified Models Table

**Tglu1A:** gluino pair production with  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$ .

**Tglu1B:** gluino pair production with  $\tilde{g} \rightarrow q\bar{q}'\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ .

**Tglu1C:** gluino pair production with a 2/3 probability of having a  $\tilde{g} \rightarrow q\bar{q}'\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$  decay and a 1/3 probability of having a  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow Z^\pm\tilde{\chi}_1^0$  decay.

**Tglu1D:** gluino pair production with one gluino decaying to  $q\bar{q}'\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{G}$ , and the other gluino decaying to  $q\bar{q}\tilde{\chi}_1^0$  with  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ .

**Tglu1E:** gluino pair production with  $\tilde{g} \rightarrow q\bar{q}'\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_2^0$  and  $\tilde{\chi}_2^0 \rightarrow Z^\pm\tilde{\chi}_1^0$  where  $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$ ,  $m_{\tilde{\chi}_2^0} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$ .

**Tglu1F:** gluino pair production with  $\tilde{g} \rightarrow q\bar{q}'\tilde{\chi}_1^\pm$  or  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0$  with equal branching ratios, where  $\tilde{\chi}_1^\pm$  decays through an intermediate scalar tau lepton or sneutrino to  $\tau\nu\tilde{\chi}_1^0$  and where  $\tilde{\chi}_2^0$  decays through an intermediate scalar tau lepton or sneutrino to  $\tau^+\tau^-\tilde{\chi}_1^0$  or  $\nu\bar{\nu}\tilde{\chi}_1^0$ ; the mass hierarchy is such that  $m_{\tilde{\chi}_1^\pm} \sim m_{\tilde{\chi}_2^0} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$  and  $m_{\tilde{\tau},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$ .

**Tglu1G:** gluino pair production with  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0$ , and  $\tilde{\chi}_2^0$  decaying through an intermediate slepton or sneutrino to  $l^+\nu\tilde{\chi}_1^0$  or  $\nu\bar{\nu}\tilde{\chi}_1^0$  where  $m_{\tilde{\chi}_2^0} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$  and  $m_{\tilde{\nu},\tilde{e}} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})/2$ .

**Tglu1H:** gluino pair production with  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0$ , and  $\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 Z^{0(*)}$ .

**Tglu1I:** gluino pair production with  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0$ , and  $\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 H$ .

**Tglu1J:** gluino pair production with  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0$ , and  $\text{BR}(\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 Z^{0(*)}) = \text{BR}(\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 H) = 0.5$ .

**Tglu1LL** gluino pair production where  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$  happens with 1/3 probability and  $\tilde{g} \rightarrow q\bar{q}'\tilde{\chi}_1^\pm$  happens with 2/3 probability. The

- $\tilde{\chi}_1^\pm$  is assumed to be few hundreds of MeV heavier than the  $\tilde{\chi}_1^0$ , and decays to  $\tilde{\chi}_1^0$  via a pion.
- Tglu2A:** gluino pair production with  $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^0$ .
- Tglu3A:** gluino pair production with  $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ .
- Tglu3B:** gluino pair production with  $\tilde{g} \rightarrow \tilde{t}\tilde{t}$  where  $\tilde{t}$  decays exclusively to  $t\tilde{\chi}_1^0$ .
- Tglu3C:** gluino pair production with  $\tilde{g} \rightarrow \tilde{t}\tilde{t}$  where  $\tilde{t}$  decays exclusively to  $c\tilde{\chi}_1^0$ .
- Tglu3D:** gluino pair production with  $\tilde{g} \rightarrow \tilde{t}\tilde{b}\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ .
- Tglu3E:** gluino pair production where the gluino decays 25% of the time through  $\tilde{g} \rightarrow \tilde{t}\tilde{\chi}_1^0$ , 25% of the time through  $\tilde{g} \rightarrow \tilde{b}\tilde{\chi}_1^0$  and 50% of the time through  $\tilde{g} \rightarrow \tilde{t}\tilde{b}\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ .
- Tglu3F:** gluino pair production with wino-like couplings to electroweakinos, that is:  $\tilde{g} \rightarrow \tilde{t}\tilde{\chi}_{1,2}^0$  with BR 17%,  $\tilde{g} \rightarrow \tilde{b}\tilde{\chi}_{1,2}^0$  with BR 17%,  $\tilde{g} \rightarrow \tilde{t}\tilde{\chi}_1^\pm$  with BR 66%.
- Tglu3G:** gluino pair production with higgsino-like couplings to electroweakinos, that is:  $\tilde{g} \rightarrow \tilde{t}\tilde{\chi}_{1,2}^0$  with BR 50%,  $\tilde{g} \rightarrow \tilde{t}\tilde{\chi}_1^\pm$  with BR 50%.
- Tglu4A:** gluino pair production with one gluino decaying to  $q\bar{q}\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{G}$ , and the other gluino decaying to  $q\bar{q}\tilde{\chi}_1^0$  with  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ .
- Tglu4B:** gluino pair production with gluinos decaying to  $q\bar{q}\tilde{\chi}_1^0$  and  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ .
- Tglu4C:** gluino pair production with gluinos decaying to  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$  and  $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$ .
- Tglu4D:** gluino pair production with  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$  where the  $\tilde{\chi}_1^0$  decays with equal probability to  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$  or to  $\tilde{\chi}_1^0 \rightarrow H + \tilde{G}$ .
- Tglu4E:** gluino pair production with  $\tilde{g} \rightarrow \tilde{b}\tilde{b}\tilde{\chi}_1^0$  where the  $\tilde{\chi}_1^0$  decays with equal probability to  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$  or to  $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$ .
- Tglu4F:** gluino pair production with  $\tilde{g} \rightarrow \tilde{t}\tilde{t}\tilde{\chi}_1^0$  where the  $\tilde{\chi}_1^0$  decays with equal probability to  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$  or to  $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$ .
- Tglu4G:** gluino pair production with  $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$  where the  $\tilde{\chi}_1^0$  decays with equal probability to  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$  or to  $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$ .
- Tglu1RPV:** gluino pair production with  $\tilde{g} \rightarrow uds$  via RPV coupling  $\lambda''_{112}$ .
- Tglu2RPV:** gluino pair production with  $\tilde{g} \rightarrow (tbd, tbs)$  via RPV coupling  $\lambda''_{313}$  or  $\lambda''_{323}$ .
- Tsqk1:** squark pair production with  $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ .
- Tsqk1LL:** squark pair production where  $\tilde{q} \rightarrow q\tilde{\chi}_1^0$  and  $\tilde{q} \rightarrow q\tilde{\chi}_1^\pm$  each happen with 50% probability. The  $\tilde{\chi}_1^\pm$  is assumed to be few hundreds of MeV heavier than the  $\tilde{\chi}_1^0$ , and decays to  $\tilde{\chi}_1^0$  via a pion.
- Tsqk2:** squark pair production with  $\tilde{q} \rightarrow q\tilde{\chi}_2^0$  and  $\tilde{\chi}_2^0 \rightarrow Z + \tilde{\chi}_1^0$ .
- Tsqk2A:** squark pair production with  $\tilde{q} \rightarrow q\tilde{\chi}_2^0$ , where one of the  $\tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0 \rightarrow f\bar{f}\tilde{\chi}_1^0$  and the other  $\tilde{\chi}_2^0 \rightarrow \tilde{\ell}\ell^+ \rightarrow \ell^+\ell^-\tilde{\chi}_1^0$ .
- Tsqk3:** squark pair production with  $\tilde{q} \rightarrow q'\tilde{\chi}_1^\pm$ ,  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$  (like Tglu1B but for squarks)
- Tsqk4:** squark pair production with squarks decaying to  $q\tilde{\chi}_1^0$  and  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ .
- Tsqk4A:** squark pair production with one squark decaying to  $q\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{G}$ , and the other squark decaying to  $q\tilde{\chi}_1^0$  with  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ .
- Tsqk4B:** squark pair production with squarks decaying to  $q\tilde{\chi}_1^0$  and  $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ .
- Tstop1:** stop pair production with  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ .
- Tstop1LL:** stop pair production where  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  and  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$  each happen with 50% probability. The  $\tilde{\chi}_1^\pm$  is assumed to be few hundreds of MeV heavier than the  $\tilde{\chi}_1^0$ , and decays to  $\tilde{\chi}_1^0$  via a pion.
- Tstop2:** stop pair production with  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ .
- Tstop3:** stop pair production with the subsequent four-body decay  $\tilde{t} \rightarrow bff'\tilde{\chi}_1^0$  where  $f$  represents a lepton or a quark.
- Tstop4:** stop pair production with  $\tilde{t} \rightarrow c\tilde{\chi}_1^0$ .
- Tstop5:** stop pair production with  $\tilde{t} \rightarrow b\tilde{\nu}\tilde{\tau}$  with  $\tilde{\tau} \rightarrow \tau\tilde{G}$ .
- Tstop6:** stop pair production with  $\tilde{t} \rightarrow t + \tilde{\chi}_2^0$ , where  $\tilde{\chi}_2^0 \rightarrow Z + \tilde{\chi}_1^0$  or  $H + \tilde{\chi}_1^0$  each with BR 50%.
- Tstop7:** stop pair production with  $\tilde{t}_2 \rightarrow \tilde{t}_1 + H/Z$ , where  $\tilde{t}_1 \rightarrow t + \tilde{\chi}_1^0$ .
- Tstop8:** stop pair production with equal probability of the stop decaying via  $\tilde{t} \rightarrow t\tilde{\chi}_1^0$  or via  $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$  with  $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ .
