[a] This value is obtained by subtracting the branching fractions for 2-, 4- and 6-prongs from unity.					
[b] This is the sum of our $K^- 2\pi^+ \pi^-$ , $K^- 2\pi^+ \pi^- \pi^0$ , $\bar{K}^0 2\pi^+ 2\pi^-$ , $K^+ 2K^- \pi^+$ , $2\pi^+ 2\pi^-$ , $2\pi^+ 2\pi^- \pi^0$ , $K^+ K^- \pi^+ \pi^-$ , and $K^+ K^- \pi^+ \pi^- \pi^0$ , branching fractions.					
[c] This is the sum of our $K^- 3\pi^+ 2\pi^-$ and $3\pi^+ 3\pi^-$ branching fractions.					
[d] The branching fractions for the $K^- e^+ \nu_e$ , $K^*(892)^- e^+ \nu_e$ , $\pi^- e^+ \nu_e$ , and $\rho^- e^+ \nu_e$ modes add up to $6.17 \pm 0.17\%$ .					
[e] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.					
[f] This is a doubly Cabibbo-suppressed mode.					
[g] Submodes of the $D^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$ mode with a $K^*$ and/or $\rho$ were studied by COFFMAN 92B, but with only 140 events. With nothing new for 18 years, we refer to our 2008 edition, Physics Letters <b>B667</b> 1 (2008), for those results.					
[h] This branching fraction includes all the decay modes of the resonance in the final state.					
[i] This limit assumes the average of $B(D^0 \rightarrow K^- e^+ \nu_e)$ and $B(D^0 \rightarrow K^- \mu^+ \nu_\mu)$ for the $B(D^0 \rightarrow K^- \ell^+ \nu_\ell)$ value.					
[j] This mode is not a useful test for a $\Delta C=1$ weak neutral current because both quarks must change flavor in this decay.					
[k] The value is for the sum of the charge states or particle/antiparticle states indicated.					
<b>FIT INFORMATION</b>					
An overall fit to 68 branching ratios uses 134 measurements to determine 33 parameters. The overall fit has a $\chi^2 = 149.3$ for 101 degrees of freedom.					
The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

4.3 $\pm$ 1.0	130	<sup>10</sup> PERUZZI	77 LGW	$e^+e^-$ 3.77 GeV	

<sup>1</sup> ABLIKIM 18W measured the combined  $K^\pm \pi^\pm$  branching fraction to be 3.898%. We have subtracted off the doubly Cabibbo-suppressed branching fraction  $B(D^0 \rightarrow K^+ \pi^-) = (1.50 \pm 0.07) \times 10^{-4}$ , even though it is less than one-third of the uncertainty of the combined measurement, in order to treat this as a measurement of  $B(D^0 \rightarrow K^- \pi^+)$ .<sup>2</sup> This combines the CLEO results of ARTUSO 98, COAN 98, and AKERIB 93.<sup>3</sup> ABACHI 88, DECAMP 91J, AKERIB 93, ALBRECHT 94F, and BARATE 97C use  $D^*(2010)^+ \rightarrow D^0 \pi^+$  decays. The  $\pi^+$  is both slow and of low  $p_T$  with respect to the event thrust axis or nearest jet ( $\approx D^{*+}$  direction). The excess number of such  $\pi^+$ 's over background gives the number of  $D^*(2010)^+ \rightarrow D^0 \pi^+$  events, and the fraction with  $D^0 \rightarrow K^- \pi^+$  gives the  $D^0 \rightarrow K^- \pi^+$  branching fraction.<sup>4</sup> DOBBS 07 and HE 05 use single- and double-tagged events in an overall fit. DOBBS 07 supersedes HE 05.<sup>5</sup> ARTUSO 98, following ALBRECHT 94, uses  $D^0$  mesons from  $\bar{B}^0 \rightarrow D^*(2010)^+ X \ell^- \bar{\nu}_\ell$  decays. Our average uses the CLEO average of this value with the values of COAN 98 and AKERIB 93.<sup>6</sup> COAN 98 assumes that  $\Gamma(B \rightarrow \bar{D} X \ell^+ \nu)/\Gamma(B \rightarrow X \ell^+ \nu) = 1.0 - 3|V_{ub}/V_{cb}|^2 - 0.010 \pm 0.005$ , the last term accounting for  $\bar{B} \rightarrow D_s^+ K X \ell^- \bar{\nu}$ . COAN 98 is included in the CLEO average in ARTUSO 98.<sup>7</sup> ALBRECHT 94 uses  $D^0$  mesons from  $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}_\ell$  decays. This is a different set of events than used by ALBRECHT 94F.<sup>8</sup> This AKERIB 93 value includes radiative corrections; without them, the value is 0.0391  $\pm$  0.0008  $\pm$  0.0017. AKERIB 93 is included in the CLEO average in ARTUSO 98.<sup>9</sup> SCHINDLER 81 (MARK-2) measures  $\sigma(e^+e^- \rightarrow \psi(3770)) \times$  branching fraction to be 0.24  $\pm$  0.02 nb. We use the MARK-3 (ADLER 88c) value of  $\sigma = 5.8 \pm 0.5 \pm 0.6$  nb.<sup>10</sup> PERUZZI 77 (MARK-1) measures  $\sigma(e^+e^- \rightarrow \psi(3770)) \times$  branching fraction to be 0.25  $\pm$  0.05 nb. We use the MARK-3 (ADLER 88c) value of  $\sigma = 5.8 \pm 0.5 \pm 0.6$  nb.

<b><math>&lt; 6.1 \times 10^{-4}</math></b>	90	1 BITENC	08 BELL	$e^+ e^-$ , 10.58 GeV

• • • We do not use the following data for averages, fits, limits, etc. • • •

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
$< 50 \times 10^{-4}$	90	2 AITALA	96c E791	$\pi^-$ nucleus, 500 GeV

<sup>1</sup> The BITENC 08 right-sign sample includes about 15% of  $D^0 \rightarrow K^- \pi^0 \ell^+ \nu_\ell$  and other decays.

<sup>2</sup> AITALA 96c uses  $D^{*+} \rightarrow D^0 \pi^+$  (and charge conjugate) decays to identify the charm at production and  $D^0 \rightarrow K^- \ell^+ \nu_\ell$  (and charge conjugate) decays to identify the charm at decay.

### $\Gamma(K^+ \text{ or } K^*(892)^+ e^- \bar{\nu}_e \text{ via } \bar{D}^0) / [\Gamma(K^- e^+ \nu_e) + \Gamma(K^*(892)^- e^+ \nu_e)]$ $\Gamma_{288} / (\Gamma_{20} + \Gamma_{22})$

This is a limit on  $R_M$  without the complications of possible doubly Cabibbo-suppressed decays that occur when using hadronic modes. The experiments use  $D^{*+} \rightarrow D^0 \pi^+$  (and charge conjugate) decays to identify the charm at production and the charge of the  $e$  to identify the charm at decay. These limits do not allow  $CP$  violation. For the limits on  $|m_1 - m_2|$  and  $(\Gamma_1 - \Gamma_2) / \Gamma$  that come from the best mixing limit, see near the beginning of these  $D^0$  Listings.

### $\Gamma(K^+ \pi^-) / \Gamma(K^- \pi^+)$ $\Gamma_{289} / \Gamma_{38}$

This is  $R$ , the time-integrated wrong-sign rate compared to the right-sign rate. See the note on " $D^0$ - $\bar{D}^0$  Mixing," near the start of the  $D^0$  Listings.

The experiments here use the charge of the pion in  $D^*(2010)^\pm \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^\pm$  decay to tell whether a  $D^0$  or a  $\bar{D}^0$  was born. The  $D^0 \rightarrow K^+ \pi^-$  decay can occur directly by doubly Cabibbo-suppressed (DCS) decay, or indirectly by  $D^0 \rightarrow \bar{D}^0$  mixing followed by  $\bar{D}^0 \rightarrow K^+ \pi^-$  decay. Some of the experiments can use the decay-time information to disentangle the two mechanisms. Here, we list the experimental branching ratio, which if there is no mixing is the DCS ratio. See the next data block for values of the DCS ratio  $R_D$ , and the following data block for limits on the mixing ratio  $R_M$ . See the section on  $CP$ -violating asymmetries near the end of this  $D^0$  Listing for values of  $A_D$ , and the note on " $D^0$ - $\bar{D}^0$  Mixing" for limits on  $x'$  and  $y'$ .

Some early limits have been omitted from this Listing; see our 1998 edition (The European Physical Journal **C3** 1 (1998)) and our 2006 edition (Journal of Physics **G33** 1 (2006)).

<0.0037	90	<sup>2</sup> ANJOS	88c	E691 Photoproduction

<sup>1</sup> AITALA 98 uses decay-time information to distinguish doubly Cabibbo-suppressed decays from  $D^0$ - $\bar{D}^0$  mixing. The fit allows interference between the two amplitudes, and also allows CP violation in this term. The central value obtained is  $0.0039^{+0.0036}_{-0.0032} \pm 0.0016$ . When interference is disallowed, the result becomes  $0.0021 \pm 0.0009 \pm 0.0002$ .

<sup>2</sup> This combines results of ANJOS 88c on  $K^+\pi^-$  and  $K^+\pi^+\pi^-$  (via  $\bar{D}^0$ ) reported in the data block above (see footnotes there). It assumes no interference.

 $\Gamma(\mu^- \text{ anything via } \bar{D}^0)/\Gamma(\mu^+ \text{ anything})$   $\Gamma_{303}/\Gamma_6$ 

This is a  $D^0$ - $\bar{D}^0$  mixing limit. See the somewhat better limits above.

 $\Gamma_{355}/\Gamma$  $D^0$  CP-EVEN FRACTIONS

The CP-even fraction  $F_+$ , defined for self-conjugate final states, like the coherence factor is useful for measuring the unitary triangle angle  $\gamma$  in  $B \rightarrow DK$  decays. A purely CP-even state has  $F_+ = 1$ , a CP-odd one has  $F_+ = 0$ . For details, see NAYAK 15.

••• We do not use the following data for averages, fits, limits, etc. •••

-0.20 ± 0.19 ± 0.10 774k <sup>2,6</sup>AAIJ 14AK LHCB See AAIJ 17M

<sup>1</sup>AAIJ 17M value combines  $\Delta A_{CP}(\pi\pi, KK)$  from AAIJ 16D,  $A_{CP}(KK)$  from AAIJ 17M, and  $A_{CP}(\pi\pi)$  from AAIJ 14AK.

<sup>2</sup>See also "D<sup>0</sup> CP-violating asymmetry differences" at the end of the CP-violating asymmetries.

<sup>3</sup>AUBERT 08M uses corrected numbers of events directly, not ratios with  $K^{\mp}\pi^{\pm}$  events.

<sup>4</sup>STARIC 08 uses  $D^0 \rightarrow K^-\pi^+$  and  $\bar{D}^0 \rightarrow K^+\pi^-$  decays to correct for detector-induced asymmetries.

<sup>5</sup>AITALA 98c, LINK 00B, CSORNA 02, and ACOSTA 05c measure  $N(D^0 \rightarrow \pi^+ \pi^-)/N(D^0 \rightarrow K^-\pi^+)$ , the ratio of numbers of events observed, and similarly for the  $\bar{D}^0$ .

<sup>6</sup>AAIJ 14AK uses  $\Delta A_{CP}(\pi\pi, KK)$  and  $A_{CP}(KK)$  reported in the same paper.

 $A_{CP}(\pi^0 \pi^0)$  in  $D^0, \bar{D}^0 \rightarrow \pi^0 \pi^0$

$-0.7 \pm 1.9$		<sup>1</sup> AAIJ	13CE	LHCB Repl. by AAJ 17A0
$-8.0 \pm 7.7$	0.8k	<sup>7</sup> LI	05A	BELL See ZHANG 06

<sup>1</sup> Based on 3 fb<sup>-1</sup> of data collected at  $\sqrt{s} = 7, 8$  TeV. Allowing for CP violation, the direct CP-violation in mixing is reported for the  $D^0 \rightarrow K^+ \pi^-$  and  $\bar{D}^0 \rightarrow K^+ \pi^-$ .

<sup>2</sup> The CPV is derived from  $A_{CP} = (R_D^+ - R_D^-)/(R_D^+ + R_D^-)$ .

<sup>3</sup> This ZHANG 06 result allows mixing.

<sup>4</sup> This LINK 05H result assumes no mixing. If mixing is allowed, it becomes  $0.13 \pm_{-0.25}^{+0.33} \pm 0.10$ .

<sup>5</sup> This AUBERT 03z limit assumes no mixing. If mixing is allowed, the 95% confidence-level interval is  $(-2.8 < A_D < 4.9) \times 10^{-3}$ .

<sup>6</sup> This GODANG 00 result assumes no  $D^0 - \bar{D}^0$  mixing and becomes  $-0.43 < A_{CP} < +0.34$  at 95% CL. If mixing is allowed  $A_{CP} = -0.01 \pm_{-0.17}^{+0.16} \pm 0.01$ .

<sup>7</sup> This LI 05A result allows mixing.

 $A_{CP}(K^- \pi^+) \text{ in } D_{CP(\pm 1)} \rightarrow K^\mp \pi^\pm$ 

$$A_{CP}(K^- \pi^+) = [B(D_{CP(-)} \rightarrow K^- \pi^+) - B(D_{CP(+)} \rightarrow K^- \pi^+)] / \text{Sum}$$

$D^0$  CP-VIOLATING ASYMMETRY DIFFERENCES

$\Delta A_{CP} = A_{CP}(K^+ K^-) - A_{CP}(\pi^+ \pi^-)$

CP violation in these modes can come from the decay amplitudes (direct) and/or from mixing or interference of mixing and decay (indirect). The difference  $\Delta A_{CP}$  is primarily sensitive to the direct component, and only retains a second-order dependence on the indirect component for measurements where the mean decay time of the  $K^+ K^-$  and  $\pi^+ \pi^-$  samples are not identical. The results below are averaged assuming the indirect component can be neglected.

<sup>1</sup> Calculated from the AUBERT 08M values of  $A_{CP}(K^+ K^-)$  and  $A_{CP}(\pi^+ \pi^-)$ . The systematic error here combines the systematic errors in quadrature, and therefore somewhat over-estimates it.

$D^0$  TESTS OF LOCAL CP-VIOLATION (CPV)

We list model-independent searches for local CP violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a  $\chi^2$  test comparing normalised yields  $N_i, \bar{N}_i$  in CP-conjugate bin pairs  $i$ :  $\chi^2 = \sum_i (N_i - \alpha \bar{N}_i) / \sigma(N_i - \alpha \bar{N}_i)$ . The factor  $\alpha = (\sum_j N_j) / (\sum_j \bar{N}_j)$  removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured  $\chi^2$  or larger under the assumption of CP conservation [AUBERT 08AO, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14C]. Results can be combined using Fisher's method [MOSTELLER 48].

CP VIOLATING ASYMMETRIES OF P-ODD (T-ODD) MOMENTS

The CP-sensitive P-odd (T-odd) correlation in  $D^0, \bar{D}^0$  decays. The  $D^0$  and  $\bar{D}^0$  are distinguished by the charge of the parent  $D^*$ :  $D^{*+} \rightarrow D^0 \pi^+$  and  $D^{*-} \rightarrow \bar{D}^0 \pi^-$ .

$A_{T\text{odd}}(K^+ K^- \pi^+ \pi^-) \text{ in } D^0, \bar{D}^0 \rightarrow K^+ K^- \pi^+ \pi^-$

$C_T \equiv \vec{p}_{K^+} \cdot (\vec{p}_{\pi^+} \times \vec{p}_{\pi^-})$  is a parity-odd correlation of the  $K^+$ ,  $\pi^+$ , and  $\pi^-$  momenta (evaluated in the  $D^0$  rest frame) for the  $D^0$ .  $\bar{C}_T \equiv \vec{p}_{K^-} \cdot (\vec{p}_{\pi^-} \times \vec{p}_{\pi^+})$  is the corresponding quantity for the  $\bar{D}^0$ . Then

$\frac{A_T}{A} \equiv \frac{[\Gamma(C_T > 0) - \Gamma(C_T < 0)]}{[\Gamma(C_T > 0) + \Gamma(C_T < 0)]}$ , and

$\bar{A}_T \equiv \frac{[\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)]}{[\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]}$ , and

# Meson Particle Listings

## $D^0$

$A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$ .  $C_T$  and  $\bar{C}_T$  are commonly referred to as  $T$ -odd moments, because they are odd under  $T$  reversal. However, the  $T$ -conjugate process  $K^+ K^- \pi^+ \pi^- \rightarrow D^0$  is not accessible, while the  $CP$ -conjugate process is.

### $A_{Tviol}(K_S^0 \pi^+ \pi^- \pi^0)$ in $D^0, \bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$

$C_T \equiv \bar{p}_{K_S^0} \cdot (\bar{p}_{\pi^+} \times \bar{p}_{\pi^-})$  is a parity-odd correlation evaluated in the  $D^0$  rest frame.  $\bar{C}_T$  is defined as the  $CP$ -conjugate observable with  $\bar{D}^0$  daughter particles. Then  $A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$ , and  $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$ , and  $A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$ .  $C_T$  and  $\bar{C}_T$  are commonly referred to as  $T$ -odd moments, because they are odd under  $T$  reversal. However, the  $T$ -conjugate process  $K_S^0 \pi^+ \pi^- \pi^0 \rightarrow D^0$  is not accessible, while the  $CP$ -conjugate process is.

VALUE (units $10^{-3}$ )	EVTS	DOCUMENT ID	TECN	COMMENT
<b><math>-0.20 \pm 1.38^{+0.23}_{-0.76}</math></b>	745k	<sup>1</sup> PRASANTH	17	BELL $e^+ e^-$ at $\Upsilon(nS)$ 's

<sup>1</sup> PRASANTH 17 also measures  $A_{Tviol}$  in sub-regions of the  $D^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$  phase-space. No evidence of  $T$  violation is found.

## $D^0$ CPT-VIOLATING DECAY-RATE ASYMMETRIES

### $A_{CPT}(K^\mp \pi^\pm)$ in $D^0 \rightarrow K^- \pi^+, \bar{D}^0 \rightarrow K^+ \pi^-$

$A_{CPT}(t)$  is defined in terms of the time-dependent decay probabilities  $P(D^0 \rightarrow K^- \pi^+)$  and  $\bar{P}(\bar{D}^0 \rightarrow K^+ \pi^-)$  by  $A_{CPT}(t) = (\bar{P} - P) / (\bar{P} + P)$ . For small mixing parameters  $x \equiv \Delta m / \Gamma$  and  $y \equiv \Delta \Gamma / 2\Gamma$  (as is the case), and times  $t, A_{CPT}(t)$  reduces to  $[y \operatorname{Re} \xi - x \operatorname{Im} \xi] \Gamma t$ , where  $\xi$  is the  $CP$ -violating parameter.

The following is actually  $y \operatorname{Re} \xi - x \operatorname{Im} \xi$ .

## Amplitude analyses

### $D \rightarrow K\pi\pi\pi, D \rightarrow KK\pi\pi$ partial wave analyses

Amplitude analyses of  $D^0$  decays to a variety of 4-body kaon or pion final states, fitting simultaneously different partial wave components.

VALUE	DOCUMENT ID	TECN	COMMENT
$1$ AAIJ	19C LHCB	$D^0 \rightarrow K^+ K^- \pi^+ \pi^-$	
ABLIKIM	19AK BES3	$D^0 \rightarrow K^- \pi^+ \pi^0 \pi^0$	
AAIJ	18AI LHCB	$D^0 \rightarrow K^- \pi^+ \pi^+ \pi^-$	
ABLIKIM	17O BES3	$D^0 \rightarrow K^- \pi^+ \pi^+ \pi^-$	

$1$  AAIJ 19C also provides measurements of  $CP$  violation in  $D^0 \rightarrow K^+ K^- \pi^+ \pi^-$ , with results compatible with  $CP$  symmetry.

$D^*(2007)^0$  DECAY MODES

$\bar{D}^*(2007)^0$  modes are charge conjugates of modes below.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Confidence level
$\Gamma_1$ $D^0 \pi^0$	(64.7 ± 0.9) %	
$\Gamma_2$ $D^0 \gamma$	(35.3 ± 0.9) %	
$\Gamma_3$ $D^0 e^+ e^-$	( 3.91 ± 0.33 ) × 10 <sup>-3</sup>	
$\Gamma_4$ $\mu^+ \mu^-$	< 2.5 × 10 <sup>-8</sup>	90%
$\Gamma_5$ $e^+ e^-$	< 1.7 × 10 <sup>-6</sup>	90%

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 5 measurements and one constraint to determine 2 parameters. The overall fit has a  $\chi^2 = 2.5$  for 4 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$$x_2 \begin{vmatrix} -100 \\ x_1 \end{vmatrix}$$

### $D^*(2010)^\pm$ DECAY MODES

$D^*(2010)^-$  modes are charge conjugates of the modes below.

Mode	Fraction ( $\Gamma_j/\Gamma$ )
$\Gamma_1 D^0 \pi^+$	(67.7 ± 0.5) %
$\Gamma_2 D^+ \pi^0$	(30.7 ± 0.5) %
$\Gamma_3 D^+ \gamma$	(1.6 ± 0.4) %

### CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 6 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 0.3$  for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_2$	-62	
$x_3$	-43	-44
	$x_1$	$x_2$

### $D_0^*(2300)$

$$I(J^P) = \frac{1}{2}(0^+)$$

was  $D_0^*(2400)$

There is a strong evidence that recent data on  $B \rightarrow D \pi \pi$  (AAIJ 15Y, AAIJ 16AH) and  $B \rightarrow D \pi K$  (AAIJ 14BH, AAIJ 15V, AAIJ 15X) call for two poles in the scalar  $I = 1/2 \pi D$  amplitude in this mass range. The data are consistent with a lower pole at  $(2105^{+6}_{-8}) - i(102^{+10}_{-11})$  MeV and a higher pole at  $(2451^{+35}_{-26}) - i(134^{+7}_{-8})$  MeV (DU 18A, DU 19, DU 21). For details see review on "Heavy Non- $q\bar{q}$  Mesons."

 $D_1(2420)$  POLARIZATION AMPLITUDE  $A_{D_1}$ 

A polarization amplitude  $A_{D_1}$  is a parameter that depends on the initial polarization of the  $D_1$  and is sensitive to a possible S-wave contribution to its decay. For  $D_1$  decays the helicity angle,  $\theta_h$ , distribution varies like  $1 + A_{D_1} \cos^2 \theta_h$ , where  $\theta_h$  is the angle in the  $D^*$  rest frame between the two pions emitted by the  $D_1 \rightarrow D^* \pi$  and the  $D^* \rightarrow D \pi$ .

Unpolarized  $D_1$  decaying purely via D-wave is predicted to give  $A_{D_1} = 3$ .

**CHARMED, STRANGE MESONS**  
**( $C = \pm 1, S = \pm 1$ )**  
**(including possibly non- $q\bar{q}$  states)**

$D_s^+ = c\bar{s}, D_s^- = \bar{c}s,$  similarly for  $D_s^*$ 's

**$D_s^\pm$**

$J(P) = 0(0^-)$

The angular distributions of the decays of the  $\phi$  and  $\bar{K}^*(892)^0$  in the  $\phi\pi^+$  and  $K^+\bar{K}^*(892)^0$  modes strongly indicate that the spin is zero. The parity given is that expected of a  $c\bar{s}$  ground state.

**$D_s^\pm$  MASS**

The fit includes  $D^\pm, D^0, D_s^\pm, D^{*\pm}, D^{*0}, D_s^{*\pm}, D_1(2420)^0, D_2^*(2460)^0,$  and  $D_{s1}(2536)^\pm$  mass and mass difference measurements. Measurements of the  $D_s^\pm$  mass with an error greater than 10 MeV are omitted from the fit and average. A number of early measurements have been omitted altogether.

<sup>1</sup> This AAIJ 17AN value is derived from the difference between the  $D_s^-$  and  $D^-$  widths. The 3rd uncertainty,  $\pm 1.7 \times 10^{-15}$  s, arises from the uncertainty of the  $D^-$  width.  
<sup>2</sup> BONVICINI 99 obtains  $1.19 \pm 0.04$  for the ratio of  $D_s^+$  to  $D^0$  lifetimes.

**$D_s^\pm$  DECAY MODES**

Unless otherwise noted, the branching fractions for modes with a resonance in the final state include all the decay modes of the resonance.  $D_s^-$  modes are charge conjugates of the modes below.

[a] This is the purely  $e^+$  semileptonic branching fraction: the  $e^+$  fraction from  $\tau^+$  decays has been subtracted off. The sum of our (non- $\tau$ )  $e^+$  exclusive fractions — an  $e^+\nu_e$  with an  $\eta, \eta', \phi, K^0$ , or  $K^{*0}$  — is  $5.99 \pm 0.31\%$ .

[b] This fraction includes  $\eta$  from  $\eta'$  decays.

[c] The sum of our exclusive  $\eta'$  fractions —  $\eta'e^+\nu_e, \eta'\mu^+\nu_\mu, \eta'\pi^+, \eta'\rho^+$ , and  $\eta'K^+$  — is  $11.8 \pm 1.6\%$ .

[d] This branching fraction includes all the decay modes of the final-state resonance.

[e] A test for  $u\bar{u}$  or  $d\bar{d}$  content in the  $D_s^+$ . Neither Cabibbo-favored nor Cabibbo-suppressed decays can contribute, and  $\omega$ - $\phi$  mixing is an unlikely explanation for any fraction above about  $2 \times 10^{-4}$ .

[f] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.

[g] We decouple the  $D_s^+ \rightarrow \phi\pi^+$  branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the  $D_s^+ \rightarrow \phi\pi^+, \phi \rightarrow K^+K^-$  branching fraction obtained from the Dalitz-plot analysis of  $D_s^+ \rightarrow K^+K^-\pi^+$ . That is, the ratio of these two branching fractions is not exactly the  $\phi \rightarrow K^+K^-$  branching fraction 0.491.

[h] This is the average of a model-independent and a  $K$ -matrix parametrization of the  $\pi^+\pi^-$  S-wave and is a sum over several  $f_0$  mesons.

[i] This mode is not a useful test for a  $\Delta C=1$  weak neutral current because both quarks must change flavor in this decay.

[j] This is *not* a test for the  $\Delta C=1$  weak neutral current, but leads to the  $\pi^+\ell^+\ell^-$  final state.

**FIT INFORMATION**

An overall fit to 16 branching ratios uses 25 measurements to determine 11 parameters. The overall fit has a  $\chi^2 = 12.7$  for 14 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

<sup>1</sup> ABLIKIM 21AC finds that the ratio of the $D_s^+$ and $D^0$ semielectronic widths is $0.790 \pm 0.016 \pm 0.020$ .					

## Meson Particle Listings

 $D_S^\pm$ 

<sup>2</sup>ABLIKIM 21AC reports a value of  $(6.30 \pm 0.13 \pm 0.09 \pm 0.04) \times 10^{-2}$ , where the last uncertainty is an external systematic from  $B(D_S^+ \rightarrow \tau \nu)$ . We have added the systematic uncertainties in quadrature.

<sup>3</sup>Using the  $D_S^+$  and  $D^0$  lifetimes, ASNER 10 finds that the ratio of the  $D_S^+$  and  $D^0$  semileptonic widths is  $0.828 \pm 0.051 \pm 0.025$ .

6.8 ± 1.1 ± 1.8	553	<sup>7</sup> HEISTER	02i ALEP Z decays

<sup>1</sup>ABLIKIM 16o also reports that when constrained by the Standard Model ratio of  $\Gamma(D^+ \rightarrow \tau^+ \nu_\tau)/\Gamma(D^+ \rightarrow \mu^+ \nu_\mu) = 9.76$ , the branching fraction is found to be  $(0.495 \pm 0.067 \pm 0.026)\%$ . The constrained value is used to obtain the decay constant,  $f_{D^+} = (241.0 \pm 16.3 \pm 6.6)$  MeV.

<sup>2</sup>ZUPANC 13 uses both  $\mu^+ \nu$  and  $\tau^+ \nu$  events to get  $f_{D^+} = (255.5 \pm 4.2 \pm 5.1)$  MeV.

<sup>3</sup>DEL-AMO-SANCHEZ 10J uses  $\mu^+ \nu_\mu$  and  $\tau^+ \nu_\tau$  events together to get  $f_{D^+} = (258.6 \pm 6.4 \pm 7.5)$  MeV.

<sup>4</sup>Superseded by ABLIKIM 23BR.

<sup>5</sup>WIDHALM 08 gets  $f_{D^+} = (275 \pm 16 \pm 12)$  MeV from the branching fraction.

<sup>6</sup>PEDLAR 07A also fits  $\mu^+$  and  $\tau^+$  events together and gets an effective  $\mu^+ \nu_\mu$  branching fraction of  $(6.38 \pm 0.59 \pm 0.33) \times 10^{-3}$

<sup>7</sup>This HEISTER 02i result is not actually an independent measurement of the absolute  $\mu^+ \nu_\mu$  branching fraction, but is in fact based on our  $\phi\pi^+$  branching fraction of  $3.6 \pm 0.9\%$ , so it cannot be included in our overall fit. HEISTER 02i combines its  $D_S^+ \rightarrow \tau^+ \nu_\tau$  and  $\mu^+ \nu_\mu$  branching fractions to get  $f_{D^+} = (285 \pm 19 \pm 40)$  MeV.

$\Gamma(\mu^+ \nu_\mu)/\Gamma(\phi\pi^+)$		$\Gamma_{21}/\Gamma_{48}$

- ABLIKIM 23BP uses  $\tau^+ \rightarrow \pi^+ \bar{\nu}_\tau$  decays.
- ABLIKIM 23BX uses  $\tau^+ \rightarrow \mu^+ \nu_\mu \bar{\nu}_\tau$  decays.
- ABLIKIM 21AF uses  $\tau^+ \rightarrow \pi^+ \pi^0 \bar{\nu}_\tau$  decays.
- ABLIKIM 21AZ uses  $\tau^+ \rightarrow e^+ \nu_e \bar{\nu}_\tau$  decays.
- ABLIKIM 16o also reports that when constrained by the Standard Model ratio of  $\Gamma(D_s^+ \rightarrow \tau^+ \nu_\tau)/\Gamma(D_s^+ \rightarrow \mu^+ \nu_\mu) = 9.75$ , the branching fraction is found to be  $(4.83 \pm 0.65 \pm 0.26)\%$ .
- ZUPANC 13 uses both  $\mu^+ \nu$  and  $\tau^+ \nu$  events to get  $f_{D_s} = (255.5 \pm 4.2 \pm 5.1)$  MeV.
- DEL-AMO-SANCHEZ 10j (with a small correction; see LEES 15d) uses  $\mu^+ \nu_\mu$  and  $\tau^+ \nu_\tau$  events together to get  $f_{D_s} = (259.9 \pm 6.6 \pm 7.6)$  MeV.
- ALEXANDER 09, NAIK 09A, and ONYISI 09 use different  $\tau$  decay modes and are independent. The three papers combined give  $f_{D_s} = (259.7 \pm 7.8 \pm 3.4)$  MeV.
- ABLIKIM 21BE uses  $\tau^+ \rightarrow \pi^+ \bar{\nu}_\tau$  decays. When constrained by the Standard Model ratio of  $\Gamma(D_s^+ \rightarrow \tau^+ \nu_\tau)/\Gamma(D_s^+ \rightarrow \mu^+ \nu_\mu) = 9.75$ , the branching fraction is found to be  $(5.22 \pm 0.10 \pm 0.14)\%$ . Superseded by ABLIKIM 23BP.
- ECKLUND 08 and PEDLAR 07A are independent: ECKLUND 08 uses  $\tau^+ \rightarrow e^+ \nu_e \bar{\nu}_\tau$  events, PEDLAR 07A uses  $\tau^+ \rightarrow \pi^+ \bar{\nu}_\tau$  events.
- HEISTER 02 combines its  $D_s^+ \rightarrow \tau^+ \nu_\tau$  and  $\mu^+ \nu_\mu$  branching fractions to get  $f_{D_s} = (285 \pm 19 \pm 40)$  MeV.
- This ABBIENDI 01L value gives a decay constant  $f_{D_s}$  of  $(286 \pm 44 \pm 41)$  MeV.
- The second ACCIARRI 97F error here combines in quadrature systematic (0.016) and normalization (0.018) errors. The branching fraction gives  $f_{D_s} = (309 \pm 58 \pm 33 \pm 38)$  MeV.

$$\frac{\Gamma(\phi \pi^+)}{\Gamma_{\text{total}}} \quad \Gamma_{48}/\Gamma$$

The results here are model-independent. For earlier, model-dependent results, see our PDG 06 edition. We decouple the  $D_S^+ \rightarrow \phi \pi^+$  branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the  $D_S^+ \rightarrow \phi \pi^+, \phi \rightarrow K^+ K^-$  branching fraction obtained from the Dalitz-plot analysis of  $D_S^+ \rightarrow K^+ K^- \pi^+$ . That is, the ratio of these two branching fractions is not exactly the  $\phi \rightarrow K^+ K^-$  branching fraction 0.491.

$3.59 \pm 0.77 \pm 0.48$		3 ARTUSO	96 CLE2	$e^+ e^-$ at $\Upsilon(4S)$

• • • We do not use the following data for averages, fits, limits, etc. • • •

$3.9 \pm 5.1 \pm 1.8$  4 BAI 95c BES  $e^+ e^-$  4.03 GeV

1 This AUBERT 06N measurement uses  $\bar{B}^0 \rightarrow D^{(*)-} D^{(*)+}$  and  $B^- \rightarrow D^{(*)-} D^{(*)0}$  decays, including some from other papers. However, the result is independent of AUBERT 05V.

2 AUBERT 05V uses the ratio of  $B^0 \rightarrow D^{*-} D_S^{*+}$  events seen in two different ways, in both of which the  $D^{*-} \rightarrow \bar{D}^0 \pi^-$  decay is fully reconstructed: (1) The  $D_S^{*+} \rightarrow D_S^+ \gamma$ ,  $D_S^+ \rightarrow \phi \pi^+$  decay is fully reconstructed. (2) The number of events in the  $D_S^+$  peak in the missing mass spectrum against the  $D^{*-} \gamma$  is measured.

3 ARTUSO 96 uses partially reconstructed  $\bar{B}^0 \rightarrow D^{*+} D_S^{*-}$  decays to get a model-independent value for  $\Gamma(D_S^- \rightarrow \phi \pi^-)/\Gamma(D^0 \rightarrow K^- \pi^+)$  of  $0.92 \pm 0.20 \pm 0.11$ .

4 BAI 95c uses  $e^+ e^- \rightarrow D_S^+ D_S^-$  events in which one or both of the  $D_S^\pm$  are observed to obtain the first model-independent measurement of the  $D_S^+ \rightarrow \phi \pi^+$  branching fraction, without assumptions about  $\sigma(D_S^\pm)$ . However, with only two "doubly-tagged" events, the statistical error is very large.

<sup>1</sup> Based on isospin considerations, the authors interpret the suppression in the observed rate of this mode compared to  $D_S^\pm \rightarrow f_0(980)\pi^+, f_0 \rightarrow K^+K^-$  as likely due to the destructive interference between  $a_0(980)$  and  $f_0(980)$  in decays to  $K_S^0K_S^0$ .

## Meson Particle Listings

 $D_S^\pm$  $\Gamma(\rho_0(1710)\pi^+, \rho_0 \rightarrow K_S^0 K_S^0)/\Gamma(2K_S^0\pi^+)$   $\Gamma_{64}/\Gamma_{62}$ 

This is the "fit fraction" from the Dalitz-plot analysis. This is likely a superposition of  $D_S^+ \rightarrow \rho_0(1710)\pi$  and  $D_S^+ \rightarrow \rho_0(1700)\pi$  which are indistinguishable in such an analysis.

<sup>1</sup> The last error reflects the uncertainty on the amplitude model.

$\Gamma(\pi^+ (\pi^+ \pi^-)_{S\text{-wave}})/\Gamma(2\pi^+ \pi^-)$		$\Gamma_{96}/\Gamma_{94}$	
This is the "fit fraction" from the Dalitz-plot analysis. See also KLEMP 08, which uses 568 $D_S^+ \rightarrow 3\pi$ decays (over 280 background events) from FNAL E791 to study various parametrizations of the decay amplitudes. The emphasis there is more on S-wave $\pi\pi$ decay products — 20 different solutions are given — than on $D_S^+$ fit fractions.

 $D_s^\pm \chi^2$  TESTS OF  $CP$ -VIOLATION ( $CPV$ )

We list model-independent searches for local  $CP$  violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a  $\chi^2$  test comparing normalised yields  $N_i, \bar{N}_i$  in  $CP$ -conjugate bin pairs  $i$ :  $\chi^2 = \sum_i (N_i - \alpha \bar{N}_i) / \sigma(N_i - \alpha \bar{N}_i)$ . The factor  $\alpha = (\sum_i N_i) / (\sum_i \bar{N}_i)$  removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured  $\chi^2$  or larger under the assumption of  $CP$  conservation [AUBERT 08A0, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14C]. Results can be combined using Fisher's method [MOSTELLER 48].

Local  $CPV$  in  $D_s^\pm \rightarrow K^+ K^- K^\pm$

 $CP$  VIOLATING ASYMMETRIES OF  $P$ -ODD ( $T$ -ODD) MOMENTS $A_{Tviol}(K_S^0 K^\pm \pi^+ \pi^-)$  in  $D_s^\pm \rightarrow K_S^0 K^\pm \pi^+ \pi^-$ 

$C_T \equiv \bar{p}_{K^+} \cdot (\bar{p}_{\pi^+} \times \bar{p}_{\pi^-})$  is a parity-odd correlation of the  $K^+$ ,  $\pi^+$ , and  $\pi^-$  momenta for the  $D_s^+$ .  $\bar{C}_T \equiv \bar{p}_{K^-} \cdot (\bar{p}_{\pi^-} \times \bar{p}_{\pi^+})$  is the corresponding quantity for the  $D_s^-$ . Then

$A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$ , and  $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$ , and

$A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$ .  $C_T$  and  $\bar{C}_T$  are commonly referred to as  $T$ -odd moments, because they are odd under  $T$  reversal. However, the  $T$ -conjugate process  $K_S^0 K^\pm \pi^+ \pi^- \rightarrow D_s^\pm$  is not accessible, while the  $P$ -conjugate process is.

$D_s^{*\pm}$

$I(J^P) = 0(1^-)$

$J^P = 1^-$  established by ABLIKIM 23AZ.

$D_s^{*\pm}$  MASS

The fit includes  $D^\pm, D^0, D_s^\pm, D^{*\pm}, D^{*0}, D_s^{*\pm}, D_1(2420)^0, D_{s1}^{*0}(2460)^0$ , and  $D_{s1}(2536)^\pm$  mass and mass difference measurements.

$D_s^{*+}$  DECAY MODES

$D_s^{*+}$  modes are charge conjugates of the modes below.

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1 D_s^{*+}\gamma$	(93.6 ± 0.4) %
$\Gamma_2 D_s^{*+}\pi^0$	( 5.77 ± 0.35) %
$\Gamma_3 D_s^{*+}e^+e^-$	( 6.7 ± 1.6 ) × 10 <sup>-3</sup>
$\Gamma_4 e^+\nu_e$	( 2.1 $\frac{+1.2}{-0.9}$ ) × 10 <sup>-5</sup>

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 4 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 0.0$  for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{total}$ . The fit constrains the  $x_i$  (argus labels appear in this array to sum to one).

$x_2$	-91	
$x_3$	-38	-4
	$x_1$	$x_2$

## $D_{s0}^*(2317)^\pm$

$I(J^P) = 0(0^+)$   
 $J, P$  need confirmation.

AUBERT 06P and CHOI 15A do not observe neutral and doubly charged partners of the  $D_{s0}^*(2317)^+$ . See the review on "Heavy Non- $q\bar{q}$  Mesons."

### $D_{s0}^*(2317)^\pm$ MASS

The fit includes  $D^\pm, D^0, D_s^\pm, D^{*\pm}, D^{*0}, D_s^{*\pm}, D_1(2420)^0, D_2^*(2460)^0$ , and  $D_{s1}(2536)^\pm$  mass and mass difference measurements.

$D_{s1}(2460)^\pm$  DECAY MODES

$D_{s1}(2460)^\pm$  modes are charge conjugates of the modes below.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor / Confidence level
$\Gamma_1 D_s^{*+}\pi^0$	(48 ± 11) %	
$\Gamma_2 D_s^+\gamma$	(18 ± 4) %	
$\Gamma_3 D_s^+\pi^+\pi^-$	(4.3 ± 1.3) %	S=1.1
$\Gamma_4 D_s^+\gamma$	< 8 %	CL=90%
$\Gamma_5 D_{s0}^*(2317)^+\gamma$	(3.7 <sup>+5.0</sup> <sub>-2.4</sub> ) %	
$\Gamma_6 D_s^+\pi^0$		
$\Gamma_7 D_s^+\pi^0\pi^0$		
$\Gamma_8 D_s^+\gamma\gamma$		

CONSTRAINED FIT INFORMATION

An overall fit to 7 branching ratios uses 8 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 3.4$  for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_2$	80

### $D_{s1}(2536)^\pm$

$$J(J^P) = 0(1^+)$$

$J, P$  need confirmation.

Seen in  $D^*(2010)^+ K^0, D^*(2007)^0 K^+,$  and  $D_s^+ \pi^+ \pi^-$ . Not seen in  $D^+ K^0$  or  $D^0 K^+$ .  $J^P = 1^+$  assignment strongly favored.

### $D_{s1}(2536)^\pm$ MASS

The fit includes  $D^\pm, D^0, D_s^\pm, D^{*\pm}, D^{*0}, D_s^{*\pm}, D_1(2420)^0, D_2^*(2460)^0,$  and  $D_{s1}(2536)^\pm$  mass and mass difference measurements.

**BOTTOM MESONS****( $B = \pm 1$ )** $B^+ = u\bar{b}$ ,  $B^0 = d\bar{b}$ ,  $\bar{B}^0 = \bar{d}b$ ,  $B^- = \bar{u}b$ , similarly for  $B^{*}$ 's***B*-particle organization**

Many measurements of  $B$  decays involve admixtures of  $B$  hadrons. Previously we arbitrarily included such admixtures in the  $B^\pm$  section, but because of their importance we have created two new sections: " $B^\pm/B^0$  Admixture" for  $T(4S)$  results and " $B^\pm/B^0/B_S^0/b$ -baryon Admixture" for results at higher energies. Most inclusive decay branching fractions and  $\chi_b$  at high energy are found in the Admixture sections.  $B^0\text{-}\bar{B}^0$  mixing data are found in the  $B^0$  section, while  $B_S^0\text{-}\bar{B}_S^0$  mixing data and  $B\text{-}\bar{B}$  mixing data for a  $B^0/B_S^0$  admixture are found in the  $B_S^0$  section.  $CP$ -violation data are found in the  $B^\pm$ ,  $B^0$ , and  $B^\pm/B^0$  Admixture sections.  $b$ -baryons are found near the end of the Baryon section. Recently, we also created a new section: " $V_{cb}$  and  $V_{ub}$  CKM Matrix Elements."

The organization of the  $B$  sections is now as follows, where bullets indicate particle sections and brackets indicate reviews.

[Production and Decay of *b*-flavored Hadrons]

[A Short Note on HFLAV Activities]

[Production and Decay of \*b\*-flavored Hadrons](#)**HEAVY FLAVOR AVERAGING GROUP**

Revised February 2024 by U. Egede (Monash University) and A. Soffer (Tel Aviv University)

The Heavy Flavor Averaging Group (HFLAV) is an international collaboration of physicists from experiments measuring properties of heavy flavored particles, *i.e.*, hadrons containing  $b$  and  $c$  quarks, and  $\tau$  leptons. HFLAV calculates and publishes [1] world average values of quantities such as lifetimes, branching fractions, form factors, mixing parameters, and  $CP$ -violating asymmetries. Most parameters concern decays of  $B$  and  $D$  mesons, and many are related to elements of the Cabibbo-Kobayashi-Maskawa (CKM) quark mixing matrix [2], [3].

HFLAV was originally formed in 2002 to continue the activities of the LEP Heavy Flavor Steering group. Since its inception, a wide range of results have become available from increasingly larger data sets. Consequently, HFLAV has expanded to include eight subgroups:

- $b$ -hadron lifetimes and oscillations, including parameters of  $CP$  violation in  $b$  mixing;
- decay-time-dependent  $CP$  violation in  $B$  decays, and angles of the CKM Unitarity Triangle;
- semileptonic decays of  $b$ -hadrons ( $B \rightarrow X\ell\nu$ ,  $\ell = e, \mu, \tau$ ), including determinations of the CKM matrix elements  $|V_{cb}|$  and  $|V_{ub}|$ ;
- $b$ -hadron decays to hadronic final states containing  $c$ -quarks (open charm and charmonium);
- (rarer)  $b$ -hadron decays to final states not containing  $c$ -quarks, including fully hadronic, semileptonic ( $B \rightarrow X\ell\ell, X\nu\bar{\nu}$ ), leptonic, and radiative decays;
- $CP$ - and  $T$ -violating asymmetries of  $D$  mesons and  $D^0\text{-}\bar{D}^0$  mixing;
- $c$ -hadron decays (hadronic, semileptonic, leptonic), properties of excited  $D$  states and charm baryons and determination of  $|V_{cs}|$  and  $|V_{cd}|$ ;
- $\tau$ -lepton physics including branching fractions, tests of lepton universality, determination of  $|V_{us}|$ , and searches for lepton flavor violation.

# Meson Particle Listings

## $b$ -flavored hadrons, $B^\pm$

Each subgroup has one or two conveners and typically a half-dozen members representing experiments that conduct measurements in that area. Most groups contain representatives from the Belle II and LHCb experiments, and some groups have representatives from the ATLAS, BABAR, Belle, BESIII and CMS experiments. Members of HFLAV are appointed by their respective experimental collaborations. HFLAV has two co-leaders, who are appointed by the managements of Belle II and LHCb.

The averaging procedures used by HFLAV are similar to those of the PDG [4]. When sufficient information is available in publications when calculating world averages, common parameters used for different input measurements are adjusted (rescaled) to common values. The  $p$ -value of the fit is provided to indicate the consistency of the measurements included in the average. However, unlike the PDG, when obtaining a world average with a low  $p$ -value (*i.e.*, a large  $\chi^2$  per degree of freedom), HFLAV does not usually scale the resulting uncertainty. Rather, the systematic uncertainties of the measurements are reviewed with experts from the experiments to understand the discrepancy. Unless inconsistencies among measurements are found, no correction is made to the calculated uncertainty. Close communication between representatives of the experiments and HFLAV members who perform averages helps ensure that measurement uncertainties, known correlations, and systematic effects are properly accounted for. If a special treatment is needed to calculate an average, or if an approximation used in an average calculation might not be sufficiently accurate (*e.g.*, assuming Gaussian uncertainties when the likelihood function is non-Gaussian), a note is included in the HFLAV publication and online documentation to describe this.

In general, HFLAV uses all publicly available results that have written documentation such as a journal publication, preprint, or conference note. These include preliminary results presented at conferences and workshops. However, preliminary results that remain unpublished for an extended period of time, or for which no publication is planned, are not included. A special subset of HFLAV averages are included in the PDG listings; for these averages, only measurements that are published or accepted for publication are used. The averages provided by HFLAV are listed by the PDG as “Produced by HFLAV”.

All HFLAV averages and input measurements are documented in an approximately biennial journal paper or preprint; the most recent version is Ref. [1]. The latest results and plots are posted on an extensive set of webpages that are updated several times per year; these are available at

<https://hflav.web.cern.ch>.

$B^\pm$

$$J(P) = \frac{1}{2}(0^-)$$

Quantum numbers not measured. Values shown are quark-model predictions.

See also the  $B^\pm/B^0$  ADMIXTURE and  $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE sections.

### $B^\pm$ MASS

The fit uses  $m_{B^\pm}$ , ( $m_{B^0} - m_{B^\pm}$ ), and  $m_{B^0}$  to determine  $m_{B^\pm}$ ,  $m_{B^0}$ , and the mass difference.

<sup>1</sup> Uses  $B^+ \rightarrow J/\psi \bar{p}$  decays.

<sup>2</sup> Uses  $B^+ \rightarrow J/\psi K^+$  fully reconstructed decays.

<sup>3</sup> Uses exclusively reconstructed final states containing a  $J/\psi \rightarrow \mu^+ \mu^-$  decays.

<sup>4</sup> CSORNA 00 uses fully reconstructed 526  $B^+ \rightarrow J/\psi(\Upsilon) K^+$  events and invariant masses without beam constraint.

<sup>5</sup> ALBRECHT 90J assumes 10580 for  $\Upsilon(4S)$  mass. Supersedes ALBRECHT 87c and ALBRECHT 87D.

<sup>6</sup> Found using fully reconstructed decays with  $J/\psi(1S)$ . ALBRECHT 87D assume  $m_{\Upsilon(4S)} = 10577$  MeV.

### $B^\pm$ MEAN LIFE

See  $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE section for data on  $B$ -hadron mean life averaged over species of bottom particles.

<sup>1</sup> Measured mean life using fully reconstructed decays ( $J/\psi K^{(*)}$ ).

- <sup>2</sup> Measured using  $B^- \rightarrow D^0 \pi^-$  with  $D^0 \rightarrow K^- \pi^+$  events that were selected using a silicon vertex trigger.
- <sup>3</sup> Measurement performed using a combined fit of  $CP$ -violation, mixing and lifetimes.
- <sup>4</sup> Measurement performed using an inclusive reconstruction and  $B$  flavor identification technique.
- <sup>5</sup> Measured mean life using fully reconstructed decays.
- <sup>6</sup> Events are selected in which one  $B$  meson is fully reconstructed while the second  $B$  meson is reconstructed inclusively.
- <sup>7</sup> Data analyzed using  $D/D^* \ell X$  event vertices.
- <sup>8</sup> Data analyzed using charge of secondary vertex.
- <sup>9</sup> ABREU 95Q assumes  $B(B^0 \rightarrow D^{*-} \ell^+ \nu_\ell) = 3.2 \pm 1.7\%$ .
- <sup>10</sup> Data analyzed using vertex-charge technique to tag  $B$  charge.
- <sup>11</sup> Combined result of  $D/D^* \ell X$  analysis and fully reconstructed  $B$  analysis.
- <sup>12</sup> Combined ABREU 95Q and ADAM 95 result.

**$B^+$  DECAY MODES**

$B^-$  modes are charge conjugates of the modes below. Modes which do not identify the charge state of the  $B$  are listed in the  $B^\pm/B^0$  ADMIXTURE section.

The branching fractions listed below assume 50%  $B^0 \bar{B}^0$  and 50%  $B^+ B^-$  production at the  $T(4S)$ . We have attempted to bring older measurements up to date by rescaling their assumed  $T(4S)$  production ratio to 50:50 and their assumed  $D, D_s, D^*$ , and  $\psi$  branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g.,  $B \rightarrow D^\pm X$ , the values usually are multiplicities, not branching fractions. They can be greater than one.

[a] An  $\ell$  indicates an e or a  $\mu$  mode, not a sum over these modes.

[b] An  $CP(\pm 1)$  indicates the  $CP=+1$  and  $CP=-1$  eigenstates of the  $D^0-\bar{D}^0$  system.

[c]  $D$  denotes  $D^0$  or  $\bar{D}^0$ .

[d]  $D_{CP^\pm}^0$  decays into  $D^0 \pi^0$  with the  $D^0$  reconstructed in  $CP$ -even eigenstates  $K^+ K^-$  and  $\pi^+ \pi^-$ .

[e]  $\bar{D}^{*}$  represents an excited state with mass  $2.2 < M < 2.8$  GeV/ $c^2$ .

[f]  $\chi_{c1}(3872)^+$  is a hypothetical charged partner of the  $\chi_{c1}(3872)$ .

[g]  $\Theta(1710)^{++}$  is a possible narrow pentaquark state and  $G(2220)$  is a possible glueball resonance.

[h]  $(\bar{\Lambda}_c^- p)_s$  denotes a low-mass enhancement near 3.35 GeV/ $c^2$ .

**FIT INFORMATION**

An overall fit to 21 branching ratios uses 66 measurements to determine 13 parameters. The overall fit has a  $\chi^2 = 68.7$  for 53 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

**FIT INFORMATION**

A multiparticle fit to  $\eta_c(1S)$ ,  $J/\psi(1S)$ ,  $\psi(2S)$ ,  $h_c(1P)$ , and  $B^\pm$  with the total width, 10 combinations of partial widths obtained from integrated cross section, and 38 branching ratios uses 113 measurements to determine 19 parameters. The overall fit has a  $\chi^2 = 184.6$  for 94 degrees of freedom.

10.1 ± 1.8 ± 1.5	ATHANAS	94	CLE2 Sup. by ARTUSO 97

- <sup>1</sup> URQUIJO 07 report a measurement of  $(10.34 \pm 0.23 \pm 0.25)\%$  for the partial branching fraction of  $B^+ \rightarrow e^+ \nu_e X_C$  decay with electron energy above 0.6 GeV. We converted the result to  $B^+ \rightarrow e^+ \nu_e X$  branching fraction.
- <sup>2</sup> The measurements are obtained for charged and neutral  $B$  mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the  $B$  rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV:  $B(B^+ \rightarrow e^+ \nu_e X) / B(B^0 \rightarrow e^+ \nu_e X) = 1.074 \pm 0.041 \pm 0.026$ .
- <sup>3</sup> ARTUSO 97 uses partial reconstruction of  $B \rightarrow D^* \ell \nu_\ell$  and inclusive semileptonic branching ratio from BARISH 96b  $(0.1049 \pm 0.0017 \pm 0.0043)$ .
- <sup>4</sup> The measurements are obtained for charged and neutral  $B$  mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the  $B$  rest frame, and their ratio of  $B(B^+ \rightarrow e^+ \nu_e X)/B(B^0 \rightarrow e^+ \nu_e X) = 1.08 \pm 0.05 \pm 0.02$ .

seen	<sup>7</sup> SANGHERA	93	CLE2 $e^+e^- \rightarrow \Upsilon(4S)$
4.1 ± 0.8 <sup>+0.8</sup> <sub>-0.9</sub>	<sup>8</sup> FULTON	91	CLEO $e^+e^- \rightarrow \Upsilon(4S)$
7.0 ± 1.8 ± 1.4	<sup>9</sup> ANTREASYAN	90B	CBAL $e^+e^- \rightarrow \Upsilon(4S)$

- <sup>1</sup> Measured using the dependence of  $B^- \rightarrow D^{*0} e^- \bar{\nu}_e$  decay differential rate and the form factor description by CAPRINI 98.
- <sup>2</sup> Simultaneous measurements of both  $B^0 \rightarrow D^{*0} \ell^+ \nu_\ell$  and  $B^+ \rightarrow \bar{D}^0(2007)^0 \ell^+ \nu_\ell$ .
- <sup>3</sup> ALBRECHT 92c reports  $0.058 \pm 0.014 \pm 0.013$ . We rescale using the method described in STONE 94 but with the updated PDG 94  $B(D^0 \rightarrow K^- \pi^+)$ . Assumes equal production of  $B^0 \bar{B}^0$  and  $B^+ B^-$  at the  $\Upsilon(4S)$ .
- <sup>4</sup> Uses a fully reconstructed  $B$  meson as a tag on the recoil side.
- <sup>5</sup> The results are based on the same analysis and data sample reported in ADAM 03.
- <sup>6</sup> BARISH 95 use  $B(D^0 \rightarrow K^- \pi^+) = (3.91 \pm 0.08 \pm 0.17)\%$  and  $B(D^{*0} \rightarrow D^0 \pi^0) = (63.6 \pm 2.3 \pm 3.3)\%$ .
- <sup>7</sup> Combining  $\bar{D}^{*0} \ell^+ \nu_\ell$  and  $\bar{D}^{*0} \ell^+ \nu_\ell$  SANGHERA 93 test  $V-A$  structure and fit the decay angular distributions to obtain  $A_{FB} = 3/4 * (\Gamma^- - \Gamma^+) / \Gamma = 0.14 \pm 0.06 \pm 0.03$ . Assuming a value of  $V_{cb}$ , they measure  $V, A_1,$  and  $A_2$ , the three form factors for the  $D^* \ell \nu_\ell$  decay, where results are slightly dependent on model assumptions.
- <sup>8</sup> Assumes equal production of  $B^0 \bar{B}^0$  and  $B^+ B^-$  at the  $\Upsilon(4S)$ . Uncorrected for  $D$  and  $D^*$  branching ratio assumptions.
- <sup>9</sup> ANTREASYAN 90b is average over  $B$  and  $\bar{D}^*(2010)$  charge states.

1.9 ± 1.0 ± 0.6	7	10 ALBRECHT 88K	ARG	$e^+e^- \rightarrow \Upsilon(4S)$

- <sup>1</sup> Measures absolute branching fractions using a missing-mass technique.  
<sup>2</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .  
<sup>3</sup> ABULENCIA 06J reports  $[\Gamma(B^+ \rightarrow \bar{D}^0\pi^+)/\Gamma_{\text{total}}] / [B(B^0 \rightarrow D^-\pi^+)] = 1.97 \pm 0.10 \pm 0.21$  which we multiply by our best value  $B(B^0 \rightarrow D^-\pi^+) = (2.51 \pm 0.08) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.  
<sup>4</sup> Uses a missing-mass method. Does not depend on  $D$  branching fractions or  $B^-/B^0$  production rates.  
<sup>5</sup> AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of  $B^0$  and  $B^+$ , which is not included here.  
<sup>6</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses the MarkIII branching fractions for the  $D$ .  
<sup>7</sup> BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.  
<sup>8</sup> AUBERT, B 04P reports  $[\Gamma(B^+ \rightarrow \bar{D}^0\pi^+)/\Gamma_{\text{total}}] \times [B(D^0 \rightarrow K^-\pi^+)] = (1.846 \pm 0.032 \pm 0.097) \times 10^{-4}$  which we divide by our best value  $B(D^0 \rightarrow K^-\pi^+) = (3.947 \pm 0.030) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.  
<sup>9</sup> ALAM 94 assume equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and use the CLEOII absolute  $B(D^0 \rightarrow K^-\pi^+)$  and the PDG 1992  $B(D^0 \rightarrow K^-\pi^+\pi^0)/B(D^0 \rightarrow K^-\pi^+)$  and  $B(D^0 \rightarrow K^-\pi^+\pi^-)/B(D^0 \rightarrow K^-\pi^+)$ .  
<sup>10</sup> ALBRECHT 88K assumes  $B^0\bar{B}^0:B^+B^-$  ratio is 45:55. Superseded by ALBRECHT 90J.

<sup>1</sup> Uses the ratio of  $B^- \rightarrow [K^+\pi^-]_D K^-$  and  $B^- \rightarrow [K^-\pi^+]_D K^-$ . AAIJ 21Q gives the charge-averaged rate as  $0.0173 \pm 0.0006$ , where the statistical and systematic uncertainties have been combined according to the correlations between the observables.

<sup>2</sup> Uses the ratio of  $B^+ \rightarrow [K^-\pi^+]_D K^+$  and  $B^+ \rightarrow [K^+\pi^-]_D K^+$ . AAIJ 21Q gives the charge-averaged rate as  $0.0173 \pm 0.0006$ , where the statistical and systematic uncertainties have been combined according to the correlations between the observables.

<sup>3</sup> AALTONEN 11AJ also measures the ratio separately for  $B^+$  ( $R^+(K)$ ) and  $B^-$  ( $R^-(K)$ ) and obtains:  $R^+(K) = (42.6 \pm 13.7 \pm 2.8) \times 10^{-3}$ ,  $R^-(K) = (3.8 \pm 10.3 \pm 2.7) \times 10^{-3}$ .

<sup>4</sup> Superseded by AAIJ 21Q.

<sup>5</sup> AUBERT 05G extract a constraint on the magnitude of the ratio of amplitudes  $|A(B^+ \rightarrow D^0K^+)/A(B^+ \rightarrow \bar{D}^0K^+)| < 0.23$  at 90% CL (Bayesian). Similar measurements from  $B^+ \rightarrow D^{*0}K^+$  are also reported.

<sup>6</sup> SAIGO 05 extract a constraint on the magnitude of the ratio of amplitudes  $|A(B^+ \rightarrow D^0K^+)/A(B^+ \rightarrow \bar{D}^0K^+)| < 0.27$  at 90% CL.

<sup>7</sup> AUBERT,B 04L extract a constraint on the magnitude of the ratio of amplitudes  $|A(B^+ \rightarrow D^0K^+)/A(B^+ \rightarrow \bar{D}^0K^+)| < 0.22$  at 90% CL.

1 CHOUDHURY 21 uses the relative production fraction of charged ( $f^{\pm}$ ) to neutral ( $f^0$ )  $B$  mesons at  $\Upsilon(4S)$  value of  $f^+/f^0 = 1.058 \pm 0.024$ .

2 CHILIKIN 19 reports  $[\Gamma(B^+ \rightarrow J/\psi(1S) K^+)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow p\bar{p}\pi^+\pi^-)] = (56.4^{+3.3+2.7}_{-3.2-2.5}) \times 10^{-7}$  which we divide by our best value  $B(J/\psi(1S) \rightarrow p\bar{p}\pi^+\pi^-) = (6.0 \pm 0.5) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

3 Measures absolute branching fractions using a missing-mass technique.

4 Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

5 AUBERT,B 05L reports  $[\Gamma(B^+ \rightarrow J/\psi(1S) K^+)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow p\bar{p})] = (2.2 \pm 0.2 \pm 0.1) \times 10^{-6}$  which we divide by our best value  $B(J/\psi(1S) \rightarrow p\bar{p}) = (2.120 \pm 0.029) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

6 BORTOLETTO 92 reports  $(8 \pm 2 \pm 2) \times 10^{-4}$  from a measurement of  $[\Gamma(B^+ \rightarrow J/\psi(1S) K^+)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+e^-) = 0.069 \pm 0.009$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

7 ALBRECHT 90J reports  $(7 \pm 3 \pm 1) \times 10^{-4}$  from a measurement of  $[\Gamma(B^+ \rightarrow J/\psi(1S) K^+)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+e^-) = 0.069 \pm 0.009$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

8 ALBRECHT 87D assume  $B^+ B^-/B^0 \bar{B}^0$  ratio is 55/45. Superseded by ALBRECHT 90J.

9 BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.

10 ALAM 86 assumes  $B^\pm/B^0$  ratio is 60/40.

<sup>1</sup> LEES 20c measurement's last uncertainty is due to the used  $B(B^\pm \rightarrow K^\pm J/\psi)$  value.

<sup>2</sup> Measures absolute branching fractions using a missing-mass technique.

<sup>3</sup> CHILIKIN 19 reports  $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow p\bar{p}\pi^+\pi^-)] = (3.7_{-1.0}^{+1.2} \pm 0.2) \times 10^{-7}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow p\bar{p}\pi^+\pi^-) = (2.1 \pm 0.7) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>5</sup> Measured in the  $B^+ \rightarrow K^+ K^- K^+$  decay.

<sup>6</sup> Measured in the  $B^+ \rightarrow K^+ K_S^0 K_S^0$  decay.

<sup>7</sup> LEES 11i reports  $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow \pi\pi)] = (1.53 \pm 0.66 \pm 0.27) \times 10^{-6}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow \pi\pi) = (8.5 \pm 0.4) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>8</sup> AUBERT 08A1 reports  $(0.70 \pm 0.10_{-0.10}^{+0.12}) \times 10^{-6}$  for  $B(B^+ \rightarrow \chi_{c0} K^+) \times B(\chi_{c0} \rightarrow \pi^+ \pi^-)$ . We compute  $B(B^+ \rightarrow \chi_{c0} K^+)$  using the PDG value  $B(\chi_{c0} \rightarrow \pi\pi) = (8.5 \pm 0.4) \times 10^{-3}$  and 2/3 for the  $\pi^+ \pi^-$  fraction. Our first error is their experiment's error and the second error is systematic error from using our best value.

<sup>9</sup> AUBERT,BE 06M reports  $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow \gamma J/\psi(1S))] = (6.1 \pm 2.6 \pm 1.1) \times 10^{-6}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow \gamma J/\psi(1S)) = (1.41 \pm 0.09) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. The significance of the observed signal is 2.4  $\sigma$ .

<sup>10</sup> AAIJ 13s reports  $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow p\bar{p})] < 6 \times 10^{-8}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow p\bar{p}) = 2.21 \times 10^{-4}$ .

<sup>11</sup> WICHT 08 reports  $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow \gamma\gamma)] < 0.11 \times 10^{-6}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow \gamma\gamma) = 2.04 \times 10^{-4}$ .

<sup>12</sup> Measured in the  $B^+ \rightarrow K^+ K^- K^+$  decay.

<sup>13</sup> AUBERT,B 05N reports  $(0.66 \pm 0.22 \pm 0.08) \times 10^{-6}$  for  $B(B^+ \rightarrow \chi_{c0}^0 K^+) \times B(\chi_{c0}^0 \rightarrow \pi^+ \pi^-)$ . We compute  $B(B^+ \rightarrow \chi_{c0}^0 K^+)$  using the PDG value  $B(\chi_{c0}^0 \rightarrow \pi^+ \pi^-) = (7.1 \pm 0.6) \times 10^{-3}$  and 2/3 for the  $\pi^+ \pi^-$  fraction.

<sup>14</sup> The measurement performed using decay channels  $\chi_{c0} \rightarrow \pi^+ \pi^-$  and  $\chi_{c0} \rightarrow K^+ K^-$ . The ratio of the branching ratios for these channels is found to be consistent with world average.

<sup>15</sup> AUBERT 04P reports  $B(B^+ \rightarrow \chi_{c0} K^+) \times B(\chi_{c0} \rightarrow \pi^+ \pi^-) = (1.5 \pm 0.4 \pm 0.1) \times 10^{-6}$  and used PDG value of  $B(\chi_{c0} \rightarrow \pi\pi) = (7.4 \pm 0.8) \times 10^{-3}$  and Clebsch-Gordan coefficient to compute  $B(B^\pm \rightarrow \chi_{c0} K^\pm)$ .

<sup>16</sup> ABE 02b measures the ratio of  $B(B^+ \rightarrow \chi_{c0} K^+)/B(B^+ \rightarrow J/\psi(1S) K^+) = 0.60 \pm 0.21 - 0.18 \pm 0.05 \pm 0.08$ , where the third error is due to the uncertainty in the  $B(\chi_{c0} \rightarrow \pi^+ \pi^-)$ , and uses  $B(B^+ \rightarrow J/\psi(1S) K^+) = (10.0 \pm 1.0) \times 10^{-4}$  to obtain the result.

<sup>17</sup> EDWARDS 01 assumes equal production of  $B^0$  and  $B^+$  at the  $\Upsilon(4S)$ . The correlated uncertainties (28.3%) from  $B(J/\psi(1S) \rightarrow \gamma\eta_c)$  in those modes have been accounted for.

$< 240$	90	<sup>5</sup> BORTOLETTO89	CLEO	$e^+e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> AAIJ 19AL reports  $0.075 \pm 0.008 \pm 0.007$  fit fraction for  $B^+ \rightarrow f_2(1270)\pi^+$  from the amplitude analysis of  $B^\pm \rightarrow \pi^\pm K^+ K^-$  decays. We use the PDG 19 value  $B(B^+ \rightarrow K^+ K^- \pi^+) = (5.2 \pm 0.4) \times 10^{-6}$  to obtain  $B(B^+ \rightarrow f_2(1270)\pi^+, f_2(1270) \rightarrow K^+ K^-)$ . We compute  $B(B^+ \rightarrow f_2(1270)\pi^+)$  using 1/2 of PDG 19 value of  $B(f_2(1270) \rightarrow K^+ K^-) = (4.6^{+0.5}_{-0.4})\%$  for  $K^+ K^-$  fraction. Our first error is the experiment's error and the second error is systematic error from using our best value.

<sup>2</sup> AUBERT 09L reports  $[\Gamma(B^+ \rightarrow \pi^+ f_2(1270))/\Gamma_{\text{total}}] \times [B(f_2(1270) \rightarrow \pi^+\pi^-)] = (0.9 \pm 0.2 \pm 0.1^{+0.3}_{-0.1}) \times 10^{-6}$  which we divide by our best value  $B(f_2(1270) \rightarrow \pi^+\pi^-) = (56.2^{+1.9}_{-0.6}) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>3</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>4</sup> AUBERT,B 05G reports  $[\Gamma(B^+ \rightarrow \pi^+ f_2(1270))/\Gamma_{\text{total}}] \times [B(f_2(1270) \rightarrow \pi^+\pi^-)] = (2.3 \pm 0.6 \pm 0.4) \times 10^{-6}$  which we divide by our best value  $B(f_2(1270) \rightarrow \pi^+\pi^-) = (56.2^{+1.9}_{-0.6}) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>5</sup> BORTOLETTO 89 reports  $< 2.1 \times 10^{-4}$  assuming the  $\Upsilon(4S)$  decays 43% to  $B^0\bar{B}^0$ . We rescale to 50%.

POLARIZATION IN  $B^+$  DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ( $L$ ) or both are transverse and parallel ( $\parallel$ ) or perpendicular ( $\perp$ ) to each other with the parameters  $\Gamma_L/\Gamma$ ,  $\Gamma_{\perp}/\Gamma$ , and the relative phases  $\phi_{\parallel}$  and  $\phi_{\perp}$ . See the definitions in the note on "Polarization in  $B$  Decays" review in the  $B^0$  Particle Listings.

<sup>1</sup> The second error includes both systematics and the uncertainties from  $CP$  asymmetries in restricted regions of phase space.

<sup>2</sup> HSU 17 provides also measurement as a function of  $K^+ K^-$  invariant mass.

<sup>3</sup> AAIJ 14 reports  $A_{CP}(B^+ \rightarrow K^+ K^- \pi^+) = -0.648 \pm 0.070 \pm 0.013 \pm 0.007$  in the Dalitz plot region of  $m_{K^+ K^-}^2 < 1.5 \text{ GeV}^2/c^4$ . The third uncertainty is due to the  $CP$  asymmetry of the  $B^\pm \rightarrow J/\psi K^\pm$  reference mode uncertainty.

 $A_{CP}(B^+ \rightarrow K^+ K^- \pi^+ \text{ nonresonant})$

### CP VIOLATION PARAMETERS IN $B^+ \rightarrow DK^+$ AND SIMILAR DECAYS

The parameters  $r_{B^+}$  and  $\delta_{B^+}$  are the magnitude ratio and strong phase difference between the amplitudes of  $A(B^+ \rightarrow \bar{D}^{(*)0}K^{(*)+})$  and  $A(B^+ \rightarrow D^{(*)0}K^{(*)+})$ . The measured observables are defined as  $x_\pm = r_{B^+} \cos(\delta_{B^+} \pm \gamma)$  and  $y_\pm = r_{B^+} \sin(\delta_{B^+} \pm \gamma)$ , and can be used to measure the CKM angle  $\gamma$ .

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV). It is derived from combinations of their results on  $B^+ \rightarrow DK^+$  and related processes.

### $\gamma$

For angle  $\gamma(\phi_3)$  of the CKM unitarity triangle, see the review on "CP Violation" in the Reviews section.

<sup>1</sup> Measured using  $B^\pm \rightarrow D^*K^\pm$  and  $B^\pm \rightarrow D^*\pi^\pm$  decays analysing the signal yield variation with the fully reconstructed  $D^* \rightarrow D\pi^0/\gamma$ ,  $D \rightarrow (KS)^0\pi^+\pi^-/(KS)^0K^+K^-$  decays. The model-independent approach uses external strong phase input from BESIII and CLEO collaborations.

<sup>2</sup> Measured using  $B^\pm \rightarrow D[K^\mp\pi^\pm\pi^\mp]h^\pm$  decays in bins of the phase space of the  $D$  decay. The third uncertainty includes systematic and finite knowledge of the  $D$ -meson decay parameters.

<sup>3</sup> A model-dependent binned analysis of the decays  $B^\pm \rightarrow [K^+K^-\pi^+\pi^-]_D h^\pm$  is used.

<sup>4</sup> Uses binned Dalitz plot analysis of  $D \rightarrow K_S^0\pi^+\pi^-$  and  $K_S^0K^+K^-$  from  $B^\pm \rightarrow DK^\pm$  modes. Strong phase measurements from CLEO-c and BES-III of the  $D$  decay over the Dalitz plot are used as input. Value is modulo  $180^\circ$ .

<sup>5</sup> Supersedes AIHARA 12.

<sup>6</sup> AAIJ 21AM presents a combination of existing measurements from LHCB collaboration. It includes also charm mixing parameters.

<sup>7</sup> Measured in  $B_S^0 \rightarrow D_S^\pm K^\mp\pi^\pm\pi^\mp$  decays in restricted phase space with  $m(K^+\pi^-) < 1950 \text{ MeV}$ ,  $m(K^+\pi^-) < 1200 \text{ MeV}$  and  $m(\pi^+\pi^-) < 1200 \text{ MeV}$ . The value is modulo  $180^\circ$ .

<sup>8</sup> A model-independent coherence factor for the decay  $B_S \rightarrow D_S K\pi$  (in the restricted phase space region) is also reported.

## Meson Particle Listings

 $B^\pm$ 

- <sup>9</sup> Uses binned analysis of  $D \rightarrow K_S^0 \pi^+ \pi^- \pi^0$  from  $B^\pm \rightarrow DK^\pm$  modes over the phase space. Strong phase measurements from RESMI 18 analysis of CLEO-c data of the  $D$  decay over the phase space binning are used as input.
- <sup>10</sup> Uses binned Dalitz plot analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$  and  $K_S^0 K^+ K^-$  from  $B^\pm \rightarrow DK^\pm$  modes. Strong phase measurements from CLEO-c of the  $D$  decay over the Dalitz plot are used as input.
- <sup>11</sup> Measured in  $B_S^0 \rightarrow D_S^\mp K^\pm$  decays, constraining  $-2\beta_S$  by the measurement of  $\phi_S = 0.030 \pm 0.033$  from HFLAV. The value is modulo  $180^\circ$ .
- <sup>12</sup> AAIJ 18z reports the intervals  $(5-86)^\circ$  or  $(185-266)^\circ$  at 68% C.L. The extraction uses the time dependent CP violation measurement in  $B^0 \rightarrow D^\mp \pi^\pm$  decays with external input and some theoretical assumptions.
- <sup>13</sup> Uses Dalitz plot analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$  decays coming from  $B^0 \rightarrow DK^*(892)^0$  modes. Measures  $r_{B^0} = 0.39 \pm 0.13$ , and  $\delta_{B^0} = 197^{+24}_{-20}$  degrees.
- <sup>14</sup> A combination of measurements from analyses of time-integrated  $B^+ \rightarrow DK^+$ ,  $B^0 \rightarrow DK^*(*)^0$ ,  $B^0 \rightarrow DK^+ \pi^-$ , and  $B^+ \rightarrow DK^+ \pi^+ \pi^-$  tree-level decays. In addition, results from a time-dependent analysis of  $B_S^0 \rightarrow D_S K$  decays are included.
- <sup>15</sup> A model-independent binned Dalitz plot analysis of the decays  $B^0 \rightarrow DK^{*0}$ , with  $D \rightarrow K_S^0 \pi^+ \pi^-$  and  $D \rightarrow K_S^0 K^+ K^-$ . The results cannot be combined with the model-dependent analysis of the same dataset reported in AAIJ 16AA.
- <sup>16</sup> Angle  $\gamma$  required to satisfy  $0 < \gamma < 180$  degrees.
- <sup>17</sup> Obtained by measuring time-dependent CP asymmetry in  $B_S^0 \rightarrow K^+ K^-$  and using a U-spin relation between  $B_S^0 \rightarrow K^+ K^-$  and  $B^0 \rightarrow \pi^+ \pi^-$ .
- <sup>18</sup> Results are also presented using additional inputs on  $B^0 \rightarrow \pi^0 \pi^0$  and  $B^+ \rightarrow \pi^+ \pi^0$  decays from other experiments and isospin symmetry assumptions. The dependence of the results on the maximum allowed amount of U-spin breaking up to 50% is also included.
- <sup>19</sup> Uses binned Dalitz plot analysis of  $B^+ \rightarrow DK^+$  decays, with  $D \rightarrow K_S^0 \pi^+ \pi^-$  and  $D \rightarrow K_S^0 K^+ K^-$ . Strong phase measurements from CLEO-c (LIBBY 10) of the  $D$  decay over the Dalitz plot are used as input. Solution that satisfies  $0 < \gamma < 180$  is chosen.
- <sup>20</sup> AAIJ 14BE uses model-dependent analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$  amplitudes. The model is the same as in DEL-AMO-SANCHEZ 10F.
- <sup>21</sup> Measured in  $B^0 \rightarrow D^\mp K^\pm$  decays, constraining  $-2\beta_S$  by the measurement of  $\phi_S = 0.01 \pm 0.07 \pm 0.0$  from AAIJ 13AR. The value is modulo  $180^\circ$  at 68% CL.
- <sup>22</sup> Presents a confidence region  $55.4^\circ < \gamma < 82.3^\circ$  at 68% CL with best fit value  $72.6^\circ$  and includes both statistical and systematic uncertainties. The corresponding 95% CL is  $40.2^\circ < \gamma < 92.7^\circ$ . The value is determined from combination of measurements using  $D$  meson decaying to  $K^+ K^-$ ,  $\pi^+ \pi^-$ ,  $K^\pm \pi^\mp$ ,  $K_S^0 \pi^+ \pi^-$ ,  $K_S^0 K^+ K^-$ , and  $K^\pm \pi^\mp \pi^\pm \pi^\mp$ . Combines  $B^\pm \rightarrow DK^\pm$  and  $B^\pm \rightarrow D\pi^\pm$ .
- <sup>23</sup> Reports combination of published measurements using GGSZ, GLW, and ADS methods. Reports also  $2\sigma$  range of  $41-102^\circ$  and a  $5.9\sigma$  significance for  $\gamma(B^+ \rightarrow D^*(*)^0 K^+)$   $\neq 0$  hypothesis.
- <sup>24</sup> Reports combined statistical and systematic uncertainties.
- <sup>25</sup> Uses binned Dalitz plot of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays from  $B^+ \rightarrow \bar{D}^0 K^+$ . Measurement of strong phases in  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  Dalitz plot from LIBBY 10 is used as input.
- <sup>26</sup> We combined the systematics in quadrature. The authors report separately the contribution to the systematic uncertainty due to the uncertainty on the bin-averaged strong phase difference between  $D^0$  and  $\bar{D}^0$  amplitudes. Superseded by ABUDINEN 22.
- <sup>27</sup> Uses Dalitz plot analysis of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ ,  $K_S^0 K^+ K^-$  decays from  $B^+ \rightarrow D^*(*)^+ K^+$ ,  $DK^{*+}$  modes. The corresponding two standard deviation interval for  $\gamma$  is  $39^\circ < \gamma < 98^\circ$ . CP conservation in the combined result is ruled out with a significance of 3.5 standard deviations.
- <sup>28</sup> Reports confidence intervals for the CKM angle  $\gamma$  from the measured values of the GLW parameters using  $B^\pm \rightarrow DK^\pm$  decays with  $D$  mesons decaying to non-CP( $K\pi$ ), CP-even ( $K^+ K^-$ ,  $\pi^+ \pi^-$ ), and CP-odd ( $K_S^0 \pi^+ \pi^-$ ,  $K_S^0 \omega$ ) states.
- <sup>29</sup> Uses Dalitz plot analysis of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays from  $B^+ \rightarrow D^*(*)^+ K^+$  modes. The corresponding two standard deviation interval for  $\gamma$  is  $54.2^\circ < \gamma < 100.5^\circ$ . CP conservation in the combined result is ruled out with a significance of 3.5 standard deviations.
- <sup>30</sup> Uses Dalitz plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays coming from  $B^0 \rightarrow D^0 K^{*0}$  modes. The corresponding 95% CL interval is  $77^\circ < \gamma < 247^\circ$ . A 180 degree ambiguity is implied.
- <sup>31</sup> Uses Dalitz plot analysis of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  and  $\bar{D}^0 \rightarrow K_S^0 K^+ K^-$  decays coming from  $B^\pm \rightarrow D^*(*)^+ K^+$  modes. The corresponding two standard deviation interval is  $29^\circ < \gamma < 122^\circ$ .
- <sup>32</sup> Uses a Dalitz plot analysis of the  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays; Combines the  $DK^+$ ,  $D^* K^+$  and  $DK^{*+}$  modes. The corresponding two standard deviations interval for gamma is  $8^\circ < \gamma < 111^\circ$ .
- <sup>33</sup> Uses a Dalitz plot analysis of neutral  $D \rightarrow K_S^0 \pi^+ \pi^-$  decays coming from  $B^\pm \rightarrow DK^\pm$  and  $B^\pm \rightarrow D^{*0} K^\pm$  followed by  $D^{*0} \rightarrow D\pi^0, D\gamma$ . The corresponding two standard deviations interval for gamma is  $12^\circ < \gamma < 137^\circ$ . AUBERT,B 05Y also reports the amplitude ratios and the strong phases.
- <sup>34</sup> Uses a Dalitz plot analysis of the 3-body  $D \rightarrow K_S^0 \pi^+ \pi^-$  decays coming from  $B^\pm \rightarrow DK^\pm$  and  $B^\pm \rightarrow D^* K^\pm$  followed by  $D^* \rightarrow D\pi^0$ ; here we use  $D$  to denote that the neutral  $D$  meson produced in the decay is an admixture of  $D^0$  and  $\bar{D}^0$ . The corresponding two standard deviations interval for  $\gamma$  is  $26^\circ < \gamma < 126^\circ$ . POLUEKTOV 04 also reports the amplitude ratios and the strong phases.

 $r_B(B^+ \rightarrow D^0 K^+)$ 

$r_B$  and  $\delta_B$  are the amplitude ratio and relative strong phase between the amplitudes of  $A(B^+ \rightarrow D^0 K^+)$  and  $A(B^+ \rightarrow \bar{D}^0 K^+)$ ,

<sup>1</sup> Measured using  $B^\pm \rightarrow D[K^\mp \pi^\pm \pi^\pm \pi^\mp] h^\pm$  decays in bins of the phase space of the  $D$  decay. The third uncertainty includes systematic and finite knowledge of the  $D$ -meson decay parameters.

<sup>2</sup> A model-dependent binned analysis of the decays  $B^\pm \rightarrow [K^+ K^- \pi^+ \pi^-]_D h^\pm$  is used.

<sup>3</sup> Uses binned Dalitz plot analysis of  $B^+ \rightarrow DK^+$  decays, with  $D \rightarrow K_S^0 \pi^+ \pi^-$  and  $D \rightarrow K_S^0 K^+ K^-$ . Strong phase measurements from CLEO-c (LIBBY 10) of the  $D$  decay over the Dalitz plot are used as input. Supersedes AIHARA 12.

<sup>4</sup> Uses binned analysis of  $D \rightarrow K_S^0 \pi^+ \pi^- \pi^0$  from  $B^\pm \rightarrow DK^\pm$  modes over the phase space. Strong phase measurements from CLEO-c and BES-III data of the  $D$  decay over the phase space binning are used as input.

<sup>5</sup> Uses binned analysis of  $D \rightarrow K_S^0 \pi^+ \pi^- \pi^0$  from  $B^\pm \rightarrow DK^\pm$  modes over the phase space. Strong phase measurements from RESMI 18 analysis of CLEO-c data of the  $D$  decay over the phase space binning are used as input.

<sup>6</sup> Uses binned Dalitz plot analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$  and  $K_S^0 K^+ K^-$  from  $B^\pm \rightarrow DK^\pm$  modes. Strong phase measurements from CLEO-c of the  $D$  decay over the Dalitz plot are used as input.

<sup>7</sup> AAIJ 14BE uses model-dependent analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$  amplitudes. The model is the same as in DEL-AMO-SANCHEZ 10F.

<sup>8</sup> Uses  $B^\pm \rightarrow [K^\pm \pi^\mp \pi^+ \pi^-]_D h^\pm$  mode.

<sup>9</sup> Reports combination of published measurements using GGSZ, GLW, and ADS methods.

<sup>10</sup> Reports combined statistical and systematic uncertainties.

<sup>11</sup> Uses binned Dalitz plot of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays from  $B^+ \rightarrow \bar{D}^0 K^+$ . Measurement of strong phases in  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  Dalitz plot from LIBBY 10 is used as input.

<sup>12</sup> We combined the systematics in quadrature. The authors report separately the contribution to the systematic uncertainty due to the uncertainty on the bin-averaged strong phase difference between  $D^0$  and  $\bar{D}^0$  amplitudes. Superseded by ABUDINEN 22.

<sup>13</sup> Uses decays of neutral  $D$  to  $K^- \pi^+ \pi^0$ .

<sup>14</sup> Uses Dalitz plot analysis of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ ,  $K_S^0 K^+ K^-$  decays from  $B^+ \rightarrow D^*(*)^+ K^+$  modes. The corresponding two standard deviation interval is  $0.037 < r_B < 0.155$ .

<sup>15</sup> Uses the Cabibbo suppressed decay of  $B^+ \rightarrow \bar{D}^0 K^+$  followed by  $\bar{D}^0 \rightarrow K^- \pi^+$ .

<sup>16</sup> Uses Dalitz plot analysis of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays from  $B^+ \rightarrow D^0 K^+$  modes. The corresponding two standard deviation interval is  $0.084 < r_B < 0.239$ .

<sup>17</sup> Uses Dalitz plot analysis of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  and  $\bar{D}^0 \rightarrow K_S^0 K^+ K^-$  decays coming from  $B^\pm \rightarrow D^*(*)^+ K^+$  modes.

<sup>18</sup> Uses a Dalitz plot analysis of the  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays; Combines the  $DK^+$ ,  $D^* K^+$  and  $DK^{*+}$  modes.

<sup>19</sup> Uses a Dalitz analysis of neutral  $D$  decays to  $K_S^0 \pi^+ \pi^-$  in the processes  $B^\pm \rightarrow D^*(*)^+ K^\pm, D^* \rightarrow D\pi^0, D\gamma$ .

 $\delta_B(B^+ \rightarrow D^0 K^+)$

<sup>2</sup> Measurements in other  $q^2$  bins are also reported.

<sup>3</sup> The ratio is determined using the relative branching fractions of the decays  $B^+ \rightarrow K^+ \ell^+ \ell^-$  and  $B^+ \rightarrow J/\psi(\rightarrow \ell^+ \ell^-) K^+$ , with  $\ell = e, \mu$ . Measured for the region  $1.1 < q^2 < 6.0 \text{ GeV}^2/c^4$ .

## FORWARD-BACKWARD ASYMMETRIES

The forward-backward asymmetry is defined as  $A_{FB} = [N(q_{FB} > 0) - N(q_{FB} < 0)] / [N(q_{FB} > 0) + N(q_{FB} < 0)]$ , where  $q_{FB} = -q_B \cdot \text{sgn}(\eta_B)$  with  $q_B$  as the  $B$  hadron electric charge,  $\eta_B$  as its pseudorapidity, and  $\text{sgn}(\eta_B)$  as a sign function of  $\eta_B$ .

$B^0$

$$I(J^P) = \frac{1}{2}(0^-)$$

Quantum numbers not measured. Values shown are quark-model predictions.

See also the  $B^\pm/B^0$  ADMIXTURE and  $B^\pm/B^0/B_S^0/b$ -baryon ADMIXTURE sections.

See the Note "Production and Decay of  $b$ -flavored Hadrons" at the beginning of the  $B^\pm$  Particle Listings and the Note on " $B^0-\bar{B}^0$  Mixing" near the end of the  $B^0$  Particle Listings.

$B^0$  MASS

The fit uses  $m_{B^\pm}$ , ( $m_{B^0} - m_{B^\pm}$ ), and  $m_{B^0}$  to determine  $m_{B^\pm}$ ,  $m_{B^0}$ , and the mass difference.

5280.6 ± 0.8 ± 2.0		BEBEK	87 CLEO	$e^+e^- \rightarrow \Upsilon(4S)$
1 Uses $B^0 \rightarrow J/\psi p\bar{p}$ decays.				
2 Measured with $B_S^0 \rightarrow J/\psi(\mu^+\mu^-) K_S^0(\pi^+\pi^-)$ decays.				
3 Uses $B^0 \rightarrow J/\psi K^0$ fully reconstructed decays.				
4 Uses exclusively reconstructed final states containing a $J/\psi \rightarrow \mu^+\mu^-$ decays.				
5 CSORNA 00 uses fully reconstructed 135 $B^0 \rightarrow J/\psi(\ell^+) K_S^0$ events and invariant masses without beam constraint.				
6 ALBRECHT 90J assumes 10580 for $\Upsilon(4S)$ mass. Supersedes ALBRECHT 87C and ALBRECHT 87D.				
7 Found using fully reconstructed decays with $J/\psi$ . ALBRECHT 87D assume $m_{\Upsilon(4S)} = 10577$ MeV.				

$m_{B^0} - m_{B^\pm}$

1 Uses exclusively reconstructed final states containing a $J/\psi \rightarrow \mu^+\mu^-$ decay.			
2 Uses the $B$ -momentum distributions in the $e^+e^-$ rest frame.			
3 BEBEK 87 actually measure the difference between half of $E_{cm}$ and the $B^\pm$ or $B^0$ mass, so the $m_{B^0} - m_{B^\pm}$ is more accurate. Assume $m_{\Upsilon(4S)} = 10580$ MeV.			

$m_{B_H^0} - m_{B_L^0}$

See the  $B^0-\bar{B}^0$  MIXING PARAMETERS section near the end of these  $B^0$  Listings.

## Meson Particle Listings

 $B^0$  $B^0$  MEAN LIFE

See  $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE section for data on  $B$ -hadron mean life averaged over species of bottom particles.

- Measured using  $B^0 \rightarrow D^{(*)-}\pi^+$  decays.
- Measured using  $B^0 \rightarrow J/\psi K^*(892)^0$  and  $B^0 \rightarrow J/\psi K_S^0$  decays.
- Measured using  $B^0 \rightarrow D^{*-}\mu^+\nu X$  decays.
- Measured mean life using  $B^0 \rightarrow J/\psi K_S^0$  decays.
- Measured using  $B^0 \rightarrow J/\psi K^*0$  decays.
- Measured using  $B^0 \rightarrow K^+\pi^-$  decays.
- Measured with  $B_d^0 \rightarrow J/\psi(\mu^+\mu^-)K_S^0(\pi^+\pi^-)$  decays.
- Measured mean life using fully reconstructed decays ( $J/\psi K^{(*)}$ ).
- Measured mean life using  $B^0 \rightarrow J/\psi K^*0$  decays.
- Measured using a simultaneous fit of the  $B^0$  lifetime and  $\bar{B}^0 B^0$  oscillation frequency  $\Delta m_d$  in the partially reconstructed  $B^0 \rightarrow D^{*-}\ell\nu$  decays.
- Measurement performed using a combined fit of  $CP$ -violation, mixing and lifetimes.
- Measurement performed using an inclusive reconstruction and  $B$  flavor identification technique.
- AUBERT 03C uses a sample of approximately 14,000 exclusively reconstructed  $B^0 \rightarrow D^*(2010)^-\ell\nu$  and simultaneously measures the lifetime and oscillation frequency.
- Measurement performed with decays  $B^0 \rightarrow D^{*-}\pi^+$  and  $B^0 \rightarrow D^{*-}\rho^+$  using a partial reconstruction technique.
- Measured mean life using fully reconstructed decays.

- Data analyzed using partially reconstructed  $\bar{B}^0 \rightarrow D^{*-}\pi^+\nu$  decays.
- Events are selected in which one  $B$  meson is fully reconstructed while the second  $B$  meson is reconstructed inclusively.
- Data analyzed using  $D/D^* \ell X$  event vertices.
- Data analyzed using charge of secondary vertex.
- Data analyzed using inclusive  $D/D^* \ell X$ .
- Measured mean life using partially reconstructed  $D^{*-}\pi^+ X$  vertices.
- ABREU 95Q assumes  $B(B^0 \rightarrow D^{*-}\ell^+\nu_\ell) = 3.2 \pm 1.7\%$ .
- Data analyzed using vertex-charge technique to tag  $B$  charge.
- AKERS 95T assumes  $B(B^0 \rightarrow D_s^{(*)}D^0) = 5.0 \pm 0.9\%$  to find  $B^+/B^0$  yield.
- Measured using the time-dependent angular analysis of  $B_d^0 \rightarrow J/\psi K^*0$  decays.
- Combined result of  $D/D^* \ell X$  analysis, fully reconstructed  $B$  analysis, and partially reconstructed  $D^{*-}\pi^+ X$  analysis.
- Combined ABREU 95Q and ADAM 95 result.
- WAGNER 90 tagged  $B^0$  mesons by their decays into  $D^{*-}e^+\nu$  and  $D^{*-}\mu^+\nu$  where the  $D^{*-}$  is tagged by its decay into  $\pi^-\bar{D}^0$ .
- AVERILL 89 is an estimate of the  $B^0$  mean lifetime assuming that  $B^0 \rightarrow D^{*+} X$  always.

 $\tau_{B^0}/\tau_{B^+}$

- Measured using  $B \rightarrow J/\psi K^{(*)}$  decays.
- Measured mean life using fully reconstructed decays ( $J/\psi K^{(*)}$ ).
- Data analyzed using  $D/D^* \mu X$  vertices.
- Measurement performed using a combined fit of  $CP$ -violation, mixing and lifetimes.
- Measurement performed using an inclusive reconstruction and  $B$  flavor identification technique.
- Measured using fully reconstructed decays.
- Events are selected in which one  $B$  meson is fully reconstructed while the second  $B$  meson is reconstructed inclusively.
- Data analyzed using charge of secondary vertex.
- ABREU 95Q assumes  $B(B^0 \rightarrow D^{*-}\ell^+\nu_\ell) = 3.2 \pm 1.7\%$ .
- Data analyzed using vertex-charge technique to tag  $B$  charge.
- AKERS 95T assumes  $B(B^0 \rightarrow D_s^{(*)}D^0) = 5.0 \pm 0.9\%$  to find  $B^+/B^0$  yield.
- Combined result of  $D/D^* \ell X$  analysis and fully reconstructed  $B$  analysis.

 $\tau_{B^+}/\tau_{B^0}$  (inferred from branching fractions)

These measurements are inferred from the branching fractions for semileptonic decay or other spectator-dominated decays by assuming that the rates for such decays are equal for  $B^0$  and  $B^+$ . We do not use measurements which assume equal production of  $B^0$  and  $B^+$  because of the large uncertainty in the production ratio.

- 1 ARTUSO 97 uses partial reconstruction of  $B \rightarrow D^* \ell \nu_\ell$  and independent of  $B^0$  and  $B^+$  production fraction.  
 2 Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .  
 3 ATHANAS 94 uses events tagged by fully reconstructed  $B^-$  decays and partially or fully reconstructed  $B^0$  decays.  
 4 Assumes equal production of  $B^0$  and  $B^+$ .  
 5 ALBRECHT 92G data analyzed using  $B \rightarrow D_s \bar{D}, D_s \bar{D}^*, D_s^* \bar{D}, D_s^* \bar{D}^*$  events.  
 6 BEAN 87B assume the fraction of  $B^0 \bar{B}^0$  events at the  $\Upsilon(4S)$  is 0.41.

$\Delta\Gamma_{B_d^0} / \Gamma_{B_d^0}$

$\Gamma_{B_d^0}$  and  $\Delta\Gamma_{B_d^0}$  are the decay rate average and difference between two  $B_d^0$  CP eigenstates (light - heavy). The  $\lambda_{CP}$  characterizes  $B^0$  and  $\bar{B}^0$  decays to states of charmonium plus  $K_L^0$ , see the review on "CP Violation" in the reviews section.

1 Measured using  $B^0 \rightarrow J/\psi K^*(892)^0$  and  $B^0 \rightarrow J/\psi K_S^0$  decays, and assuming  $\beta = 21.9 \pm 0.7$  degrees.  
 2 Measured from the ratio of decay time distributions of  $B^0 \rightarrow J/\psi K_S^0$  and  $B^0 \rightarrow J/\psi K^{*0}$  decays.  
 3 Measured using the effective lifetimes of  $B^0 \rightarrow J/\psi K_S^0$  and  $B^0 \rightarrow J/\psi K^{*0}$  decays.  
 4 Reports  $-\Delta\Gamma_d/\Gamma_d$  using  $B^0 \rightarrow J/\psi K_S^0, J/\psi K_L^0, D^- \pi^+, D^{*-} \pi^+, D^{*-} \rho^+$ , and  $D^{*-} \ell^+ \nu$  decays.  
 5 Corresponds to 90% confidence range [-0.084, 0.068].  
 6 Used the measured  $\tau_{B^0} = 1.55 \pm 0.03$  ps. Corresponds to an upper limit of < 0.18 at 95% C.L.  
 7 BEHRENS 00B uses high-momentum lepton tags and partially reconstructed  $\bar{B}^0 \rightarrow D^{*+} \pi^-, \rho^-$  decays to determine the flavor of the B meson. Assumes  $\Delta_{md} = 0.478 \pm 0.018$  ps<sup>-1</sup> and  $\tau_{B^0} = 1.548 \pm 0.032$  ps.

**B<sup>0</sup> DECAY MODES**

$\bar{B}^0$  modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing. Modes which do not identify the charge state of the B are listed in the  $B^\pm/B^0$  ADMIXTURE section.

The branching fractions listed below assume 50%  $B^0 \bar{B}^0$  and 50%  $B^+ B^-$  production at the  $\Upsilon(4S)$ . We have attempted to bring older measurements up to date by rescaling their assumed  $\Upsilon(4S)$  production ratio to 50:50 and their assumed  $D, D_s, D^*$ , and  $\psi$  branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g.,  $B \rightarrow D^\pm X$ , the values usually are multiplicities, not branching fractions. They can be greater than one.

- <sup>1</sup> Uses fully reconstructed  $D^{*-} \ell^+ \nu$  events with  $\ell = e$  or  $\mu$ .
- <sup>2</sup> WAHEED 21 uses fully reconstructed  $D^{*-} \ell^+ \nu$  events ( $\ell = e$  or  $\mu$ ).
- <sup>3</sup> Uses a fully reconstructed  $B$  meson as a tag on the recoil side.
- <sup>4</sup> Measured using fully reconstructed  $D^*$  sample and a simultaneous fit to the Caprin-Lellouch-Neubert form factor parameters:  $\rho^2 = 1.191 \pm 0.048 \pm 0.028$ ,  $R_1(1) = 1.429 \pm 0.061 \pm 0.044$ , and  $R_2(1) = 0.827 \pm 0.038 \pm 0.022$ .
- <sup>5</sup> Measured using fully reconstructed  $D^*$  sample.
- <sup>6</sup> Uses the combined fit of both  $B^0 \rightarrow D^*(2010)^- \ell \nu$  and  $B^+ \rightarrow \bar{D}^*(2007)^0 \ell \nu$  samples.
- <sup>7</sup> ABREU 01H measured using about 5000 partial reconstructed  $D^*$  sample.
- <sup>8</sup> ABBIENDI 00Q assumes the fraction  $B(B \rightarrow B^0) = (39.7^{+1.8}_{-2.2})\%$ . This result is an average of two methods using exclusive and partial  $D^*$  reconstruction.
- <sup>9</sup> BUSKULIC 97 assumes fraction ( $B^+$ ) = fraction ( $B^0$ ) =  $(37.8 \pm 2.2)\%$  and PDG 96 values for  $B$  lifetime and  $D^*$  and  $D$  branching fractions.
- <sup>10</sup> Uses fully reconstructed  $D^{*-} e^+ \nu$  events.
- <sup>11</sup> Uses fully reconstructed  $D^{*-} \mu^+ \nu$  events.

- <sup>12</sup> Combines with previous partial reconstructed  $D^*$  measurement.
- <sup>13</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .
- <sup>14</sup> The results are based on the same analysis and data sample reported in ADAM 03.
- <sup>15</sup> ACKERSTAFF 97G assumes fraction ( $B^+$ ) = fraction ( $B^0$ ) =  $(37.8 \pm 2.2)\%$  and PDG 96 values for  $B$  lifetime and branching ratio of  $D^*$  and  $D$  decays.
- <sup>16</sup> ABREU 96P result is the average of two methods using exclusive and partial  $D^*$  reconstruction.
- <sup>17</sup> BARISH 95 use  $B(D^0 \rightarrow K^- \pi^+) = (3.91 \pm 0.08 \pm 0.17)\%$  and  $B(D^{*+} \rightarrow D^0 \pi^+) = (68.1 \pm 1.0 \pm 1.3)\%$ .
- <sup>18</sup> BUSKULIC 95N assumes fraction ( $B^+$ ) = fraction ( $B^0$ ) =  $38.2 \pm 1.3 \pm 2.2\%$  and  $\tau_{B^0} = 1.58 \pm 0.06$  ps.  $\Gamma(D^{*-} \ell^+ \nu_\ell) / \text{total} = [5.18 - 0.13(\text{fraction}(B^0) - 38.2) - 1.5(\tau_{B^0} - 1.58)]\%$ .
- <sup>19</sup> ALBRECHT 94 assumes  $B(D^{*+} \rightarrow D^0 \pi^+) = 68.1 \pm 1.0 \pm 1.3\%$ . Uses partial reconstruction of  $D^{*+}$  and is independent of  $D^0$  branching ratios.
- <sup>20</sup> ALBRECHT 93 reports  $0.052 \pm 0.005 \pm 0.006$ . We rescale using the method described in STONE 94 but with the updated PDG 94  $B(D^0 \rightarrow K^- \pi^+)$ . We have taken their average  $e$  and  $\mu$  value. They also obtain  $\alpha = 2 * \Gamma^0 / (\Gamma^- + \Gamma^+) - 1 = 1.1 \pm 0.4 \pm 0.2$ ,  $A_{AF} = 3/4 * (\Gamma^- - \Gamma^+) / \Gamma = 0.2 \pm 0.08 \pm 0.06$  and a value of  $|V_{cb}| = 0.036 - 0.045$  depending on model assumptions.
- <sup>21</sup> Combining  $\bar{D}^{*0} \ell^+ \nu_\ell$  and  $D^{*-} \ell^+ \nu_\ell$  SANGHERA 93 test  $V-A$  structure and fit the decay angular distributions to obtain  $A_{FB} = 3/4 * (\Gamma^- - \Gamma^+) / \Gamma = 0.14 \pm 0.06 \pm 0.03$ . Assuming a value of  $V_{cb}$ , they measure  $V, A_1$ , and  $A_2$ , the three form factors for the  $D^* \ell \nu_\ell$  decay, where results are slightly dependent on model assumptions.
- <sup>22</sup> ANTREASAYAN 90B is average over  $B$  and  $\bar{D}^*(2010)$  charge states.
- <sup>23</sup> The measurement of ALBRECHT 89c suggests a  $D^*$  polarization  $\chi_L / \chi_T$  of  $0.85 \pm 0.45$ , or  $\alpha = 0.7 \pm 0.9$ .
- <sup>24</sup> ALBRECHT 89J is ALBRECHT 87J value rescaled using  $B(D^*(2010)^- \rightarrow D^0 \pi^-) = 0.57 \pm 0.04 \pm 0.04$ . Superseded by ALBRECHT 93.
- <sup>25</sup> We have taken average of the the BORTOLETTO 89b values for electrons and muons,  $0.046 \pm 0.005 \pm 0.007$ . We rescale using the method described in STONE 94 but with the updated PDG 94  $B(D^0 \rightarrow K^- \pi^+)$ . The measurement suggests a  $D^*$  polarization parameter value  $\alpha = 0.65 \pm 0.66 \pm 0.25$ .
- <sup>26</sup> ALBRECHT 87J assume  $\mu-e$  universality, the  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = 0.45$ , the  $B(D^0 \rightarrow K^- \pi^+) = (0.042 \pm 0.004 \pm 0.004)$ , and the  $B(D^*(2010)^- \rightarrow D^0 \pi^-) = 0.49 \pm 0.08$ . Superseded by ALBRECHT 89J.

<4.1	90 <sup>10</sup> BEAN 93B	CLE2	e <sup>+</sup> e <sup>-</sup> → T(4S)

<sup>1</sup> The signal events are tagged by a second B meson reconstructed in the fully hadronic decays.

<sup>2</sup> B<sup>+</sup> and B<sup>0</sup> decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.

<sup>3</sup> The B<sup>0</sup> and B<sup>+</sup> results are combined assuming the isospin, B lifetimes, and relative charged/neutral B production at the T(4S).

<sup>4</sup> The signal events are tagged by a second B meson reconstructed in the semileptonic mode B → D<sup>(\*)</sup> ℓ ν<sub>ℓ</sub>.

<sup>5</sup> Averaging with ALEXANDER 96T results including experimental and theoretical correlations considered, BEHRENS 00 reports systematic errors +0.33 ± 0.41, where the second error is theoretical model dependence. We combine these in quadrature.

<sup>6</sup> ATHAR 03 reports systematic errors +0.47 ± 0.41 ± 0.01, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.

<sup>7</sup> Uses isospin constraints and extrapolation to all electron energies according to five different form-factor calculations. The second error combines the systematic and theoretical uncertainties in quadrature.

<sup>8</sup> BEHRENS 00 reports +0.35 ± 0.50, where the second error is the theoretical model dependence. We combine these in quadrature. B<sup>+</sup> and B<sup>0</sup> decays combined using isospin symmetry: Γ(B<sup>0</sup> → ρ<sup>-</sup> ℓ<sup>+</sup> ν) = 2Γ(B<sup>+</sup> → ρ<sup>0</sup> ℓ<sup>+</sup> ν) ≈ 2Γ(B<sup>+</sup> → ω ℓ<sup>+</sup> ν). No evidence for ω ℓ ν is reported.

<sup>9</sup> ALEXANDER 96T reports +0.5 ± 0.5 where the second error is the theoretical model dependence. We combine these in quadrature. B<sup>+</sup> and B<sup>0</sup> decays combined using isospin symmetry: Γ(B<sup>0</sup> → ρ<sup>-</sup> ℓ<sup>+</sup> ν) = 2Γ(B<sup>+</sup> → ρ<sup>0</sup> ℓ<sup>+</sup> ν) ≈ 2Γ(B<sup>+</sup> → ω ℓ<sup>+</sup> ν). No evidence for ω ℓ ν is reported.

<sup>10</sup> BEAN 93B limit set using ISGW Model. Using isospin and the quark model to combine Γ(ρ<sup>0</sup> ℓ<sup>+</sup> ν<sub>ℓ</sub>) and Γ(ω ℓ<sup>+</sup> ν<sub>ℓ</sub>) with this result, they obtain a limit <(1.6-2.7) × 10<sup>-4</sup> at 90% CL for B<sup>+</sup> → (ω or ρ<sup>0</sup>) ℓ<sup>+</sup> ν<sub>ℓ</sub>. The range corresponds to the ISGW, WSB, and KS models. An upper limit on |V<sub>ub</sub>/V<sub>cb</sub>| < 0.08-0.13 at 90% CL is derived as well.

<sup>1</sup> The signal events are tagged by a second B meson reconstructed in the fully hadronic decays.

<sup>2</sup> Uses loose neutrino reconstruction technique. Assumes B(T(4S) → B<sup>+</sup> B<sup>-</sup>) = (51.6 ± 0.6)% and B(T(4S) → B<sup>0</sup> B<sup>0</sup>) = (48.4 ± 0.6)%.

<sup>3</sup> Reports also a branching fraction value B(B<sup>0</sup> → π<sup>-</sup> ℓ<sup>+</sup> ν) = (1.45 ± 0.04 ± 0.06) × 10<sup>-4</sup> from the decays of B<sup>+</sup> and B<sup>0</sup> that are combined using the isospin symmetry relation.

<sup>4</sup> Using the isospin symmetry relation, B<sup>+</sup> and B<sup>0</sup> branching fractions are combined.

<sup>5</sup> The B<sup>0</sup> and B<sup>+</sup> results are combined assuming the isospin, B lifetimes, and relative charged/neutral B production at the T(4S).

<sup>6</sup> Also report the rate for q<sup>2</sup> > 16 GeV<sup>2</sup> of (0.41 ± 0.08 ± 0.04) × 10<sup>-4</sup> from which they obtain |V<sub>ub</sub>| = 3.6 ± 0.4 ± 0.2 ± 0.6 (last error is from theory).

<sup>7</sup> The signal events are tagged by a second B meson reconstructed in the semileptonic mode B → D<sup>(\*)</sup> ℓ ν<sub>ℓ</sub>.

<sup>8</sup> This analysis provides the inclusive and exclusive measurement of |V<sub>ub</sub>|.

<sup>9</sup> The analysis uses events in which the signal B decays are reconstructed with an innovative loose neutrino reconstruction technique.

<sup>10</sup> The signals are tagged by a second B meson reconstructed in a semileptonic or hadronic decay. The B<sup>0</sup> and B<sup>+</sup> results are combined assuming the isospin symmetry.

<sup>11</sup> B<sup>+</sup> and B<sup>0</sup> decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.

<sup>12</sup> ATHAR 03 reports systematic errors 0.11 ± 0.01 ± 0.07, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.

<sup>13</sup> ALEXANDER 96T gives systematic errors ±0.3 ± 0.2 where the second error reflects the estimated model dependence. We combine these in quadrature. Assumes isospin symmetry: Γ(B<sup>0</sup> → π<sup>-</sup> ℓ<sup>+</sup> ν) = 2 × Γ(B<sup>+</sup> → π<sup>0</sup> ℓ<sup>+</sup> ν).

$2.83 \pm 0.42 \pm 0.05$  <sup>8</sup>ALAM 94 CLE2 Repl. by AHMED 02B

$3.1 \pm 1.3 \pm 1.0$  <sup>5</sup>ALBRECHT 88k ARG  $e^+ e^- \rightarrow \Upsilon(4S)$

<sup>1</sup>Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>2</sup>Uses a missing-mass method. Does not depend on  $D$  branching fractions or  $B^+/B^0$  production rates.

<sup>3</sup>AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of  $B^0$  and  $B^+$ , which is not included here.

<sup>4</sup>BORTOLETTO 92 assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ .

<sup>5</sup>ALBRECHT 88k assumes  $B^0\bar{B}^0:B^+B^-$  production ratio is 45:55. Superseded by ALBRECHT 90i which assumes 50:50.

<sup>6</sup>BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.

<sup>7</sup>AUBERT,B 04o reports  $[\Gamma(B^0 \rightarrow D^-\pi^+)/\Gamma_{\text{total}}] \times [B(D^+ \rightarrow K_S^0\pi^+)] = (42.7 \pm 2.1 \pm 2.2) \times 10^{-6}$  which we divide by our best value  $B(D^+ \rightarrow K_S^0\pi^+) = (1.562 \pm 0.031) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>8</sup>ALAM 94 reports  $[\Gamma(B^0 \rightarrow D^-\pi^+)/\Gamma_{\text{total}}] \times [B(D^+ \rightarrow K^-2\pi^+)] = (0.265 \pm 0.032 \pm 0.023) \times 10^{-3}$  which we divide by our best value  $B(D^+ \rightarrow K^-2\pi^+) = (9.38 \pm 0.16) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

 $\Gamma(D^-\ell^+\nu_\ell)/\Gamma(D^-\pi^+)$  $\Gamma_5/\Gamma_{38}$

8.95 ± 0.15 ± 0.52			<sup>1</sup> AAIJ	15Y	LHCB	$pp$ at 7, 8 TeV
8.4 ± 0.4 ± 0.8			<sup>2</sup> KUZMIN	07	BELL	$e^+e^- \rightarrow \Upsilon(4S)$

• • • We do not use the following data for averages, fits, limits, etc. • • •

8.0 ± 0.6 ± 1.5	2,3	SATPATHY 03	BELL	Repl. by KUZMIN 07	
< 16	90	<sup>2</sup> ALAM	94	CLE2	$e^+e^- \rightarrow \Upsilon(4S)$
< 70	90	<sup>4</sup> BORTOLETTO92	CLEO	$e^+e^- \rightarrow \Upsilon(4S)$	
< 340	90	<sup>5</sup> BEBEK	87	CLEO	$e^+e^- \rightarrow \Upsilon(4S)$
700 ± 500	5	<sup>6</sup> BEHREND	83	CLEO	$e^+e^- \rightarrow \Upsilon(4S)$

<sup>1</sup>The second uncertainty combines in quadrature all systematic uncertainties quoted in the paper. AAIJ 15Y reports  $B(\bar{D}^0\pi^+\pi^-) = (8.46 \pm 0.14 \pm 0.49) \times 10^{-4}$  in the kinematic region  $m(\bar{D}^0\pi^\pm) > 2.1$  GeV which we corrected to the full phase-space dividing by 0.945 from Belle.

<sup>2</sup>Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>3</sup>No assumption about the intermediate mechanism is made in the analysis.

<sup>4</sup>BORTOLETTO 92 assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ . The product branching fraction into  $D_S^*(2340)\pi$  followed by  $D_S^*(2340) \rightarrow D^0\pi$  is  $< 0.0001$  at 90% CL and into  $D_S^*(2460)$  followed by  $D_S^*(2460) \rightarrow D^0\pi$  is  $< 0.0004$  at 90% CL.

<sup>5</sup>BEBEK 87 assume the  $\Upsilon(4S)$  decays 43% to  $B^0\bar{B}^0$ . We rescale to 50%.  $B(\bar{D}^0 \rightarrow K^-\pi^+) = (4.2 \pm 0.4 \pm 0.4)\%$  and  $B(\bar{D}^0 \rightarrow K^-\pi^+\pi^-\pi^-) = (9.1 \pm 0.8 \pm 0.8)\%$  were used.

<sup>6</sup>Corrected by us using assumptions:  $B(\bar{D}^0 \rightarrow K^-\pi^+) = (0.042 \pm 0.006)$  and  $B(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 50\%$ . The product branching ratio is  $B(\bar{D}^0 \rightarrow \bar{D}^0\pi^+\pi^-)B(\bar{D}^0 \rightarrow K^+\pi^-) = (0.39 \pm 0.26) \times 10^{-2}$ .

 $\Gamma(D^*(2010)^-\pi^+)/\Gamma_{\text{total}}$  $\Gamma_{48}/\Gamma$

<sup>1</sup>KROHN 23 reports  $(2.623 \pm 0.016 \pm 0.086) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{\text{total}}] / [B(\Upsilon(4S) \rightarrow B^0\bar{B}^0)]$  assuming  $B(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 0.486 \pm 0.006$ .

<sup>2</sup>Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>3</sup>AUBERT,BE 06j reports  $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{\text{total}}] / [B(B^0 \rightarrow D^-\pi^+)] = 0.99 \pm 0.11 \pm 0.08$  which we multiply by our best value  $B(B^0 \rightarrow D^-\pi^+) = (2.51 \pm 0.08) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup>Uses a missing-mass method. Does not depend on  $D$  branching fractions or  $B^+/B^0$  production rates.

<sup>5</sup>BRANDENBURG 98 assume equal production of  $B^+$  and  $B^0$  at  $\Upsilon(4S)$  and use the  $D^*$  reconstruction technique. The first error is their experiment's error and the second error is the systematic error from the PDG 96 value of  $B(D^* \rightarrow D\pi)$ .

<sup>6</sup>ALAM 94 assume equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and use the CLEO II  $B(D^*(2010)^+ \rightarrow D^0\pi^+)$  and absolute  $B(D^0 \rightarrow K^-\pi^+)$  and the PDG 1992  $B(D^0 \rightarrow K^-\pi^+\pi^0)/B(D^0 \rightarrow K^-\pi^+)$  and  $B(D^0 \rightarrow K^-2\pi^+\pi^-)/B(D^0 \rightarrow K^-\pi^+)$ .

<sup>7</sup>BORTOLETTO 92 reports  $(4.0 \pm 1.0 \pm 0.7) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$  assuming  $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$ , which we rescale to our best value  $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ .

<sup>8</sup>ALBRECHT 90j reports  $(2.8 \pm 0.9 \pm 0.6) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$  assuming  $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$ , which we rescale to our best value  $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ .

<sup>9</sup>BEBEK 87 reports  $(2.8 \pm 1.5 \pm 1.0) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$  assuming  $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$ , which we rescale to our best value  $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92 and ALBRECHT 90j.

<sup>10</sup>Assumes  $B(Z \rightarrow b\bar{b}) = 0.217$  and 38%  $B_d$  production fraction.

<sup>11</sup>ALBRECHT 87c use PDG 86 branching ratios for  $D$  and  $D^*(2010)$  and assume  $B(\Upsilon(4S) \rightarrow B^+B^-) = 55\%$  and  $B(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 45\%$ . Superseded by ALBRECHT 90j.

<sup>12</sup>ALBRECHT 86f uses pseudomass that is independent of  $D^0$  and  $D^+$  branching ratios.

<sup>13</sup>Assumes  $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.60 \pm 0.08$ . Assumes  $B(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 0.40 \pm 0.02$ . Does not depend on  $D$  branching ratios.

Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ .

<sup>4</sup> ALBRECHT 90j reports  $0.007 \pm 0.003 \pm 0.003$  from a measurement of  $[\Gamma(B^0 \rightarrow D^*(2010)^- \rho^+) / \Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$  assuming  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$ , which we rescale to our best value  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ .

<sup>5</sup> MATVIENKO 15 reports  $B(B^0 \rightarrow D^*(2010)^- \rho^+, \rho^+ \rightarrow \omega \pi^+) = (1.48 \pm 0.27 + 0.15 + 0.21) \times 10^{-3}$ . The last uncertainty is a model one.

<sup>6</sup> ALAM 94 assume equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and use the CLEO II  $B(D^*(2010)^+ \rightarrow D^0 \pi^+)$  and absolute  $B(D^0 \rightarrow K^- \pi^+)$  and the PDG 1992  $B(D^0 \rightarrow K^- \pi^+ \pi^0) / B(D^0 \rightarrow K^- \pi^+)$  and  $B(D^0 \rightarrow K^- 2\pi^+ \pi^-) / B(D^0 \rightarrow K^- \pi^+)$ .

<sup>7</sup> This decay is nearly completely longitudinally polarized,  $\Gamma_L / \Gamma = (93 \pm 5 \pm 5)\%$ , as expected from the factorization hypothesis (ROSNER 90). The nonresonant  $\pi^+ \pi^0$  contribution under the  $\rho^+$  is less than 9% at 90% CL.

<sup>8</sup> Uses  $B(D^* \rightarrow D^0 \pi^+) = 0.6 \pm 0.15$  and  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = 0.4$ . Does not depend on  $D$  branching ratios.

0.012 ± 0.007 3 <sup>6</sup>BORTOLETTO90 CLEO  $e^+e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> ZUPANC 07 reports  $(7.5 \pm 0.2 \pm 1.1) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow D^- D_s^+)/\Gamma_{total}] \times [B(D_s^+ \rightarrow \phi \pi^+)]$  assuming  $B(D_s^+ \rightarrow \phi \pi^+) = (4.4 \pm 0.6) \times 10^{-2}$ , which we rescale to our best value  $B(D_s^+ \rightarrow \phi \pi^+) = (4.5 \pm 0.4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>2</sup> AUBERT 06N reports  $(0.64 \pm 0.13 \pm 0.10) \times 10^{-2}$  from a measurement of  $[\Gamma(B^0 \rightarrow D^- D_s^+)/\Gamma_{total}] \times [B(D_s^+ \rightarrow \phi \pi^+)]$  assuming  $B(D_s^+ \rightarrow \phi \pi^+) = 0.0462 \pm 0.0062$ , which we rescale to our best value  $B(D_s^+ \rightarrow \phi \pi^+) = (4.5 \pm 0.4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>3</sup> GIBAUT 96 reports  $0.0087 \pm 0.0024 \pm 0.0020$  from a measurement of  $[\Gamma(B^0 \rightarrow D^- D_s^+)/\Gamma_{total}] \times [B(D_s^+ \rightarrow \phi \pi^+)]$  assuming  $B(D_s^+ \rightarrow \phi \pi^+) = 0.035$ , which we rescale to our best value  $B(D_s^+ \rightarrow \phi \pi^+) = (4.5 \pm 0.4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> ALBRECHT 92G reports  $0.017 \pm 0.013 \pm 0.006$  from a measurement of  $[\Gamma(B^0 \rightarrow D^- D_s^+)/\Gamma_{total}] \times [B(D_s^+ \rightarrow \phi \pi^+)]$  assuming  $B(D_s^+ \rightarrow \phi \pi^+) = 0.027$ , which we rescale to our best value  $B(D_s^+ \rightarrow \phi \pi^+) = (4.5 \pm 0.4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes PDG 1990  $D^+$  branching ratios, e.g.,  $B(D^+ \rightarrow K^- 2\pi^+) = 7.7 \pm 1.0\%$ .

<sup>5</sup> BORTOLETTO 92 reports  $0.0080 \pm 0.0045 \pm 0.0030$  from a measurement of  $[\Gamma(B^0 \rightarrow D^- D_s^+)/\Gamma_{total}] \times [B(D_s^+ \rightarrow \phi \pi^+)]$  assuming  $B(D_s^+ \rightarrow \phi \pi^+) = 0.030 \pm 0.011$ , which we rescale to our best value  $B(D_s^+ \rightarrow \phi \pi^+) = (4.5 \pm 0.4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and use MarkIII branching fractions for the  $D$ .

## Meson Particle Listings

 $B^0$ 

- <sup>1</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .  
<sup>2</sup> AUBERT 02M also assumes the measured  $CP$ -odd fraction of the final states is  $0.22 \pm 0.18 \pm 0.03$ .  
<sup>3</sup> ARTUSO 99 uses  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = (48 \pm 4)\%$ .  
<sup>4</sup> BARATE 98Q (ALEPH) observes 2 events with an expected background of  $0.10 \pm 0.03$  which corresponds to a branching ratio of  $(2.3^{+1.9}_{-1.2} \pm 0.4) \times 10^{-3}$ .  
<sup>5</sup> ASNER 97 at CLEO observes 1 event with an expected background of  $0.022 \pm 0.011$ . This corresponds to a branching ratio of  $(5.3^{+7.1}_{-3.7} \pm 1.0) \times 10^{-4}$ .

<sup>5</sup> BORTOLETTO 92 reports  $(1.1 \pm 0.5 \pm 0.3) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow J/\psi(1S) K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+e^-) = 0.069 \pm 0.009$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>6</sup> ALBRECHT 90J reports  $(1.1 \pm 0.5 \pm 0.2) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow J/\psi(1S) K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+e^-) = 0.069 \pm 0.009$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>7</sup> BEBEK 87 reports  $(3.5 \pm 1.6 \pm 0.3) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow J/\psi(1S) K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+e^-) = 0.069 \pm 0.009$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BORTOLETTO 92 to use the same assumptions.

<sup>8</sup> ABE 96H assumes that  $B(B^+ \rightarrow J/\psi K^+) = (1.02 \pm 0.14) \times 10^{-3}$ .

<sup>9</sup> The neutral and charged  $B$  events together are predominantly longitudinally polarized,  $\Gamma_{\perp}/\Gamma = 0.080 \pm 0.08 \pm 0.05$ . This can be compared with a prediction using HQET, 0.73 (KRAMER 92). This polarization indicates that the  $B \rightarrow \psi K^*$  decay is dominated by the  $CP = -1$   $CP$  eigenstate. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>10</sup> ALBRECHT 94G measures the polarization in the vector-vector decay to be predominantly longitudinal,  $\Gamma_{\perp}/\Gamma = 0.03 \pm 0.16 \pm 0.15$  making the neutral decay a  $CP$  eigenstate when the  $K^*0$  decays through  $K_S^0 \pi^0$ .

<sup>11</sup> ALBAJAR 91E assumes  $B_d^0$  production fraction of 36%.

<sup>12</sup> ALBRECHT 87D assume  $B^+B^-/B^0\bar{B}^0$  ratio is 55/45. Superseded by ALBRECHT 90J.

<sup>13</sup> ALAM 86 assumes  $B^{\pm}/B^0$  ratio is 60/40. The observation of the decay  $B^+ \rightarrow J/\psi K^*(892)^+$  (HAAS 85) has been retracted in this paper.

<sup>1</sup> AAIJ 18F uses Dalitz plot analysis of the  $B^0 \rightarrow K_S^0 \pi^+ \pi^-$  final state decays. For the branching fraction of the reference mode, the PDG 18 average  $B(B^0 \rightarrow K_S^0 \pi^+ \pi^-) = (4.96 \pm 0.20) \times 10^{-5}$  is used. We compute  $B(B^0 \rightarrow \chi_{c0} K^0)$  using the PDG value  $B(\chi_{c0} \rightarrow \pi\pi) = (8.51 \pm 0.33) \times 10^{-3}$  and 2/3 for the  $\pi^+ \pi^-$  fraction. Our first error is their experiment's error and the second error is systematic error from using our best value.

<sup>2</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>3</sup> LEES 12i reports  $[\Gamma(B^0 \rightarrow \chi_{c0} K^0)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow K_S^0 K_S^0)] = (0.46 \pm 0.25 \pm 0.21) \times 10^{-6}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow K_S^0 K_S^0) = (3.17 \pm 0.19) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> Measured in the  $B^0 \rightarrow K_S^0 K^+ K^-$  decay.

<sup>5</sup> Uses Dalitz plot analysis of the  $B^0 \rightarrow K^0 \pi^+ \pi^-$  final state decays.

<sup>6</sup> EDWARDS 01 assumes equal production of  $B^0$  and  $B^+$  at the  $\Upsilon(4S)$ . The correlated uncertainties (28.3%) from  $B(J/\psi(1S) \rightarrow \gamma \eta_c)$  in those modes have been accounted for.

- <sup>1</sup> Supercedes results of AAIJ 12AR.

- <sup>2</sup> DUH 13 reports also for the same data  $B(B^0 \rightarrow K^+K^-) < 0.20 \times 10^{-6}$  at 90% CL.

- <sup>3</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

- <sup>4</sup> AAIJ 12AR reports  $[\Gamma(B^0 \rightarrow K^+K^-)/\Gamma_{\text{total}}] / [B(B_s^0 \rightarrow K^+K^-)] / [\Gamma(\bar{B} \rightarrow B_s^0) / \Gamma(\bar{B} \rightarrow B^0)] = 0.018^{+0.008}_{-0.007} \pm 0.009$  which we multiply by our best values  $B(B_s^0 \rightarrow K^+K^-) = (2.72 \pm 0.23) \times 10^{-5}$ ,  $\Gamma(\bar{B} \rightarrow B_s^0) / \Gamma(\bar{B} \rightarrow B^0) = 0.246 \pm 0.023$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.

- <sup>5</sup> Reported a central value of  $(0.23 \pm 0.10 \pm 0.10) \times 10^{-6}$  using  $B(B^0 \rightarrow K^+\pi^-) = (19.4 \pm 0.6) \times 10^{-6}$ .

- <sup>6</sup> Obtains this result from  $B(K^+K^-)/B(K^+\pi^-) = 0.020 \pm 0.008 \pm 0.006$ , assuming  $B(B^0 \rightarrow K^+\pi^-) = (19.4 \pm 0.6) \times 10^{-6}$ .

<sup>7</sup> ABULENCIA, A 06D obtains this from  $\Gamma(K^+K^-)/\Gamma(K^+\pi^-) < 0.10$  at 90% CL, assuming  $B(B^0 \rightarrow K^+\pi^-) = (18.9 \pm 0.7) \times 10^{-6}$ .

<sup>8</sup> ABE 00c assumes  $B(Z \rightarrow b\bar{b}) = (21.7 \pm 0.1)\%$  and the  $B$  fractions  $f_{B^0} = f_{B^+} = (39.7^{+1.8}_{-2.2}\%)$  and  $f_{B_s} = (10.5^{+1.8}_{-2.2}\%)$ .

<sup>9</sup> ADAM 96D assumes  $f_{B^0} = f_{B^-} = 0.39$  and  $f_{B_s} = 0.12$ . Contributions from  $B^0$  and  $B_s$  decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral  $B$  mesons.

<sup>10</sup> BUSKULIC 96V assumes PDG 96 production fractions for  $B^0, B^+, B_s, b$  baryons.

<sup>11</sup> Assumes a  $B^0, B^-$  production fraction of 0.39 and a  $B_s$  production fraction of 0.12. Contributions from  $B^0$  and  $B_s$  decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral  $B$  mesons.

## Meson Particle Listings

 $B^0$ 

- <sup>1</sup> Uses  $B(\Upsilon(4S) \rightarrow B^+ B^-) = (51.4 \pm 0.6)\%$  and  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = (48.6 \pm 0.6)\%$ .  
<sup>2</sup> Uses  $B(\Upsilon(4S) \rightarrow B^+ B^-) = (51.6 \pm 0.6)\%$  and  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = (48.4 \pm 0.6)\%$ .  
<sup>3</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ . No evidence for a nonresonant  $K\pi\gamma$  contamination was seen; the central value assumes no contamination.  
<sup>4</sup> Uses the production ratio of charged and neutral B from  $\Upsilon(4S)$  decays  $R^{+0} = 1.006 \pm 0.048$ .  
<sup>5</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .  
<sup>6</sup> ADAM 96D assumes  $f_{B^0} = f_{B^-} = 0.39$  and  $f_{B_s} = 0.12$ .  
<sup>7</sup> AMMAR 93 observed  $6.6 \pm 2.8$  events above background.  
<sup>8</sup> AVERY 89B reports  $< 2.8 \times 10^{-4}$  assuming the  $\Upsilon(4S)$  decays 43% to  $B^0 \bar{B}^0$ . We rescale to 50%.

 $B^0$ 

- 1 Explicitly vetoes resonant production of  $p\bar{p}$  from charmonium states.  
 2 Assumes equal production of  $B^+$  and  $B^0$  at the  $\mathcal{T}(4S)$ .  
 3 Explicitly vetoes resonant production of  $p\bar{p}$  from charmonium states and  $\rho K^0$  production from  $\Lambda_c$ .  
 4 Provides also results with  $M_{p\bar{p}} < 2.85$  GeV/ $c^2$  and angular asymmetry of  $p\bar{p}$  system.  
 5 The branching fraction for  $M_{p\bar{p}} < 2.85$  is also reported.

[Polarization in B Decays](#)

POLARIZATION IN  $B^0$  DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ( $L$ ) or both are transverse and parallel ( $\parallel$ ) or perpendicular ( $\perp$ ) to each other with the parameters  $\Gamma_L/\Gamma$ ,  $\Gamma_\perp/\Gamma$ , and the relative phases  $\phi_\parallel$  and  $\phi_\perp$ . See the definitions in the note on "Polarization in  $B$  Decays" review in the  $B^0$  Particle Listings.

$\Gamma_L/\Gamma$  in  $B^0 \rightarrow J/\psi(1S) K^*(892)^0$

$B^0 - \bar{B}^0$  Mixing

$B^0 - \bar{B}^0$  MIXING PARAMETERS

For a discussion of  $B^0 - \bar{B}^0$  mixing see the note on " $B^0 - \bar{B}^0$  Mixing" in the  $B^0$  Particle Listings above.

$\chi_d$  is a measure of the time-integrated  $B^0 - \bar{B}^0$  mixing probability that a produced  $B^0 (\bar{B}^0)$  decays as a  $\bar{B}^0 (B^0)$ . Mixing violates  $\Delta B \neq 2$  rule.

$$\chi_d = \frac{x_d^2}{2(1+x_d^2)}$$

$$x_d = \frac{\Delta m_{B^0}}{\Gamma_{B^0}} = (m_{B_H^0} - m_{B_L^0}) \tau_{B^0}$$

where  $H, L$  stand for heavy and light states of two  $B^0$  CP eigenstates and  $\tau_{B^0} = \frac{1}{0.5(\Gamma_{B_H^0} + \Gamma_{B_L^0})}$ .

$\chi_d$

This  $B^0 - \bar{B}^0$  mixing parameter is the probability (integrated over time) that a produced  $B^0$  (or  $\bar{B}^0$ ) decays as a  $\bar{B}^0$  (or  $B^0$ ), e.g. for inclusive lepton decays

$$\chi_d = \frac{\Gamma(B^0 \rightarrow \ell^- X \text{ (via } \bar{B}^0)) / \Gamma(B^0 \rightarrow \ell^\pm X)}{\Gamma(\bar{B}^0 \rightarrow \ell^+ X \text{ (via } B^0)) / \Gamma(\bar{B}^0 \rightarrow \ell^\pm X)}$$

Where experiments have measured the parameter  $r = \chi / (1 - \chi)$ , we have converted to  $\chi$ . Mixing violates the  $\Delta B \neq 2$  rule.

Note that the measurement of  $\chi$  at energies higher than the  $\Upsilon(4S)$  have not separated  $\chi_d$  from  $\chi_s$  where the subscripts indicate  $B^0(\bar{B}^0)$  or  $B_s^0(\bar{B}_s^0)$ . They are listed in the  $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE section.

The experiments at  $\Upsilon(4S)$  make an assumption about the  $B^0 - \bar{B}^0$  fraction and about the ratio of the  $B^\pm$  and  $B^0$  semileptonic branching ratios (usually that it equals one).

"OUR EVALUATION" is an average using rescaled values of the data listed below. The averaging/rescaling procedure takes into account correlations between the measurements, includes  $\chi_d$  calculated from  $\Delta m_{B^0}$  and  $\tau_{B^0}$ .

<0.27	90	<sup>10</sup> AVERY	84 CLEO	$e^+ e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> BEHRENS 00B uses high-momentum lepton tags and partially reconstructed  $\bar{B}^0 \rightarrow D^{*+} \pi^-, \rho^-$  decays to determine the flavor of the B meson.

- <sup>2</sup> ALBRECHT 94 reports  $r=0.194 \pm 0.062 \pm 0.054$ . We convert to  $\chi$  for comparison. Uses tagged events (lepton + pion from  $D^*$ ).
- <sup>3</sup> BARTELT 93 analysis performed using tagged events (lepton+pion from  $D^*$ ). Using dilepton events they obtain  $0.157 \pm 0.016^{+0.033}_{-0.028}$ .
- <sup>4</sup> ALBRECHT 92L is a combined measurement employing several lepton-based techniques. It uses all previous ARGUS data in addition to new data and therefore supersedes ALBRECHT 87I. A value of  $r = 20.6 \pm 7.0\%$  is directly measured. The value can be used to measure  $x = \Delta M/\Gamma = 0.72 \pm 0.15$  for the  $B_d$  meson. Assumes  $f_{+,-}/f_0 = 1.0 \pm 0.05$  and uses  $\tau_{B^\pm}/\tau_{B^0} = (0.95 \pm 0.14) (f_{+,-}/f_0)$ .
- <sup>5</sup> Uses  $D^{*+} K^\pm$  correlations.
- <sup>6</sup> Uses  $(D^{*+} \ell^-) K^\pm$  correlations.
- <sup>7</sup> These experiments see a combination of  $B_s$  and  $B_d$  mesons.
- <sup>8</sup> ALBRECHT 87I is inclusive measurement with like-sign dileptons, with tagged B decays plus leptons, and one fully reconstructed event. Measures  $r=0.21 \pm 0.08$ . We convert to  $\chi$  for comparison. Superseded by ALBRECHT 92L.
- <sup>9</sup> BEAN 87B measured  $r < 0.24$ ; we converted to  $\chi$ .
- <sup>10</sup> Same-sign dilepton events. Limit assumes semileptonic BR for  $B^+$  and  $B^0$  equal. If  $B^0/B^\pm$  ratio  $< 0.58$ , no limit exists. The limit was corrected in BEAN 87B from  $r < 0.30$  to  $r < 0.37$ . We converted this limit to  $\chi$ .

$\Delta m_{B^0} = m_{B_H^0} - m_{B_L^0}$

$\Delta m_{B^0}$  is a measure of  $2\pi$  times the  $B^0 - \bar{B}^0$  oscillation frequency in time-dependent mixing experiments.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The averaging/rescaling procedure takes into account correlations between the measurements and includes  $\Delta m_d$  calculated from  $\chi_d$  measured at  $\Upsilon(4S)$ .

- 1 Measured using  $B^0 \rightarrow D^{(*)-} \pi^+$  decays.
- 2 Uses semileptonic decays of  $B^0 \rightarrow D^- \mu^+ \nu_\mu X$  and  $B^0 \rightarrow D^{(*)-} \mu^+ \nu_\mu X$ , where the  $D$  mesons are reconstructed in  $D^- \rightarrow K^+ \pi^- \pi^-$  and  $D^{(*)-} \rightarrow \bar{D}^0 \pi^-$  with  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- 3 Uses semileptonic decays of  $B^0 \rightarrow D^- \mu^+ \nu_\mu X$  where the  $D^-$  mesons are reconstructed in  $D^- \rightarrow K^+ K^- \pi^-$ .
- 4 Measured using  $B^0 \rightarrow D^- \pi^+$  and  $B^0 \rightarrow J/\psi K^*(892)^0$  decays.
- 5 Measured using  $B^0 \rightarrow D^- \pi^+$ .
- 6 Uses opposite-side flavor-tagging with  $B \rightarrow D^{(*)} \mu \nu_\mu X$  events.
- 7 Measured using a simultaneous fit of the  $B^0$  lifetime and  $\bar{B}^0 B^0$  oscillation frequency  $\Delta m_d$  in the partially reconstructed  $B^0 \rightarrow D^{*-} \ell^+ X$  decays.
- 8 Measurement performed using a combined fit of  $CP$ -violation, mixing and lifetimes.
- 9 Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.
- 10 AUBERT 03c uses a sample of approximately 14,000 exclusively reconstructed  $B^0 \rightarrow D^{*}(2010)^- \ell \nu$  and simultaneously measures the lifetime and oscillation frequency.
- 11 HASTINGS 03 measurement based on the time evolution of dilepton events. It also reports  $f_+/f_0 = 1.01 \pm 0.03 \pm 0.09$  and  $CPT$  violation parameters in  $B^0$ - $\bar{B}^0$  mixing.
- 12 ZHENG 03 data analyzed using partially reconstructed  $\bar{B}^0 \rightarrow D^{*-} \pi^+$  decay and a flavor tag based on the charge of the lepton from the accompanying  $B$  decay.
- 13 Uses a tagged sample of fully-reconstructed neutral  $B$  decays at  $\Upsilon(4S)$ .
- 14 Measured based on the time evolution of dilepton events in  $\Upsilon(4S)$  decays.
- 15 Data analyzed using partially reconstructed  $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}$  decay and a combination of flavor tags from the rest of the event.
- 16 Uses di-muon events.
- 17 Uses jet-charge and lepton-flavor tagging.
- 18 Uses  $\ell^- D^{*+} - \ell$  events.
- 19 Uses  $\pi^- B$  in the same side.
- 20 Uses  $\ell$ - $\ell$ .
- 21 Uses  $\ell$ - $Q_{\text{hem}}$ .
- 22 Uses  $\ell$ - $\ell$  with impact parameters.
- 23 Uses  $D^{*\pm} Q_{\text{hem}}$ .
- 24 Uses  $\pi_s^\pm \ell$ - $Q_{\text{hem}}$ .
- 25 Uses  $D^{*\pm} \ell/Q_{\text{hem}}$ .
- 26 Uses  $D^{*\pm} \ell$ - $Q_{\text{hem}}$ .
- 27 Uses  $D^{*\pm} \ell$ .
- 28 AUBERT 02N result based on the same analysis and data sample reported in AUBERT 02I.
- 29 Uses a tagged sample of  $B^0$  decays reconstructed in the mode  $B^0 \rightarrow D^{*} \ell \nu$ .
- 30 Uses a tagged sample of fully-reconstructed hadronic  $B^0$  decays at  $\Upsilon(4S)$ .
- 31 ACCIARRI 98D combines results from  $\ell$ - $\ell$ ,  $\ell$ - $Q_{\text{hem}}$ , and  $\ell$ - $\ell$  with impact parameters.
- 32 ABREU 97N combines results from  $D^{*\pm} Q_{\text{hem}}$ ,  $\ell$ - $Q_{\text{hem}}$ ,  $\pi_s^\pm \ell$ - $Q_{\text{hem}}$ , and  $\ell$ - $\ell$ .
- 33 ACKERSTAFF 97V combines results from  $\ell$ - $\ell$ ,  $\ell$ - $Q_{\text{hem}}$ ,  $D^{*-} \ell$ , and  $D^{*\pm} Q_{\text{hem}}$ .
- 34 BUSKULIC 97D combines results from  $D^{*\pm} \ell/Q_{\text{hem}}$ ,  $\ell$ - $Q_{\text{hem}}$ , and  $\ell$ - $\ell$ .
- 35 ABREU 96Q analysis performed using lepton, kaon, and jet-charge tags.
- 36 ALEXANDER 96V combines results from  $D^{*\pm} \ell$  and  $D^{*\pm} \ell$ - $Q_{\text{hem}}$ .
- 37 AKERS 95J combines results from charge measurement,  $D^{*\pm} \ell$ - $Q_{\text{hem}}$  and  $\ell$ - $\ell$ .

 $\chi_d = \Delta m_{B^0} / \Gamma_{B^0}$ 

"OUR EVALUATION" is an average using rescaled values of the data listed below. The averaging/rescaling procedure takes into account correlations between the measurements and includes  $\Delta m_d$  calculated from  $\chi_d$  measured at  $\Upsilon(4S)$ .

VALUE	DOCUMENT ID
<b>0.7697 <math>\pm</math> 0.0035 OUR EVALUATION</b>	(Produced by HFLAV)

 $\text{Re}(\lambda_{CP} / |\lambda_{CP}|) \text{Re}(z)$ 

The  $\lambda_{CP}$  characterizes  $B^0$  and  $\bar{B}^0$  decays to states of charmonium plus  $K^0$ . Parameter  $z$  is used to describe  $CPT$  violation in mixing, see the review on "CP Violation" in the reviews section.

1	Measurement uses decays $B^0/\bar{B}^0 \rightarrow c\bar{c} K_S^0/K_L^0$ .		
2	Measured using $B^0 \rightarrow J/\psi K_S^0, J/\psi K_L^0, D^- \pi^+, D^{*-} \pi^+, D^{*-} \rho^+$ , and $D^{*-} \ell^+ \nu$ decays.		
3	Measurement uses $B^0/\bar{B}^0 \rightarrow \ell^+ X/\ell^- X$ decays. Assuming $\Delta \Gamma = 0$ , the result becomes $\text{Im}(z) = (-0.37 \pm 0.54) \times 10^{-2}$ .		
4	Corresponds to 90% confidence range $[-0.028, 0.104]$ .		
5	Measured using inclusive dilepton events from $B^0$ decay.		

## CP VIOLATION PARAMETERS

 $\text{Re}(\epsilon_{B^0}) / (1 + |\epsilon_{B^0}|^2)$ 

$CP$  impurity in  $B_d^0$  system. It is obtained from either  $a_{\ell\ell}$ , the charge asymmetry in like-sign dilepton events or  $a_{CP}$ , the time-dependent asymmetry of inclusive  $B^0$  and  $\bar{B}^0$  decays.

"OUR EVALUATION" is the result of a fit to  $B_d$  and  $B_s$   $CP$  asymmetries, which includes the  $B_d$  measurements listed below and the  $B_s$  measurements listed in the  $B_s$  section, taking into account correlations between those measurements.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- 1 AAIJ 15F uses semileptonic  $B^0$  decays in the inclusive final states  $D^- \mu^+ X$  and  $D^{*-} \mu^+ X$ , where the  $D^-$  meson decays into the  $K^+ \pi^- \pi^-$  final state, and the  $D^{*-}$  meson into the  $\bar{D}^0 (\rightarrow K^+ \pi^-) \pi^-$  final state. Reports  $A_{SL}^d = (-0.02 \pm 0.19 \pm 0.30)\%$ , which equals to  $4\text{Re}(\epsilon_{B^0}) / (1 + |\epsilon_{B^0}|^2)$ .
- 2 Uses the charge asymmetry in like-sign dilepton events. LEES 15A reports  $A_{SL}^d = (-3.9 \pm 3.5 \pm 1.9) \times 10^{-3}$ .
- 3 ABAZOV 14 uses the dimuon charge asymmetry with different impact parameters from which it reports  $A_{SL}^d = (-0.62 \pm 0.42) \times 10^{-2}$ .
- 4 Uses  $B^0 \rightarrow D^{*-} X \ell^+ \nu_\ell$  and a kaon-tagged sample which yields measurement of  $A_{SL}^d = (0.06 \pm 0.17 \pm 0.38 \pm 0.32)\%$ , corresponding to  $\Delta_{CP} = 1 - |q/p| = (0.29 \pm 0.84 \pm 1.88 \pm 1.61) \times 10^{-3}$ .
- 5 ABAZOV 12aC uses  $B^0 \rightarrow D^- \mu^+ X$  and  $B^0 \rightarrow D^{*}(2010)^- \mu^+ X$  decays without initial state flavor tagging which yields measurement of  $A_{SL}^d = (6.8 \pm 4.5 \pm 1.4) \times 10^{-3}$ .
- 6 AUBERT 06T reports  $|q/p| - 1 = (-0.8 \pm 2.7 \pm 1.9) \times 10^{-3}$ . We convert to  $(1 - |q/p|^2)/4$ .
- 7 Uses the charge asymmetry in like-sign dilepton events and reports  $|q/p| = 1.0005 \pm 0.0040 \pm 0.0043$ .
- 8 JAFFE 01 finds  $a_{\ell\ell} = 0.013 \pm 0.050 \pm 0.005$  and combines with the previous BEHRENS 00B independent measurement.
- 9 ABAZOV 11U uses the dimuon charge asymmetry with different impact parameters from which it reports  $A_{SL}^d = (-1.2 \pm 5.2) \times 10^{-3}$ .
- 10 Uses the dimuon charge asymmetry.
- 11 AUBERT 04C reports  $|q/p| = 1.029 \pm 0.013 \pm 0.011$  and we converted it to  $(1 - |q/p|^2)/4$ .
- 12 BARATE 01D measured by investigating time-dependent asymmetries in semileptonic and fully inclusive  $B_d^0$  decays.
- 13 BEHRENS 00B uses high-momentum lepton tags and partially reconstructed  $\bar{B}^0 \rightarrow D^{*+} \pi^-, \rho^-$  decays to determine the flavor of the  $B$  meson.

<sup>14</sup>Data analyzed using the time-dependent asymmetry of inclusive  $B^0$  decay. The production flavor of  $B^0$  mesons is determined using both the jet charge and the charge of secondary vertex in the opposite hemisphere.

<sup>15</sup>ACKERSTAFF 97U assumes  $CP T$  and is based on measuring the charge asymmetry in a sample of  $B^0$  decays defined by lepton and  $Q_{\text{hem}}$  tags. If  $CP T$  is not invoked,  $\text{Re}(\epsilon_B) = -0.006 \pm 0.010 \pm 0.006$  is found. The indirect  $CP T$  violation parameter is determined to  $\text{Im}(\delta B) = -0.020 \pm 0.016 \pm 0.006$ .

<sup>16</sup>BARTELT 93 finds  $a_{\ell\ell} = 0.031 \pm 0.096 \pm 0.032$  which corresponds to  $|a_{\ell\ell}| < 0.18$ , which yields the above  $|\text{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)|$ .

 $A_{T/CP}$ 

$A_{T/CP}$  is defined as

$$\frac{P(\bar{B}^0 \rightarrow B^0) - P(B^0 \rightarrow \bar{B}^0)}{P(\bar{B}^0 \rightarrow B^0) + P(B^0 \rightarrow \bar{B}^0)}$$

the  $CP T$  invariant asymmetry between the oscillation probabilities  $P(\bar{B}^0 \rightarrow B^0)$  and  $P(B^0 \rightarrow \bar{B}^0)$ .

VALUE	DOCUMENT ID	TECN	COMMENT
<b>0.005 ± 0.012 ± 0.014</b>	<sup>1</sup> AUBERT	02K	BABR $e^+e^- \rightarrow \Upsilon(4S)$

<sup>1</sup>AUBERT 02K uses the charge asymmetry in like-sign dilepton events.

 $A_{CP}(B^0 \rightarrow D^*(2010)^+ D^-)$ 

$A_{CP}$  is defined as

$$\frac{B(\bar{B}^0 \rightarrow \bar{D}^+) - B(B^0 \rightarrow D^+)}{B(\bar{B}^0 \rightarrow \bar{D}^+) + B(B^0 \rightarrow D^+)}$$

the  $CP$ -violation charge asymmetry of exclusive  $B^0$  and  $\bar{B}^0$  decay.

 $C_{\pi \pi}(B^0 \rightarrow \pi^+ \pi^-)$ 

$C_{\pi \pi}$  is defined as  $(1-|\lambda|^2)/(1+|\lambda|^2)$ , where the quantity  $\lambda=q/p \bar{A}_f/A_f$  is a phase convention independent observable quantity for the final state  $f$ . For details, see the review on "CP Violation" in the Reviews section.

$0.42 \pm 0.49 \pm 0.16$	<sup>3</sup> AUBERT	07BH	BABR $e^+ e^- \rightarrow \Upsilon(4S)$
$1.87^{+0.40+0.22}_{-0.53-0.32}$	<sup>4</sup> KROKOVNY	06	BELL Repl. by VOROBYEV 16

<sup>1</sup> Analyzes joint data sample of Belle and BaBar using Dalitz plot analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$ ; the second error combines experimental systematic uncertainty and the Dalitz plot model uncertainty.

<sup>2</sup> A model-independent measurement uses the binned Dalitz plot technique.

<sup>3</sup> AUBERT 07BH evaluates the likelihoods for the positive and negative solutions assuming  $\sin(2\beta_{eff}) = 0.678$ . It quotes  $L_+ / (L_+ + L_-) = 0.86$  corresponding to a likelihood ratio of  $L_+ / L_- = 6.14$  in favor of the positive solution.

<sup>4</sup> KROKOVNY 06 evaluates the likelihoods for the positive and negative solutions assuming  $\sin(2\beta_{eff}) = 0.689$ . It quotes  $L_+ / (L_+ + L_-) = 0.983$  corresponding to a likelihood ratio of  $L_+ / L_- = 57.8$  in favor of the positive solution.

 $(S_+ + S_-)/2 (B^0 \rightarrow D^{*-} \pi^+)$ 

$S_{\pm} = -\frac{2Im(\lambda_{\pm})}{1+|\lambda_{\pm}|^2}$  where  $\lambda_+$  and  $\lambda_-$  are defined in the  $C_{\pi\pi}$  datablock above for

$B^0 \rightarrow D^{*-} \pi^+$  and  $\bar{B}^0 \rightarrow D^{*+} \pi^-$ .

- A combination of this Run 2 result with the Run 1 result from AAIJ 17BN is reported with a correlation coefficient of 0.40.
- Measurement based on  $B^0 \rightarrow J/\psi K_S^0$ ,  $B^0 \rightarrow \psi(2S) K_S^0$ ,  $B^0 \rightarrow J/\psi K_L^0$ , and  $B^0 \rightarrow \chi_{c1}(1P) K_S^0$  decays.
- Uses Dalitz plot analysis of  $B^0 \rightarrow K^0 \pi^+ \pi^-$  decays and the first of two equivalent solutions is used.
- Measurement based on  $B^0 \rightarrow c\bar{c}K^{(*)0}$  decays.
- Measurement based on  $B^0 \rightarrow J/\psi K_S^0$ ,  $B^0 \rightarrow \psi(2S) K_S^0$  with  $J/\psi \rightarrow \mu^+ \mu^-$ ,  $J/\psi \rightarrow e^+ e^-$  and  $\psi(2S) \rightarrow \mu^+ \mu^-$ .
- AAIJ 24 provides the correlation coefficient  $\rho = 0.441$  between the uncertainties of  $\sin(2\beta)$  and  $C_{c\bar{c}K^{(*)0}}(B^0 \rightarrow c\bar{c}K^{(*)0})$  measurements.
- AAIJ 17BN provides the correlation coefficient  $\rho = 0.42$  between the uncertainties of  $S_{B^0 \rightarrow c\bar{c}K^{(*)0}}(B^0 \rightarrow c\bar{c}K^{(*)0})$  and  $C_{c\bar{c}K^{(*)0}}(B^0 \rightarrow c\bar{c}K^{(*)0})$  measurements.
- Reports value of A of  $B^0 \rightarrow \psi(2S) K^0$  which is equal to  $-C$ .
- Reports value of A of  $B^0 \rightarrow J/\psi K^0$  which is equal to  $-C$ .
- Measurement based on  $152 \times 10^6 B\bar{B}$  pairs.
- Measurement based on  $227 \times 10^6 B\bar{B}$  pairs.
- Measured with both  $\eta_f = \pm 1$  samples.
- Measured with the high purity of  $\eta_f = -1$  samples.

### $\sin(2\beta)$

For a discussion of CP violation, see the review on "CP Violation" in the Reviews section.  $\sin(2\beta)$  is a measure of the CP-violating amplitude in the  $B^0_d \rightarrow J/\psi(1S) K_S^0$ .

- A combination of this Run 2 result with the Run 1 result from AAIJ 17BN is reported with a correlation coefficient of 0.40.
- Measurement based on  $B^0 \rightarrow J/\psi K_S^0$ ,  $B^0 \rightarrow \psi(2S) K_S^0$ ,  $B^0 \rightarrow J/\psi K_L^0$ , and  $B^0 \rightarrow \chi_{c1}(1P) K_S^0$  decays.
- SATO 12 uses  $121 \text{ fb}^{-1}$  data collected on  $\Upsilon(5S)$  resonance. Uses the " $B - \pi$  tagging" where  $B\pi^+$  and  $B\pi^-$  tagged  $J/\psi K_S^0$  events are compared.

- Uses Dalitz plot analysis of  $B^0 \rightarrow K^0 \pi^+ \pi^-$  decays and the first of two equivalent solutions.
- Measurement based on  $B^0 \rightarrow c\bar{c}K^{(*)0}$  decays.
- Measurement in which the  $J/\psi$  decays to hadrons or to muons that do not satisfy the standard identification criteria.
- AFFOLDER 00C uses about 400  $B^0 \rightarrow J/\psi(1S) K_S^0$  events. The production flavor of  $B^0$  was determined using three tagging algorithms: a same-side tag, a jet-charge tag, and a soft-lepton tag.
- BARATE 00Q uses 23 candidates for  $B^0 \rightarrow J/\psi(1S) K_S^0$  decays. A combination of jet-charge, vertex-charge, and same-side tagging techniques were used to determine the  $B^0$  production flavor.
- ACKERSTAFF 98Z uses 24 candidates for  $B^0_d \rightarrow J/\psi(1S) K_S^0$  decay. A combination of jet-charge and vertex-charge techniques were used to tag the  $B^0_d$  production flavor.
- Measurement based on  $B^0 \rightarrow J/\psi K_S^0$ ,  $B^0 \rightarrow \psi(2S) K_S^0$  with  $J/\psi \rightarrow \mu^+ \mu^-$ ,  $J/\psi \rightarrow e^+ e^-$  and  $\psi(2S) \rightarrow \mu^+ \mu^-$ .
- AAIJ 24 provides the correlation coefficient  $\rho = 0.441$  between the uncertainties of  $\sin(2\beta)$  and  $C_{c\bar{c}K^{(*)0}}(B^0 \rightarrow c\bar{c}K^{(*)0})$  measurements.
- AAIJ 17BN provides the correlation coefficient  $\rho = 0.42$  between the uncertainties of  $\sin(2\beta)$  and  $\cos(2\beta)$  measurements.
- Based on  $B^0 \rightarrow \psi(2S) K_S^0$  decays.
- Measurement based on  $152 \times 10^6 B\bar{B}$  pairs.
- Measurement based on  $227 \times 10^6 B\bar{B}$  pairs.
- ABE 02U result is based on the same analysis and data sample reported in ABE 01G.
- ABE 02Z result is based on  $85 \times 10^6 B\bar{B}$  pairs.
- AUBERT 02N result is based on the same analysis and data sample reported in AUBERT 01B.
- AUBERT 02P result is based on  $88 \times 10^6 B\bar{B}$  pairs.
- First observation of CP violation in  $B^0$  meson system.
- ABE 98U uses  $198 \pm 17 B^0_d \rightarrow J/\psi(1S) K^0$  events. The production flavor of  $B^0$  was determined using the same side tagging technique.

- 1 A combination of this Run 2 result with the Run 1 result from AAIJ 17BN is reported with a correlation coefficient of 0.40.  
 2 Uses  $B^0 \rightarrow J/\psi K_S^0$  decays.  
 3 Based on  $B^0 \rightarrow \psi(2S) K_S^0$  decays.  
 4 Uses  $B^0 \rightarrow J/\psi K_S^0$  decays.  
 5 SATO 12 uses  $121 \text{ fb}^{-1}$  data collected at  $\Upsilon(5S)$  resonance. Uses the " $B - \pi$  tagging" where  $B \pi^+$  and  $B \pi^-$  tagged  $J/\psi K_S^0$  events are compared.  
 6 AFFOLDER 00C uses about 400  $B^0 \rightarrow J/\psi(1S) K_S^0$  events. The production flavor of  $B^0$  was determined using three tagging algorithms: a same-side tag, a jet-charge tag, and a soft-lepton tag.  
 7 BARATE 00Q uses 23 candidates for  $B^0 \rightarrow J/\psi(1S) K_S^0$  decays. A combination of jet-charge, vertex-charge, and same-side tagging techniques were used to determine the  $B^0$  production flavor.  
 8 ACKERSTAFF 98Z uses 24 candidates for  $B_d^0 \rightarrow J/\psi(1S) K_S^0$  decay. A combination of jet-charge and vertex-charge techniques were used to tag the  $B_d^0$  production flavor.  
 9 Measurement based on  $B^0 \rightarrow J/\psi K_S^0$ ,  $B^0 \rightarrow \psi(2S) K_S^0$  with  $J/\psi \rightarrow \mu^+ \mu^-$ ,  $J/\psi \rightarrow e^+ e^-$  and  $\psi(2S) \rightarrow \mu^+ \mu^-$ .  
 10 AAIJ 24 provides the correlation coefficient  $\rho = 0.441$  between the uncertainties of  $C_{J/\psi(nS) K^0}$  ( $B^0 \rightarrow J/\psi(nS) K^0$ ) and  $S_{J/\psi(nS) K^0}$  ( $B^0 \rightarrow J/\psi(nS) K^0$ ) measurements.  
 11 Measurement based on  $B^0 \rightarrow \psi(2S) K_S^0$  with  $\psi(2S) \rightarrow \mu^+ \mu^-$ .  
 12 Measurement based on  $B^0 \rightarrow J/\psi K_S^0$  with  $J/\psi \rightarrow \mu^+ \mu^-$  and  $J/\psi \rightarrow e^+ e^-$ .  
 13 AAIJ 17BN provides the correlation coefficient  $\rho = 0.42$  between the uncertainties of  $S_{J/\psi(nS) K^0}$  ( $B^0 \rightarrow J/\psi(nS) K^0$ ) and  $C_{J/\psi(nS) K^0}$  ( $B^0 \rightarrow J/\psi(nS) K^0$ ) measurements.  
 14 AAIJ 15N uses 41,560 flavor-tagged  $B_d \rightarrow J/\psi K_S^0$  events from  $3 \text{ fb}^{-1}$  of integrated luminosity. Provides the correlation coefficient  $\rho = 0.483$  between the statistical uncertainties of and measurements.  
 15 AAIJ 13K uses 8200 flavor-tagged  $B_d \rightarrow J/\psi K_S^0$  events from  $1 \text{ fb}^{-1}$  of integrated luminosity. Provides the correlation coefficient  $\rho = 0.42$  between the statistical uncertainties of  $S_{J/\psi(nS) K^0}$  ( $B^0 \rightarrow J/\psi(nS) K^0$ ) and  $C_{J/\psi(nS) K^0}$  ( $B^0 \rightarrow J/\psi(nS) K^0$ ) measurements.  
 16 Combined result of CHEN 07 and SAHOO 08.

WEIGHTED AVERAGE

<sup>1</sup> Based on an isospin analysis of the  $B \rightarrow \rho\rho$  system.

<sup>2</sup> Obtained using the time dependent analysis of  $B^0 \rightarrow a_1(1260) \pi^+ \pi^-$  and branching fraction measurements of  $B \rightarrow a_1(1260) K$  and  $B \rightarrow K_1 \pi$ . Uses SU(3) flavor relations.

<sup>3</sup> The angle  $\alpha_{\text{eff}}$  is obtained using the measured CP parameters of  $B^0 \rightarrow a_1(1260) \pi^+ \pi^-$  and choosing one of the four solutions that is compatible with the result of SM-based fits.

<sup>4</sup> Obtained using isospin relation and selecting a solution closest to the CKM best fit average; the 90% CL allowed interval is  $59^\circ < \phi_2 (\equiv \alpha) < 115^\circ$ .

<sup>5</sup> Obtained using isospin relation and selecting a solution closest to the CKM best fit average; 90% CL allowed interval is  $79^\circ < \alpha < 123^\circ$ .

<sup>6</sup> Obtained from the measured CP parameters of the longitudinal polarization by selecting the solution closest to the CKM best fit central value of  $\alpha = 95^\circ - 98^\circ$ .

CP VIOLATION PARAMETERS IN  $B^0 \rightarrow D^0 K^{*0}$  DECAY

The parameters  $r_{B^0}$  and  $\delta_{B^0}$  are the magnitude ratio and strong phase difference between the amplitudes of  $A(B^0 \rightarrow D^0 K^{*0})$  and  $A(B^0 \rightarrow \bar{D}^0 K^{*0})$ . The measured observables are defined as  $x_{\pm} = r_{B^0} \cos(\delta_{B^0} \pm \gamma)$  and  $y_{\pm} = r_{B^0} \sin(\delta_{B^0} \pm \gamma)$  where  $\gamma$  is the CKM angle  $\gamma$ .

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV). The CKM angle  $\gamma$  is listed in the  $B^+$  section for "CP VIOLATION PARAMETERS IN  $B^+ \rightarrow D K^+$  AND SIMILAR DECAYS."
