## Meson Particle Listings

 $B^0$ 

<sup>1</sup> Uses Dalitz plot analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$  decays coming from  $B^0 \rightarrow DK^*(892)^0$  modes.

<sup>2</sup> Measurement is performed with  $K^+ \pi^-$  masses within 50 MeV of the  $K^{*0}$  mass and an absolute value of the cosine of the  $K^{*0}$  helicity angle greater than 0.4. Angle  $\gamma$  is required to satisfy  $0 < \gamma < 180$  degrees.

 $a_{CP}(B^0 \rightarrow p\bar{p}K^+\pi^-)$ 

Observable  $a_{CP}(B^0 \rightarrow p\bar{p}K^+\pi^-)$  calculated as half of the difference between triple products for  $B^0$  and  $\bar{B}^0$ , which is sensitive to  $CP$  violation.

VALUE (%)	DOCUMENT ID	TECN	COMMENT
$0.51 \pm 0.85 \pm 0.08$	<sup>1</sup> AAIJ	23AG LHCb	$pp$ at 7, 8 and 13 TeV

<sup>1</sup> Phase-space integrated asymmetry.

 $a_P(B^0 \rightarrow p\bar{p}K^+\pi^-)$ 

Observable  $a_P(B^0 \rightarrow p\bar{p}K^+\pi^-)$  calculated as the average of the triple products for  $B^0$  and  $\bar{B}^0$ , which is sensitive to parity violation.

VALUE (%)	DOCUMENT ID	TECN	COMMENT
$1.49 \pm 0.85 \pm 0.08$	<sup>1</sup> AAIJ	23AG LHCb	$pp$ at 7, 8 and 13 TeV

<sup>1</sup> Phase-space integrated asymmetry.

## T and CPT VIOLATION PARAMETERS

Measured values of the  $T$ ,  $CP$ , and  $CPT$ -asymmetry parameters, defined as the differences in  $S_{\alpha,\beta}^{\pm}$  and  $C_{\alpha,\beta}^{\pm}$  between symmetry-transformed transitions. The indices  $\alpha = \ell^+$ ,  $\ell^-$  and  $\beta = K_S^0$ ,  $K_L^0$  stand for reconstructed the flavor final state and the  $CP$  final states from  $\Upsilon(4S)$  decay. The sign  $\pm$  indicates whether the decay to the flavor final state  $\alpha$  occurs before or after the decay to the  $CP$  final state.

Alternatively, violations of  $CPT$  symmetry and Lorentz invariance are searched for by studying interference effects in  $B^0$  mixing. Results are expressed in terms of the standard model extension parameter  $\Delta a$ , which describes the difference between the couplings of the valence quarks within  $B^0$  meson with the Lorentz-violating fields.

**B<sup>±</sup>/B<sup>0</sup> ADMIXTURE**

**B DECAY MODES**

The branching fraction measurements are for an admixture of B mesons at the  $\Upsilon(4S)$ . The values quoted assume that  $B(\Upsilon(4S) \rightarrow B\bar{B}) = 100\%$ .

For inclusive branching fractions, e.g.,  $B \rightarrow D^{\pm}$  anything, the treatment of multiple D's in the final state must be defined. One possibility would be to count the number of events with one-or-more D's and divide by the total number of B's. Another possibility would be to count the total number of D's and divide by the total number of B's, which is the definition of average multiplicity. The two definitions are identical if only one D is allowed in the final state. Even though the "one-or-more" definition seems sensible, for practical reasons inclusive branching fractions are almost always measured using the multiplicity definition. For heavy final state particles, authors call their results inclusive branching fractions while for light particles some authors call their results multiplicities. In the B sections, we list all results as inclusive branching fractions, adopting a multiplicity definition. This means that inclusive branching fractions can exceed 100% and that inclusive partial widths can exceed total widths, just as inclusive cross sections can exceed total cross section.

$\bar{B}$  modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level

- 13 YANAGISAWA 91 also measures an average semileptonic branching ratio at the  $\Upsilon(5S)$  of 9.6–10.5% depending on assumptions about the relative production of different  $B$  meson species.
- 14 ALBRECHT 90H uses the model of ALTARELLI 82 to correct over all lepton momenta.  $0.099 \pm 0.006$  is obtained using ISGUR 89b.
- 15 ALBRECHT 90H uses the model of ALTARELLI 82 to correct over all lepton momenta.  $0.097 \pm 0.006$  is obtained using ISGUR 89b.
- 16 Using data above  $p(e) = 2.4$  GeV, WACHS 89 determine  $\sigma(B \rightarrow e \nu \mu p) / \sigma(B \rightarrow e \nu \text{charm}) < 0.065$  at 90% CL.
- 17 Ratio  $\sigma(b \rightarrow e \nu \mu p) / \sigma(b \rightarrow e \nu \text{charm}) < 0.055$  at CL = 90%.

- [a] These values are model dependent.  
 [b] An  $\ell$  indicates an  $e$  or a  $\mu$  mode, not a sum over these modes.  
 [c] Here “anything” means at least one particle observed.  
 [d] This is a  $B(B^0 \rightarrow D^{*-} \ell^+ \nu_\ell)$  value.  
 [e]  $D^{**}$  stands for the sum of the  $D(1^1P_1)$ ,  $D(1^3P_0)$ ,  $D(1^3P_1)$ ,  $D(1^3P_2)$ ,  $D(2^1S_0)$ , and  $D(2^1S_1)$  resonances.  
 [f] The value is for the sum of the charge states or particle/antiparticle states indicated.  
 [g]  $D^{(*)} \bar{D}^{(*)}$  stands for the sum of  $D^* \bar{D}^*$ ,  $D^* \bar{D}$ ,  $D \bar{D}^*$ , and  $D \bar{D}$ .  
 [h]  $X(3915)$  denotes a near-threshold enhancement in the  $\omega J/\psi$  mass spectrum.  
 [i] Inclusive branching fractions have a multiplicity definition and can be greater than 100%.

- 1 LEES 17b measurement is obtained from semileptonic decays to electrons. The result is averaged over  $B^\pm$  and  $B^0$  mesons, assuming lepton universality.
- 2 URQUIJO 07 report a measurement of  $(10.07 \pm 0.18 \pm 0.21)\%$  for the partial branching fraction of  $B \rightarrow e \nu_e X_c$  decay with electron energy above 0.6 GeV. We converted the result to  $B \rightarrow e \nu_e X$  branching fraction.
- 3 Uses charge and angular correlations in  $\Upsilon(4S)$  events with a high-momentum lepton and an additional electron.
- 4 ALBRECHT 93H analysis performed using tagged semileptonic decays of the  $B$ . This technique is almost model independent for the lepton branching ratio.
- 5 The measurements are obtained for charged and neutral  $B$  mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the  $B$  rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV:  $B(B^+ \rightarrow e^+ \nu_e X) / B(B^0 \rightarrow e^+ \nu_e X) = 1.074 \pm 0.041 \pm 0.026$ .
- 6 The measurements are obtained for charged and neutral  $B$  mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the  $B$  rest frame, and their ratio of  $B(B^+ \rightarrow e^+ \nu_e X) / B(B^0 \rightarrow e^+ \nu_e X) = 1.08 \pm 0.05 \pm 0.02$ .
- 7 The semileptonic branching ratio,  $|V_{cb}|$  and other heavy-quark parameters are determined from a simultaneous fit to moments of the hadronic-mass and lepton-energy distribution.
- 8 Uses the high-momentum lepton tag method and requires the electron energy above 0.6 GeV.
- 9 Uses the high-momentum lepton tag method. They also report  $|V_{cb}| = 0.0423 \pm 0.0007(\text{exp}) \pm 0.0020(\text{theo.})$ .
- 10 Uses the high-momentum lepton tag method. ABE 02y also reports  $|V_{cb}| = 0.0408 \pm 0.0010(\text{exp}) \pm 0.0025(\text{theo.})$ . The second error is due to uncertainties of theoretical inputs.
- 11 BARISH 96b analysis performed using tagged semileptonic decays of the  $B$ . This technique is almost model independent for the lepton branching ratio.
- 12 HENDERSON 92 measurement employs  $e$  and  $\mu$ . The systematic error contains 0.004 in quadrature from model dependence. The authors average a variation of the Isgur, Scora, Grinstein, and Wise model with that of the Altarelli-Cabibbo-Corbò-Maiani-Martinelli model for semileptonic decays to correct the acceptance.

<sup>1</sup> The measurement is obtained from semileptonic decays to electrons  $B \rightarrow X_c \ell \nu$ , and using a theoretical model (GAMBINO 07, GAMBINO 11) to predict the contribution from  $B \rightarrow X_c \ell \nu$ . The result is averaged over  $B^\pm$  and  $B^0$  mesons, assuming lepton universality.  
<sup>2</sup> Measured the independent  $B^+$  and  $B^0$  partial branching fractions with electron energy above 0.4 GeV.  
<sup>3</sup> Obtained from a combined fit to the moments of observed spectra in inclusive  $B \rightarrow X_c \ell^+ \nu_\ell$  decay.  
<sup>4</sup> The semileptonic branching ratio,  $|V_{cb}|$  and other heavy-quark parameters are determined from a simultaneous fit to moments of the hadronic-mass and lepton-energy distribution.

$\Gamma(X_u \ell^+ \nu_\ell)/\Gamma_{\text{total}}$   $\Gamma_{25}/\Gamma$   
 Error includes scale factor of 2.4.

<sup>1</sup> Measures several partial branching fractions in different phase space regions. The most inclusive result of the full branching fraction is obtained in the region for lepton energy in  $B$  rest frame  $E_\ell^* > 1$  GeV, where the measured partial branching fraction is  $\Delta B = (1.59 \pm 0.07 \pm 0.16) \times 10^{-3}$ . The acceptance in that region is reported to be 0.86.  
<sup>2</sup> Obtained from the partial rate  $\Delta B = (1.554 \pm 0.082 \pm 0.095 \pm 0.086) \times 10^{-3}$  for the electron momentum interval of 0.8–2.7 GeV/c based on GGOU1 method ( $X_c \ell \nu$ ,  $m_c$  constraint fit of SF parameters).  
<sup>3</sup> Measures several partial branching fractions in different phase space regions. The most precise result on the full branching fraction is obtained in the region for lepton momentum in  $B$  rest frame  $p_\ell^* > 1$  GeV/c, where the measured partial branching fraction is  $\Delta B = (1.80 \pm 0.13 \pm 0.15) \times 10^{-3}$ . The acceptance in that region is reported in a private communication by the Authors to be 0.894. The corresponding  $|V_{ub}|$  from the BLPN method is  $(4.28 \pm 0.15 \pm 0.18 \pm 0.19) \times 10^{-3}$ , where the last uncertainty comes from theoretical prediction.  
<sup>4</sup> Determined from the partial rate  $\Delta B = (4.41 \pm 0.42 \pm 0.42) \times 10^{-4}$  measured for electron energy  $> 2$  GeV and hadronic mass squared  $< 3.5$  GeV<sup>2</sup>, and calculated acceptance 0.174 in that region. The  $V_{ub}$  is measured as  $(4.41 \pm 0.30 \pm 0.65 \pm 0.47) \times 10^{-3}$ .  
<sup>5</sup> Uses electrons in the momentum interval 1.9–2.6 GeV/c in the center-of-mass frame. The  $V_{ub}$  is found to be  $(5.08 \pm 0.47 \pm 0.49 \pm 0.48) \times 10^{-3}$ .

## Meson Particle Listings

 $B^\pm/B^0$  ADMIXTURE

<sup>6</sup>BORNHEIM 02 uses the observed yield of leptons from semileptonic  $B$  decays in the end-point momentum interval 2.2–2.6 GeV/c with recent CLEO-2 data on  $B \rightarrow X_S \gamma$ . The  $V_{ub}$  is found to be  $(4.08 \pm 0.34 \pm 0.53) \times 10^{-3}$ .

<sup>7</sup>Measurement requires lepton energy  $E_\ell^* > 1$  GeV in the  $B$  rest frame. It is a part of the inclusive and exclusive  $|V_{ub}|$  determination.

<sup>8</sup>Uses a multivariate analysis method and requires lepton momentum in the  $B$  rest frame,  $p_\ell^* > 1.0$  GeV/c.

<sup>9</sup>Measures several partial branching fractions in different phase space regions. The most precise result is obtained in the region for hadronic mass  $M_X < 1.55$  GeV/ $c^2$ , and is  $\Delta B = (1.18 \pm 0.09 \pm 0.07) \times 10^{-3}$ . The corresponding  $|V_{ub}|$  from the BLNP method is  $(4.27 \pm 0.16 \pm 0.13 \pm 0.30) \times 10^{-3}$ , where the last uncertainty comes from the theoretical prediction of the partial rate in the given phase-space region.

<sup>10</sup>Obtained from the partial rate  $\Delta B = (0.572 \pm 0.041 \pm 0.065) \times 10^{-3}$  for the electron momentum interval of 2.0–2.6 GeV/c based on BLNP method.

<sup>11</sup>Used BaBar measurement of Semileptonic branching fraction  $B(B \rightarrow X \ell \nu_\ell) = (10.87 \pm 0.18 \pm 0.30)\%$  to convert the ratio of rates to branching fraction.

<sup>12</sup>The third error includes the systematics and theoretical errors summed in quadrature.

$\Gamma(X_u \ell^+ \nu_\ell)/\Gamma(\ell^+ \nu_\ell \text{ anything})$   $\Gamma_{25}/\Gamma_3$   
 $\ell$  denotes  $e$  or  $\mu$ , not the sum. These experiments measure this ratio in very limited momentum intervals.

<b>0.26 ± 0.25 ± 0.42</b>			<sup>1</sup> AUBERT 04i	BABR	$e^+ e^- \rightarrow \Upsilon(4S)$
			••• We do not use the following data for averages, fits, limits, etc. •••		
			<sup>2</sup> ALBRECHT 94c	ARG	$e^+ e^- \rightarrow \Upsilon(4S)$
		107	<sup>3</sup> BARTELT 93B	CLE2	$e^+ e^- \rightarrow \Upsilon(4S)$
		77	<sup>4</sup> ALBRECHT 91c	ARG	$e^+ e^- \rightarrow \Upsilon(4S)$
		41	<sup>5</sup> ALBRECHT 90	ARG	$e^+ e^- \rightarrow \Upsilon(4S)$
		76	<sup>6</sup> FULTON 90	CLEO	$e^+ e^- \rightarrow \Upsilon(4S)$
<4.0	90		<sup>7</sup> BEHRENDIS 87	CLEO	Direct $e$ at $\Upsilon(4S)$
<4.0	90		CHEN 84	CLEO	Direct $e$ at $\Upsilon(4S)$
<5.5	90		KLOPFEN...	83B	CUSB Direct $e$ at $\Upsilon(4S)$

<sup>1</sup>The third error includes the systematics and theoretical errors summed in quadrature.

<sup>2</sup>ALBRECHT 94c find  $\Gamma(b \rightarrow c)/\Gamma(b \rightarrow \text{all}) = 0.99 \pm 0.02 \pm 0.04$ .

<sup>3</sup>BARTELT 93B (CLEO II) measures an excess of  $107 \pm 15 \pm 11$  leptons in the lepton momentum interval 2.3–2.6 GeV/c which is attributed to  $b \rightarrow u \ell \nu_\ell$ . This corresponds to a model-dependent partial branching ratio  $\Delta B_{ub}$  between  $(1.15 \pm 0.16 \pm 0.15) \times 10^{-4}$ , as evaluated using the KS model (KOERNER 88), and  $(1.54 \pm 0.22 \pm 0.20) \times 10^{-4}$  using the ACCMM model (ARTUSO 93). The corresponding values of  $|V_{ub}|/|V_{cb}|$  are  $0.056 \pm 0.006$  and  $0.076 \pm 0.008$ , respectively.

<sup>4</sup>ALBRECHT 91c result supersedes ALBRECHT 90. Two events are fully reconstructed providing evidence for the  $b \rightarrow u$  transition. Using the model of ALTARELLI 82, they obtain  $|V_{ub}|/|V_{cb}| = 0.11 \pm 0.012$  from 77 leptons in the 2.3–2.6 GeV momentum range.

<sup>5</sup>ALBRECHT 90 observes  $41 \pm 10$  excess  $e$  and  $\mu$  (lepton) events in the momentum interval  $p = 2.3$ –2.6 GeV signaling the presence of the  $b \rightarrow u$  transition. The events correspond to a model-dependent measurement of  $|V_{ub}|/|V_{cb}| = 0.10 \pm 0.01$ .

<sup>6</sup>FULTON 90 observe  $76 \pm 20$  excess  $e$  and  $\mu$  (lepton) events in the momentum interval  $p = 2.4$ –2.6 GeV signaling the presence of the  $b \rightarrow u$  transition. The average branching ratio,  $(1.8 \pm 0.4 \pm 0.3) \times 10^{-4}$ , corresponds to a model-dependent measurement of approximately  $|V_{ub}|/|V_{cb}| = 0.1$  using  $B(b \rightarrow c \ell \nu) = 10.2 \pm 0.2 \pm 0.7\%$ .

<sup>7</sup>The quoted possible limits range from 0.018 to 0.04 for the ratio, depending on which model or momentum range is chosen. We select the most conservative limit they have calculated. This corresponds to a limit on  $|V_{ub}|/|V_{cb}| < 0.20$ . While the endpoint technique employed is more robust than their previous results in CHEN 84, these results do not provide a numerical improvement in the limit.

$\Gamma(X_u e^+ \nu_e)/\Gamma_{\text{total}}$   $\Gamma_{26}/\Gamma$   
 Requires  $E_e^* > 1$  GeV, where  $E_e^*$  is  $e^+$  energy in  $B$  rest frame.

- GIBBONS 97B reports  $B(B \rightarrow D^*(2010)^\pm \text{ anything}) = 0.239 \pm 0.015 \pm 0.014 \pm 0.009$  using CLEO measured  $D$  and  $D^*$  branching fractions. We rescale to our PDG 96 values of  $D$  and  $D^*$  branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.
- ALBRECHT 96D reports  $B(B \rightarrow D^*(2010)^\pm \text{ anything}) = 0.196 \pm 0.019$  using CLEO measured  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.681 \pm 0.01 \pm 0.013$ ,  $B(D^0 \rightarrow K^- \pi^+) = 0.0401 \pm 0.0014$ ,  $B(D^0 \rightarrow K^- \pi^+ \pi^+ \pi^-) = 0.081 \pm 0.005$ . We rescale to our PDG 96 values of  $D$  and  $D^*$  branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.
- BORTOLETTO 92 reports  $B(B \rightarrow D^*(2010)^\pm \text{ anything}) = 0.25 \pm 0.03 \pm 0.04$  using MARK II  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$  and  $B(D^0 \rightarrow K^- \pi^+) = 0.042 \pm$

0.008. We rescale to our PDG 96 values of  $D$  and  $D^*$  branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.

- ALBRECHT 91H reports  $0.348 \pm 0.060 \pm 0.035$  from a measurement of  $[\Gamma(B \rightarrow D^*(2010)^\pm \text{ anything})/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$  assuming  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.55 \pm 0.04$ , which we rescale to our best value  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Uses the PDG 90  $B(D^0 \rightarrow K^- \pi^+) = 0.0371 \pm 0.0025$ .
- BORTOLETTO 87 uses old MARK III (BALTRUSAITIS 86E) branching ratios  $B(D^0 \rightarrow K^- \pi^+) = 0.056 \pm 0.004 \pm 0.003$  and also assumes  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.60^{+0.08}_{-0.15}$ . The product branching ratio for  $B(B \rightarrow D^*(2010)^+) B(D^*(2010)^+ \rightarrow D^0 \pi^+)$  is  $0.13 \pm 0.02 \pm 0.012$ . Superseded by BORTOLETTO 92.
- $V-A$  momentum spectrum used to extrapolate below  $p = 1$  GeV. We correct the value assuming  $B(D^0 \rightarrow K^- \pi^+) = 0.042 \pm 0.006$  and  $B(D^+ \rightarrow D^0 \pi^+) = 0.6^{+0.08}_{-0.15}$ . The product branching fraction is  $B(B \rightarrow D^* X) \cdot B(D^* \rightarrow \pi^+ D^0) \cdot B(D^0 \rightarrow K^- \pi^+) = (68 \pm 15 \pm 9) \times 10^{-4}$ .

$3.50 \pm 0.32 \pm 0.31$	<sup>1,12</sup> KOPPENBURG	04	BELL Repl. by LIMOSANI 09
$3.36 \pm 0.53 \pm 0.65$ $-0.68$	<sup>13</sup> ABE	01F	BELL Repl. by SAITO 15
$2.32 \pm 0.57 \pm 0.35$	ALAM	95	CLE2 Repl. by CHEN 01c

- We extrapolate the measured value to  $E_\gamma > 1.6$  GeV using the method of BUCH-MUELLER 06 (average of three theoretical models).
- SAITO 15 measured  $(3.51 \pm 0.17 \pm 0.33) \times 10^{-4}$  using a sum-of-exclusive approach in which 38 of the hadronic final states with  $m_{X_s} < 2.8$  GeV/c<sup>2</sup> are reconstructed. The cut of minimum photon energy is  $E_\gamma > 1.9$  GeV.
- Reports  $(3.29 \pm 0.19 \pm 0.48) \times 10^{-4}$  for  $E_\gamma > 1.9$  GeV.
- Reports  $(3.21 \pm 0.15 \pm 0.29 \pm 0.08) \times 10^{-4}$  for  $1.8 < E_\gamma < 2.8$  GeV, where the last systematic uncertainty is for model dependency. Results with other cutoffs are also reported.
- The measurement reported is  $(3.45 \pm 0.15 \pm 0.40) \times 10^{-4}$  for  $E_\gamma > 1.7$  GeV.
- Uses a fully reconstructed  $B$  meson as a tag on the recoil side. The measurement reported is  $(3.66 \pm 0.85 \pm 0.60) \times 10^{-4}$  for  $E_\gamma > 1.9$  GeV.
- The measurement reported is  $(3.21 \pm 0.43 \pm 0.32) \times 10^{-4}$  for  $E_\gamma > 2.0$  GeV.
- Measured using sums of seven exclusive final states  $B \rightarrow X_{d(s)}\gamma$  where  $X_{d(s)}$  is a nonstrange (strange) charmless hadronic system in mass range 0.5–2.0 GeV/c<sup>2</sup>.
- Measured using sums of seven exclusive final states  $B \rightarrow X_{d(s)}\gamma$  where  $X_{d(s)}$  is a nonstrange (strange) charmless hadronic system in mass range 0.6–1.8 GeV/c<sup>2</sup>.
- The measurement reported is  $(3.67 \pm 0.29 \pm 0.45) \times 10^{-4}$  for  $E_\gamma > 1.9$  GeV.
- The measurement reported is  $(3.27 \pm 0.18 \pm 0.55) \times 10^{-4}$  for  $E_\gamma > 1.9$  GeV.
- The measurement reported is  $(3.55 \pm 0.32 \pm 0.32) \times 10^{-4}$  for  $E_\gamma > 1.8$  GeV.
- ABE 01F reports their systematic errors  $(\pm 0.42 \pm 0.50) \times 10^{-4}$ , where the second error is due to the theoretical uncertainty. We combine them in quadrature.

VALUE	CL%	EVTS	DOCUMENT ID	TECN	COMMENT
<b><math>&lt; 0.068</math></b>	90		<sup>1</sup> COAN	98	CLE2 $e^+e^- \rightarrow \Upsilon(4S)$
$< 0.08$		2	<sup>2</sup> ALBRECHT	95D	ARG $e^+e^- \rightarrow \Upsilon(4S)$

- • • We do not use the following data for averages, fits, limits, etc. • • •
- COAN 98 uses  $D$ - $l$  correlation.
  - ALBRECHT 95D use full reconstruction of one  $B$  decay as tag. Two candidate events for charmless  $B$  decay can be interpreted as either  $b \rightarrow \text{sgluon}$  or  $b \rightarrow u$  transition. If interpreted as  $b \rightarrow \text{sgluon}$  they find a branching ratio of  $\sim 0.026$  and the upper limit quoted above. Result is highly model dependent.

### $\Gamma(\eta \text{ anything})/\Gamma_{\text{total}}$ $\Gamma_{84}/\Gamma$

- • • We do not use the following data for averages, fits, limits, etc. • • •
- Uses  $B \rightarrow \eta X_S$  with  $0.4 < m_{X_S} < 2.6$  GeV/c<sup>2</sup>.
  - Uses  $B \rightarrow \eta X_S$  with  $1.8 < m_{X_S} < 2.6$  GeV/c<sup>2</sup>.
  - BROWDER 98 search for high momentum  $B \rightarrow \eta X_S$  between 2.1 and 2.7 GeV/c.

### $\Gamma(\eta' \text{ anything})/\Gamma_{\text{total}}$ $\Gamma_{85}/\Gamma$

VALUE (units $10^{-4}$ )	DOCUMENT ID	TECN	COMMENT
<b><math>4.2 \pm 0.9</math> OUR AVERAGE</b>			
$3.9 \pm 0.8 \pm 0.9$	<sup>1</sup> AUBERT, B	04F	BABR $e^+e^- \rightarrow \Upsilon(4S)$
$4.6 \pm 1.1 \pm 0.6$	<sup>2</sup> BONVICINI	03	CLE2 $e^+e^- \rightarrow \Upsilon(4S)$
$6.2 \pm 1.6 \pm 1.3$ $-2.0$	<sup>3</sup> BROWDER	98	CLE2 $e^+e^- \rightarrow \Upsilon(4S)$

- • • We do not use the following data for averages, fits, limits, etc. • • •
- AUBERT, B 04F reports branching ratio  $B \rightarrow \eta' X_S$  for high momentum  $\eta'$  between 2.0 and 2.7 GeV/c in the  $\Upsilon(4S)$  center-of-mass frame.  $X_S$  represents a recoil system consisting of a kaon and zero to four pions.
  - BONVICINI 03 observed a signal of  $61.2 \pm 13.9$  events in  $B \rightarrow \eta' X_{\text{HC}}$  production for high momentum  $\eta'$  between 2.0 and 2.7 GeV/c in the  $\Upsilon(4S)$  center-of-mass frame. The  $X_{\text{HC}}$  denotes "charmless" hadronic states recoiling against  $\eta'$ . The second error combines systematic and background subtraction uncertainties in quadrature.
  - BROWDER 98 observed a signal of  $39.0 \pm 11.6$  events in high momentum  $B \rightarrow \eta' X_S$  production between 2.0 and 2.7 GeV/c. The branching fraction is based on the interpretation of  $b \rightarrow \text{sg}$ , where the last error includes additional uncertainties due to the color-suppressed  $b \rightarrow$  backgrounds.

$<11.2$	90	<sup>4</sup> ALAM 87	CLEO	$e^+e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> AUBERT 07c reports  $0.045 \pm 0.003 \pm 0.012$  from a measurement of  $[\Gamma(B \rightarrow \Lambda_c^+ / \bar{\Lambda}_c^- \text{ anything})/\Gamma_{\text{total}}] \times [B(\Lambda_c^+ \rightarrow pK^- \pi^+)]$  assuming  $B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (5.0 \pm 1.3) \times 10^{-2}$ , which we rescale to our best value  $B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (6.24 \pm 0.28) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>2</sup> CRAWFORD 92 result derived from lepton baryon correlations. Assumes all charmed baryons in  $B^0$  and  $B^\pm$  decay are  $\Lambda_c$ .

<sup>3</sup> ALBRECHT 88E measured  $B(B \rightarrow \Lambda_c^+ X) \cdot B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (0.30 \pm 0.12 \pm 0.06)\%$  and used  $B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (2.2 \pm 1.0)\%$  from ABRAMS 80 to obtain above number.

<sup>4</sup> Assuming all baryons result from charmed baryons, ALAM 86 conclude the branching fraction is  $7.4 \pm 2.9\%$ . The limit given above is model independent.

<b>0.068 ± 0.005 ± 0.003</b>	<sup>1</sup> ALBRECHT 92o	ARG	$e^+e^- \rightarrow \Upsilon(4S)$
• • • We do not use the following data for averages, fits, limits, etc. • • •			
0.076 ± 0.014	<sup>2</sup> ALBRECHT 89k	ARG	$e^+e^- \rightarrow \Upsilon(4S)$

<sup>1</sup>ALBRECHT 92o result is from simultaneous analysis of  $p$  and  $\Lambda$  yields,  $p\bar{p}$  and  $\Lambda\bar{\Lambda}$  correlations, and various lepton-baryon and lepton-baryon-antibaryon correlations. Supersedes ALBRECHT 89k.  
<sup>2</sup>ALBRECHT 89k obtain this result by adding their measurements (5.5 ± 1.6)% for direct protons and (4.2 ± 0.5 ± 0.6)% for inclusive  $\Lambda$  production. They then assume (5.5 ± 1.6)% for neutron production and add it in also. Since each  $B$  decay has two baryons, they divide by 2 to obtain (7.6 ± 1.4)%.

POLARIZATION IN  $B$  DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ( $L$ ) or both are transverse and parallel ( $\parallel$ ) or perpendicular ( $\perp$ ) to each other with the parameters  $\Gamma_L/\Gamma$ ,  $\Gamma_\perp/\Gamma$ , and the relative phases  $\phi_\parallel$  and  $\phi_\perp$ . See the definitions in the note on "Polarization in  $B$  Decays" review in the  $B^0$  Particle Listings.

### $B(B \rightarrow X_s \mu^+ \mu^-)$ (14.2 < $q^2$ $\text{GeV}^2/c^4$ )

VALUE (units $10^{-6}$ )	DOCUMENT ID	TECN	COMMENT
<b>0.60<sup>+0.31</sup><sub>-0.29</sub>±0.05</b>	<sup>1</sup> LEES	14D BABR	$e^+e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> Measured from sum of exclusive modes through  $K^+$ ,  $K^+\pi^0$ ,  $K^+\pi^-$ ,  $K^+\pi^-\pi^0$ ,  $K^+\pi^-\pi^+$ ,  $K_S^0$ ,  $K_S^0\pi^0$ ,  $K_S^0\pi^+$ ,  $K_S^0\pi^+\pi^0$ , and  $K_S^0\pi^+\pi^-$  corrected for unobserved modes.

### LEPTON (HADRON) FORWARD-BACKWARD ASYMMETRY IN $B \rightarrow K^{(*)} \ell^+ \ell^-$ ( $B \rightarrow K/\pi h^+ h^-$ ) DECAY

The forward-backward angular asymmetry of the lepton pair in  $B \rightarrow K^{(*)} \ell^+ \ell^-$  ( $B \rightarrow K/\pi h^+ h^-$ ) decay is defined as

$$A_{FB}(s) = \frac{N(\cos\theta > 0) - N(\cos\theta < 0)}{N(\cos\theta > 0) + N(\cos\theta < 0)}$$

where  $s=q^2/m_B^2$ , and  $\theta$  is the angle of the  $\ell^-$  ( $h^-$ ) with respect to the flight direction of the  $B$  meson, measured in the dilepton (dihadron) rest frame. In addition, the fraction of longitudinal polarization  $F_L$  of the  $K^*$  and  $F_S$ , the relative contribution from scalar and pseudoscalar penguin amplitudes in  $B \rightarrow K\ell^+\ell^-$ , can be measured from the angular distribution of its decay products.

### $A_{FB}(B \rightarrow K^* \ell^+ \ell^-)$ ( $q^2 > 0.1 \text{ GeV}^2/c^4$ )

## ISOSPIN ASYMMETRY

$\Delta_0^-$  is defined as

$$\frac{\Gamma(B^0 \rightarrow f_d) - \Gamma(B^- \rightarrow f_d)}{\Gamma(B^0 \rightarrow f_d) + \Gamma(B^- \rightarrow f_d)},$$

the isospin asymmetry of inclusive neutral and charged B decay.

 $\Delta_0^-(B \rightarrow X_s \gamma)$

## Meson Particle Listings

 $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE MEAN LIFE

Each measurement of the  $B$  mean life is an average over an admixture of various bottom mesons and baryons which decay weakly. Different techniques emphasize different admixtures of produced particles, which could result in a different  $B$  mean life.

"OUR EVALUATION" is an average using rescaled values of the data listed below. This is a weighted average of the lifetimes of the five main  $b$ -hadron species ( $B^+$ ,  $B^0$ ,  $B_{sH}^0$ ,  $B_{sL}^0$ , and  $\Lambda_b$ ) that assumes the production fractions in  $Z$  decays (given at the end of this section) and equal production fractions of  $B_{sH}^0$  and  $B_{sL}^0$  mesons.

<sup>1</sup> Measurement performed using an inclusive reconstruction and  $B$  flavor identification technique.

<sup>2</sup> Measured using inclusive  $J/\psi(1S) \rightarrow \mu^+\mu^-$  vertex.

<sup>3</sup> ACCIARRI 98 uses inclusively reconstructed secondary vertex and lepton impact parameter.

<sup>4</sup> ACKERSTAFF 97F uses inclusively reconstructed secondary vertices.

<sup>5</sup> Combines ABREU 96E secondary vertex result with ABREU 94L impact parameter result.

<sup>6</sup> BUSKULIC 96F analyzed using 3D impact parameter.

<sup>7</sup> ABE,K 95B uses an inclusive topological technique.

<sup>8</sup> ABREU 94L uses charged particle impact parameters. Their result from inclusively reconstructed secondary vertices is superseded by ABREU 96E.

<sup>9</sup> From proper time distribution of  $b \rightarrow J/\psi(1S)$  anything.

<sup>10</sup> ABE 93J analyzed using  $J/\psi(1S) \rightarrow \mu\mu$  vertices.

<sup>11</sup> ABREU 93D data analyzed using  $D/D^*\ell$  anything event vertices.

<sup>12</sup> ABREU 93C data analyzed using charged and neutral vertices.

<sup>13</sup> ACTON 93C analysed using  $D/D^*\ell$  anything event vertices.

<sup>14</sup> ACTON 93L and ADRIANI 93K analyzed using lepton ( $e$  and  $\mu$ ) impact parameter at  $Z$ .

<sup>15</sup> BUSKULIC 93O analyzed using dipole method.

<sup>16</sup> ABREU 92 is combined result of muon and hadron impact parameter analyses. Hadron tracks gave  $(12.7 \pm 0.4 \pm 1.2) \times 10^{-13}$  s for an admixture of  $B$  species weighted by production fraction and mean charge multiplicity, while muon tracks gave  $(13.0 \pm 1.0 \pm 0.8) \times 10^{-13}$  s for an admixture weighted by production fraction and semileptonic branching fraction.

<sup>17</sup> ACTON 92 is combined result of muon and electron impact parameter analyses.

<sup>18</sup> BUSKULIC 92F uses the lepton impact parameter distribution for data from the 1991 run.

<sup>19</sup> BUSKULIC 92G use  $J/\psi(1S)$  tags to measure the average  $b$  lifetime. This is comparable to other methods only if the  $J/\psi(1S)$  branching fractions of the different  $b$ -flavored hadrons are in the same ratio.

<sup>20</sup> Using  $Z \rightarrow e^+X$  or  $\mu^+X$ , ADEVA 91H determined the average lifetime for an admixture of  $B$  hadrons from the impact parameter distribution of the lepton.

<sup>21</sup> Using  $Z \rightarrow J/\psi(1S)X$ ,  $J/\psi(1S) \rightarrow \ell^+\ell^-$ , ALEXANDER 91G determined the average lifetime for an admixture of  $B$  hadrons from the decay point of the  $J/\psi(1S)$ .

<sup>22</sup> Using  $Z \rightarrow eX$  or  $\mu X$ , DECAMP 91C determines the average lifetime for an admixture of  $B$  hadrons from the signed impact parameter distribution of the lepton.

<sup>23</sup> HAGEMANN 90 uses electrons and muons in an impact parameter analysis.

<sup>24</sup> LYONS 90 combine the results of the  $B$  lifetime measurements of ONG 89, BRAUNSCHWEIG 89B, KLEM 88, and ASH 87, and JADE data by private communication. They use statistical techniques which include variation of the error with the mean life, and possible correlations between the systematic errors. This result is not independent of the measured results used in our average.

<sup>25</sup> We have combined an overall scale error of 15% in quadrature with the systematic error of  $\pm 0.7$  to obtain  $\pm 2.1$  systematic error.

<sup>26</sup> Statistical and systematic errors were combined by BROM 87.

 $\bar{b}$  PRODUCTION FRACTIONS AND DECAY MODES

The branching fraction measurements are for an admixture of  $B$  mesons and baryons at energies above the  $T(4S)$ . Only the highest energy results (LHC, LEP, Tevatron,  $Sp\bar{p}S$ ) are used in the branching fraction averages. In the following, we assume that the production fractions are the same at the LHC, LEP, and at the Tevatron.

For inclusive branching fractions, e.g.,  $B \rightarrow D^\pm$  anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

The modes below are listed for a  $\bar{b}$  initial state.  $b$  modes are their charge conjugates. Reactions indicate the weak decay vertex and do not include mixing.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level
------	--------------------------------	-----------------------------------

## PRODUCTION FRACTIONS

The production fractions for weakly decaying  $b$ -hadrons at high energy have been calculated from the best values of mean lives, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFLAV) as described in the note " $B^0$ - $\bar{B}^0$  Mixing" in the  $B^0$  Particle Listings. We no longer provide world averages of the  $b$ -hadron production fractions, where results from LEP, Tevatron and LHC are averaged together; indeed the available data (from CDF and LHCb) shows that the fractions depend on the kinematics (in particular the  $p_T$ ) of the produced  $b$  hadron. Hence we would like to list the fractions in  $Z$  decays instead, which are well-defined physics observables. The production fractions in  $p\bar{p}$  collisions at the Tevatron are also listed at the end of the section. Values assume

$$\begin{aligned} B(\bar{b} \rightarrow B^+) &= B(\bar{b} \rightarrow B^0) \\ B(\bar{b} \rightarrow B^+) + B(\bar{b} \rightarrow B^0) + B(\bar{b} \rightarrow B_s^0) + B(b \rightarrow b\text{-baryon}) &= 100\%. \end{aligned}$$

The correlation coefficients between production fractions are also reported:

$$\begin{aligned} \text{cor}(B_s^0, b\text{-baryon}) &= 0.064 \\ \text{cor}(B_s^0, B^\pm=B^0) &= -0.633 \\ \text{cor}(b\text{-baryon}, B^\pm=B^0) &= -0.813. \end{aligned}$$

## Meson Particle Listings

 $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE

The notation for production fractions varies in the literature ( $f_d, d_{B^0}, f(b \rightarrow \bar{B}^0), B(b \rightarrow \bar{B}^0)$ ). We use our own branching fraction notation here,  $B(\bar{b} \rightarrow B^0)$ .

Note these production fractions are  $b$ -hadronization fractions, not the conventional branching fractions of  $b$ -quark to a  $B$ -hadron, which may have considerable dependence on the initial and final state kinematic and production environment.

<b>0.1230 ± 0.0115 OUR EVALUATION</b>	(Produced by HFLAV)		
• • • We do not use the following data for averages, fits, limits, etc. • • •			
0.122 ± 0.006	<sup>1</sup> AAIJ	19AD LHCb	$p\bar{p}$ at 13 TeV
0.134 ± 0.004 <sup>+0.011</sup> / <sub>-0.010</sub>	<sup>2</sup> AAIJ	12j LHCb	$p\bar{p}$ at 7 TeV
0.1265 ± 0.0085 ± 0.0131	<sup>3</sup> AAIJ	11F LHCb	$p\bar{p}$ at 7 TeV
0.128 <sup>+0.011</sup> / <sub>-0.010</sub> ± 0.011	<sup>4</sup> AALTONEN	08N CDF	$p\bar{p}$ at 1.96 TeV
0.213 ± 0.068	<sup>5</sup> AFFOLDER	00E CDF	$p\bar{p}$ at 1.8 TeV
0.21 ± 0.036 <sup>+0.038</sup> / <sub>-0.030</sub>	<sup>6</sup> ABE	99P CDF	$p\bar{p}$ at 1.8 TeV

- <sup>1</sup> AAIJ 19AD measured the average value using  $b$ -hadron semileptonic decays and assuming isospin symmetry for  $b$ -hadron  $p_T$  of 4 and 25 GeV and  $\eta$  of 2 and 5.
- <sup>2</sup> AAIJ 12j measured this value using  $b$ -hadron semileptonic decays and assuming isospin symmetry.
- <sup>3</sup> AAIJ 11F measured  $f_s/f_d = 0.253 \pm 0.017 \pm 0.017 \pm 0.020$ , where the errors are statistical, systematic, and theoretical. We divide their value by 2. Our second error combines systematic and theoretical uncertainties.
- <sup>4</sup> AALTONEN 08N reports  $[\Gamma(\bar{b} \rightarrow B_s^0)/[\Gamma(\bar{b} \rightarrow B^+) + \Gamma(\bar{b} \rightarrow B^0)]] \times [B(D_s^+ \rightarrow \phi\pi^+)] = (5.76 \pm 0.18 <sup>+0.45</sup>/<sub>-0.42</sub>) \times 10^{-3}$  which we divide by our best value  $B(D_s^+ \rightarrow \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.
- <sup>5</sup> AFFOLDER 00E uses several electron-charm final states in  $b \rightarrow ce^-X$ .
- <sup>6</sup> ABE 99P uses the numbers of  $K^*(892)^0$ ,  $K^*(892)^+$ , and  $\phi(1020)$  events produced in association with the double semileptonic decays  $b \rightarrow c\mu^-X$  with  $c \rightarrow s\mu^+X$ .

$$\Gamma(B_s^0)/\Gamma(B^0) \quad \Gamma_3/\Gamma_2$$

<b>0.246 ± 0.023 OUR EVALUATION</b>	(Produced by HFLAV)		
<b>0.239 ± 0.016 OUR AVERAGE</b>			
0.240 ± 0.004 ± 0.020	<sup>1</sup> AAD	15CM ATLAS	$p\bar{p}$ at 7 TeV
0.238 ± 0.004 ± 0.026	<sup>2</sup> AAIJ	13P LHCb	$p\bar{p}$ at 7 TeV
• • • We do not use the following data for averages, fits, limits, etc. • • •			
0.2385 ± 0.0075	<sup>3</sup> AAIJ	21Y LHCb	$p\bar{p}$ at 8 TeV
0.2539 ± 0.0079	<sup>3</sup> AAIJ	21Y LHCb	$p\bar{p}$ at 13 TeV
0.2390 ± 0.0076	<sup>3</sup> AAIJ	21Y LHCb	$p\bar{p}$ at 7 TeV

- <sup>1</sup> AAD 15CM measurement is derived from the observed  $B_s^0 \rightarrow J/\psi\phi$  and  $B_d^0 \rightarrow J/\psi K^{*0}$  yields and a recent theory prediction of  $B(B_s^0 \rightarrow J/\psi\phi)/B(B_d^0 \rightarrow J/\psi K^{*0})$ . The second uncertainty combines in quadrature systematic and theoretical uncertainties.
- <sup>2</sup> AAIJ 13P studies also separately the  $p_T(B)$  and  $\eta(B)$  dependency of  $\Gamma(\bar{b} \rightarrow B_s^0)/\Gamma(\bar{b} \rightarrow B^0)$ , finding  $f_s/f_d(p_T) = (0.256 \pm 0.020) + (-2.0 \pm 0.6) 10^{-3} / \text{GeV}/c$  ( $p_T - \langle p_T \rangle$ ) and  $f_s/f_d(\eta) = (0.256 \pm 0.020) + (0.005 \pm 0.006)(\eta - \langle \eta \rangle)$ , where  $\langle p_T \rangle = 10.4 \text{ GeV}/c$  and  $\langle \eta \rangle = 3.28$ . AAIJ 13P reports the measurement as  $0.238 \pm 0.004 \pm 0.015 \pm 0.021$  where the last uncertainty is theoretical.
- <sup>3</sup> AAIJ 21Y uses hadronic decays  $B^0 \rightarrow D^-\pi^+$ ,  $B^0 \rightarrow D^-K^+$ ,  $B_s^0 \rightarrow D_s^-\pi^+$  and  $B_s^0 \rightarrow J/\psi\phi$  as well as semileptonic  $B^0$  and  $B_s^0$  decays. Measured within the  $p_T$  range [0.5,4.0] GeV/c,  $\eta$  range [2, 6.4].

$$\Gamma(B_c^+)/[\Gamma(B^+) + \Gamma(B^0)] \quad \Gamma_4/(\Gamma_1 + \Gamma_2)$$

0.105 ± 0.006 ± 0.005	<sup>10</sup> AKERS	93B OPAL	Repl. by ABBI- ENDI 00E

- <sup>1</sup> Uses the combination of lepton transverse momentum spectrum and the correlation between the charge of the lepton and opposite jet charge. The first error is statistic and the second error is the total systematic error including the modeling.
- <sup>2</sup> The experimental systematic and model uncertainties are combined in quadrature.
- <sup>3</sup> ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged  $Z \rightarrow b\bar{b}$  sample using artificial neural network techniques. The first error is statistic; the second error is the total systematic error.
- <sup>4</sup> ACCIARRI 00 result obtained from a combined fit of  $R_B = \Gamma(Z \rightarrow b\bar{b})/\Gamma(Z \rightarrow \text{hadrons})$  and  $B(b \rightarrow \ell\nu X)$ , using double-tagging method.
- <sup>5</sup> ACCIARRI 96c result obtained by a fit to the single lepton spectrum.
- <sup>6</sup> Assumes Standard Model value for  $R_B$ .
- <sup>7</sup> ABREU 95D give systematic errors  $\pm 0.0019$  (model) and 0.0012 ( $R_c$ ). We combine these in quadrature.
- <sup>8</sup> BUSKULIC 94G uses  $e$  and  $\mu$  events. This value is from a global fit to the lepton  $p$  and  $p_T$  (relative to jet) spectra which also determines the  $b$  and  $c$  production fractions, the fragmentation functions, and the forward-backward asymmetries. This branching ratio depends primarily on the ratio of dileptons to single leptons at high  $p_T$ , but the lower  $p_T$  portion of the lepton spectrum is included in the global fit to reduce the model dependence. The model dependence is  $\pm 0.0026$  and is included in the systematic error.
- <sup>9</sup> ABREU 93C event count includes  $ee$  events. Combining  $ee$ ,  $\mu\mu$ , and  $e\mu$  events, they obtain  $0.100 \pm 0.007 \pm 0.007$ .
- <sup>10</sup> AKERS 93B analysis performed using single and dilepton events.

0.0276 $\pm 0.0027 \pm 0.0011$	<sup>2</sup> AKERS	95Q	OPAL $e^+e^- \rightarrow Z$	

<sup>1</sup> ABREU 00R reports their experiment's uncertainties  $\pm 0.0017 \pm 0.0013 \pm 0.0009$ , where the first error is statistical, the second is systematic, and the third is the uncertainty due to the  $D$  branching fraction. We combine first two in quadrature.

<sup>2</sup> AKERS 95Q reports  $[B(\bar{b} \rightarrow D^* \ell^+ \nu_\ell X) \times B(D^{*+} \rightarrow D^0 \pi^+) \times B(D^0 \rightarrow K^- \pi^+)] = ((7.53 \pm 0.47 \pm 0.56) \times 10^{-4})$  and uses  $B(D^{*+} \rightarrow D^0 \pi^+) = 0.681 \pm 0.013$  and  $B(D^0 \rightarrow K^- \pi^+) = 0.0401 \pm 0.0014$  to obtain the above result. The first error is the experiments error and the second error is the systematic error from the  $D^{*+}$  and  $D^0$  branching ratios.

"OUR EVALUATION" is an average of the data listed below performed by the LEP Heavy Flavour Steering Group. The averaging procedure takes into account correlations between the measurements.

<sup>1</sup> Obtained from the best fit of the MC simulated events to the data based on the  $b \rightarrow X_{u\ell} \ell \nu$  neutral network output distributions.

<sup>2</sup> ABREU 00D result obtained from a fit to the numbers of decays in  $b \rightarrow u$  enriched and depleted samples and their lepton spectra, and assuming  $|V_{cb}| = 0.0384 \pm 0.0033$  and  $\tau_b = 1.564 \pm 0.014$  ps.

<sup>3</sup> Uses lifetime tagged  $b\bar{b}$  sample.

<sup>4</sup> ACCIARRI 98K assumes  $R_b = 0.2174 \pm 0.0009$  at Z decay.

“OUR EVALUATION” is an average of the data listed below, excluding all asymmetry measurements, performed by the LEP Electroweak Working Group as described in the “Note on the Z boson” in the Z Particle Listings.

- <sup>1</sup> Uses the combination of lepton transverse momentum spectrum and the correlation between the charge of the lepton and opposite jet charge. The first error is statistic and the second error is the total systematic error including the modeling.  
<sup>2</sup> The experimental systematic and model uncertainties are combined in quadrature.  
<sup>3</sup> ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged  $Z \rightarrow b\bar{b}$  sample using artificial neural network techniques. The first error is statistic; the second error is the total systematic error.  
<sup>4</sup> ABREU 95D give systematic errors  $\pm 0.0033$  (model) and  $0.0032$  ( $R_c$ ). We combine these in quadrature. This result is from the same global fit as their  $\Gamma(\bar{D} \rightarrow \ell^+ \nu_\ell X)$  data.  
<sup>5</sup> BUSKULIC 94G uses  $e$  and  $\mu$  events. This value is from the same global fit as their  $\Gamma(\bar{D} \rightarrow \ell^+ \nu_\ell \text{ anything})/\Gamma_{\text{total}}$  data.  
<sup>6</sup> AKERS 93B analysis performed using single and dilepton events.

$<3.9 \times 10^{-4}$	1	GROSSMAN	96	RVUE	$e^+e^- \rightarrow Z$

<sup>1</sup>GROSSMAN 96 limit is derived from the ALEPH BUSKULIC 95 limit  $B(B^+ \rightarrow \tau^+ \nu_\tau) < 1.8 \times 10^{-3}$  at CL=90% using conservative simplifying assumptions.

### $\chi_b$ AT HIGH ENERGY

$\chi_b$  is the average  $B\text{--}\bar{B}$  mixing parameter at high-energy  $\chi_b = f_d' \chi_d + f_s' \chi_s$  where  $f_d'$  and  $f_s'$  are the fractions of  $B^0$  and  $B_s^0$  hadrons in an unbiased sample of semileptonic  $b$ -hadron decays. We consider here  $\bar{\chi}$  for hadrons produced in  $Z$  decays.

- The average  $B$  mixing parameter is determined simultaneously with  $b$  and  $c$  forward-backward asymmetries in the fit.
- The experimental systematic and model uncertainties are combined in quadrature.
- ACCIARRI 99d uses maximum-likelihood fits to extract  $\chi_b$  as well as the  $A_{FB}^b$  in  $Z \rightarrow b\bar{b}$  events containing prompt leptons.
- This ABREU 94j result is from 5182  $\ell\ell$  and 279  $\ell\ell$  events. The systematic error includes 0.004 for model dependence.
- BUSKULIC 94g data analyzed using  $ee$ ,  $e\mu$ , and  $\mu\mu$  events.
- BUSKULIC 92b uses a jet charge technique combined with electrons and muons.
- Uses the dimuon charge asymmetry. Averaged over the mix of  $b$ -flavored hadrons.
- Measurement performed using events containing a dimuon or an  $e/\mu$  pair.
- Uses di-muon events.
- ALEXANDER 96 uses a maximum likelihood fit to simultaneously extract  $\chi$  as well as the forward-backward asymmetries in  $e^+e^- \rightarrow Z \rightarrow b\bar{b}$  and  $c\bar{c}$ .
- UENO 96 extracted  $\chi$  from the energy dependence of the forward-backward asymmetry.
- ABREU 94f uses the average electric charge sum of the jets recoiling against a  $b$ -quark jet tagged by a high  $p_T$  muon. The result is for  $\bar{\chi} = f_d\chi_d + 0.9f_s\chi_s$ .
- This ABREU 94j result combines  $\ell\ell$ ,  $\ell\ell$ , and jet-charge  $\ell$  (ABREU 94f) analyses. It is for  $\bar{\chi} = f_d\chi_d + 0.96f_s\chi_s$ .
- ALBAJAR 94 uses dimuon events. Not independent of ALBAJAR 91d.
- ABREU 93c data analyzed using  $ee$ ,  $e\mu$ , and  $\mu\mu$  events.
- AKERS 93b analysis performed using dilepton events.
- ACTON 92c uses electrons and muons. Superseded by AKERS 93b.
- ADEVA 92c uses electrons and muons.
- ABE 91g measurement of  $\chi$  is done with  $e\mu$  and  $ee$  events.
- ALBAJAR 91d measurement of  $\chi$  is done with dimuons.
- DECAMP 91 done with opposite and like-sign dileptons. Superseded by BUSKULIC 92b.
- ADEVA 90p measurement uses  $ee$ ,  $\mu\mu$ , and  $e\mu$  events from 118k events at the Z. Superseded by ADEVA 92c.
- These experiments are not in the average because the combination of  $B_s$  and  $B_d$  mesons which they see could differ from those at higher energy.
- The WEIR 90 measurement supersedes the limit obtained in SCHAAD 85. The 90% CL are 0.06 and 0.38.
- ALBAJAR 87c measured  $\chi = (\bar{B}^0 \rightarrow B^0 \rightarrow \mu^+X)$  divided by the average production weighted semileptonic branching fraction for  $B$  hadrons at 546 and 630 GeV.
- Limit is average probability for hadron containing  $B$  quark to produce a positive lepton.

CP VIOLATION PARAMETERS in semileptonic  $b$ -hadron decays. $Re(\epsilon_b) / (1 + |\epsilon_b|^2)$ CP impurity in semileptonic  $b$ -hadron decays.

VALUE (units $10^{-3}$ )	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •			
$-6.2 \pm 5.2 \pm 4.7$	1 AABOUD	17E	ATLS $pp$ at 8 TeV
$-1.24 \pm 0.38 \pm 0.18$	2 ABAZOV	14	D0 $p\bar{p}$ at 1.96 TeV
$-1.97 \pm 0.43 \pm 0.23$	3 ABAZOV	11u	D0 Repl. by ABAZOV 14
$-2.39 \pm 0.63 \pm 0.37$	4 ABAZOV	10H	D0 Repl. by ABAZOV 11u

- AABOUD 17e reports a measurement of charge asymmetry of  $A_{SL}^b = (-25 \pm 21 \pm 19) \times 10^{-3}$  in lepton + jets  $t\bar{t}$  events in which a  $b$ -hadron decays semileptonically to a soft muon.
- ABAZOV 14 reports a measurement of like-sign dimuon charge asymmetry of  $A_{SL}^b = (-4.96 \pm 1.53 \pm 0.72) \times 10^{-3}$  in semileptonic  $b$ -hadron decays.
- ABAZOV 11u reports a measurement of like-sign dimuon charge asymmetry of  $A_{SL}^b = (-7.87 \pm 1.72 \pm 0.93) \times 10^{-3}$  in semileptonic  $b$ -hadron decays.
- ABAZOV 10H reports a measurement of like-sign dimuon charge asymmetry of  $A_{SL}^b = (-9.57 \pm 2.51 \pm 1.46) \times 10^{-3}$  in semileptonic  $b$ -hadron decays. Using the measured production ratio of  $B_d^0$  and  $B_s^0$ , and the asymmetry of  $B_d^0 A_{SL}^b = (-4.7 \pm 4.6) \times 10^{-3}$  measured from  $B$ -factories, they obtain the asymmetry for  $B_s^0 A_{SL}^b = (-14.6 \pm 7.5) \times 10^{-3}$ .

B-HADRON PRODUCTION FRACTIONS IN  $p\bar{p}$  COLLISIONS AT Tevatron

The production fractions for  $b$ -hadrons in  $p\bar{p}$  collisions at the Tevatron have been calculated from the best values of mean lifetimes, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFLAV) (see <https://hflav.web.cern.ch/>).

The values reported below assume:

$$f(\bar{b} \rightarrow B^+) = f(\bar{b} \rightarrow B^0) \\ f(\bar{b} \rightarrow B^+) + f(\bar{b} \rightarrow B^0) + f(\bar{b} \rightarrow B_s^0) + f(b \rightarrow b\text{-baryon}) = 1$$

The values are:

$$f(\bar{b} \rightarrow B^+) = f(\bar{b} \rightarrow B^0) = 0.344 \pm 0.021 \\ f(\bar{b} \rightarrow B_s^0) = 0.115 \pm 0.013$$

$$f(b \rightarrow b\text{-baryon}) = 0.198 \pm 0.046 \\ f(\bar{b} \rightarrow B_s^0) / f(\bar{b} \rightarrow B^0) = 0.334 \pm 0.041$$

and their correlation coefficients are:

$$\text{cor}(B_s^0, b\text{-baryon}) = -0.429$$

$$\text{cor}(B_s^0, B^+ = B^0) = +0.159$$

$$\text{cor}(b\text{-baryon}, B^+ = B^0) = -0.960$$

as obtained with the Tevatron average of time-integrated mixing parameter

$$\bar{\chi} = 0.147 \pm 0.011.$$

## PRODUCTION ASYMMETRIES

 $A_{FB}^{b\bar{b}}$ 

$$A_{FB}^{b\bar{b}} = [N(\Delta y > 0) - N(\Delta y < 0)] / [N(\Delta y > 0) + N(\Delta y < 0)] \text{ with } \Delta y = |y_b| - |y_{\bar{b}}|$$

where  $y_{b/\bar{b}}$  is rapidity of  $b$  or  $\bar{b}$  quarks.

••• We do not use the following data for averages, fits, limits, etc. •••

- Measured from differential shapes of exclusive  $B \rightarrow D^* \ell^- \nu_\ell$  ( $\ell = e$  or  $\mu$ ) decays. Using CNL form factor parametrization and the zero-recoil lattice QCD point  $F(1) = 0.906 \pm 0.013$  ADACHI 23J finds  $|V_{cb}|_{CNL} = (40.57 \pm 0.31 \pm 0.95 \pm 0.58) \times 10^{-3}$  where the last uncertainty is due to the prediction of  $F(1)$ . Also reports a measurement of  $|V_{cb}|_{BGL} = (40.13 \pm 0.27 \pm 0.93 \pm 0.58) \times 10^{-3}$  using BGL form factors parametrization.
- Measured from differential shapes of exclusive  $B \rightarrow D^* \ell^- \nu_\ell$  decays with hadronic tag-side reconstruction and extracting the CNL and BGL form factor parameters. PRIM 23 finds  $|V_{cb}|_{CNL} = (40.2 \pm 0.9) \times 10^{-3}$  with the zero-recoil lattice QCD point  $F(1) = 0.906 \pm 0.013$ . PRIM 23 provides also a measurement of  $|V_{cb}|_{BGL} = (40.7 \pm 1.0) \times 10^{-3}$ .
- WAHEED 21 uses fully reconstructed  $D^{*-} \ell^+ \nu$  events ( $\ell = e$  or  $\mu$ ) and  $\eta_{EW} = 1.0066$ .
- Obtained from a global fit to  $B \rightarrow D^{*+} \ell \nu_\ell$  events, with reconstructed  $D^0 \ell$  and  $D^+ \ell$  final states and  $\rho^2 = 1.22 \pm 0.02 \pm 0.07$ .
- Measurement using fully reconstructed  $D^*$  sample with a  $\rho^2 = 1.32 \pm 0.15 \pm 0.33$ .
- Average of the  $B^0 \rightarrow D^*(2010)^- \ell^+ \nu$  and  $B^+ \rightarrow \bar{D}^*(2007)^+ \ell^+ \nu$  modes with  $\rho^2 = 1.61 \pm 0.09 \pm 0.21$  and  $f_{+-} = 0.521 \pm 0.012$ .
- ABREU 01H measured using about 5000 partial reconstructed  $D^*$  sample with a  $\rho^2 = 1.34 \pm 0.14 \pm 0.24 \pm 0.22$ .
- ABBIENDI 00Q: measured using both inclusively and exclusively reconstructed  $D^{*\pm}$  samples with a  $\rho^2 = 1.21 \pm 0.12 \pm 0.20$ . The statistical and systematic correlations between  $|V_{cb}| \times F(1)$  and  $\rho^2$  are 0.90 and 0.54 respectively.
- BUSKULIC 97: measured using exclusively reconstructed  $D^{*\pm}$  with a  $a^2 = 0.31 \pm 0.17 \pm 0.08$ . The statistical correlation is 0.92.
- Uses fully reconstructed  $D^{*-} \ell^+ \nu$  events ( $\ell = e$  or  $\mu$ ).
- Measured using the dependence of  $B^- \rightarrow D^{*0} e^- \bar{\nu}_e$  decay differential rate and the form factor description by CAPRINI 98 with  $\rho^2 = 1.16 \pm 0.06 \pm 0.08$ .
- Measured using fully reconstructed  $D^*$  sample and a simultaneous fit to the Caprini-Lellouch-Neubert form factor parameters:  $\rho^2 = 1.191 \pm 0.048 \pm 0.028$ ,  $R_1(1) = 1.429 \pm 0.061 \pm 0.044$ , and  $R_2(1) = 0.827 \pm 0.038 \pm 0.022$ .
- Measurement using fully reconstructed  $D^*$  sample with a  $\rho^2 = 1.29 \pm 0.03 \pm 0.27$ .
- Combines with previous partial reconstructed  $D^*$  measurement with a  $\rho^2 = 1.39 \pm 0.10 \pm 0.33$ .
- Measured using exclusive  $B^0 \rightarrow D^*(892)^- e^+ \nu$  decays with  $\rho^2 = 1.35 \pm 0.17 \pm 0.19$  and a correlation of 0.91.
- BRIERE 02 result is based on the same analysis and data sample reported in ADAM 03.
- ABREU 96P: measured using both inclusively and exclusively reconstructed  $D^{*\pm}$  samples.
- BARISH 95: measured using both exclusive reconstructed  $B^0 \rightarrow D^{*-} \ell^+ \nu$  and  $B^+ \rightarrow D^{*0} \ell^+ \nu$  samples. They report their experiment's uncertainties  $\pm 0.0019 \pm 0.0018 \pm 0.0008$ , where the first error is statistical, the second is systematic, and the third is the uncertainty in the lifetimes. We combine the last two in quadrature.

$V_{cb}$  and  $V_{ub}$  CKM Matrix Elements

OMITTED FROM SUMMARY TABLE

See the related review(s):

Semileptonic  $B$  Hadron Decays, Determination of  $V_{cb}$  and  $V_{ub}$

$V_{cb}$  MEASUREMENTS

For the discussion of  $V_{cb}$  measurements, which is not repeated here, see the review on "Determination of  $|V_{cb}|$  and  $|V_{ub}|$ ."

The CKM matrix element  $|V_{cb}|$  can be determined by studying the rate of the semileptonic decay  $B \rightarrow D^{(*)} \ell \nu$  as a function of the recoil kinematics of  $D^{(*)}$  mesons. Taking advantage of theoretical constraints on the normalization and a linear  $\omega$  dependence of the form factors ( $F(\omega)$ ,  $G(\omega)$ ) provided by Heavy Quark Effective Theory (HQET), the  $|V_{cb}| \times F(\omega)$  and  $\rho^2$  can be simultaneously extracted from data, where  $\omega$  is the scalar product of the two-meson four velocities,  $F(1)$  is the form factor at zero recoil ( $\omega=1$ ) and  $\rho^2$  is the slope. Using the theoretical input of  $F(1)$ , a value of  $|V_{cb}|$  can be obtained.

$|V_{cb}| \times F(1)$  (from  $B^0 \rightarrow D^{*-} \ell^+ \nu$ )

- 1 Obtained from a fit to the combined partially reconstructed  $B \rightarrow \bar{D} \ell \nu_\ell$  sample while tagged by the other fully reconstructed  $B$  meson in the event. Also reports fitted  $\rho^2 = 1.09 \pm 0.05$ .
- 2 Obtained from a fit to the combined  $B \rightarrow \bar{D} \ell^+ \nu_\ell$  sample in which a hadronic decay of the second  $B$  meson is fully reconstructed and  $\rho^2 = 1.20 \pm 0.09 \pm 0.04$ .
- 3 Obtained from a global fit to  $B \rightarrow D^{(*)} \ell \nu_\ell$  events, with reconstructed  $D^0 \ell$  and  $D^+ \ell$  final states and  $\rho^2 = 1.20 \pm 0.04 \pm 0.07$ .
- 4 BARTELT 99: measured using both exclusive reconstructed  $B^0 \rightarrow D^- \ell^+ \nu$  and  $B^+ \rightarrow D^0 \ell^+ \nu$  samples.
- 5 BUSKULIC 97: measured using exclusively reconstructed  $D^\pm$  with a  $a^2 = -0.05 \pm 0.53 \pm 0.38$ . The statistical correlation is 0.99.
- 6 Using the missing energy and momentum to extract kinematic information about the undetected neutrino in the  $B^0 \rightarrow D^- \ell^+ \nu$  decay.
- 7 ATHANAS 97: measured using both exclusive reconstructed  $B^0 \rightarrow D^- \ell^+ \nu$  and  $B^+ \rightarrow D^0 \ell^+ \nu$  samples with a  $\rho^2 = 0.59 \pm 0.22 \pm 0.12^{+0.59}_{-0}$ . They report their experiment's uncertainties  $\pm 0.0044 \pm 0.0048^{+0.0053}_{-0.0012}$ , where the first error is statistical, the second is systematic, and the third is the uncertainty due to the form factor model variations. We combine the last two in quadrature.

### $|V_{cb}|$ (from $D_s^{*-} \mu^+ \nu_\mu$ )

VALUE (units $10^{-3}$ )	DOCUMENT ID	TECN	COMMENT
<b>41.4 ± 0.6 ± 0.9 ± 1.2</b>	1 AAIJ	20E LHCB	$pp$ at 7, 8 TeV

1 Measured from an inclusive sample of  $D_s^{*-} \mu^+$  candidates using CNL parameterization of the form factor. AAIJ 20E provides also measurement of  $|V_{cb}| = (42.3 \pm 0.8 \pm 0.9 \pm 1.2) \times 10^{-3}$  using BGL parameterization of the form factor. The third uncertainty is due to the external inputs used in the measurement.

### $V_{ub}$ MEASUREMENTS

For the discussion of  $V_{ub}$  measurements, which is not repeated here, see the review on "Determination of  $|V_{cb}|$  and  $|V_{ub}|$ ."

The CKM matrix element  $|V_{ub}|$  can be determined by studying the rate of the charmless semileptonic decay  $b \rightarrow u \ell \nu$ . The relevant branching ratio measurements based on exclusive and inclusive decays can be found in the  $B$  Listings, and are not repeated here.

• • • We do not use the following data for averages, fits, limits, etc. • • •

5713 $\pm 2$  <sup>4</sup> ACCIARRI 99N L3  $e^+e^- \rightarrow Z$

<sup>1</sup> AFFOLDER 01F uses the reconstructed  $B$  meson through semileptonic decay channels. The fraction of light  $B$  mesons that are produced at  $L=1$   $B^{**}$  states is measured to be  $0.28 \pm 0.06 \pm 0.03$ .

<sup>2</sup> BARATE 98L uses fully reconstructed  $B$  mesons to search for  $B^{**}$  production in the  $B \pi^\pm$  system. In the framework of heavy quark symmetry (HQSS), they also measured the mass of  $B_2^*$  to be  $5739^{+8+6}_{-11-4}$  MeV/ $c^2$  and the relative production rate of  $B(b \rightarrow B_2^* \rightarrow B^{(*)} \pi)/B(b \rightarrow B_{u,d}) = (31 \pm 9^{+6}_{-5})\%$ .

<sup>3</sup> Using  $m_{B \pi^-} - m_B = 424 \pm 4 \pm 10$  MeV.

<sup>4</sup> ACCIARRI 99N uses inclusive reconstructed  $B$  mesons to search for  $B^{**}$  production in the  $B^{(*)} \pi^\pm$  system. In the framework of HQET, they measured the mass of  $B_1^*$  and  $B_2^*$  to be  $5670 \pm 10 \pm 13$  MeV and  $5768 \pm 5 \pm 6$  with the  $B(b \rightarrow B^{**}) = (32 \pm 3 \pm 6) \times 10^{-2}$ . They also reported the evidence for the existence of an excited  $B$ -meson state or mixture of states in the region 5.9–6.0 GeV.

- 1 Measured using time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi K^+ K^-$  decays.
- 2 Measured using the time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi \phi$  decays.
- 3 Reports a combination of  $0.0657 \pm 0.0043 \pm 0.0037 \text{ ps}^{-1}$  with AAD 16AP.
- 4 Measured using a time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi \phi$  decays with  $J/\psi \rightarrow e^+ e^-$ .
- 5 Reports a combination of  $0.1032 \pm 0.0095 \pm 0.0048 \text{ ps}^{-1}$  with KHACHATRYAN 16s.
- 6 Measured using time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi K^+ K^-$  in the region  $m(KK) > 1.05 \text{ GeV}$ .
- 7 Reports a combination of  $0.066^{+0.041}_{-0.044} \pm 0.007 \text{ ps}^{-1}$  with AAD 14U.
- 8 Measured using time-dependent angular analysis of  $B_s^0 \rightarrow \psi(2S) \phi$  decays.
- 9 The error includes both statistical and systematic uncertainties.
- 10 AAIJ 13AR result comes from a combined fit to  $B_s^0 \rightarrow J/\psi K^+ K^-$  and  $B_s^0 \rightarrow J/\psi \pi^+ \pi^-$  data sets. Also reports  $\Delta\Gamma_s = 0.100 \pm 0.016 \pm 0.003 \text{ ps}^{-1}$  from a fit to  $B_s^0 \rightarrow J/\psi K^+ K^-$  decays.
- 11 Uses the time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi \phi$  decays and assuming CP-violating angle  $\beta_s(B^0 \rightarrow J/\psi \phi) = 0.02$ .
- 12 Measured the angular and lifetime parameters for the time-dependent angular untagged decays  $B_d^0 \rightarrow J/\psi K^{*0}$  and  $B_s^0 \rightarrow J/\psi \phi$ .
- 13 Measured using the time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi \phi$  decays and assuming CP-violating phase  $\phi_s = 0$ .
- 14 Obtains 90% CL interval  $-0.06 < \Delta\Gamma_s < 0.30$ .
- 15 ABAZOV 07 reports  $0.17 \pm 0.09 \pm 0.02$  with CP-violating phase  $\phi_s$  as a free parameter.
- 16 Combines  $D^0$  measurements of time-dependent angular distributions in  $B_s^0 \rightarrow J/\psi \phi$  and charge asymmetry in semileptonic decays. There is a 4-fold ambiguity in the solution.

### $\Delta\Gamma_{B_s^0}/\Gamma_{B_s^0}$

$\Gamma_{B_s^0}$  and  $\Delta\Gamma_{B_s^0}$  are the decay rate average and difference between two  $B_s^0$  CP eigenstates (light - heavy). "OUR EVALUATION" is derived from the averages of  $\Gamma_{B_s^0}$  and  $\Delta\Gamma_{B_s^0}$  (and their correlation).

- Assumes CP violation is negligible.
- Measured using the time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi\phi$  decays.
- Uses the time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi\phi$  decays and assuming CP-violating angle  $\beta_s(B^0 \rightarrow J/\psi\phi) = 0.02$ .
- Measured using fully reconstructed  $B_s \rightarrow J/\psi\phi$  decays.
- Assumes  $2\text{B}(B_s^0 \rightarrow D_s^{(*)} D_s^{(*)}) \approx \Delta\Gamma_s^{CP} / \Gamma_s$ .
- Measured using the time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi\phi$  decays.
- Uses  $|A_0|^2 - |A_{\parallel}|^2 = 0.355 \pm 0.066$  from ACOSTA 05.
- Uses  $D_s^- \ell^+$ , and  $\phi \ell^+$  vertices.
- Measured using  $D_s$  hadron vertices.
- Uses  $\phi\phi$  correlations from  $B_s^0 \rightarrow D_s^{(*)+} D_s^{(*)-}$ .
- ABE 99D assumes  $\tau_{B_s^0} = 1.55 \pm 0.05$  ps.
- ACCIARRI 98S assumes  $\tau_{B_s^0} = 1.49 \pm 0.06$  ps and PDG 98 values of  $b$  production fraction.

## $B_{sH}^0$ MEAN LIFE

$B_{sH}^0$  is the heavy mass state of two  $B_s^0$  CP eigenstates.

- Measured using  $B_s \rightarrow \mu^+ \mu^-$  decays which, in the Standard Model, correspond to  $B_{sH}^0$  decays. Assumes  $-2\text{Re}(\lambda)/(1+|\lambda|^2) = 1$ .
- Measured using  $B_s^0 \rightarrow J/\psi\pi^+\pi^-$  decays with  $0.9240 < m(\pi\pi) < 1.0204$  GeV, which is dominated by the  $f_0(980)$  resonance, making it a CP-odd state.
- Measured using  $J/\psi\pi^+\pi^-$  mode with  $0.880 < m(\pi\pi) < 1.080$  GeV/ $c^2$ , which is mostly  $J/\psi f(0)(980)$  mode, a pure CP-odd final state.
- Measured using a pure CP-odd final state  $J/\psi K_S^0$  with the assumption that contributions from penguin diagrams are small.
- Measured using  $B_s \rightarrow J/\psi\pi^+\pi^-$  decays which, in the limit of  $\phi_s = 0$  and  $|\lambda| = 1$ , correspond to  $B_{sH}^0$  decays.
- Measured using a pure CP-odd final state  $J/\psi f_0(980)$ .
- Uses the time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi\phi$  decays assuming CP-violating angle  $\beta_s(B^0 \rightarrow J/\psi\phi) = 0.02$ .
- Obtained from  $\Delta\Gamma_s$  and  $\Gamma_s$  fit with a correlation of 0.6.
- Measured using the time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi\phi$  decays.

## $B_{sL}^0$ MEAN LIFE

$B_{sL}^0$  is the light mass state of two  $B_s^0$  CP eigenstates.

<sup>1</sup> Measured in  $B_s^0 \rightarrow J/\psi \pi^+ \pi^-$  decays.

 $B_s^0$  DECAY MODES

These branching fractions all scale with  $B(\bar{B} \rightarrow B_s^0)$ .

The branching fraction  $B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything})$  is not a pure measurement since the measured product branching fraction  $B(\bar{B} \rightarrow B_s^0) \times B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything})$  was used to determine  $B(\bar{B} \rightarrow B_s^0)$ , as described in the note on " $B^0$ - $\bar{B}^0$  Mixing"

For inclusive branching fractions, e.g.,  $B \rightarrow D^\pm \text{ anything}$ , the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level
$\Gamma_1$ $D_s^-$ anything	(62 ± 6) %	
$\Gamma_2$ $D_s^\pm$ anything	(92 ± 11) %	
$\Gamma_3$ $D^0/\bar{D}^0$ anything	(38 ± 10) %	
$\Gamma_4$ $\ell \nu_\ell X$	(9.6 ± 0.8) %	
$\Gamma_5$ $e^+ \nu X^-$	(9.1 ± 0.8) %	
$\Gamma_6$ $\mu^+ \nu X^-$	(10.2 ± 1.0) %	
$\Gamma_7$ $D_s^- \ell^+ \nu_\ell$ anything	[a] (8.1 ± 1.3) %	
$\Gamma_8$ $D_s^- \ell^+ \nu_\ell$ anything	(5.4 ± 1.1) %

- [a] Not a pure measurement. See note at head of  $B_s^0$  Decay Modes.  
 [b] Here S and P are the hypothetical scalar and pseudoscalar particles with masses of 2.5 GeV/c<sup>2</sup> and 214.3 MeV/c<sup>2</sup>, respectively.  
 [c] The value is for the sum of the charge states or particle/antiparticle states indicated.

## FIT INFORMATION

An overall fit to 12 branching ratios uses 20 measurements to determine 7 parameters. The overall fit has a  $\chi^2 = 27.0$  for 13 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

0.81 ± 0.24 ± 0.22	3 BUSKULIC 96E ALEP $e^+ e^- \rightarrow Z$
1.56 ± 0.58 ± 0.44	4 ACTON 92N OPAL $e^+ e^- \rightarrow Z$

<sup>1</sup> WANG 22 selects the  $B_s$  events by tagging the accompanying  $B_s$  via partial reconstruction of the semileptonic decays  $B_s \rightarrow D_s X \ell^+ \nu$ .

<sup>2</sup> The extraction of this result takes into account the correlation between the measurements of  $B(\Upsilon(5S) \rightarrow D_s X)$  and  $B(\Upsilon(5S) \rightarrow D^0 X)$ .

<sup>3</sup> BUSKULIC 96E separate  $c\bar{c}$  and  $b\bar{b}$  sources of  $D_s^+$  mesons using a lifetime tag, subtract generic  $\bar{b} \rightarrow W^+ \rightarrow D_s^+$  events, and obtain  $B(\bar{b} \rightarrow B_s^0) \times B(B_s^0 \rightarrow D_s^- \text{ anything}) = 0.088 \pm 0.020 \pm 0.020$  assuming  $B(D_s \rightarrow \phi\pi) = (3.5 \pm 0.4) \times 10^{-2}$  and PDG 1994 values for the relative partial widths to other  $D_s$  channels. We evaluate using our current values  $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$  and  $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$ . Our first error is their experiment's and our second error is that due to  $B(\bar{b} \rightarrow B_s^0)$  and  $B(D_s \rightarrow \phi\pi)$ .

<sup>4</sup> ACTON 92N assume that excess of  $147 \pm 48 D_s^0$  events over that expected from  $B^0, B^+,$  and  $c\bar{c}$  is all from  $B_s^0$  decay. The product branching fraction is measured to be  $B(\bar{b} \rightarrow B_s^0) B(B_s^0 \rightarrow D_s^- \text{ anything}) \times B(D_s^- \rightarrow \phi\pi^-) = (5.9 \pm 1.9 \pm 1.1) \times 10^{-3}$ . We evaluate using our current values  $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$  and  $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$ . Our first error is their experiment's and our second error is that due to  $B(\bar{b} \rightarrow B_s^0)$  and  $B(D_s \rightarrow \phi\pi)$ .

<sup>1</sup> The measurement corresponds to the average of the electron and muon branching fractions.

<sup>2</sup> The measurement corresponds to a branching fraction where the lepton originates from bottom decay and is the average between the electron and muon branching fractions. LEES 12A uses the correlation of the production of  $\phi$  mesons in association with a lepton in  $e^+ e^-$  data taken at center-of-mass energies between 10.54 and 11.2 GeV.

The values and averages in this section serve only to show what values result if one assumes our  $B(\bar{b} \rightarrow B_s^0)$ . They cannot be thought of as measurements since the underlying product branching fractions were also used to determine  $B(\bar{b} \rightarrow B_s^0)$  as described in the note on "Production and Decay of b-Flavored Hadrons."

••• We do not use the following data for averages, fits, limits, etc. •••

<sup>1</sup> Obtains  $B_s \rightarrow D_s X e \nu$ , and  $D_s X \mu \nu$  separately, then combines them by assuming systematic uncertainties are fully correlated, except for the one on lepton identification. The third uncertainty adds in quadrature systematic uncertainties from external sources (number of  $B_s$  events, and  $D_s^{(*)}$  branching fractions). OSWALD 15 also measures the cross-section  $\sigma(e^+ e^- \rightarrow B_s^{(*)} \bar{B}_s^{(*)}) = 53.8 \pm 1.4 \pm 5.3$  pb at  $\sqrt{s} = 10.86$  GeV.

<sup>2</sup> BUSKULIC 95O use  $D_s \ell$  correlations. The measured product branching ratio is  $B(\bar{b} \rightarrow B_s) \times B(B_s \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) = (0.82 \pm 0.09^{+0.13}_{-0.14})\%$  assuming  $B(D_s \rightarrow \phi\pi) = (3.5 \pm 0.4) \times 10^{-2}$  and PDG 1994 values for the relative partial widths to the six other  $D_s$  channels used in this analysis. Combined with results from  $\Upsilon(4S)$  experiments this can be used to extract  $B(\bar{b} \rightarrow B_s) = (11.0 \pm 1.2^{+2.2}_{-2.6})\%$ . We evaluate using our current values  $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$  and  $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$ . Our first error is their experiment's and our second error is that due to  $B(\bar{b} \rightarrow B_s^0)$  and  $B(D_s \rightarrow \phi\pi)$ .

<sup>3</sup> ABREU 92M measured muons only and obtained product branching ratio  $B(Z \rightarrow bor \bar{b}) \times B(\bar{b} \rightarrow B_s) \times B(B_s \rightarrow D_s \mu^+ \nu_\mu \text{ anything}) \times B(D_s \rightarrow \phi\pi) = (18 \pm 8) \times 10^{-5}$ . We evaluate using our current values  $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$  and  $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$ . Our first error is their experiment's and our second error is that due to  $B(\bar{b} \rightarrow B_s^0)$  and  $B(D_s \rightarrow \phi\pi)$ . We use  $B(Z \rightarrow bor \bar{b}) = 2B(Z \rightarrow b \bar{b}) = 2 \times (0.2212 \pm 0.0019)$ .

<sup>4</sup> ACTON 92N is measured using  $D_s \rightarrow \phi\pi^+$  and  $K^*(892)^0 K^+$  events. The product branching fraction measured is measured to be  $B(\bar{b} \rightarrow B_s^0) B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) \times B(D_s^- \rightarrow \phi\pi^-) = (3.9 \pm 1.1 \pm 0.8) \times 10^{-4}$ . We evaluate using our current values

$B(\bar{D} \rightarrow B_s^0) = 0.107 \pm 0.014$  and  $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$ . Our first error is their experiment's and our second error is that due to  $B(\bar{D} \rightarrow B_s^0)$  and  $B(D_s \rightarrow \phi\pi)$ .

<sup>5</sup> BUSKULIC 92E is measured using  $D_s \rightarrow \phi\pi^+$  and  $K^*(892)^0 K^+$  events. They use  $2.7 \pm 0.7\%$  for the  $\phi\pi^+$  branching fraction. The average product branching fraction is measured to be  $B(\bar{D} \rightarrow B_s^0)B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) = 0.020 \pm 0.0055_{-0.006}^{+0.005}$ . We evaluate using our current values  $B(\bar{D} \rightarrow B_s^0) = 0.107 \pm 0.014$  and  $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$ . Our first error is their experiment's and our second error is that due to  $B(\bar{D} \rightarrow B_s^0)$  and  $B(D_s \rightarrow \phi\pi)$ . Superseded by BUSKULIC 950.

1 AAIJ 16P reports  $[\Gamma(B_S^0 \rightarrow D_S^{(*)+} D_S^{(*)-})/\Gamma_{\text{total}}] / [B(B^0 \rightarrow D^- D_S^+)] = 4.24 \pm 0.14 \pm 0.27$  which we multiply by our best value  $B(B^0 \rightarrow D^- D_S^+) = (7.2 \pm 0.8) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

2 Use  $\mathcal{T}(5S) \rightarrow B_S^* \bar{B}_S^*$  decays assuming  $B(\mathcal{T}(5S) \rightarrow B_S^* \bar{B}_S^*) = (17.1 \pm 3.0)\%$  and  $\Gamma(\mathcal{T}(5S) \rightarrow B_S^* \bar{B}_S^*) / \Gamma(\mathcal{T}(5S) \rightarrow B_S^{(*)+} \bar{B}_S^{(*)-}) = (87.0 \pm 1.7)\%$ .

3 AALTONEN 12c reports  $(f_S/f_d) (B(B_S^0 \rightarrow D_S^{(*)+} D_S^{(*)-}) / B(B^0 \rightarrow D^- D_S^+)) = 1.261 \pm 0.095 \pm 0.112$ . We multiply this result by our best value of  $B(B^0 \rightarrow D^- D_S^+) = (7.2 \pm 0.8) \times 10^{-3}$  and divide by our best value of  $f_S/f_d$ , where  $1/2 f_S/f_d = 0.1230 \pm 0.0115$ . Our first quoted uncertainty is the combined experiment's uncertainty and our second is the systematic uncertainty from using our best values.

4 Uses the final states where  $D_S^+ \rightarrow \phi \pi^+$  and  $D_S^- \rightarrow \phi \mu^- \bar{\nu}_\mu$ .

5 Reports  $B(B_S^0(\text{short}) \rightarrow D_S^{(*)+} D_S^{(*)-}) = (0.23 \pm 0.10 \pm 0.05) \cdot [0.17/B(D_S \rightarrow \phi \chi)]^2$  assuming  $B(B_S^0 \rightarrow B^0(\text{short})) = 50\%$ . We use our best value of  $B(D_S \rightarrow \phi \chi) = 15.7 \pm 1.0\%$  to obtain the quoted result.

6 Uses  $\phi\phi$  correlations from  $B_S^0(\text{short}) \rightarrow D_S^{(*)+} D_S^{(*)-}$ .

7 Sum of exclusive  $B_S \rightarrow D_S^+ D_S^-$ ,  $B_S \rightarrow D_S^{\pm} D_S^{\mp}$  and  $B_S \rightarrow D_S^{*+} D_S^{*-}$ .

8 Uses  $\mathcal{T}(10860) \rightarrow B_S^* \bar{B}_S^*$  assuming  $B(\mathcal{T}(10860) \rightarrow B_S^{(*)+} \bar{B}_S^{(*)-}) = (19.3 \pm 2.9)\%$  and  $\Gamma(\mathcal{T}(10860) \rightarrow B_S^* \bar{B}_S^*) / \Gamma(\mathcal{T}(10860) \rightarrow B_S^{(*)+} \bar{B}_S^{(*)-}) = (90.1^{+3.8}_{-4.0})\%$ .

## POLARIZATION IN $B_s^0$ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ( $L$ ), or both are transverse and parallel ( $\parallel$ ), or perpendicular ( $\perp$ ) to each other with the parameters  $\Gamma_L/\Gamma$ ,  $\Gamma_\perp/\Gamma$ , and the relative phases  $\phi_\parallel$  and  $\phi_\perp$ . In decays involving two tensor mesons, the transverse polarization states are described by parameters  $\Gamma_{\parallel 1}$ ,  $\Gamma_{\parallel 2}$ ,  $\Gamma_{\perp 1}$ ,  $\Gamma_{\perp 2}$  and their relative phases  $\phi_{\parallel 1}$ ,  $\phi_{\parallel 2}$ ,  $\phi_{\perp 1}$ ,  $\phi_{\perp 2}$ . See also the review on "Polarization in  $B$  Decays."

 $B_s^0$ - $\bar{B}_s^0$  MIXING

For a discussion of  $B_s^0$ - $\bar{B}_s^0$  mixing see the note on " $B^0$ - $\bar{B}^0$  Mixing" in the  $B^0$  Particle Listings above.

$x_s$  is a measure of the time-integrated  $B_s^0$ - $\bar{B}_s^0$  mixing probability that produced  $B_s^0$  ( $\bar{B}_s^0$ ) decays as a  $\bar{B}_s^0$  ( $B_s^0$ ). Mixing violates  $\Delta B \neq 2$  rule.

$$x_s = \frac{x_s^2}{2(1+x_s^2)}$$

$$x_s = \frac{\Delta m_{B_s^0}}{\Gamma_{B_s^0}} = (m_{B_{sH}^0} - m_{B_{sL}^0}) \tau_{B_s^0}$$

where  $H, L$  stand for heavy and light states of two  $B_s^0$  CP eigenstates and

$$\tau_{B_s^0} = \frac{1}{0.5(\Gamma_{B_{sH}^0} + \Gamma_{B_{sL}^0})}$$

 $\Delta m_{B_s^0} = m_{B_{sH}^0} - m_{B_{sL}^0}$ 

$\Delta m_{B_s^0}$  is a measure of  $2\pi$  times the  $B_s^0$ - $\bar{B}_s^0$  oscillation frequency in time-dependent mixing experiments.

- 1 Measured using time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi K^+ K^-$  decays.
- 2 Measured using  $B_s^0 \rightarrow D_s^- \pi^+$  decays.
- 3 Measured using  $B_s^0 \rightarrow D_s^- \pi^+ \pi^- \pi^+$  decays.
- 4 Measured using time-dependent angular analysis of  $B_s^0 \rightarrow J/\psi \phi$  decays.
- 5 Measured using  $B_s^0 \rightarrow D_s^- \mu^+ \nu_\mu X$  decays.
- 6 Significance of oscillation signal is  $5.4 \sigma$ . Also reports  $|V_{td} / V_{ts}| = 0.2060 \pm 0.0007^{+0.0081}_{-0.0060}$ .
- 7 Measured using  $B_s^0 \rightarrow D_s^- \pi^+$  and  $D_s^- \pi^+ \pi^- \pi^+$  decays.
- 8 A likelihood scan over the oscillation frequency,  $\Delta m_s$ , gives a most probable value of  $19 \text{ ps}^{-1}$  and a range of  $17 < \Delta m_s < 21 (\text{ps}^{-1})$  at 90% C.L. assuming Gaussian uncertainties. Also excludes  $\Delta m_s < 14.8 \text{ ps}^{-1}$  at 95% C.L.
- 9 Significance of oscillation signal is 0.2%. Also reported the value  $|V_{td} / V_{ts}| = 0.208^{+0.001+0.008}_{-0.002-0.006}$ .
- 10 Uses leptons emitted with large momentum transverse to a jet and improved techniques for vertexing and flavor-tagging.
- 11 Updates of  $D_s$ -lepton analysis.
- 12 Combined results from all Delphi analyses.
- 13 Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.
- 14 ABE 03 uses the novel "charge dipole" technique to reconstruct separate secondary and tertiary vertices originating from the  $B \rightarrow D$  decay chain. The analysis excludes  $\Delta m_s < 4.9 \text{ ps}^{-1}$  and  $7.9 < \Delta m_s < 10.3 \text{ ps}^{-1}$ .
- 15 Three analyses based on complementary event selections: (1) fully-reconstructed hadronic decays; (2) semileptonic decays with  $D_s$  exclusively reconstructed; (3) inclusive semileptonic decays.
- 16 ABE 02v uses exclusively reconstructed  $D_s^-$  mesons and excludes  $\Delta m_s < 1.4 \text{ ps}^{-1}$  and  $2.4 < \Delta m_s < 5.3 \text{ ps}^{-1}$  at 95% C.L.
- 17 Uses fully or partially reconstructed  $D_s \ell$  vertices and a mixing tag as a flavor tagging.
- 18 Replaced by ABDALLAH 04A. Uses  $D_s^- \ell^+$ , and  $\phi \ell^+$  vertices, and a multi-variable discriminant as a flavor tagging.
- 19 Uses inclusive  $D_s$  vertices and fully reconstructed  $B_s$  decays and a multi-variable discriminant as a flavor tagging.
- 20 Uses  $\ell$ - $Q_{\text{hem}}$  and  $\ell$ - $\ell$ .
- 21 ABE 99D assumes  $\tau_{B_s^0} = 1.55 \pm 0.05 \text{ ps}$  and  $\Delta\Gamma/\Delta m = (5.6 \pm 2.6) \times 10^{-3}$ .
- 22 ABE 99i uses  $\phi$ - $\ell$  correlation.
- 23 BARATE 99j uses combination of an inclusive lepton and  $D_s^-$ -based analyses.
- 24 BARATE 98c combines results from  $D_s h\ell/Q_{\text{hem}}$ ,  $D_s h\ell$  in the same side,  $D_s \ell/Q_{\text{hem}}$  and  $D_s \ell$ - $K$  in the same side.
- 25 Uses  $\ell$ - $Q_{\text{hem}}$ .
- 26 Uses  $\ell$ - $\ell$ .
- 27 ADAM 97 combines results from  $D_s \ell$ - $Q_{\text{hem}}$ ,  $\ell$ - $Q_{\text{hem}}$ , and  $\ell$ - $\ell$ .
- 28 BUSKULIC 96M uses  $D_s$  lepton correlations and lepton, kaon, and jet charge tags.
- 29 BUSKULIC 95j uses  $\ell$ - $Q_{\text{hem}}$ . They find  $\Delta m_s > 5.6$  [ $> 6.1$ ] for  $f_s = 10\%$  [12%]. We interpolate to our central value  $f_s = 10.5\%$ .

$x_s = \Delta m_{B_s^0} / \Gamma_{B_s^0}$   
 Derived from the results on  $\Delta m_{B_s^0}$  and "OUR EVALUATION" of the  $B_s^0$  mean lifetime.

$3_{-20}^{+19}$  <sup>2</sup> AAIJ 14Bf LHCb Repl. by AAIJ 18U

<sup>1</sup> Measured in  $B_S^0 \rightarrow D_s^\mp K^\pm$  decays, constraining  $-2\beta_S$  by the measurement of  $\phi_S = 0.030 \pm 0.033$  from HFLAV. The value is modulo  $180^\circ$ .

<sup>2</sup> Measured in  $B_S^0 \rightarrow D_s^\mp K^\pm$  decays, constraining  $-2\beta_S$  by the measurement of  $\phi_S = 0.01 \pm 0.07 \pm 0.0$  from AAIJ 13AR. The value is modulo  $180^\circ$  at 68% CL.

$\delta_B(B_S^0 \rightarrow D_s^\pm K^\mp \pi^\pm \pi^\mp)$	DOCUMENT ID	TECN	COMMENT
VALUE (°) $-6_{-12-4}^{+10+2}$	1,2 AAIJ	21M LHCb	$pp$ at 7, 8, 13 TeV

<sup>1</sup> Measured in restricted phase space with  $m(K^+\pi^+\pi^-) < 1950$  MeV,  $m(K^+\pi^-) < 1200$  MeV and  $m(\pi^+\pi^-) < 1200$  MeV. The value is modulo  $180^\circ$ .

<sup>2</sup> A model-independent coherence factor for the decay  $B_S \rightarrow D_s K \pi \pi$  (in the restricted phase space region) is also reported.

CP Violation phase  $\beta_s$  ( $b \rightarrow c\bar{c}s$ )

$-2\beta_s$  is the weak phase difference between  $B_S^0$  mixing amplitude and the  $B_S^0 \rightarrow J/\psi\phi$  decay amplitude driven by the  $b \rightarrow c\bar{c}s$  transition (such as  $B_S \rightarrow J/\psi\phi$ ,  $J/\psi K^+ K^-$ ,  $J/\psi\pi^+\pi^-$ , and  $D_s^+ D_s^-$ ). The Standard Model value of  $\beta_s$  is  $\arg(-\frac{V_{ts}V_{cb}^*}{V_{cs}V_{cb}^*})$  if penguin contributions are neglected.

<sup>1</sup> AAIJ 19Q reports  $\phi_S = -2\beta_S = -0.039 \pm 0.022 \pm 0.006$  rad. measured using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi K^+ K^-$  decays.

<sup>2</sup> Reports a combination of  $0.0435 \pm 0.0180 \pm 0.0105$  with AAD 16AP.

<sup>3</sup> AAD 21AE measured  $\phi_S = -2\beta_S = -0.087 \pm 0.036 \pm 0.021$  rad. using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi\phi$  decays.

<sup>4</sup> AAIJ 21AN measured  $\phi_S = -2\beta_S = 0.00 \pm 0.28 \pm 0.07$  rad, using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi\phi$  decays with  $J/\psi \rightarrow e^+e^-$ .

<sup>5</sup> Reports a combination of  $0.0105 \pm 0.0220 \pm 0.0050$  with KHACHATRYAN 16s.

<sup>6</sup> SIRUNYAN 21E measured  $\phi_S = -2\beta_S = -0.021 \pm 0.044 \pm 0.010$  rad. using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi\phi$  decays.

<sup>7</sup> Reports a combination of  $-0.001 \pm 0.022 \pm 0.006$  with AAIJ 14S.

<sup>8</sup> AAIJ 19AF reports  $\phi_S = -2\beta_S = 0.002 \pm 0.044 \pm 0.012$  rad. and  $|\lambda| = 0.949 \pm 0.036 \pm 0.019$ , when direct CP violation is allowed. Measured using a time-dependent fit to  $B_S^0 \rightarrow J/\psi\pi^+\pi^-$  decays.

<sup>9</sup> Measured  $\phi_S = -2\beta_S = 0.119 \pm 0.107 \pm 0.034$  rad using time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi K^+ K^-$  in the region  $m(KK) > 1.05$  GeV.

<sup>10</sup> Reports a combination of  $0.0435 \pm 0.0180 \pm 0.0105$  with AAD 14U.

<sup>11</sup> AAD 16AP reports  $\phi_S = -2\beta_S = -0.090 \pm 0.078 \pm 0.041$  rad. that was measured using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi\phi$  decays.

<sup>12</sup> AAIJ 16AK reports  $\phi_S = -2\beta_S = 0.23_{-0.28}^{+0.29} \pm 0.02$  rad. that was measured using a time-dependent angular analysis of  $B_S^0 \rightarrow \psi(2S)\phi$  decays.

<sup>13</sup> KHACHATRYAN 16s reports  $\phi_S = -2\beta_S = -0.075 \pm 0.097 \pm 0.031$  rad. that was measured using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi\phi$  decays.

<sup>14</sup> AAIJ 15I reports  $\phi_S = -2\beta_S = -0.058 \pm 0.049 \pm 0.006$  rad. that was measured using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi K^+ K^-$  decays. It also combines this result with that of AAIJ 14S and quotes  $\phi_S = -2\beta_S = -0.010 \pm 0.039$  rad.

<sup>15</sup> AAD 14U reports  $\phi_S = -2\beta_S = 0.12 \pm 0.25 \pm 0.05$  rad. that was measured using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi\phi$  decays.

<sup>16</sup> AAIJ 14AY reports  $\phi_S = -2\beta_S = 0.02 \pm 0.17 \pm 0.02$  rad. in a time-dependent fit to  $B_S^0 \rightarrow D_s^+ D_s^-$ , while allowing CP violation in decay.

<sup>17</sup> AAIJ 14S reports  $\phi_S = -2\beta_S = 0.070 \pm 0.068 \pm 0.008$  rad. and  $|\lambda| = 0.89 \pm 0.05 \pm 0.01$ , when direct CP violation is allowed. Measured using a time-dependent fit to  $B_S^0 \rightarrow J/\psi\pi^+\pi^-$  decays.

<sup>18</sup> AALTONEN 12AJ reports  $-\pi/2 < \beta_S < -1.51$  or  $-0.06 < \beta_S < 0.30$ , or  $1.26 < \beta_S < \pi/2$  rad. at 68% CL. Measured using the time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi\phi$  decays.

<sup>19</sup> ABAZOV 12D reports  $\phi_S = -2\beta_S = -0.55_{-0.36}^{+0.38}$  rad. that was measured using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi\phi$  decays. A single error includes both statistical and systematic uncertainties.

<sup>20</sup> AAIJ 19Q reports  $\phi_S = -2\beta_S = -0.083 \pm 0.041 \pm 0.006$  rad. that was measured using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi K^+ K^-$  decays.

<sup>21</sup> AAIJ 18S reports  $\phi_S = -2\beta_S = -0.10 \pm 0.13 \pm 0.14$  rad measured in  $B_S^0 \rightarrow (K^+\pi^-)(K^-\pi^+)$  in the region  $0.75 < m(K^\pm\pi^\mp) < 1.6$  GeV. This is a  $b \rightarrow d\bar{d}s$  transition with a decay amplitude phase different from that of  $b \rightarrow c\bar{c}s$  transition.

<sup>22</sup> AAIJ 15K reports  $-2\beta_S = -0.12_{-0.16}^{+0.14}$  rad. The value was obtained by measuring time-dependent CP asymmetry in  $B_S^0 \rightarrow K^+ K^-$  and using a U-spin relation between  $B_S^0 \rightarrow K^+ K^-$  and  $B^0 \rightarrow \pi^+ \pi^-$ .

<sup>23</sup> Results are also presented using additional inputs on  $B^0 \rightarrow \pi^0\pi^0$  and  $B^+ \rightarrow \pi^+\pi^0$  decays from other experiments and isospin symmetry assumptions. The dependence of the results on the maximum allowed amount of U-spin breaking up to 50% is also included.

<sup>24</sup> AAIJ 13AR reports  $\phi_S = -2\beta_S = 0.01 \pm 0.07 \pm 0.01$  rad. obtained from combined fit to  $B_S^0 \rightarrow J/\psi K^+ K^-$  and  $B_S^0 \rightarrow J/\psi\pi^+\pi^-$  data sets. Also reports separate results of  $\phi_S = 0.07 \pm 0.09 \pm 0.01$  rad. from  $B_S^0 \rightarrow J/\psi K^+ K^-$  decays and  $\phi_S = -0.14_{-0.16}^{+0.17} \pm 0.01$  rad. from  $B_S^0 \rightarrow J/\psi\pi^+\pi^-$  decays.

<sup>25</sup> AAD 12CV reports  $\phi_S = -2\beta_S = 0.22 \pm 0.41 \pm 0.10$  rad. that was measured using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi\phi$  decays.

<sup>26</sup> Reports  $\phi_S = -2\beta_S = -0.44 \pm 0.44 \pm 0.02$  rad. that was measured using a time-dependent fit to  $B_S^0 \rightarrow J/\psi\eta(980)$  decays.

<sup>27</sup> Reports  $\phi_S = -2\beta_S = 0.15 \pm 0.18 \pm 0.06$  rad. that was measured using a time-dependent angular analysis of  $B_S^0 \rightarrow J/\psi\phi$  decays.

<sup>28</sup> Reports  $\phi_S = -2\beta_S = -0.019_{-0.174-0.003}^{+0.173+0.004}$  rad. which was measured using a time-dependent fit to  $B_S^0 \rightarrow J/\psi\pi^+\pi^-$  decays, with the  $\pi^+\pi^-$  mass within 775–1550 MeV. Searches for, but finds no evidence, for direct CP violation in  $B_S^0 \rightarrow J/\psi\pi\pi$  decays.

<sup>29</sup> Reports  $0.02 < \phi_S < 0.52$  or  $1.08 < \phi_S < 1.55$  rad. at 68% C.L. confidence regions in the two-dimensional space of  $\phi_S$  and  $\Delta\Gamma_{B_S^0}$  from  $B_S^0 \rightarrow J/\psi\phi$  decays.

<sup>30</sup> Reports  $0.32 < 2\beta_S < 2.82$  rad. at 68% C.L. and confidence regions in the two-dimensional space of  $2\beta_S$  and  $\Delta\Gamma$  from the first measurement of  $B_S^0 \rightarrow J/\psi\phi$  decays using flavor tagging. The probability of a deviation from SM prediction as large as the level of observed data is 15%.

<sup>31</sup> Reports  $\phi_S = -2\beta_S$  and obtains 90% CL interval  $-0.03 < \beta_S < 0.60$  rad.

<sup>32</sup> The first direct measurement of the CP-violating mixing phase is reported from the time-dependent analysis of flavor untagged  $B_S^0 \rightarrow J/\psi\phi$  decays.

<sup>33</sup> Reports  $\phi_S$  which equals to  $-2\beta_S$ .

<sup>34</sup> Combines D0 collaboration measurements of time-dependent angular distributions in  $B_S^0 \rightarrow J/\psi\phi$  and charge asymmetry in semileptonic decays. There is a 4-fold ambiguity in the solution.

CP Violation phase  $\beta_s$  ( $b \rightarrow s\bar{s}s$ )

VALUE	DOCUMENT ID	TECN	COMMENT
<b>-0.049 ± 0.096 ± 0.025</b>	AAIJ	15AV	LHCB $pp$ at 7, 8 TeV

## $A_{CP}(B_S \rightarrow \pi^+ K^-)$

$A_{CP}$  is defined as

$$\frac{B(\bar{B}_S^0 \rightarrow f) - B(B_S^0 \rightarrow \bar{f})}{B(\bar{B}_S^0 \rightarrow f) + B(B_S^0 \rightarrow \bar{f})}$$

the  $CP$ -violation asymmetry of exclusive  $B_S^0$  and  $\bar{B}_S^0$  decay.

VALUE	DOCUMENT ID	TECN	COMMENT
<b>0.43 ± 0.30 ± 0.11</b>	<sup>1</sup> AAIJ	19AE	LHCB $pp$ at 7, 8 TeV

<sup>1</sup> Measured in flavor tagged time dependent analysis.

## $C(B_S^0 \rightarrow \phi\gamma)$

VALUE	DOCUMENT ID	TECN	COMMENT
<b>0.11 ± 0.29 ± 0.11</b>	<sup>1</sup> AAIJ	19AE	LHCB $pp$ at 7, 8 TeV

<sup>1</sup> Measured in flavor tagged time dependent analysis.

## $A^\Delta(B_S^0 \rightarrow \phi\gamma)$

$A^\Delta(B_S \rightarrow \phi\gamma)$  is the multiplicative coefficient of the  $\sinh(\Delta\Gamma t/2)$  term in the  $B_S \rightarrow \phi\gamma$  decay rate time dependence.

VALUE	DOCUMENT ID	TECN	COMMENT
<b>-0.67<sup>+0.37</sup><sub>-0.41</sub> ± 0.17</b>	<sup>1</sup> AAIJ	19AE	LHCB $pp$ at 7, 8 TeV

## $B_S^0$

### CPT VIOLATION PARAMETERS

In the  $B_S^0$  mixing, propagating mass eigenstates can be written as

$$|B_{SL}\rangle \propto p \sqrt{1-\xi} |B_S^0\rangle + q \sqrt{1+\xi} |\bar{B}_S^0\rangle$$

$$|B_{SH}\rangle \propto p \sqrt{1+\xi} |B_S^0\rangle - q \sqrt{1-\xi} |\bar{B}_S^0\rangle$$

where parameter  $\xi$  controls  $CPT$  violation. If  $\xi$  is zero, then  $CPT$  is conserved. The parameter  $\xi$  can be written as

$$\xi = \frac{2(M_{11}-M_{22})-i(\Gamma_{11}-\Gamma_{22})}{-2\Delta m_S+i\Delta\Gamma_S} \approx \frac{-2\beta^H \Delta a_\mu}{2\Delta m_S-i\Delta\Gamma_S},$$

where  $M_{ii}$ ,  $\Gamma_{ii}$ ,  $\Delta m_S$ , and  $\Delta\Gamma_S$  are parameters of Hamiltonian governing  $B_S$  oscillations,  $\beta^H$  is the  $B_S^0$  meson velocity and  $\Delta a_\mu$  characterizes Lorentz-invariance violation.

0.46 $^{+0.18}_{-0.16}$ ± 0.03	<sup>5</sup> ABE	98M CDF	$p\bar{p}$ 1.8 TeV

- <sup>1</sup> The lifetime is measured using the decays  $B_c^+ \rightarrow J/\psi\pi^+$  and  $B^+ \rightarrow J/\psi K^+$ .
- <sup>2</sup> Also measures the width difference  $\Delta\Gamma = \Gamma_{B_c^+} - \Gamma_{B^+} = 4.46 \pm 0.14 \pm 0.07$   $\text{mm}^{-1}c$ .
- <sup>3</sup> Uses fully reconstructed  $B_c^+ \rightarrow J/\psi\pi^+$  decays.
- <sup>4</sup> Measured using  $B_c^+ \rightarrow J/\psi\mu^+\nu_\mu X$  decays.
- <sup>5</sup> The lifetime is measured from the  $J/\psi e$  decay vertices.

$B_c^+$  DECAY MODES  $\times B(\bar{b} \rightarrow B_c)$

The following quantities are not pure branching ratios; rather the fractions  $\Gamma_i/\Gamma \times B(\bar{b} \rightarrow B_c)$ .  $B_c^-$  modes are charge conjugates of the modes below.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Confidence level

VALUE (units $10^{-5}$ )	CL%	DOCUMENT ID	TECN	COMMENT
<b>8.2 ± 1.3 OUR AVERAGE</b>		Error includes scale factor of 1.4.		
$8.8 \pm 1.0 \pm 0.2$		<sup>1,2</sup> AALTONEN	16A CDF	$p\bar{p}$ at 1.96 TeV
$5.2^{+2.4}_{-2.1}$		<sup>3</sup> ABE	98M CDF	$p\bar{p}$ 1.8 TeV
• • • We do not use the following data for averages, fits, limits, etc. • • •				
$< 16$	90	<sup>4</sup> ACKERSTAFF	98O OPAL	$e^+e^- \rightarrow Z$
$< 19$	90	<sup>5</sup> ABREU	97E DLPH	$e^+e^- \rightarrow Z$
$< 12$	90	<sup>6</sup> BARATE	97H ALEP	$e^+e^- \rightarrow Z$

- <sup>1</sup> AALTONEN 16A reports  $[\Gamma(B_c^+ \rightarrow J/\psi(1S)\ell^+\nu_\ell \text{ anything})/\Gamma_{\text{total}} \times B(\bar{b} \rightarrow B_c)] / [B(\bar{b} \rightarrow B^+)] / [B(B^+ \rightarrow J/\psi(1S)K^+)] = 0.211 \pm 0.012^{+0.021}_{-0.020}$  which we multiply by our best values  $B(\bar{b} \rightarrow B^+) = (40.8 \pm 0.7) \times 10^{-2}$ ,  $B(B^+ \rightarrow J/\psi(1S)K^+) = (1.020 \pm 0.019) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>2</sup> AALTONEN 16A also measures the cross-section  $\sigma(B_c) \times B(B_c \rightarrow J/\psi\mu\nu_\mu) = 0.60 \pm 0.09$  nb and estimates the total cross-section  $\sigma(B_c)$  to be in the range  $25 \pm 4$  to  $52 \pm 8$  nb for  $p_T(B_c) > 6$  GeV/ $c$  and  $|y(B_c)| < 1$ .
- <sup>3</sup> ABE 98M result is derived from the measurement of  $[\sigma(B_c) \times B(B_c \rightarrow J/\psi(1S)\ell\nu_\ell)] / [\sigma(B^+) \times B(B^+ \rightarrow J/\psi(1S)K^+)] = 0.132^{+0.041}_{-0.037}(\text{stat}) \pm 0.031(\text{sys}) \pm 0.032(\text{lifetime})$  by using PDG 98 values of  $B(b \rightarrow B^+)$  and  $B(B^+ \rightarrow J/\psi(1S)K^+)$ .

## Meson Particle Listings

 $B_c^+$ 

<sup>4</sup>ACKERSTAFF 98o reports  $B(Z \rightarrow B_c X)/B(Z \rightarrow qq) \times B(B_c \rightarrow J/\psi(1S) \ell \nu_\ell) < 6.95 \times 10^{-5}$  at 90%CL. We rescale to our PDG 98 values of  $B(Z \rightarrow b\bar{b})$ .

<sup>5</sup>ABREU 97E value listed is for an assumed  $\tau_{B_c} = 0.4$  ps and improves to  $1.6 \times 10^{-4}$  for  $\tau_{B_c} = 1.4$  ps.

<sup>6</sup>BARATE 97H reports  $B(Z \rightarrow B_c X)/B(Z \rightarrow qq) \times B(B_c \rightarrow J/\psi(1S) \ell \nu_\ell) < 5.2 \times 10^{-5}$  at 90%CL. We rescale to our PDG 96 values of  $B(Z \rightarrow b\bar{b})$ . A  $B_c^+ \rightarrow J/\psi(1S) \mu^+ \nu_\mu$  candidate event is found, compared to all the known background sources  $2 \times 10^{-3}$ , which gives  $m_{B_c} = 5.96^{+0.25}_{-0.19}$  GeV and  $\tau_{B_c} = 1.77 \pm 0.17$  ps.

$\Gamma(J/\psi(1S) \tau^+ \nu_\tau) / \Gamma(J/\psi(1S) \mu^+ \nu_\mu)$   $\Gamma_3 / \Gamma_2$

$91 \pm 10 \pm 8.5$	<sup>1</sup> AAIJ	23M LHCb	$pp$ at 13 TeV

<sup>1</sup> The  $B_s^0$  mesons are reconstructed via the decays  $B_s^0 \rightarrow J/\psi \phi$  and  $B_s^0 \rightarrow D_s^- \pi^+$ . The third uncertainty includes systematic ( $\pm 8$ ) and imprecise knowledge of the branching fractions ( $\pm 3$ ).

**POLARIZATION IN  $B_c^+$  DECAY**

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ( $L$ ) or both are transverse and parallel ( $\parallel$ ) or perpendicular ( $\perp$ ) to each other with the parameters  $\Gamma_L/\Gamma$ ,  $\Gamma_\perp/\Gamma$ , and the relative phases  $\phi_\parallel$  and  $\phi_\perp$ . See the definitions in the note on "Polarization in  $B$  Decays" review in the  $B^0$  Particle Listings.

Spectroscopy of Mesons Containing Two Heavy Quarks

# Meson Particle Listings

## Charmonium, $\eta_c(1S)$

### $c\bar{c}$ MESONS (including possibly non- $q\bar{q}$ states)

Updated March 2024.

The level scheme of meson states containing a minimal quark content of  $c\bar{c}$  and having  $S = C = B = 0$ . The name of a state is determined by its quantum numbers  $I^G J^{PC}$  (see the review “Naming Scheme for Hadrons”). States included in the Summary Tables are shown with solid lines; selected states not in the Summary Tables, but with assigned quantum numbers, are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including  $\psi(nS) \rightarrow \gamma\eta_c(mS)$ ,  $\psi(nS) \rightarrow \gamma\chi_{cJ}(1P)$ , and  $\chi_{cJ}(1P) \rightarrow \gamma J/\psi$ , are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open charm mesons is indicated in the figure. The  $J^P$  of  $T_{cc}(4020)$  is not established. Decays to open flavour final states are not shown in the figure.

### $\eta_c(1S)$

$$I^G(J^{PC}) = 0^+(0^{-+})$$

1 AAIJ 20H report  $m_{J/\psi} - m_{\eta_c(1S)} = 113.0 \pm 0.7 \pm 0.1$  MeV. We use the current value  $m_{J/\psi} = 3096.900 \pm 0.006$  MeV to obtain the quoted mass.

2 AAIJ 17AD report  $m_{J/\psi} - m_{\eta_c(1S)} = 110.2 \pm 0.5 \pm 0.9$  MeV. We use the current value  $m_{J/\psi} = 3096.900 \pm 0.006$  MeV to obtain the quoted mass.

3 From a fit of the  $\phi\phi$  invariant mass with the mass and width of  $\eta_c(1S)$  as free parameters.

4 AAIJ 15BI reports  $m_{J/\psi} - m_{\eta_c(1S)} = 114.7 \pm 1.5 \pm 0.1$  MeV from a sample of  $\eta_c(1S)$  and  $J/\psi$  produced in  $b$ -hadron decays. We have used current value of  $m_{J/\psi} = 3096.900 \pm 0.006$  MeV to arrive at the quoted  $m_{\eta_c(1S)}$  result.

5 Taking into account an asymmetric photon lineshape.

6 With floating width.

7 Ignoring possible interference with the non-resonant  $0^-$  amplitude.

8 Using both,  $\eta \rightarrow \gamma\gamma$  and  $\eta \rightarrow \pi^+\pi^-\pi^0$  decays.

9 From a simultaneous fit to six decay modes of the  $\eta_c$ .

10 Accounts for interference with non-resonant continuum.

11 Taking into account interference with the non-resonant  $J^P = 0^-$  amplitude.

12 From a fit of the  $J/\psi$  recoil mass spectrum. Supersedes ABE,K 02 and ABE 04G.

13 Using mass of  $\psi(2S) = 3686.00$  MeV.

14 Not independent from the measurements reported by LEES 10.

15 MITCHELL 09 observes a significant asymmetry in the lineshapes of  $\psi(2S) \rightarrow \gamma\eta_c$  and  $J/\psi \rightarrow \gamma\eta_c$  transitions. If ignored, this asymmetry could lead to significant bias whenever the mass and width are measured in  $\psi(2S)$  or  $J/\psi$  radiative decays.

16 From the fit of the kaon momentum spectrum. Systematic errors not evaluated.

17 Superseded by LEES 10.

18 From a simultaneous fit of five decay modes of the  $\eta_c$ .

19 Superseded by VINOKUROVA 11.

20 Weighted average of the  $\psi(2S)$  and  $J/\psi(1S)$  samples. Using an  $\eta_c$  width of 13.2 MeV.

21 Average of several decay modes. Using an  $\eta_c$  width of 13.2 MeV.

22 Superseded by ASNER 04.

23 Average of several decay modes.

24  $\eta_c \rightarrow \phi\phi$ .

25 Mass adjusted by us to correspond to  $J/\psi(1S)$  mass = 3097 MeV.

See key on page 1171

FIT INFORMATION

A multiparticle fit to  $\eta_c(1S)$ ,  $J/\psi(1S)$ ,  $\psi(2S)$ ,  $h_c(1P)$ , and  $B^\pm$  with the total width, 10 combinations of partial widths obtained from integrated cross section, and 38 branching ratios uses 113 measurements to determine 19 parameters. The overall fit has a  $\chi^2 = 184.6$  for 94 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

<sup>1</sup> ABLIKIM 19AP quotes  $B(\eta_c \rightarrow K^+K^-\pi^0) = (1.15 \pm 0.12 \pm 0.10) \times 10^{-2}$  which we multiply by 6 to account for isospin symmetry.

<sup>2</sup> ABLIKIM 19AP quotes  $B(\eta_c \rightarrow K_S^0 K^\pm \pi^\mp) = (2.60 \pm 0.21 \pm 0.20) \times 10^{-2}$  which we multiply by 3 to account for isospin symmetry.

<sup>3</sup> ABLIKIM 12N quotes  $B(\psi(2S) \rightarrow \pi^0 h_c) \cdot B(h_c \rightarrow \gamma\eta_c) \cdot B(\eta_c \rightarrow K^+K^-\pi^0) = (4.54 \pm 0.76 \pm 0.48) \times 10^{-6}$  which we multiply by 6 to account for isospin symmetry.

<sup>4</sup> ABLIKIM 12N reports  $[\Gamma(\eta_c(1S) \rightarrow K\bar{K}\pi)/\Gamma_{total}] \times [B(\psi(2S) \rightarrow h_c(1P)\pi^0)] \times [B(h_c(1P) \rightarrow \gamma\eta_c(1S))] = (27.24 \pm 4.56 \pm 2.88) \times 10^{-6}$  which we divide by our best values  $B(\psi(2S) \rightarrow h_c(1P)\pi^0) = (7.4 \pm 0.5) \times 10^{-4}$ ,  $B(h_c(1P) \rightarrow \gamma\eta_c(1S)) = (60 \pm 4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.

<sup>5</sup> ABLIKIM 12N quotes  $B(\psi(2S) \rightarrow \pi^0 h_c) \cdot B(h_c \rightarrow \gamma\eta_c) \cdot B(\eta_c \rightarrow K_S^0 K^\pm \pi^\mp) = (11.35 \pm 1.25 \pm 1.50) \times 10^{-6}$  which we multiply by 3 to account for isospin symmetry.

<sup>6</sup> ABLIKIM 12N reports  $[\Gamma(\eta_c(1S) \rightarrow K\bar{K}\pi)/\Gamma_{total}] \times [B(\psi(2S) \rightarrow h_c(1P)\pi^0)] \times [B(h_c(1P) \rightarrow \gamma\eta_c(1S))] = (34.05 \pm 3.75 \pm 4.50) \times 10^{-6}$  which we divide by our best values  $B(\psi(2S) \rightarrow h_c(1P)\pi^0) = (7.4 \pm 0.5) \times 10^{-4}$ ,  $B(h_c(1P) \rightarrow \gamma\eta_c(1S)) = (60 \pm 4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.

<sup>7</sup> Determined from the ratio of  $B(B^\pm \rightarrow K^\pm \eta_c) \cdot B(\eta_c \rightarrow K\bar{K}\pi) = (7.4 \pm 0.5 \pm 0.7) \times 10^{-5}$  reported in AUBERT, B 04B and  $B(B^\pm \rightarrow K^\pm \eta_c) = (8.7 \pm 1.5) \times 10^{-3}$  reported in AUBERT 06E.

<sup>8</sup> BAI 04 reports  $B(J/\psi \rightarrow \gamma\eta_c) \cdot B(\eta_c \rightarrow K^\pm K_S^0 \pi^\mp) = (2.2 \pm 0.3 \pm 0.5) \times 10^{-4}$  which we multiply by 3 to account for isospin symmetry.

<sup>9</sup> BAI 04 reports  $[\Gamma(\eta_c(1S) \rightarrow K\bar{K}\pi)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow \gamma\eta_c(1S))] = (6.6 \pm 0.9 \pm 1.5) \times 10^{-4}$  which we divide by our best value  $B(J/\psi(1S) \rightarrow \gamma\eta_c(1S)) = (1.41 \pm 0.14) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>10</sup> BISELLO 91 reports  $[\Gamma(\eta_c(1S) \rightarrow K\bar{K}\pi)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow \gamma\eta_c(1S))] = (8.76 \pm 1.80 \pm 1.68) \times 10^{-4}$  which we divide by our best value  $B(J/\psi(1S) \rightarrow \gamma\eta_c(1S)) = (1.41 \pm 0.14) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>11</sup> BISELLO 91 reports  $B(J/\psi \rightarrow \gamma\eta_c) \cdot B(\eta_c \rightarrow K^+K^-\pi^0) = (1.46 \pm 0.30 \pm 0.28) \times 10^{-4}$  which we multiply by 6 to account for isospin symmetry.

<sup>12</sup> BISELLO 91 reports  $[\Gamma(\eta_c(1S) \rightarrow K\bar{K}\pi)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow \gamma\eta_c(1S))] = (6.9 \pm 1.2 \pm 1.2) \times 10^{-4}$  which we divide by our best value  $B(J/\psi(1S) \rightarrow \gamma\eta_c(1S)) = (1.41 \pm 0.14) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>13</sup> BISELLO 91 reports  $B(J/\psi \rightarrow \gamma\eta_c) \cdot B(\eta_c \rightarrow K^\pm K_S^0 \pi^\mp) = (2.3 \pm 0.4 \pm 0.4) \times 10^{-4}$  which we multiply by 3 to account for isospin symmetry.

<sup>14</sup> Average from  $K^+K^-\pi^0$  and  $K^\pm K_S^0 \pi^\mp$  decay channels.

<sup>15</sup> The quoted branching ratios use  $B(J/\psi(1S) \rightarrow \gamma\eta_c(1S)) = 0.0127 \pm 0.0036$ . Where relevant, the error in this branching ratio is treated as a common systematic in computing averages.

<sup>16</sup> BALTRUSAITIS 86 reports  $[\Gamma(\eta_c(1S) \rightarrow K\bar{K}\pi)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow \gamma\eta_c(1S))] = (7.8 \pm 3.0) \times 10^{-4}$  which we divide by our best value  $B(J/\psi(1S) \rightarrow \gamma\eta_c(1S)) = (1.41 \pm 0.14) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>17</sup> BALTRUSAITIS 86 reports  $B(J/\psi \rightarrow \gamma\eta_c) \cdot B(\eta_c \rightarrow K^+K^-\pi^0) = (1.3 \pm 0.5) \times 10^{-4}$  which we multiply by 6 to account for isospin symmetry.

<sup>18</sup> BALTRUSAITIS 86 reports  $[\Gamma(\eta_c(1S) \rightarrow K\bar{K}\pi)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow \gamma\eta_c(1S))] = (5.7 \pm 1.5) \times 10^{-4}$  which we divide by our best value  $B(J/\psi(1S) \rightarrow \gamma\eta_c(1S)) = (1.41 \pm 0.14) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>19</sup> BALTRUSAITIS 86 reports  $B(J/\psi \rightarrow \gamma\eta_c) \cdot B(\eta_c \rightarrow K^\pm K_S^0 \pi^\mp) = (1.9 \pm 0.5) \times 10^{-4}$  which we multiply by 3 to account for isospin symmetry.

<sup>20</sup> HIMEL 80B reports  $[\Gamma(\eta_c(1S) \rightarrow K\bar{K}\pi)/\Gamma_{total}] \times [B(\psi(2S) \rightarrow \gamma\eta_c(1S))] = (4.5 \pm 2.4 \pm 1.8) \times 10^{-4}$  which we divide by our best value  $B(\psi(2S) \rightarrow \gamma\eta_c(1S)) = (3.6 \pm 0.5) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

3097.0 ± 1		<sup>6</sup> BRANDELIC	79C DASP	$e^+e^-$

- <sup>1</sup> Supersedes AULCHENKO 03.
- <sup>2</sup> Reanalysis of ZHOLENTZ 80 using new electron mass (COHEN 87) and radiative corrections (KURAEV 85).
- <sup>3</sup> Mass central value and systematic error recalculated by us according to Eq. (16) in ARMSTRONG 93B, using the value for the  $\psi(2S)$  mass from AULCHENKO 03.
- <sup>4</sup> From a sample of  $\eta_c(1S)$  and  $J/\psi$  produced in  $b$ -hadron decays. Systematic uncertainties not estimated.
- <sup>5</sup> Superseded by ARTAMONOV 00.
- <sup>6</sup> From a simultaneous fit to  $e^+e^-$ ,  $\mu^+\mu^-$  and hadronic channels assuming  $\Gamma(e^+e^-) = \Gamma(\mu^+\mu^-)$ .

## $J/\psi(1S)$

### $J/\psi(1S)$ WIDTH

VALUE (keV)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>92.6 ± 1.7 OUR AVERAGE</b>		Error includes scale factor of 1.1.		
92.45 ± 1.40 ± 1.48		1 ANASHIN	20 KEDR	$e^+e^-$
96.1 ± 3.2	13k	2 ADAMS	06A CLEO	$e^+e^- \rightarrow \mu^+\mu^-\gamma$
84.4 ± 8.9		BAI	95B BES	$e^+e^-$
91 ± 11 ± 6		3 ARMSTRONG	93B E760	$\bar{p}p \rightarrow e^+e^-$
85.5 + 6.1 - 5.8		4 HSUEH	92 RVUE	See $\Upsilon$ mini-review
• • • We do not use the following data for averages, fits, limits, etc. • • •				
92.94 ± 1.83		5,6 ANASHIN	18A KEDR	$e^+e^-$
94.1 ± 2.7		7 ANASHIN	10 KEDR	3.097 $e^+e^- \rightarrow e^+e^-, \mu^+\mu^-$
93.7 ± 3.5	7.8k	2 AUBERT	04 BABR	$e^+e^- \rightarrow \mu^+\mu^-\gamma$

1 Based on the same dataset as ANASHIN 18A and correlated to the values reported there  
 2 Calculated by us from the reported values of  $\Gamma(e^+e^-) \times B(\mu^+\mu^-)$  using  $B(e^+e^-) = (5.94 \pm 0.06)\%$  and  $B(\mu^+\mu^-) = (5.93 \pm 0.06)\%$ .  
 3 The initial-state radiation correction reevaluated by ANDREOTTI 07 in its Ref. [4].  
 4 Using data from COFFMAN 92, BALDINI-CELIO 75, BOYARSKI 75, ESPOSITO 75B, BRANDELIK 79c.  
 5 Using  $\Gamma(e^+e^-)$  from ANASHIN 18A and  $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032)\%$  from PDG 16.  
 6 Superseded by ANASHIN 20 that is based on the same dataset.  
 7 Assuming  $\Gamma(e^+e^-) = \Gamma(\mu^+\mu^-)$  and using  $\Gamma(e^+e^-)/\Gamma_{\text{total}} = (5.94 \pm 0.06)\%$ .

----------------	-----------	-----	------------------	--------

- [a] For  $E_\gamma > 100$  MeV.
- [b] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [c]  $\Theta(1540)$  is a hypothetical pentaquark state of 1.54 GeV/c<sup>2</sup> mass and a width of less than 25 MeV/c<sup>2</sup>.
- [d] Includes  $p\bar{p}\pi^+\pi^-\gamma$  and excludes  $p\bar{p}\eta, p\bar{p}\omega, p\bar{p}\eta'$ .
- [e] For a narrow state  $A$  with mass less than 960 MeV.
- [f] For a narrow scalar or pseudoscalar  $A^0$  with mass 0.21–3.0 GeV.
- [g] For a dark photon  $U$  with mass between 100 and 2100 MeV.

### FIT INFORMATION

A multiparticle fit to  $\eta_c(1S), J/\psi(1S), \psi(2S), h_c(1P)$ , and  $B^\pm$  with the total width, 10 combinations of partial widths obtained from integrated cross section, and 38 branching ratios uses 113 measurements to determine 19 parameters. The overall fit has a  $\chi^2 = 184.6$  for 94 degrees of freedom.

<sup>1</sup> By a simultaneous fit of the  $\pi\pi$  invariant mass distribution over the decay modes  $J/\psi \rightarrow \rho^0 \pi^0, J/\psi \rightarrow \rho^+ \pi^-, J/\psi \rightarrow \rho^- \pi^+$ . In the fit only the intermediate states  $\rho(770) \pi$  and  $\rho(1450) \pi$  are considered.  
<sup>2</sup> From the ratio of  $\Gamma(e^+ e^-) B(\pi^+ \pi^- \pi^0)$  and  $\Gamma(e^+ e^-) B(\mu^+ \mu^-)$  (AUBERT 04).  
<sup>3</sup> Not independent of their  $B(\pi^+ \pi^- \pi^0)$ .  
<sup>4</sup> From  $J/\psi \rightarrow \pi^+ \pi^- \pi^0$  events directly.  
<sup>5</sup> Obtained comparing the rates for  $\pi^+ \pi^- \pi^0$  and  $\mu^+ \mu^-$ , using  $J/\psi$  events produced via  $\psi(2S) \rightarrow \pi^+ \pi^- J/\psi$  and with  $B(J/\psi \rightarrow \mu^+ \mu^-) = 5.88 \pm 0.10\%$ .

15 ± 2	168	FRANKLIN	83	MRK2 $e^+e^-$	

<sup>1</sup> By a simultaneous fit of the  $\pi\pi$  invariant mass distribution over the decay modes  $J/\psi \rightarrow \rho^0\pi^0$ ,  $J/\psi \rightarrow \rho^+\pi^-$ ,  $J/\psi \rightarrow \rho^-\pi^+$ . In the fit only the intermediate states  $\rho(770)\pi$  and  $\rho(1450)\pi$  are considered.

<sup>2</sup> The quoted systematic error includes a contribution of 1.23% (added in quadrature) from the uncertainty on the number of  $J/\psi$  events.

<sup>3</sup> AUBERT 07AU reports  $[\Gamma(J/\psi(1S) \rightarrow \pi^+\pi^-\pi^0)/\Gamma_{total}] \times [\Gamma(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \rightarrow e^+e^-)]/\Gamma_{total} = (18.6 \pm 1.2 \pm 1.1) \times 10^{-3}$  keV which we divide by our best value  $\Gamma(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \rightarrow e^+e^-)/\Gamma_{total} = 0.808 \pm 0.014$  keV. Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> From  $J/\psi \rightarrow \pi^+\pi^-\pi^0$  events directly.

<sup>5</sup> Mostly  $\rho\pi$ , see also  $\rho\pi$  subsection.

<sup>6</sup> Obtained comparing the rates for  $\pi^+\pi^-\pi^0$  and  $\mu^+\mu^-$ , using  $J/\psi$  events produced via  $\psi(2S) \rightarrow \pi^+\pi^-J/\psi$  and with  $B(J/\psi \rightarrow \mu^+\mu^-) = 5.88 \pm 0.10\%$ .

-------------------------------------	------	----------------------	----------	---

<sup>1</sup>From a fit of the measured  $\pi^+\pi^-\eta'$  lineshape that accounts for the abrupt distortion observed at the  $p\bar{p}$  threshold with a Flatté formula in addition to known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner ( $M \approx 1919$  MeV;  $\Gamma \approx 51$  MeV) that is required for a good fit. Another explanation for the distortion provided by ABLIKIM 16j is that a second resonance near 1870 MeV interferes with the  $X(1835)$ ; fits to this possibility yield product branching fraction values compatible with that shown within the respective systematic uncertainties.<sup>2</sup>From a fit of the  $\pi^+\pi^-\eta'$  mass distribution to a combination of  $\gamma f_1(1510)$ ,  $\gamma X(1835)$ , and two states  $\gamma X(2120)$  and  $\gamma X(2370)$ , for  $M(\pi^+\pi^-\eta') < 2.8$  GeV, and accounting for backgrounds from non- $\eta'$  events and  $J/\psi \rightarrow \pi^0 \pi^+\pi^-\eta'$ . $\Gamma(\gamma X(1835) \rightarrow \gamma \rho\bar{\rho})/\Gamma_{\text{total}}$   $\Gamma_{342}/\Gamma$

BRANCHING RATIOS OF  $\psi(2S)$ ,  $\chi_{c0,1,2}$  AND  $\eta_c$ 

Updated March 2024 by J.J. Hernández-Rey (IFIC, Valencia), R. Mitchell (Indiana U.), S. Navas (U. of Granada), and C. Patrignani (Bologna Univ., INFN)

Since 2002, the treatment of the branching ratios of the  $\psi(2S)$  and  $\chi_{c0,1,2}$  has undergone an important restructuring. Since the 2023 online edition, the  $\eta_c(1S)$  is now treated in a similar way (see the end of this note).

When measuring a branching ratio experimentally, it is not always possible to normalize the number of events observed in the corresponding decay mode to the total number of particles produced. Therefore, the experimenters sometimes report the number of observed decays with respect to another decay mode of the same or another particle in the relevant decay chain. This is actually equivalent to measuring combinations of branching fractions of several decay modes.

To extract the branching ratio of a given decay mode, the collaborations use some previously reported measurements of the required branching ratios. However, the values are frequently taken from the *Review of Particle Physics* (RPP), which in turn uses the branching ratio reported by the experiment in the following edition, giving rise either to correlations or to plain vicious circles, as discussed in more detail in earlier editions of this review [1,2].

The way to avoid these dependencies and correlations is to extract the branching ratios through a fit that uses the truly measured combinations of branching fractions and partial widths. This fit, in fact, should involve decays from the four concerned particles,  $\psi(2S)$ ,  $\chi_{c0}$ ,  $\chi_{c1}$ , and  $\chi_{c2}$ , and occasionally some combinations of branching ratios of more than one of them. This is what is done since the 2002 edition [3].

The PDG policy is to quote the results of the collaborations in a manner as close as possible to what appears in their original publications. However, in order to avoid the problems mentioned above, we had in some cases to work out the values originally measured, using the number of events and detection efficiencies given by the collaborations, or rescaling back the published results. The information was sometimes spread over several articles, and some articles referred to papers still unpublished, which in turn contained the relevant numbers in footnotes.

Even though the experimental collaborations are entitled to extract whatever branching ratios they consider appropriate by using other published results, we would like to encourage them to also quote explicitly in their articles the actual quantities measured, so that they can be used directly in averages and fits of different experimental determinations.

To inform the reader how we computed some of the values used in this edition of RPP, we use footnotes to indicate the branching ratios actually given by the experiments and the quantities they use to derive them from the true combination of branching ratios actually measured.

None of the branching ratios of the  $\chi_{c0,1,2}$  are measured independently of the  $\psi(2S)$  radiative decays. We tried to identify those branching ratios which can be correlated in a non-trivial

See key on page 1171

## Branching Ratios of $\psi$ 's and $\chi$ 's, $\chi_{c0}(1P)$

way, and although we cannot preclude the existence of other cases, we are confident that the most relevant correlations have already been removed. Nevertheless, correlations in the errors of different quantities measured by the same experiment have not been taken into account.

The  $\eta_c(1S)$  can be produced in  $\gamma\gamma$  collisions, in the radiative decays of vector and axial-vector charmonia ( $J/\psi$ ,  $\psi(2S)$  and  $h_c(1P)$ ) or in B meson decays. As for the  $\psi(2S)$  and  $\chi_{c0,1,2}$ , correlations can be introduced if the derived branching ratios are not properly extracted. We now obtain the corresponding branching ratios using the products of branching ratios originally measured by the experiments, sometimes among different particles (cross-particle branching ratios) and performing an overall fit. In some cases, we were obliged to infer the original product from the information given by the collaborations. However, for recent experiments our policy is not to use anymore extracted branching ratios, so that if the original measured quantity is missing in the relevant publication, the value will not be used in our averages and fits.

### 1. Fit Information for the $\psi(2S)$ and $\chi_{c0,1,2}$

This is an overall fit to 4 total widths, 1 partial width, 25 combinations of partial widths, 10 branching fractions, and 76 branching ratios or combinations thereof. Of the latter, 58 involve decays of more than one particle.

The overall fit uses 253 measurements to determine 49 parameters and gives a  $\chi^2$  of 389.6 for 204 degrees of freedom. We have applied scaling factors in the final errors of the fitted values following the procedure described in section 5.2.3 of our Introduction. After rescaling, the total  $\chi^2$  is 149.6.

In the listing we provide the inter-particle correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the corresponding parameter  $x_i$ .

### 2. Fit Information for the $\eta_c(1S)$

This is an overall fit to 1 total width, 10 combinations of partial widths, 6 branching fractions and 32 branching ratios or combinations thereof. Of the latter, 31 involve decays of more than one particle.

The overall fit uses 113 measurements to determine 19 parameters and has a  $\chi^2$  of 184.6 for 94 degrees of freedom. We have applied scaling factors in the final errors of the fitted values following the procedure described in section 5.2.3 of our Introduction. After rescaling, the total  $\chi^2$  is 74.1.

In the listing we provide the inter-particle correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the corresponding parameter  $x_i$ .

## CONSTRAINED FIT INFORMATION

A multiparticle fit to  $\chi_{c1}(1P)$ ,  $\chi_{c0}(1P)$ ,  $\chi_{c2}(1P)$ , and  $\psi(2S)$  with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 86 branching ratios uses 253 measurements to determine 49 parameters. The overall fit has a  $\chi^2 = 389.6$  for 204 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

- We do not use the following data for averages, fits, limits, etc. •••
- <sup>1</sup> From a fit of the  $\phi\phi$  invariant mass with the width of  $\chi_{c1}(1P)$  fixed to the PDG 16 value.
- <sup>2</sup> AAIJ 17BI reports also  $m(\chi_{c2}) - m(\chi_{c1}) = 45.39 \pm 0.07 \pm 0.03$  MeV.
- <sup>3</sup> Recalculated by ANDREOTTI 05A, using the value of  $\psi(2S)$  mass from AULCHENKO 03.
- <sup>4</sup> Using mass of  $\psi(2S) = 3686.0$  MeV.
- <sup>5</sup>  $J/\psi(1S)$  mass constrained to 3097 MeV.
- <sup>6</sup> Mass value shifted by us by amount appropriate for  $\psi(2S)$  mass = 3686 MeV and  $J/\psi(1S)$  mass = 3097 MeV.
- <sup>7</sup> From a simultaneous fit to radiative and hadronic decay channels.

### CONSTRAINED FIT INFORMATION

A multiparticle fit to  $\chi_{c1}(1P)$ ,  $\chi_{c0}(1P)$ ,  $\chi_{c2}(1P)$ , and  $\psi(2S)$  with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 86 branching ratios uses 253 measurements to determine 49 parameters. The overall fit has a  $\chi^2 = 389.6$  for 204 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

$x_{48}$	4				
$x_{58}$	-1	0

<sup>1</sup> Combination of exclusive and inclusive analyses for the reaction  $\psi(2S) \rightarrow \pi^0\eta_c \rightarrow \pi^0\eta_c\gamma$ . This result is the average of DOBBS 08A and ROSNER 05.

<sup>2</sup> Superseded by ABLIKIM 22AQ

<sup>3</sup> With floating width.

<sup>4</sup> Superseded by DOBBS 08A.

<sup>5</sup> Mass central value and systematic error recalculated by us according to Eq. (16) in ARMSTRONG 93B, using the value for the  $\psi(2S)$  mass from AULCHENKO 03.

FIT INFORMATION

A multiparticle fit to  $\eta_c(1S)$ ,  $J/\psi(1S)$ ,  $\psi(2S)$ ,  $h_c(1P)$ , and  $B^\pm$  with the total width, 10 combinations of partial widths obtained from integrated cross section, and 38 branching ratios uses 113 measurements to determine 19 parameters. The overall fit has a  $\chi^2 = 184.6$  for 94 degrees of freedom.

<sup>1</sup> From a fit of the  $\phi\phi$  invariant mass with the width of  $\chi_{c2}(1P)$  fixed to the PDG 16 value.

<sup>2</sup> AAIJ 17Bi reports also  $m(\chi_{c2}) - m(\chi_{c1}) = 45.39 \pm 0.07 \pm 0.03$  MeV.

<sup>3</sup> Recalculated by ANDREOTTI 05A, using the value of  $\psi(2S)$  mass from AULCHENKO 03.

<sup>4</sup> Using mass of  $\psi(2S) = 3686.0$  MeV.

<sup>5</sup>  $J/\psi(1S)$  mass constrained to 3097 MeV.

<sup>6</sup> Assuming  $\psi(2S)$  mass = 3686 MeV and  $J/\psi(1S)$  mass = 3097 MeV.

<sup>7</sup> Mass value shifted by us by amount appropriate for  $\psi(2S)$  mass = 3686 MeV and  $J/\psi(1S)$  mass = 3097 MeV.

<sup>8</sup> From a simultaneous fit to radiative and hadronic decay channels.

CONSTRAINED FIT INFORMATION

A multiparticle fit to  $\chi_{c1}(1P)$ ,  $\chi_{c0}(1P)$ ,  $\chi_{c2}(1P)$ , and  $\psi(2S)$  with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 86 branching ratios uses 253 measurements to determine 49 parameters. The overall fit has a  $\chi^2 = 389.6$  for 204 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{total}$ .

## $\psi(2S)$

$$I^G(J^{PC}) = 0^-(1^{--})$$

See the Review on "Branching Ratios of  $\psi(2S)$ ,  $\chi_{c0,1,2}$  and  $\eta_c(1S)$ " before the  $\chi_{c0}(1P)$  Listings.

### $\psi(2S)$ MASS

OUR FIT includes measurements of  $m_{\psi(2S)}$ ,  $m_{\psi(3770)}$ , and  $m_{\psi(3770)} - m_{\psi(2S)}$ .

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>3686.097 ± 0.011 OUR FIT</b>	Error includes scale factor of 1.1.			
<b>3686.097 ± 0.010 OUR AVERAGE</b>				
3686.099 ± 0.004 ± 0.009		<sup>1</sup> ANASHIN 15	KEDR	$e^+e^- \rightarrow$ hadrons
3686.12 ± 0.06 ± 0.10	4k	AAIJ	12H LHCB	$p\bar{p} \rightarrow J/\psi \pi^+ \pi^- X$
3685.95 ± 0.10	413	<sup>2</sup> ARTAMONOV 00	OLYA	$e^+e^- \rightarrow$ hadrons
3685.98 ± 0.09 ± 0.04		<sup>3</sup> ARMSTRONG 93B	E760	$\bar{p}p \rightarrow e^+e^-$
3686.08 ± 0.07	1301	<sup>4</sup> AAIJ	23AP LHCB	$B_s^0 \rightarrow J/\psi 2(\pi^+ \pi^-)$
3686.114 ± 0.007 ± 0.011 -0.016		<sup>5</sup> ANASHIN 12	KEDR	$e^+e^- \rightarrow$ hadrons
3686.111 ± 0.025 ± 0.009		AULCHENKO 03	KEDR	$e^+e^- \rightarrow$ hadrons
3686.00 ± 0.10	413	<sup>6</sup> ZHOLENTZ 80	OLYA	$e^+e^-$

- <sup>1</sup> Supersedes AULCHENKO 03 and ANASHIN 12.
- <sup>2</sup> Reanalysis of ZHOLENTZ 80 using new electron mass (COHEN 87) and radiative corrections (KURAEV 85).
- <sup>3</sup> Mass central value and systematic error recalculated by us according to Eq. (16) in ARMSTRONG 93B, using the value for the  $J/\psi(1S)$  mass from AULCHENKO 03.
- <sup>4</sup> From a fit of a relativistic S-wave Breit-Wigner convolved with the detector resolution. The width of  $\psi(2S)$  is constrained to the PDG 22 value. Systematic errors not evaluated.

- <sup>5</sup> From the scans in 2004 and 2006. ANASHIN 12 reports the value  $3686.114 \pm 0.007 \pm 0.011 \pm 0.002$  MeV, where the third uncertainty is due to assumptions on the interference between the resonance and hadronic continuum. We combined the two systematic uncertainties.
- <sup>6</sup> Superseded by ARTAMONOV 00.

### $m_{\psi(2S)} - m_{J/\psi(1S)}$

VALUE (MeV)	DOCUMENT ID	TECN	COMMENT
<b>589.188 ± 0.028 OUR AVERAGE</b>

[a]  $\Theta(1540)$  is a hypothetical pentaquark state of 1.54 GeV/c<sup>2</sup> mass and a width of less than 25 MeV/c<sup>2</sup>.

[b] For a narrow resonance in the range 2.2 < M(X) < 2.8 GeV.

### CONSTRAINED FIT INFORMATION

A multiparticle fit to  $\chi_{c1}(1P)$ ,  $\chi_{c0}(1P)$ ,  $\chi_{c2}(1P)$ , and  $\psi(2S)$  with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 86 branching ratios uses 253 measurements to determine 49 parameters. The overall fit has a  $\chi^2 = 389.6$  for 204 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

### FIT INFORMATION

A multiparticle fit to  $\eta_c(1S)$ ,  $J/\psi(1S)$ ,  $\psi(2S)$ ,  $h_c(1P)$ , and  $B^\pm$  with the total width, 10 combinations of partial widths obtained from integrated cross section, and 38 branching ratios uses 113 measurements to determine 19 parameters. The overall fit has a  $\chi^2 = 184.6$  for 94 degrees of freedom.

### $\psi(2S) \Gamma(i) \Gamma(e^+ e^-) / \Gamma(\text{total})$

This combination of a partial width with the partial width into  $e^+ e^-$  and with the total width is obtained from the integrated cross section into channel(i) in the  $e^+ e^-$  annihilation. We list only data that have not been used to determine the partial width  $\Gamma(i)$  or the branching ratio  $\Gamma(i) / \text{total}$ .

	2.2 ± 0.4	ABRAMS	75 MRK1	$e^+ e^-$	
<sup>1</sup> ANASHIN 12 reports the value 2.233 ± 0.015 ± 0.037 ± 0.020 keV, where the third uncertainty is due to assumptions on the interference between the resonance and hadronic continuum. We combined the two systematic uncertainties.

<sup>1</sup>Using CLEO-c data but not authored by the CLEO Collaboration.

<sup>2</sup>AUBERT 07BD reports  $[\Gamma(\psi(2S) \rightarrow \Lambda\bar{\Lambda})/\Gamma_{total}] \times [\Gamma(\psi(2S) \rightarrow e^+e^-)] = (15 \pm 4 \pm 1) \times 10^{-4}$  keV which we divide by our best value  $\Gamma(\psi(2S) \rightarrow e^+e^-) = 2.33 \pm 0.04$  keV. Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>3</sup>Superseded by DOBBS 17.

<sup>4</sup>Estimated using  $B(\psi(2S) \rightarrow J/\psi\pi^+\pi^-) = 0.310 \pm 0.028$ .

VALUE (units $10^{-4}$ )	CL%	DOCUMENT ID	TECN	COMMENT
<b>7 ± 2 ± 4</b>		<sup>1</sup> ABLIKIM	12g	BES3 $\psi(2S) \rightarrow \gamma K^0 K \pi, K K \pi^0$

••• We do not use the following data for averages, fits, limits, etc. •••

< 8	90	<sup>2</sup> CRONIN-HENL.10	CLEO	$\psi(2S) \rightarrow \gamma K \bar{K} \pi$
<20	90	ATHAR 04	CLEO	$e^+ e^- \rightarrow \gamma X$
20-130	95	EDWARDS 82c	CBAL	$e^+ e^- \rightarrow \gamma X$

<sup>1</sup> ABLIKIM 12G reports  $[\Gamma(\psi(2S) \rightarrow \gamma \eta_c(2S))/\Gamma_{\text{total}}] \times [B(\eta_c(2S) \rightarrow K \bar{K} \pi)] = (1.30 \pm 0.20 \pm 0.30) \times 10^{-5}$  which we divide by our best value  $B(\eta_c(2S) \rightarrow K \bar{K} \pi) = (1.9 \pm 1.2) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>2</sup> CRONIN-HENNESSY 10 reports  $[\Gamma(\psi(2S) \rightarrow \gamma \eta_c(2S))/\Gamma_{\text{total}}] \times [B(\eta_c(2S) \rightarrow K \bar{K} \pi)] < 14.5 \times 10^{-6}$  which we divide by our best value  $B(\eta_c(2S) \rightarrow K \bar{K} \pi) = 1.9 \times 10^{-2}$ . This measurement assumes  $\Gamma(\eta_c(2S)) = 14$  MeV. CRONIN-HENNESSY 10 gives the analytic dependence of limits on width.

**CONSTRAINED FIT INFORMATION**

An overall fit to the total width, a partial width, and 3 branching ratios uses 23 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 20.1$  for 19 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

1 Neglecting interference.  
 2 Obtained by comparing a measurement of the total cross section (corrected in BESSON 10) with that of  $D \bar{D}$  reported by CLEO in DOBBS 07.  
 3 From the joint analysis of the data on the  $D \bar{D}$  and inclusive hadronic cross sections in the  $\psi(3770)$  region from BaBar, Belle, BES-II, CLEO and KEDR.  
 4 Using  $\sigma^{obs} = 7.07 \pm 0.58$  nb and neglecting interference.  
 5 Not independent of ABLIKIM 08B.  
 6 From a measurement of  $\sigma(e^+ e^- \rightarrow D \bar{D})$  at  $\sqrt{s} = 3773$  MeV, using the  $\psi(3770)$  resonance parameters measured by ABLIKIM 06L.

$\psi_2(3823)$

$I^G(J^{PC}) = 0^-(2^{--})$   
I, J, P need confirmation.

was  $\psi(3823)$ ,  $X(3823)$

Seen by BHARDWAJ 13 in  $B \rightarrow \chi_{c1} \gamma K$  and ABLIKIM 15S in  $e^+e^- \rightarrow \pi^+\pi^-\gamma\chi_{c1}$  decays as a narrow peak in the invariant mass distribution of the  $\chi_{c1} \gamma$  system. Properties consistent with the  $\psi_2(1^3D_2) c\bar{c}$  state.

$\psi_2(3823)$  MASS

## $\chi_{c1}(3872)$

$$J^{G(J^{PC})} = 0^+(1^{++})$$

also known as  $X(3872)$

This state shows properties different from a conventional  $q\bar{q}$  state. A candidate for an exotic structure. See the review on non- $q\bar{q}$  states.

First observed by CHOI 03 in  $B \rightarrow K\pi^+\pi^-J/\psi(1S)$  decays as a narrow peak in the invariant mass distribution of the  $\pi^+\pi^-J/\psi(1S)$  final state. Isovector hypothesis excluded by AUBERT 05B and CHOI 11.

AAIJ 13Q perform a full five-dimensional amplitude analysis of the angular correlations between the decay products in  $B^+ \rightarrow \chi_{c1}(3872)K^+$  decays, where  $\chi_{c1}(3872) \rightarrow J/\psi\pi^+\pi^-$  and  $J/\psi \rightarrow \mu^+\mu^-$ , which unambiguously gives the  $J^{PC} = 1^{++}$  assignment under the assumption that the  $\pi^+\pi^-$  and  $J/\psi$  are in an S-wave. AAIJ 15AO extend this analysis with more data to limit D-wave contributions to < 4% at 95% CL.

See the review on "Spectroscopy of Mesons Containing Two Heavy Quarks."

3836 ± 13	58	3,15	ANTONIAZZI	94	E705 $300 \pi^\pm Li \rightarrow J/\psi \pi^+ \pi^- X$

- 1 Calculated from  $m_{\chi_{c1}(3872)} - m_{\psi(2S)} = 185.54 \pm 0.06$  MeV obtained by combining the data with  $\chi_{c1}(3872)$  produced in  $B^+$  decays from AAIJ 20s and inclusive  $b$ -hadron decays from AAIJ 20AD and using  $m_{\psi(2S)} = 3686.097$  MeV. Breit-Wigner parametrization.
- 2 The mass difference for the  $\chi_{c1}(3872)$  produced in  $B^+$  and  $B^0$  decays is  $(-0.71 \pm 0.96 \pm 0.19)$  MeV.
- 3 Width consistent with detector resolution.
- 4 A possible equal mixture of two states with a mass difference greater than 3.6 MeV/ $c^2$  is excluded at 95% CL.
- 5 Calculated from the corresponding  $m_{\chi_{c1}(3872)} - m_{J/\psi}$  using  $m_{J/\psi} = 3096.916$  MeV.
- 6 From a fit of a relativistic S-wave Breit-Wigner convolved with the detector resolution. The width of  $\chi_{c1}(3872)$  is constrained to the PDG 22 value. Systematic errors not evaluated.
- 7 Using  $\chi_{c1}(3872)$  produced in inclusive  $b$ -hadron decays and  $m_{\psi(2S)} = 3686.097 \pm 0.010$  MeV. Breit-Wigner parametrization. Superseded by the combined value in AAIJ 20s.
- 8 Using Breit-Wigner parametrization. Superseded by the combined value in AAIJ 20s.
- 9 Fit with fixed width and including two resonances,  $\chi_{c0}(3915)$  and  $X(3960)$ .
- 10 Could be a different state.
- 11 Calculated from the corresponding  $m_{\chi_{c1}(3872)} - m_{\psi(2S)}$  using  $m_{\psi(2S)} = 3686.093$  MeV. Superseded by AUBERT 08y.
- 12 Calculated from the corresponding  $m_{\chi_{c1}(3872)} - m_{\psi(2S)}$  using  $m_{\psi(2S)} = 3685.96$  MeV. Superseded by AUBERT 06.
- 13 Superseded by AALTONEN 09Au.
- 14 Superseded by CHOI 11.
- 15 A lower mass value can be due to an incorrect momentum scale for soft pions.

$\Gamma(\eta J/\psi)/\Gamma_{total}$	CL%	DOCUMENT ID	TECN	COMMENT	$\Gamma_{28}/\Gamma$
<b>&lt;0.017</b>	90	1,2 IWASHITA	14 BELL	$B \rightarrow K \eta J/\psi$	
<b>&lt;0.034</b>	90	3 AUBERT	04Y BABR	$B \rightarrow K \eta J/\psi$	

• • • We do not use the following data for averages, fits, limits, etc. • • •

<sup>1</sup> IWASHITA 14 reports  $[\Gamma(\chi_{c1}(3872) \rightarrow \eta J/\psi)/\Gamma_{total}] \times [B(B^+ \rightarrow \chi_{c1}(3872) K^+)] < 3.8 \times 10^{-6}$  which we divide by our best value  $B(B^+ \rightarrow \chi_{c1}(3872) K^+) = 2.3 \times 10^{-4}$ .

<sup>2</sup> IWASHITA 14 also scans the  $\eta J/\psi$  mass range 3.8–4.75 GeV and sets upper limits for  $B(B^\pm \rightarrow \chi_{c1}(3872) K^\pm) \times B(\chi_{c1}(3872) \rightarrow \eta J/\psi)$  in 5 MeV intervals.

<sup>3</sup> AUBERT 04Y reports  $[\Gamma(\chi_{c1}(3872) \rightarrow \eta J/\psi)/\Gamma_{total}] \times [B(B^+ \rightarrow \chi_{c1}(3872) K^+)] < 7.7 \times 10^{-6}$  which we divide by our best value  $B(B^+ \rightarrow \chi_{c1}(3872) K^+) = 2.3 \times 10^{-4}$ .

## $\chi_{c0}(3915)$

$$I^G(J^{PC}) = 0^+(0^{++})$$

was  $X(3915)$

The  $\chi_{c0}(3915)$  was originally seen by BELLE in its  $\omega J/\psi$  decay mode and was produced in both  $B$  decays in CHOI 05 and  $\gamma\gamma$  collisions in UEHARA 10. The  $J^{PC}$  was determined to be  $0^{++}$  by BABAR in LEES 12AD but this assignment was questioned by ZHOU 15C. In AAIJ 20A1 LHCb found the  $D^+ D^-$  decay mode of the  $\chi_{c0}(3915)$  using  $B$  decays and determined its  $J^{PC}$  to be  $0^{++}$ . Based on their compatible mass, width, and  $J^{PC}$ , we assume the state decaying to  $\omega J/\psi$  and the state decaying to  $D^+ D^-$  are both the  $\chi_{c0}(3915)$ . See also the  $\chi_{c2}(3930)$ .

### $\psi(4040)$ DECAY MODES

Due to the complexity of the  $c\bar{c}$  threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective  $\sqrt{s}$  near this particle’s central mass value, more (less) than  $2\sigma$  above zero, without regard to any peaking behavior in  $\sqrt{s}$  or absence thereof. See mode listing(s) for details and references.

## $\chi_{c1}(4140), \psi(4160)$

### $\chi_{c1}(4140)$

$$I^G(J^{PC}) = 0^+(1^{++})$$

was  $X(4140)$

This state shows properties different from a conventional  $q\bar{q}$  state. A candidate for an exotic structure. See the review on non- $q\bar{q}$  states.

Seen by AALTONEN 09AH, ABAZOV 14A, CHATRCHYAN 14M, AAIJ 17C in  $B^+ \rightarrow \chi_{c1} K^+$ ,  $\chi_{c1} \rightarrow J/\psi\phi$ , and by ABAZOV 15M separately in both prompt (4.7  $\sigma$ ) and non-prompt (5.6  $\sigma$ ) production in  $p\bar{p} \rightarrow J/\psi\phi + \text{anything}$ . Not seen by SHEN 10 in  $\gamma\gamma \rightarrow J/\psi\phi$  and ABLIKIM 15 in  $e^+e^- \rightarrow \gamma J/\psi\phi$  at  $\sqrt{s} = 4.23, 4.26, 4.36$  GeV.

 $\psi(4160)$  DECAY MODES

Due to the complexity of the  $c\bar{c}$  threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective  $\sqrt{s}$  near this particle's central mass value, more (less) than  $2\sigma$  above zero, without regard to any peaking behavior in  $\sqrt{s}$  or absence thereof. See mode listing(s) for details and references.

## $X(4160)$

$$I^G(J^{PC}) = ?(???)$$

OMITTED FROM SUMMARY TABLE

Seen by PAKHOLOV 08 in  $e^+e^- \rightarrow J/\psi X$ ,  $X \rightarrow D^* \bar{D}^*$

A state with consistent mass and width is seen by AAIJ 21E in  $B^+ \rightarrow X(4160)K^+$  with  $X(4160) \rightarrow J/\psi\phi$  using an amplitude analysis of  $B^+ \rightarrow J/\psi\phi K^+$  with a significance (accounting for systematic uncertainties) of 4.8  $\sigma$ . The  $J^{PC} = 2^{-+}$  assignment is favored over other assignments with a significance of more than 4  $\sigma$ .

## $\psi(4230)$

$$J^G(J^{PC}) = 0^-(1^{--})$$

also known as Y(4230); was  $\psi(4260)$

The original  $\psi(4260)$  (also known as Y(4260)) was observed by AUBERT,B 05I as a peak in the energy dependence of the  $e^+ e^- \rightarrow \pi^+ \pi^- J/\psi$  cross section and was confirmed by HE 06B, YUAN 07, LEES 12AC, and LIU 13B in the same process. A higher-statistics analysis by ABLIKIM 17B revealed an asymmetry in the cross section and resulted in a shift of the peak position to a lower mass. The  $\psi(4260)$  was therefore renamed  $\psi(4230)$ . The energy-dependent cross sections for  $e^+ e^-$  to other channels also exhibit peaks in the same mass region. The parameters corresponding to those peaks are also listed here, but the number of states in this region remains to be determined.

For details see the review on "Spectroscopy of mesons containing two heavy quarks."

<sup>1</sup> From a three-resonance fit to the dressed cross section in the range  $\sqrt{s} = 4.128-4.950$  GeV.

<sup>2</sup> From a cross-section measurement of  $e^+ e^- \rightarrow D^{*0} D^{*-} \pi^+$  between 4.189 and 4.951 GeV, assuming a coherent sum of 3 Breit-Wigner resonances plus a continuum amplitude. The two other resonances have masses (widths)  $4675.3 \pm 29.7$  (218.3 ± 73.5) MeV and  $4469.1 \pm 26.4$  (246.3 ± 37.9) MeV.

<sup>3</sup> From a three-resonance fit to the Born cross section in the range  $\sqrt{s} = 3.7730-4.7008$  GeV.

<sup>4</sup> From a two-resonance fit to the dressed cross section in the range  $\sqrt{s} = 4.127-4.600$  GeV. The second resonance has a mass of  $4484.7 \pm 13.3 \pm 24.1$  MeV and a total width of  $111.1 \pm 30.1 \pm 15.2$  MeV.

<sup>5</sup> From a three-resonance fit to the Born cross section in the range  $\sqrt{s} = 4.008-4.698$  GeV.

<sup>6</sup> Solution 1 of 8 with equal fit quality to the  $e^+ e^- \rightarrow \mu^+ \mu^-$  cross section between 3.8 and 4.6 GeV to the coherent sum of four resonant amplitudes. Other solutions range from  $4212.8 \pm 7.2 \pm 4.0$  to  $4219.4 \pm 11.2 \pm 4.1$  MeV.

<sup>7</sup> From a fit of the measured cross section in the range  $\sqrt{s} = 3.808-4.600$  GeV.

<sup>8</sup> From a fit of the measured cross section from  $\sqrt{s} = 4.178-4.278$  GeV. Supersedes ABLIKIM 15C.

<sup>9</sup> Simultaneous fit to  $\chi_{c1} \rightarrow \omega J/\psi$  and  $\chi_{c1} \rightarrow \pi^+ \pi^- J/\psi$ .

<sup>10</sup> From a three-resonance fit. Superseded by ABLIKIM 22AM.

<sup>11</sup> From a fit to the cross section for  $e^+ e^- \rightarrow \pi^+ \pi^- \psi(2S) \rightarrow 2(\pi^+ \pi^-) \ell^+ \ell^-$  obtained from 16 center-of-mass energies between 4.008 and 4.600 GeV and comprising 5.1 fb<sup>-1</sup>. Superseded by ABLIKIM 21AJ.

<sup>12</sup> From a three-resonance fit.

<sup>13</sup> From a combined fit of BELLE, BABAR and BES3  $e^+ e^- \rightarrow \pi^+ \pi^- J/\psi$  and  $e^+ e^- \rightarrow \pi^+ \pi^- \psi(2S)$  data.

<sup>14</sup> From a 3-parameter fit of measured cross sections from  $\sqrt{s} = 4.21-4.42$  GeV to a phase-space modified Breit-Wigner function, using the decays  $\chi_{c0} \rightarrow \pi^+ \pi^-, \chi_{c0} \rightarrow K^+ K^-,$  and  $\omega \rightarrow \pi^+ \pi^- \pi^0$ .

<sup>15</sup> From a two-resonance fit.

<sup>16</sup> From a single-resonance fit. Supersedes AUBERT,B 05I.

<sup>17</sup> Superseded by LIU 13B.

<sup>18</sup> From a single-resonance fit. Two interfering resonances are not excluded. Superseded by LEES 12AC.

- 1 From a three-resonance fit to the dressed cross section in the range  $\sqrt{s} = 4.128-4.950$  GeV.
- 2 From a cross-section measurement of  $e^+e^- \rightarrow D^{*0}D^{*-}\pi^+$  between 4.189 and 4.951 GeV, assuming a coherent sum of 3 Breit-Wigner resonances plus a continuum amplitude. The two other resonances have masses (widths) 4675.3 ± 29.7 (218.3 ± 73.5) MeV and 4469.1 ± 26.4 (246.3 ± 37.9) MeV.
- 3 From a three-resonance fit to the Born cross section in the range  $\sqrt{s} = 3.7730-4.7008$  GeV.
- 4 From a two-resonance fit to the dressed cross section in the range  $\sqrt{s} = 4.127-4.600$  GeV. The second resonance has a mass of 4484.7 ± 13.3 ± 24.1 MeV and a total width of 111.1 ± 30.1 ± 15.2 MeV.
- 5 From a three-resonance fit to the Born cross section in the range  $\sqrt{s} = 4.008-4.698$  GeV.
- 6 Solution 1 of 8 with equal fit quality to the  $e^+e^- \rightarrow \mu^+\mu^-$  cross section between 3.8 and 4.6 GeV to the coherent sum of four resonant amplitudes. Other solutions range from 36.4 ± 16.8 ± 8.1 to 49.6 ± 22.6 ± 11.0 MeV.
- 7 From a fit of the measured cross section in the range  $\sqrt{s} = 3.808-4.600$  GeV.
- 8 From a fit of the measured cross section from  $\sqrt{s} = 4.178-4.278$  GeV. Supersedes ABLIKIM 15C.
- 9 Simultaneous fit to  $\chi_{c1} \rightarrow \omega J/\psi$  and  $\chi_{c1} \rightarrow \pi^+\pi^- J/\psi$ .
- 10 From a three-resonance fit. Superseded by ABLIKIM 22AM.
- 11 From a fit to the cross section for  $e^+e^- \rightarrow \pi^+\pi^- \psi(2S) \rightarrow 2(\pi^+\pi^-)\ell^+\ell^-$  obtained from 16 center-of-mass energies between 4.008 and 4.600 GeV and comprising 5.1 fb<sup>-1</sup>. Superseded by ABLIKIM 21AJ.
- 12 From a three-resonance fit.
- 13 From a combined fit of BELLE, BABAR and BES3  $e^+e^- \rightarrow \pi^+\pi^- J/\psi$  and  $e^+e^- \rightarrow \pi^+\pi^- \psi(2S)$  data.
- 14 From a 3-parameter fit of measured cross sections from  $\sqrt{s} = 4.21-4.42$  GeV to a phase-space modified Breit-Wigner function, using the decays  $\chi_{c0} \rightarrow \pi^+\pi^-, \chi_{c0} \rightarrow K^+K^-,$  and  $\omega \rightarrow \pi^+\pi^-\pi^0$ .
- 15 From a two-resonance fit.
- 16 From a single-resonance fit. Supersedes AUBERT,B 05i.
- 17 Superseded by LIU 13B.
- 18 From a single-resonance fit. Two interfering resonances are not excluded. Superseded by LEES 12AC.

## $\chi_{c1}(4274)$

$$J^G(J^{PC}) = 0^+(1^{++})$$

was X(4274)  
This state shows properties different from a conventional  $q\bar{q}$  state. A candidate for an exotic structure. See the review on non- $q\bar{q}$  states.

Seen by AAIJ 17C in  $B^+ \rightarrow \chi_{c1} K^+$ ,  $\chi_{c1} \rightarrow J/\psi\phi$  using an amplitude analysis of  $B^+ \rightarrow J/\psi\phi K^+$  with a significance (accounting for systematic uncertainties) of 6.0  $\sigma$ .

$\psi(4415)$  DECAY MODES

Due to the complexity of the  $c\bar{c}$  threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective  $\sqrt{s}$  near this particle's central mass value, more (less) than  $2\sigma$  above zero, without regard to any peaking behavior in  $\sqrt{s}$  or absence thereof. See mode listing(s) for details and references.

### $\chi_{c0}(4500)$

$$I^G(J^{PC}) = 0^+(0^{++})$$

OMITTED FROM SUMMARY TABLE  
was  $X(4500)$

This state shows properties different from a conventional  $q\bar{q}$  state. A candidate for an exotic structure. See the review on non- $q\bar{q}$  states.

Seen by AAIJ 17C in  $B^+ \rightarrow \chi_{c0} K^+$ ,  $\chi_{c0} \rightarrow J/\psi \phi$  using an amplitude analysis of  $B^+ \rightarrow J/\psi \phi K^+$  with a significance (accounting for systematic uncertainties) of 6.1  $\sigma$ .

$$I^G(J^{PC}) = 0^+(?^{?+})$$

OMITTED FROM SUMMARY TABLE

This state shows properties different from a conventional  $q\bar{q}$  state. A candidate for an exotic structure. See the review on "Heavy Non- $q\bar{q}$  Mesons."

Seen by AAIJ 21E in  $B^+ \rightarrow X(4630) K^+$  with  $X(4630) \rightarrow J/\psi \phi$  using an amplitude analysis of  $B^+ \rightarrow J/\psi \phi K^+$  with a significance (accounting for systematic uncertainties) of 5.5  $\sigma$ . The  $J^P = 1^-$  assignment is favored over  $2^-$  with a significance of 3  $\sigma$  and other assignments are disfavored by more than 5  $\sigma$ .

## $\psi(4660)$

### $\psi(4660)$

$$I^G(J^{PC}) = 0^-(1^{--})$$

also known as  $Y(4660)$ ; was  $X(4660)$

This state shows properties different from a conventional  $q\bar{q}$  state. A candidate for an exotic structure. See the review on non- $q\bar{q}$  states.

Seen in radiative return from  $e^+e^-$  collisions at  $\sqrt{s} = 9.54\text{--}10.58$  GeV by WANG 07D. Also obtained in a combined fit of WANG 07D, AUBERT 07s, and LEES 14F. See also the review on "Spectroscopy of mesons containing two heavy quarks."

- • • We do not use the following data for averages, fits, limits, etc. • • •
- 1 Seen as a peak in the c.m. energy dependence of the  $e^+e^- \rightarrow K^+K^-J/\psi$  cross section using 5.85 fb<sup>-1</sup> of data at c.m. energies 4.61–4.95 GeV. Statistical significance is over 5 $\sigma$ .
- 2 Fit model parameterized as the coherent sum of a Breit-Wigner resonance and a continuum amplitude term.
- 3 From a cross-section measurement of  $e^+e^- \rightarrow D^{*0}D^{*-}\pi^+$  between 4.189 and 4.951 GeV, assuming a coherent sum of 3 Breit-Wigner resonances plus a continuum amplitude. The two other resonances have masses (widths) 4209.6 ± 7.5 (81.6 ± 19.9) MeV and 4469.1 ± 26.4 (246.3 ± 37.9) MeV.
- 4 From a three-resonance fit to the Born cross section in the range  $\sqrt{s} = 4.008\text{--}4.698$  GeV.
- 5 Using  $D_s^{*2-}(2573)^- \rightarrow \bar{D}^0 K^-$  decays.
- 6 From a fit of a Breit-Wigner convolved with a Gaussian.
- 7 From a two-resonance fit. Supersedes WANG 07D.
- 8 From a two-resonance fit.
- 9 The  $\pi^+\pi^-\psi(2S)$  and  $\Lambda_C^+\Lambda_C^-$  states are not necessarily the same.
- 10 From a fit to the  $e^+e^- \rightarrow \pi^+\pi^-\psi(3823)$  cross section between 4.23 and 4.70 GeV with two coherent Breit-Wigner resonances. The data is also consistent with a single peak with mass 4417.5 ± 26.2 ± 3.5 MeV and width 245 ± 48 ± 13 MeV.
- 11 The pole parameters are extracted from the speed plot.
- 12 From a three-resonance fit.
- 13 From a combined fit of BELLE, BABAR and BES3  $e^+e^- \rightarrow \pi^+\pi^-J/\psi$  and  $e^+e^- \rightarrow \pi^+\pi^-\psi(2S)$  data.
- 14 From a combined fit of AUBERT 07s and WANG 07D data with two resonances.

## $b\bar{b}$ MESONS (including possibly non- $q\bar{q}$ states)

Updated March 2024.

The level scheme of meson states containing a minimal quark content of  $b\bar{b}$  and having  $S = C = B = 0$ . The name of a state is determined by its quantum numbers  $I^G J^{PC}$  (see the review “Naming Scheme for Hadrons”). States included in the Summary Tables are shown with solid lines; those requiring confirmation are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including  $\Upsilon(nS) \rightarrow \gamma\eta_b(mS)$ ,  $\Upsilon(nS) \rightarrow \gamma\chi_{bJ}(mP)$ , and  $\chi_{bJ}(nP) \rightarrow \gamma\Upsilon(mS)$ , are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open bottom mesons is indicated in the figure. Decays to open flavour final states are not shown in the figure. The transitions  $\Upsilon(10753) \rightarrow \omega\chi_{b1}(1P)$ ,  $\omega\chi_{b2}(1P)$  have also been reported.

### WIDTH DETERMINATIONS OF THE $\Upsilon$ STATES

As is the case for the  $J/\psi(1S)$  and  $\psi(2S)$ , the full widths of the  $b\bar{b}$  states  $\Upsilon(1S)$ ,  $\Upsilon(2S)$ , and  $\Upsilon(3S)$  are not directly measurable, since they are much narrower than the energy resolution of the  $e^+e^-$  storage rings where these states are produced. The common indirect method to determine  $\Gamma$  starts from

$$\Gamma = \Gamma_{\ell\ell}/B_{\ell\ell}, \quad (1)$$

where  $\Gamma_{\ell\ell}$  is one leptonic partial width and  $B_{\ell\ell}$  is the corresponding branching fraction ( $\ell = e, \mu, \text{ or } \tau$ ). One then assumes  $e\text{-}\mu\text{-}\tau$  universality and uses

$$\begin{aligned} \Gamma_{\ell\ell} &= \Gamma_{ee} \\ B_{\ell\ell} &= \text{average of } B_{ee}, B_{\mu\mu}, \text{ and } B_{\tau\tau}. \end{aligned} \quad (2)$$

The electronic partial width  $\Gamma_{ee}$  is also not directly measurable at  $e^+e^-$  storage rings, only in the combination  $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$ , where  $\Gamma_{\text{had}}$  is the hadronic partial width and

$$\Gamma_{\text{had}} + 3\Gamma_{ee} = \Gamma. \quad (3)$$

This combination is obtained experimentally from the energy-integrated hadronic cross section

$$\begin{aligned} &\int_{\text{resonance}} \sigma(e^+e^- \rightarrow \Upsilon \rightarrow \text{hadrons})dE \\ &= \frac{6\pi^2 \Gamma_{ee}\Gamma_{\text{had}}}{M^2 \Gamma} C_r = \frac{6\pi^2 \Gamma_{ee}^{(0)}\Gamma_{\text{had}}}{M^2 \Gamma} C_r^{(0)}, \end{aligned} \quad (4)$$

where  $M$  is the  $\Upsilon$  mass, and  $C_r$  and  $C_r^{(0)}$  are radiative correction factors.  $C_r$  is used for obtaining  $\Gamma_{ee}$  as defined in Eq. (1), and contains corrections from all orders of QED for describing  $(b\bar{b}) \rightarrow e^+e^-$ . The lowest order QED value  $\Gamma_{ee}^{(0)}$ , relevant for comparison with potential-model calculations, is defined by the lowest order QED graph (Born term) alone, and is about 7% lower than  $\Gamma_{ee}$ .

The Listings give experimental results on  $B_{ee}$ ,  $B_{\mu\mu}$ ,  $B_{\tau\tau}$ , and  $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$ . The entries of the last quantity have been re-evaluated consistently using the correction procedure of KURAEV 85 [1]. The partial width  $\Gamma_{ee}$  is obtained from the average values for  $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$  and  $B_{\ell\ell}$  using

$$\Gamma_{ee} = \frac{\Gamma_{ee}\Gamma_{\text{had}}}{\Gamma(1 - 3B_{\ell\ell})}. \quad (5)$$

The total width  $\Gamma$  is then obtained from Eq. (1). We do not list  $\Gamma_{ee}$  and  $\Gamma$  values of individual experiments. The  $\Gamma_{ee}$  values in the Meson Summary Table are also those defined in Eq. (1).

### References

1. E.A. Kuraev, V.S. Fadin, Sov. J. Nucl. Phys. **41**, 466 (1985).

## $\eta_b(1S)$

$$I^G(J^{PC}) = 0^+(0^{-+})$$

Quantum numbers shown are quark-model predictions. Observed in radiative decay of the  $\Upsilon(3S)$ , therefore  $C = +$ .

<sup>1</sup> BESSON 07 reports  $[\Gamma(\Upsilon(1S) \rightarrow \tau^{+}\tau^{-})/\Gamma(\text{total})] / [B(\Upsilon(1S) \rightarrow \mu^{+}\mu^{-})] = 1.02 \pm 0.02 \pm 0.05$  which we multiply by our best value  $B(\Upsilon(1S) \rightarrow \mu^{+}\mu^{-}) = (2.48 \pm 0.04) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.  
<sup>2</sup> Using  $B(\Upsilon(1S) \rightarrow ee) = B(\Upsilon(1S) \rightarrow \mu\mu) = 0.0256$ ; not used for width evaluations.

$\chi_{b1}(1P)$

$J^{G(JPC)} = 0^+(1^{++})$   
 J needs confirmation.

Observed in radiative decay of the  $T(2S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .  $J = 1$  from SKWARNICKI 87.
