Search for lepton-flavor-violation in Z -boson decays with τ -leptons with the ATLAS detector

The ATLAS Collaboration

A search for lepton-flavor-violating $Z \rightarrow e\tau$ and $Z \rightarrow \mu\tau$ decays with pp collision data recorded by the ATLAS detector at the LHC is presented. This analysis uses 139 fb^{-1} of Run 2 pp collisions at $\sqrt{s} = 13 \text{ TeV}$ and is combined with the results of a similar ATLAS search in the final state in which the τ -lepton decays hadronically, using the same data set as well as Run 1 data. The addition of leptonically decaying τ -leptons significantly improves the sensitivity reach for $Z \rightarrow \ell\tau$ decays. The $Z \rightarrow \ell\tau$ branching fractions are constrained in this analysis to $\mathcal{B}(Z \rightarrow e\tau) < 7.0 \times 10^{-6}$ and $\mathcal{B}(Z \rightarrow \mu\tau) < 7.2 \times 10^{-6}$ at 95% confidence level. The combination with the previously published analyses sets the strongest constraints to date: $\mathcal{B}(Z \rightarrow e\tau) < 5.0 \times 10^{-6}$ and $\mathcal{B}(Z \rightarrow \mu\tau) < 6.5 \times 10^{-6}$ at 95% confidence level.

Three lepton families (flavors) exist in the Standard Model of particle physics (SM) [1–4], and the number of leptons of each family is conserved in their interactions. Nevertheless, this conservation is not postulated by any fundamental principle of the theory, and neutrino oscillations [5, 6] indicate that processes violating this conservation do occur in nature. According to current knowledge, lepton-flavor-violating (LFV) processes in charged-lepton interactions can occur via neutrino mixing but are too rare to be detected by current experiments [7]. An observation of these would be an unambiguous sign of physics beyond the SM. LFV processes occur, for example, in theories predicting the existence of heavy neutrinos [8], which may also explain the observed tiny masses and large mixing of the SM neutrinos. In such theories, up to one in 10^5 Z bosons would undergo an LFV decay involving τ -leptons. In an earlier analysis, the ATLAS experiment at the LHC set the strongest constraints on the branching fractions (\mathcal{B}) of the LFV decays of the Z boson involving a τ -lepton by searching for such decays in which the τ -lepton decays hadronically [9]. This result was achieved by analyzing proton–proton (pp) collision data corresponding to an integrated luminosity of 139 fb^{-1} at a center-of-mass energy $\sqrt{s} = 13 \text{ TeV}$ and 20.3 fb^{-1} at $\sqrt{s} = 8 \text{ TeV}$. In that search, ATLAS measured the branching fractions to be $\mathcal{B}(Z \rightarrow e\tau) < 8.1 \times 10^{-6}$ and $\mathcal{B}(Z \rightarrow \mu\tau) < 9.5 \times 10^{-6}$ at 95% confidence level (CL), superseding former limits set by the LEP experiments of $\mathcal{B}(Z \rightarrow e\tau) < 9.8 \times 10^{-6}$ [10] and $\mathcal{B}(Z \rightarrow \mu\tau) < 1.2 \times 10^{-5}$ [11] at 95% CL.

This Letter presents a complementary search for $Z \rightarrow \ell\tau$ decays ($\ell =$ light lepton, e or μ) in which the τ -leptons decay into electrons or muons ($\ell\tau_{\ell'}$ channel) using 139 fb^{-1} of pp collision data at $\sqrt{s} = 13 \text{ TeV}$ collected by the ATLAS experiment [12–14]. The search is performed here for the first time at the LHC and is combined with the similar ATLAS search using hadronic τ -lepton decays ($\ell\tau_{\text{had}}$ channel) [9]. The two searches follow similar analysis strategies. Neural network classifiers are used for optimal discrimination of signal from backgrounds and their distributions are employed in a binned maximum-likelihood fit to achieve better sensitivity.

ATLAS¹ is a multipurpose particle detector with a forward–backward symmetric cylindrical geometry and a near 4π coverage in solid angle [12, 15, 16]. It consists of an inner tracking detector surrounded by a superconducting solenoid, electromagnetic and hadronic calorimeters, and a muon spectrometer. This search analyzes pp collision events recorded by the ATLAS experiment using single-electron or single-muon triggers [17–19]. Prompt electrons and muons from the Z -boson decays and those from the τ -lepton decays are reconstructed and selected in the same way. Candidates for electrons [20], muons [21], jets [22–24], and visible decay products of hadronic τ -lepton decays ($\tau_{\text{had-vis}}$) [25, 26] are reconstructed from energy deposits in the calorimeters and charged-particle tracks measured in the inner detector and the muon spectrometer. These candidates are selected with sets of requirements similar to those used in Ref. [9]. Electron candidates are required to pass the *Medium* likelihood-based identification requirement [20] and have a transverse momentum $p_T > 15 \text{ GeV}$ and a pseudorapidity $|\eta| < 1.37$ or $1.52 < |\eta| < 2.47$. Muon candidates are required to pass the *Medium* identification requirement [27] and have $p_T > 10 \text{ GeV}$ and $|\eta| < 2.5$. Both the electron and muon candidates must satisfy the *Tight* isolation requirement [20, 27]. Events with exactly one electron and one muon candidate are selected with the requirement that the lepton with higher transverse momentum has $p_T > 27 \text{ GeV}$. This selection lies above the threshold for constant efficiency of both single-lepton trigger selections. Events with same-flavor lepton pairs are not considered, in order to reduce the background from $Z \rightarrow \ell\ell$ decays. Events with a leading- p_T electron are used in the search for $Z \rightarrow e\tau$ decays ($e\tau_e$ channel), while those with a leading- p_T muon are used in the search for $Z \rightarrow \mu\tau$ decays ($\mu\tau_e$ channel), assuming the prompt lepton from the Z -boson decay is the leading one

¹ ATLAS uses a right-handed coordinate system with its origin at the nominal interaction point (IP) in the center of the detector and the z -axis along the beam pipe. The x -axis points from the IP to the center of the LHC ring, and the y -axis points upward. Cylindrical coordinates (r, ϕ) are used in the transverse plane, ϕ being the azimuthal angle around the z -axis. The pseudorapidity is defined in terms of the polar angle θ as $\eta = -\ln \tan(\theta/2)$.

in p_T . In the $\mu\tau_e$ channel, the ratio of the electron’s p_T reconstructed in the inner tracking detector to that reconstructed in the electromagnetic calorimeter, $p_T^{\text{track}}(e)/p_T^{\text{cluster}}(e)$, is required to be smaller than 1.1 in order to reject $Z \rightarrow \mu\mu$ events. Opposite-charge lepton-pair events are analyzed in the search for signal events, while events with same-charge lepton pairs are used for estimates of background processes. Quark- or gluon-initiated particle showers (jets) are reconstructed using the anti- k_r algorithm [22, 23] with a radius parameter $R = 0.4$. Jets fulfilling $p_T > 20$ GeV and $|\eta| < 2.5$ are identified as containing b -hadrons if tagged by a dedicated multivariate algorithm [28]. To ensure the samples of selected events do not overlap with those used in the $\ell\tau_{\text{had}}$ channel, events with a $\tau_{\text{had-vis}}$ candidate are vetoed. The $\tau_{\text{had-vis}}$ candidates reconstructed from jets with $p_T > 10$ GeV and with one or three associated tracks are selected in $|\eta| < 1.37$ or $1.52 < |\eta| < 2.5$. The $\tau_{\text{had-vis}}$ identification is performed by a recurrent neural network algorithm [25]. A $\tau_{\text{had-vis}}$ candidate is required to have $p_T > 25$ GeV and pass the *Tight* identification selection. The missing transverse momentum (E_T^{miss}) is calculated as the negative vectorial sum of the p_T of all fully reconstructed and calibrated physics objects [29, 30]. Additionally, the calculation includes inner detector tracks that originate from the vertex associated with the hard-scattering process but are not associated with any of the reconstructed objects.

The $Z \rightarrow \ell\tau \rightarrow \ell\ell' + 2\nu$ signal events are characterized by their unique final state, which has two light leptons with different flavor and opposite electric charge, two neutrinos and an invariant mass of all these particles compatible with the Z -boson mass. In most cases, these two leptons are emitted approximately back-to-back in the plane transverse to the proton beam direction. Since the τ -lepton is typically boosted due to the large difference between its mass and the mass of its parent Z boson, the two neutrinos from its decay are usually almost collinear with the lepton from the τ -lepton decay. The dominant background contribution is from the lepton-flavor-conserving $Z \rightarrow \tau\tau \rightarrow \ell\ell' + 4\nu$ decays, where the two τ -leptons decay leptonically. Subleading background contributions from other SM processes with final states with two prompt leptons include the decays of a top–antitop-quark pair ($t\bar{t}$), two gauge bosons (diboson), or a Higgs boson. Finally, small background contributions come from $Z \rightarrow \ell\ell$ decays, where one of the light leptons is misidentified with the wrong flavor, and events with non-prompt leptons. The latter is hereafter referred to as events with “fake leptons” and it includes mostly $W(\rightarrow \ell\nu)$ +jets events with misidentified leptons from heavy-flavor quark decays or light-quark-initiated jets. The signal and background events are separated by using a set of selection criteria that define a signal-enhanced sample, referred to as the signal region (SR). The selection criteria are listed in Table 1. Three neural network (NN) binary classifiers similar to those used in Ref. [9] are trained on simulated events to distinguish signal events from $Z \rightarrow \tau\tau$, top-quark pair and diboson background events individually. The input to these NNs is a mixture of low-level and high-level kinematic variables, following the same strategy as in the $\ell\tau_{\text{had}}$ channel [9]. The low-level variables are the momentum components of the reconstructed light leptons and the E_T^{miss} . The high-level variables are kinematic properties of the $e-\mu-E_T^{\text{miss}}$ system, such as the collinear mass $m_{\text{coll}}(e, \mu)$, defined as the invariant mass of the $e-\mu-2\nu$ system, where the two neutrinos are assumed to have a vectorial momentum sum that is equal in p_T and ϕ to the measured E_T^{miss} and equal in η to the subleading- p_T lepton momentum. The outputs of the individual NNs (values between zero and one) are combined into a final discriminant as shown in Eq. (1), hereafter referred to as the “combined NN output”:

$$\text{Combined NN output} = 1 - \sqrt{\frac{1}{3} \sum_{\text{bkg}} (1 - \text{NN}_{\text{bkg}})^2}. \quad (1)$$

Events classified by the NN trained for $Z \rightarrow \tau\tau$ as background-like are excluded from the SR and used in a control region to better determine the $Z \rightarrow \tau\tau$ background in the maximum-likelihood fit (see Table 1). The signal acceptance in the SR is 19.5% for the $e\tau_\mu$ channel and 11.2% for the $\mu\tau_e$ channel, as determined from simulated signal samples.

Table 1: Selection criteria for events in the signal region.

Selection criterion	Purpose
Exactly two isolated light leptons (ℓ_0, ℓ_1) with opposite electric charge and different flavor (e or μ); $p_T(\ell_0) > p_T(\ell_1)$	Select events consistent with signal decays.
No $\tau_{\text{had-vis}}$ candidate	Orthogonality with $\ell\tau_{\text{had}}$ channel.
Transverse mass ² $m_T(\ell_1, E_T^{\text{miss}}) < 35$ GeV $ \Delta\phi(\ell_0, E_T^{\text{miss}}) > 1$ rad No b -tagged jets (using the 77% efficiency working point [28])	Reject top-quark and diboson events.
Invariant mass of the ℓ_0 - ℓ_1 pair $m(\ell_0, \ell_1) > 40$ GeV	Reject events incompatible with Z -boson decays.
Neural network (optimized for signal vs. $Z \rightarrow \tau\tau$) output > 0.2	Ensure selection is orthogonal to the CRZ $\tau\tau$ region.
In $\mu\tau_e$ channel: $p_T^{\text{track}}(e)/p_T^{\text{cluster}}(e) < 1.1$	Reject $Z \rightarrow \mu\mu$ events.

Predictions for signal and background contributions are based partly on Monte Carlo (MC) simulations and partly on estimates from data. Signal and background processes were simulated as in Ref. [9]. The signal events were simulated using PYTHIA 8 [31] with matrix elements calculated at leading order (LO) in the strong coupling constant. Nominal signal samples were generated with a parity-conserving $Z\ell\tau$ vertex and unpolarized τ -leptons. Scenarios where the decays are maximally parity-violating were considered by reweighting the simulated events using TAU SPINNER [32], as discussed in Ref. [9]. The $Z \rightarrow \tau\tau$ background events were simulated with the SHERPA 2.2.1 [33] generator using the NNPDF 3.0 NNLO PDF set [34] and next-to-leading-order (NLO) matrix elements for up to two partons, and LO matrix elements for up to four partons, calculated with the COMIX [35] and OPENLOOPS [36–38] libraries. Background $Z \rightarrow \ell\ell$ events were simulated using the POWHEG-BOX [39] generator with NLO matrix elements. All MC samples include a detailed simulation of the ATLAS detector with GEANT4 [40, 41]. As in Ref. [9], the simulation of Z -boson production is improved through a correction derived from measurements in data. The simulated p_T spectra of the Z boson were reweighted to match the unfolded distribution measured by ATLAS in Ref. [42]. The predicted overall yields of signal and $Z \rightarrow \tau\tau$ events were determined by a binned maximum-likelihood fit to the combined data in the SR and in a control region enhanced in $Z \rightarrow \tau\tau$ events (CRZ $\tau\tau$). This was done by using an unconstrained fit parameter, which eliminated the theoretical uncertainties in the total Z -boson production cross section (σ_Z), as well as the experimental uncertainties related to the acceptance of the common $\ell\ell'$ final state. The selection criteria for events in the CRZ $\tau\tau$ are the same as those for events in the SR, except that events are required to be classified as $Z \rightarrow \tau\tau$ -like, i.e. with an output smaller than 0.2 for the $Z \rightarrow \tau\tau$ NN and greater than 0.2 for both the top-quark and diboson NNs. In the $\mu\tau_e$ channel, a small contribution to the total background originates from $Z \rightarrow \mu\mu$ events and their predicted yield is based on the measured σ_Z [43]. The modeling of these events was validated in a region enhanced with $Z \rightarrow \mu\mu$ events where the subleading muon is misreconstructed as an electron. This region has the same selection as the $\mu\tau_e$ SR except for the inverse selection on $p_T^{\text{track}}(e)/p_T^{\text{cluster}}(e)$. Based on the observed level of agreement between data and simulation, a systematic uncertainty of 15% is assigned to the predicted yield of $Z \rightarrow \mu\mu$ events in the SR, with no further correction.

² The invariant transverse mass of ℓ and E_T^{miss} is defined as $m_T(\ell, E_T^{\text{miss}}) = \sqrt{2 p_T(\ell) E_T^{\text{miss}} (1 - \cos(\phi_\ell - \phi_{E_T^{\text{miss}}}))}$.

Events with fake leptons yield a small but still significant background contribution. In most cases the misreconstructed lepton (i.e. the “fake” lepton) is the subleading one. These events are estimated from data using a “fake-factor method” similar to the method used in Ref. [9]. The fake factor is defined as the ratio $N_{\text{fake}}^{\text{pass-iso}}/N_{\text{fake}}^{\text{fail-iso}}$, where “fake” indicates events with at least one fake lepton and “pass/fail-iso” indicates whether the subleading lepton passes or fails the isolation requirement. The fake factor is measured in events with pairs of leptons with the same electric charge (“SS”). These events are enhanced in $W(\rightarrow \ell\nu)+\text{jets}$, which is the dominant contribution of events with fake leptons in the SR. Events in the SS region pass the same event selections as those in the SR except for a same-charge requirement. The fake factors are measured as functions of the transverse momentum and pseudorapidity of the leptons, separately for $e\tau_\mu$ and $\mu\tau_e$ events. The kinematic properties of events with fake leptons in the SR or in the CRs are estimated by the distributions of events with the subleading lepton failing the isolation requirement, but otherwise satisfying all other selection criteria for that region, multiplied by the fake factor. The total predicted yields of the events with fake leptons in the SR and CRs are instead determined by a combined maximum-likelihood fit to data, separately for $e\tau_\mu$ and $\mu\tau_e$ events. The remaining background processes are estimated using simulations. These backgrounds include events from the production and decay of top quarks [31, 39], pairs of gauge bosons [33, 34] and the Higgs boson [31, 39]. The yield of the events with top quarks is determined in the maximum-likelihood fit to data via the inclusion of a top-quark control region (“CRTop”). The selection requirements for the CRTop are the same as for the SR except that at least one b -tagged jet is required. The yields of the remaining processes are normalized to their predicted cross sections.

A statistical analysis of the selected events is performed to assess the presence of signal events, following the same method used in Ref. [9]. A simultaneous binned maximum-likelihood fit to the combined NN output distribution in the SR, the $m_{\text{coll}}(e, \mu)$ distribution in the CRZ $\tau\tau$, and the event yield in CRTop is used to constrain uncertainties in the predictions and extract evidence of a possible signal. The fit is performed independently for the $e\tau$ and $\mu\tau$ channels. The fraction of $Z \rightarrow e\tau$ events selected in the $\mu\tau$ channel (and vice versa) is negligible and therefore neglected. In order to improve the discrimination between signal and the events with fake leptons, the events in the SR are further split into two regions based on the transverse momentum of the subleading- p_T lepton ℓ_1 . The low- p_T SR contains events with $p_T(\ell_1) < 20$ (25) GeV in the $e\tau_\mu$ ($\mu\tau_e$) channel, while the high- p_T SR contains the events above these thresholds. Both SRs in the $e\tau_\mu$ channel have comparable sensitivity, while the low- p_T SR in the $\mu\tau_e$ channel is more sensitive than the high- p_T SR. Both SRs are fitted simultaneously. There are four unconstrained parameters in the fits: the parameter of interest determines the LFV branching fraction $\mathcal{B}(Z \rightarrow \ell\tau)$ by modifying an arbitrary pre-fit signal yield, μ_Z determines σ_Z times the overall acceptance and reconstruction efficiency of the $\ell\ell'$ final state in $Z \rightarrow \tau\tau$ and signal events, μ_{top} determines the yield of the top-quark events, and μ_{fakes} determines the yield of the events with fake leptons. Constrained parameters are also introduced to account for systematic uncertainties in the signal and background predictions, as in Ref. [9]. These include uncertainties in simulated events in the modeling of trigger, reconstruction, identification and isolation efficiencies, as well as energy calibrations and resolutions of reconstructed objects. No systematic uncertainties are assigned to the overall yields of events with Z -boson decays, fake leptons or top quarks as these yields are determined from data. Uncertainties related to events with fake leptons include statistical uncertainties due to the size of the data sample used to measure the fake factors and to model their distributions in the SRs and CRs. Systematic uncertainties assigned to events with fake leptons account for: shape differences in the modeling of the combined NN output in the SS events; differences in the composition of the events with fake leptons between SS events and the events in the SRs; and uncertainties affecting the number of events with prompt leptons failing the isolation requirements as estimated by simulation. The dominant uncertainties of the search are statistical in nature. Among the systematic uncertainties, the dominant

Table 2: Summary of the contributions to the uncertainty in the measured $\mathcal{B}(Z \rightarrow \ell\tau_{\ell'})$. The uncertainties related to light leptons include those in the trigger, reconstruction, identification and isolation efficiencies, as well as energy calibrations. The uncertainties related to jets and $E_{\text{T}}^{\text{miss}}$ include those in the energy calibration and resolution. The uncertainty in the $Z \rightarrow \mu\mu$ yield is only applicable in the $\mu\tau$ channel. The total systematic uncertainty can differ from the sum in quadrature of the different contributions due to correlations among uncertainties as a result of the likelihood fit to data.

Source of uncertainty	Uncertainty in $\mathcal{B}(Z \rightarrow \ell\tau)$ [$\times 10^{-6}$]	
	$e\tau$	$\mu\tau$
Statistical	± 3.5	± 3.9
Fake leptons (statistical)	± 0.1	± 0.1
Systematic	± 2.7	± 3.4
Light leptons	± 0.4	± 0.4
$E_{\text{T}}^{\text{miss}}$, jets and flavor tagging	± 2.1	± 2.4
$E_{\text{T}}^{\text{miss}}$	± 0.4	± 0.8
Jets	± 1.9	± 2.2
Flavor tagging	± 0.5	± 0.9
Z-boson modeling	< 0.1	± 0.1
$Z \rightarrow \mu\mu$ yield	–	± 0.8
Other backgrounds	± 0.1	± 0.6
Fake leptons (systematic)	± 0.4	± 0.9
Total	± 4.4	± 5.2

ones are those in the jet calibration which enter through the calculation of the $E_{\text{T}}^{\text{miss}}$. A summary of the uncertainties and their impact on the LFV branching fraction is given in Table 2.

The observed and best-fit predicted distributions of the combined NN output in the low- p_{T} and high- p_{T} SRs are shown in Figure 1. The corresponding distributions of the collinear mass in the high- p_{T} SRs are shown in Figure 2. The best-fit yield of $Z \rightarrow \ell\tau$ signal corresponds to the branching fractions $\mathcal{B}(Z \rightarrow e\tau) = (-2.6 \pm 3.5 \text{ (stat)} \pm 2.7 \text{ (syst)}) \times 10^{-6}$ and $\mathcal{B}(Z \rightarrow \mu\tau) = (-4.4 \pm 3.9 \text{ (stat)} \pm 3.4 \text{ (syst)}) \times 10^{-6}$. The best-fit yields of $Z \rightarrow \tau\tau$, top quarks and events with fake leptons are close to the pre-fit predicted values and are determined with a relative precision of 2%–4%, except the events with fake leptons in the $\mu\tau_e$ channel, which have an uncertainty of 30%. As no significant excess of data over the predicted background is observed, a combined fit of the $\ell\tau_{\ell'}$ and $\ell\tau_{\text{had}}$ channels is used to set upper limits on $\mathcal{B}(Z \rightarrow \ell\tau)$. The analysis of the $\ell\tau_{\text{had}}$ channel with Run 2 data [9] uses a similar scheme of regions and unconstrained parameters. In the statistical combination, the parameters of interest are correlated among the different SRs and CRs. The other unconstrained parameters are uncorrelated as these account either for backgrounds specific to each channel or for different acceptances of the $\ell\tau_{\ell'}$ or $\ell\tau_{\text{had}}$ final states. Common systematic uncertainties are correlated, besides those related to the jet energy calibrations, which are uncorrelated. This conservative correlation scheme was chosen because of different best-fit values for the parameters associated with these uncertainties in the two channels. However, the fit with correlated jet energy calibration uncertainties yields compatible combined upper limits. The analysis of the $\ell\tau_{\text{had}}$ channel with Run 1 data is combined using the same correlation scheme as in Ref. [9]. The combined best-fit amount of $Z \rightarrow \ell\tau$ signal corresponds to the branching fractions $\mathcal{B}(Z \rightarrow e\tau) = (-1.4 \pm 2.5 \text{ (stat)} \pm 1.8 \text{ (syst)}) \times 10^{-6}$ and $\mathcal{B}(Z \rightarrow \mu\tau) = (1.7 \pm 2.2 \text{ (stat)} \pm 1.6 \text{ (syst)}) \times 10^{-6}$.

Figure 1: Observed and best-fit predicted distributions of the combined NN output in the SRs. The distributions in the low- p_T SR are shown in plots (a) and (b) for the $e\tau_\mu$ and $\mu\tau_e$ channels, respectively, while plots (c) and (d) show the distributions in the high- p_T SR for the $e\tau_\mu$ and $\mu\tau_e$ channels, respectively. The expected signal, normalized to an arbitrary $\mathcal{B}(Z \rightarrow \ell\tau) = 3 \times 10^{-4}$ for visualization purposes, is shown as a dashed histogram in each plot. In the panel below each plot, the ratios of the observed yield (dots) and the best-fit background-plus-signal yield (solid line) to the best-fit background yield are shown. The hatched error bands represent one standard deviation of the combined statistical and systematic uncertainties. The first and last bins in each plot include underflow and overflow events, respectively.

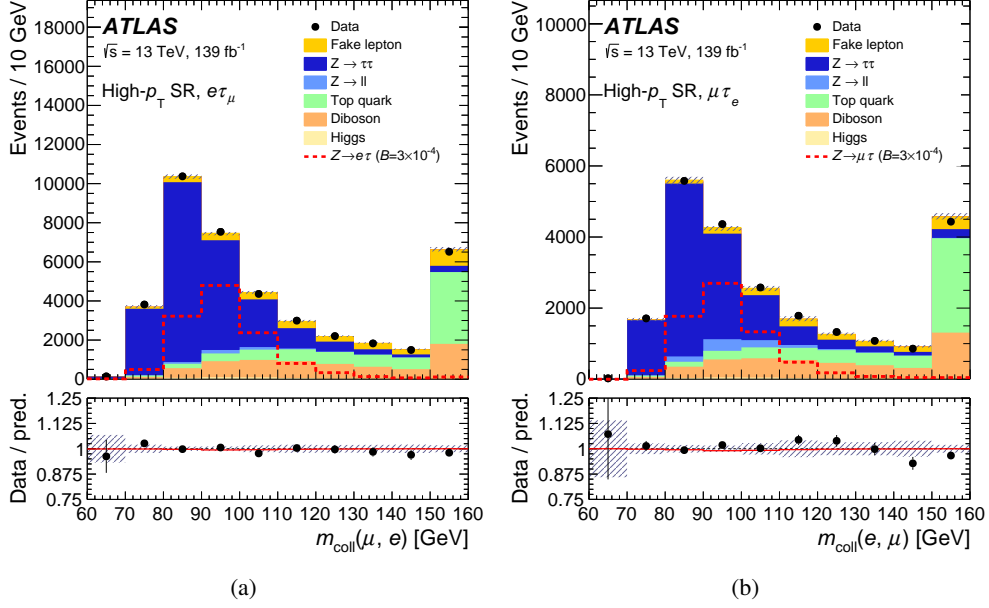

Figure 2: Observed and best-fit predicted distributions of the collinear mass in the high- p_T SRs. Plots (a) and (b) show the distributions for the $e\tau_\mu$ and $\mu\tau_e$ channels, respectively. The expected signal, normalized to an arbitrary $\mathcal{B}(Z \rightarrow \ell\tau) = 3 \times 10^{-4}$ for visualization purposes, is shown as a dashed histogram in each plot. In the panel below each plot, the ratios of the observed yield (dots) and the best-fit background-plus-signal yield (solid line) to the best-fit background yield are shown. The hatched error bands represent one standard deviation of the combined statistical and systematic uncertainties. The first and last bins in each plot include underflow and overflow events, respectively.

Table 3: Observed and expected (median) upper limits on the signal branching fraction at 95% CL, in different τ -polarization scenarios.

Final state, polarization assumption	Observed (expected) upper limit on $\mathcal{B}(Z \rightarrow \ell\tau)$ [$\times 10^{-6}$]	
	$e\tau$	$\mu\tau$
$\ell\tau_{\text{had}}$ Run 1 + Run 2, unpolarized τ [9]	8.1 (8.1)	9.5 (6.1)
$\ell\tau_{\text{had}}$ Run 2, left-handed τ [9]	8.2 (8.6)	9.5 (6.7)
$\ell\tau_{\text{had}}$ Run 2, right-handed τ [9]	7.8 (7.6)	10 (5.8)
$\ell\tau_{\ell'}$ Run 2, unpolarized τ	7.0 (8.9)	7.2 (10)
$\ell\tau_{\ell'}$ Run 2, left-handed τ	5.9 (7.5)	5.7 (8.5)
$\ell\tau_{\ell'}$ Run 2, right-handed τ	8.4 (11)	9.2 (13)
Combined $\ell\tau$ Run 1 + Run 2, unpolarized τ	5.0 (6.0)	6.5 (5.3)
Combined $\ell\tau$ Run 2, left-handed τ	4.5 (5.7)	5.6 (5.3)
Combined $\ell\tau$ Run 2, right-handed τ	5.4 (6.2)	7.7 (5.3)

Since no significant deviation from the SM background hypothesis is observed, exclusion limits are set using the CL_S method [44]. The upper limits are shown in Table 3 for LFV decays with different assumptions about the τ -polarization state. The polarization of the τ -lepton affects the energy of the visible decay products and thus the acceptance for signal events. In the scenario where the τ -leptons are unpolarized, the observed upper limits at 95% CL on $\mathcal{B}(Z \rightarrow e\tau)$ and $\mathcal{B}(Z \rightarrow \mu\tau)$ are 5.0×10^{-6} and 6.5×10^{-6} , respectively.

In conclusion, this Letter reports the first analysis of the $\ell\tau\ell'$ channel in the search for $Z \rightarrow \ell\tau$ decays at the LHC. This channel yields a sensitivity similar to the $\ell\tau_{\text{had}}$ channel. With the combined results of the two channels, the ATLAS experiment sets the most stringent constraints on LFV Z -boson decays involving τ -leptons to date. The precision of these results is mainly limited by statistical uncertainties.

Acknowledgments

We thank CERN for the very successful operation of the LHC, as well as the support staff from our institutions without whom ATLAS could not be operated efficiently.

We acknowledge the support of ANPCyT, Argentina; YerPhI, Armenia; ARC, Australia; BMWFW and FWF, Austria; ANAS, Azerbaijan; SSTC, Belarus; CNPq and FAPESP, Brazil; NSERC, NRC and CFI, Canada; CERN; ANID, Chile; CAS, MOST and NSFC, China; Minciencias, Colombia; MSMT CR, MPO CR and VSC CR, Czech Republic; DNRf and DNSRC, Denmark; IN2P3-CNRS and CEA-DRF/IRFU, France; SRNSFG, Georgia; BMBF, HGF and MPG, Germany; GSRT, Greece; RGC and Hong Kong SAR, China; ISF and Benozio Center, Israel; INFN, Italy; MEXT and JSPS, Japan; CNRST, Morocco; NWO, Netherlands; RCN, Norway; MNiSW and NCN, Poland; FCT, Portugal; MNE/IFA, Romania; JINR; MES of Russia and NRC KI, Russian Federation; MESTD, Serbia; MSSR, Slovakia; ARRS and MIZŠ, Slovenia; DST/NRF, South Africa; MICINN, Spain; SRC and Wallenberg Foundation, Sweden; SERI, SNSF and Cantons of Bern and Geneva, Switzerland; MOST, Taiwan; TAEK, Turkey; STFC, United Kingdom; DOE and NSF, United States of America. In addition, individual groups and members have received support from BCKDF, CANARIE, Compute Canada, CRC and IVADO, Canada; Beijing Municipal Science & Technology Commission, China; COST, ERC, ERDF, Horizon 2020 and Marie Skłodowska-Curie Actions, European Union; Investissements d'Avenir Labex, Investissements d'Avenir IDEX and ANR, France; DFG and AvH Foundation, Germany; Herakleitos, Thales and Aristeia programmes co-financed by EU-ESF and the Greek NSRF, Greece; BSF-NSF and GIF, Israel; La Caixa Banking Foundation, CERCA Programme Generalitat de Catalunya and PROMETEO and GenT Programmes Generalitat Valenciana, Spain; Göran Gustafssons Stiftelse, Sweden; The Royal Society and Leverhulme Trust, United Kingdom.

The crucial computing support from all WLCG partners is acknowledged gratefully, in particular from CERN, the ATLAS Tier-1 facilities at TRIUMF (Canada), NDGF (Denmark, Norway, Sweden), CC-IN2P3 (France), KIT/GridKA (Germany), INFN-CNAF (Italy), NL-T1 (Netherlands), PIC (Spain), ASGC (Taiwan), RAL (UK) and BNL (USA), the Tier-2 facilities worldwide and large non-WLCG resource providers. Major contributors of computing resources are listed in Ref. [45].

- ⁸⁰Graduate School of Science, Kobe University, Kobe; Japan.
- ⁸¹(*a*) AGH University of Science and Technology, Faculty of Physics and Applied Computer Science, Krakow; (*b*) Marian Smoluchowski Institute of Physics, Jagiellonian University, Krakow; Poland.
- ⁸²Institute of Nuclear Physics Polish Academy of Sciences, Krakow; Poland.
- ⁸³Faculty of Science, Kyoto University, Kyoto; Japan.
- ⁸⁴Kyoto University of Education, Kyoto; Japan.
- ⁸⁵Research Center for Advanced Particle Physics and Department of Physics, Kyushu University, Fukuoka ; Japan.
- ⁸⁶Instituto de Física La Plata, Universidad Nacional de La Plata and CONICET, La Plata; Argentina.
- ⁸⁷Physics Department, Lancaster University, Lancaster; United Kingdom.
- ⁸⁸Oliver Lodge Laboratory, University of Liverpool, Liverpool; United Kingdom.
- ⁸⁹Department of Experimental Particle Physics, Jožef Stefan Institute and Department of Physics, University of Ljubljana, Ljubljana; Slovenia.
- ⁹⁰School of Physics and Astronomy, Queen Mary University of London, London; United Kingdom.
- ⁹¹Department of Physics, Royal Holloway University of London, Egham; United Kingdom.
- ⁹²Department of Physics and Astronomy, University College London, London; United Kingdom.
- ⁹³Louisiana Tech University, Ruston LA; United States of America.
- ⁹⁴Fysiska institutionen, Lunds universitet, Lund; Sweden.
- ⁹⁵Centre de Calcul de l'Institut National de Physique Nucléaire et de Physique des Particules (IN2P3), Villeurbanne; France.
- ⁹⁶Departamento de Física Teórica C-15 and CIAFF, Universidad Autónoma de Madrid, Madrid; Spain.
- ⁹⁷Institut für Physik, Universität Mainz, Mainz; Germany.
- ⁹⁸School of Physics and Astronomy, University of Manchester, Manchester; United Kingdom.
- ⁹⁹CPPM, Aix-Marseille Université, CNRS/IN2P3, Marseille; France.
- ¹⁰⁰Department of Physics, University of Massachusetts, Amherst MA; United States of America.
- ¹⁰¹Department of Physics, McGill University, Montreal QC; Canada.
- ¹⁰²School of Physics, University of Melbourne, Victoria; Australia.
- ¹⁰³Department of Physics, University of Michigan, Ann Arbor MI; United States of America.
- ¹⁰⁴Department of Physics and Astronomy, Michigan State University, East Lansing MI; United States of America.
- ¹⁰⁵B.I. Stepanov Institute of Physics, National Academy of Sciences of Belarus, Minsk; Belarus.
- ¹⁰⁶Research Institute for Nuclear Problems of Byelorussian State University, Minsk; Belarus.
- ¹⁰⁷Group of Particle Physics, University of Montreal, Montreal QC; Canada.
- ¹⁰⁸P.N. Lebedev Physical Institute of the Russian Academy of Sciences, Moscow; Russia.

- ¹⁰⁹National Research Nuclear University MEPhI, Moscow; Russia.
- ¹¹⁰D.V. Skobeltsyn Institute of Nuclear Physics, M.V. Lomonosov Moscow State University, Moscow; Russia.
- ¹¹¹Fakultät für Physik, Ludwig-Maximilians-Universität München, München; Germany.
- ¹¹²Max-Planck-Institut für Physik (Werner-Heisenberg-Institut), München; Germany.
- ¹¹³Graduate School of Science and Kobayashi-Maskawa Institute, Nagoya University, Nagoya; Japan.
- ¹¹⁴Department of Physics and Astronomy, University of New Mexico, Albuquerque NM; United States of America.
- ¹¹⁵Institute for Mathematics, Astrophysics and Particle Physics, Radboud University/Nikhef, Nijmegen; Netherlands.
- ¹¹⁶Nikhef National Institute for Subatomic Physics and University of Amsterdam, Amsterdam; Netherlands.
- ¹¹⁷Department of Physics, Northern Illinois University, DeKalb IL; United States of America.
- ¹¹⁸^(a)Budker Institute of Nuclear Physics and NSU, SB RAS, Novosibirsk;^(b)Novosibirsk State University Novosibirsk; Russia.
- ¹¹⁹Institute for High Energy Physics of the National Research Centre Kurchatov Institute, Protvino; Russia.
- ¹²⁰Institute for Theoretical and Experimental Physics named by A.I. Alikhanov of National Research Centre "Kurchatov Institute", Moscow; Russia.
- ¹²¹Department of Physics, New York University, New York NY; United States of America.
- ¹²²Ochanomizu University, Otsuka, Bunkyo-ku, Tokyo; Japan.
- ¹²³Ohio State University, Columbus OH; United States of America.
- ¹²⁴Homer L. Dodge Department of Physics and Astronomy, University of Oklahoma, Norman OK; United States of America.
- ¹²⁵Department of Physics, Oklahoma State University, Stillwater OK; United States of America.
- ¹²⁶Palacký University, RCPTM, Joint Laboratory of Optics, Olomouc; Czech Republic.
- ¹²⁷Institute for Fundamental Science, University of Oregon, Eugene, OR; United States of America.
- ¹²⁸Graduate School of Science, Osaka University, Osaka; Japan.
- ¹²⁹Department of Physics, University of Oslo, Oslo; Norway.
- ¹³⁰Department of Physics, Oxford University, Oxford; United Kingdom.
- ¹³¹LPNHE, Sorbonne Université, Université de Paris, CNRS/IN2P3, Paris; France.
- ¹³²Department of Physics, University of Pennsylvania, Philadelphia PA; United States of America.
- ¹³³Konstantinov Nuclear Physics Institute of National Research Centre "Kurchatov Institute", PNPI, St. Petersburg; Russia.
- ¹³⁴Department of Physics and Astronomy, University of Pittsburgh, Pittsburgh PA; United States of America.
- ¹³⁵^(a)Laboratório de Instrumentação e Física Experimental de Partículas - LIP, Lisboa;^(b)Departamento de Física, Faculdade de Ciências, Universidade de Lisboa, Lisboa;^(c)Departamento de Física, Universidade de Coimbra, Coimbra;^(d)Centro de Física Nuclear da Universidade de Lisboa, Lisboa;^(e)Departamento de Física, Universidade do Minho, Braga;^(f)Departamento de Física Teórica y del Cosmos, Universidad de Granada, Granada (Spain);^(g)Dep Física and CEFITEC of Faculdade de Ciências e Tecnologia, Universidade Nova de Lisboa, Caparica;^(h)Instituto Superior Técnico, Universidade de Lisboa, Lisboa; Portugal.
- ¹³⁶Institute of Physics of the Czech Academy of Sciences, Prague; Czech Republic.
- ¹³⁷Czech Technical University in Prague, Prague; Czech Republic.
- ¹³⁸Charles University, Faculty of Mathematics and Physics, Prague; Czech Republic.
- ¹³⁹Particle Physics Department, Rutherford Appleton Laboratory, Didcot; United Kingdom.
- ¹⁴⁰IRFU, CEA, Université Paris-Saclay, Gif-sur-Yvette; France.

- ¹⁴¹Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz CA; United States of America.
- ¹⁴²^(a)Departamento de Física, Pontificia Universidad Católica de Chile, Santiago;^(b)Universidad Andres Bello, Department of Physics, Santiago;^(c)Instituto de Alta Investigación, Universidad de Tarapacá, Arica;^(d)Departamento de Física, Universidad Técnica Federico Santa María, Valparaíso; Chile.
- ¹⁴³Universidade Federal de São João del Rei (UFSJ), São João del Rei; Brazil.
- ¹⁴⁴Department of Physics, University of Washington, Seattle WA; United States of America.
- ¹⁴⁵Department of Physics and Astronomy, University of Sheffield, Sheffield; United Kingdom.
- ¹⁴⁶Department of Physics, Shinshu University, Nagano; Japan.
- ¹⁴⁷Department Physik, Universität Siegen, Siegen; Germany.
- ¹⁴⁸Department of Physics, Simon Fraser University, Burnaby BC; Canada.
- ¹⁴⁹SLAC National Accelerator Laboratory, Stanford CA; United States of America.
- ¹⁵⁰Physics Department, Royal Institute of Technology, Stockholm; Sweden.
- ¹⁵¹Departments of Physics and Astronomy, Stony Brook University, Stony Brook NY; United States of America.
- ¹⁵²Department of Physics and Astronomy, University of Sussex, Brighton; United Kingdom.
- ¹⁵³School of Physics, University of Sydney, Sydney; Australia.
- ¹⁵⁴Institute of Physics, Academia Sinica, Taipei; Taiwan.
- ¹⁵⁵^(a)E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi;^(b)High Energy Physics Institute, Tbilisi State University, Tbilisi; Georgia.
- ¹⁵⁶Department of Physics, Technion, Israel Institute of Technology, Haifa; Israel.
- ¹⁵⁷Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv; Israel.
- ¹⁵⁸Department of Physics, Aristotle University of Thessaloniki, Thessaloniki; Greece.
- ¹⁵⁹International Center for Elementary Particle Physics and Department of Physics, University of Tokyo, Tokyo; Japan.
- ¹⁶⁰Department of Physics, Tokyo Institute of Technology, Tokyo; Japan.
- ¹⁶¹Tomsk State University, Tomsk; Russia.
- ¹⁶²Department of Physics, University of Toronto, Toronto ON; Canada.
- ¹⁶³^(a)TRIUMF, Vancouver BC;^(b)Department of Physics and Astronomy, York University, Toronto ON; Canada.
- ¹⁶⁴Division of Physics and Tomonaga Center for the History of the Universe, Faculty of Pure and Applied Sciences, University of Tsukuba, Tsukuba; Japan.
- ¹⁶⁵Department of Physics and Astronomy, Tufts University, Medford MA; United States of America.
- ¹⁶⁶Department of Physics and Astronomy, University of California Irvine, Irvine CA; United States of America.
- ¹⁶⁷Department of Physics and Astronomy, University of Uppsala, Uppsala; Sweden.
- ¹⁶⁸Department of Physics, University of Illinois, Urbana IL; United States of America.
- ¹⁶⁹Instituto de Física Corpuscular (IFIC), Centro Mixto Universidad de Valencia - CSIC, Valencia; Spain.
- ¹⁷⁰Department of Physics, University of British Columbia, Vancouver BC; Canada.
- ¹⁷¹Department of Physics and Astronomy, University of Victoria, Victoria BC; Canada.
- ¹⁷²Fakultät für Physik und Astronomie, Julius-Maximilians-Universität Würzburg, Würzburg; Germany.
- ¹⁷³Department of Physics, University of Warwick, Coventry; United Kingdom.
- ¹⁷⁴Waseda University, Tokyo; Japan.
- ¹⁷⁵Department of Particle Physics and Astrophysics, Weizmann Institute of Science, Rehovot; Israel.
- ¹⁷⁶Department of Physics, University of Wisconsin, Madison WI; United States of America.
- ¹⁷⁷Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal; Germany.

- ¹⁷⁸Department of Physics, Yale University, New Haven CT; United States of America.
- ^a Also at Borough of Manhattan Community College, City University of New York, New York NY; United States of America.
- ^b Also at Bruno Kessler Foundation, Trento; Italy.
- ^c Also at Center for High Energy Physics, Peking University; China.
- ^d Also at Centro Studi e Ricerche Enrico Fermi; Italy.
- ^e Also at CERN, Geneva; Switzerland.
- ^f Also at CPPM, Aix-Marseille Université, CNRS/IN2P3, Marseille; France.
- ^g Also at Département de Physique Nucléaire et Corpusculaire, Université de Genève, Genève; Switzerland.
- ^h Also at Departament de Física de la Universitat Autònoma de Barcelona, Barcelona; Spain.
- ⁱ Also at Department of Financial and Management Engineering, University of the Aegean, Chios; Greece.
- ^j Also at Department of Physics and Astronomy, Michigan State University, East Lansing MI; United States of America.
- ^k Also at Department of Physics and Astronomy, University of Louisville, Louisville, KY; United States of America.
- ^l Also at Department of Physics, Ben Gurion University of the Negev, Beer Sheva; Israel.
- ^m Also at Department of Physics, California State University, East Bay; United States of America.
- ⁿ Also at Department of Physics, California State University, Fresno; United States of America.
- ^o Also at Department of Physics, California State University, Sacramento; United States of America.
- ^p Also at Department of Physics, King's College London, London; United Kingdom.
- ^q Also at Department of Physics, St. Petersburg State Polytechnical University, St. Petersburg; Russia.
- ^r Also at Department of Physics, University of Fribourg, Fribourg; Switzerland.
- ^s Also at Faculty of Physics, M.V. Lomonosov Moscow State University, Moscow; Russia.
- ^t Also at Faculty of Physics, Sofia University, 'St. Kliment Ohridski', Sofia; Bulgaria.
- ^u Also at Giresun University, Faculty of Engineering, Giresun; Turkey.
- ^v Also at Graduate School of Science, Osaka University, Osaka; Japan.
- ^w Also at Hellenic Open University, Patras; Greece.
- ^x Also at Institutio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona; Spain.
- ^y Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg; Germany.
- ^z Also at Institute for Particle and Nuclear Physics, Wigner Research Centre for Physics, Budapest; Hungary.
- ^{aa} Also at Institute of Particle Physics (IPP); Canada.
- ^{ab} Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku; Azerbaijan.
- ^{ac} Also at Instituto de Física Teórica, IFT-UAM/CSIC, Madrid; Spain.
- ^{ad} Also at Istanbul University, Dept. of Physics, Istanbul; Turkey.
- ^{ae} Also at Joint Institute for Nuclear Research, Dubna; Russia.
- ^{af} Also at Moscow Institute of Physics and Technology State University, Dolgoprudny; Russia.
- ^{ag} Also at Physikalisches Institut, Albert-Ludwigs-Universität Freiburg, Freiburg; Germany.
- ^{ah} Also at The City College of New York, New York NY; United States of America.
- ^{ai} Also at TRIUMF, Vancouver BC; Canada.
- ^{aj} Also at Università di Napoli Parthenope, Napoli; Italy.
- ^{ak} Also at University of Chinese Academy of Sciences (UCAS), Beijing; China.
- ^{al} Also at Yeditepe University, Physics Department, Istanbul; Turkey.
